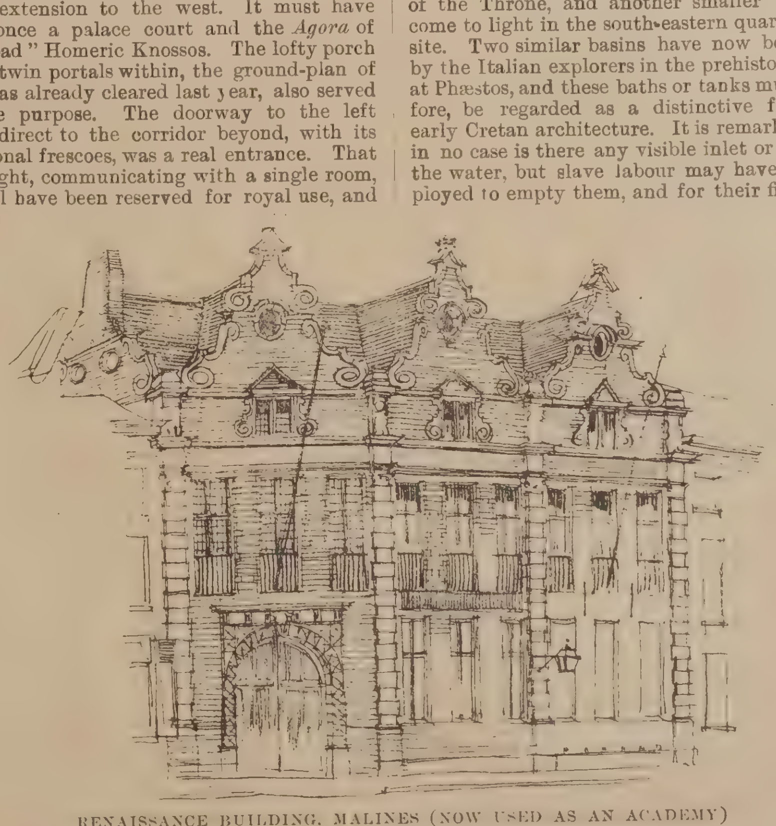
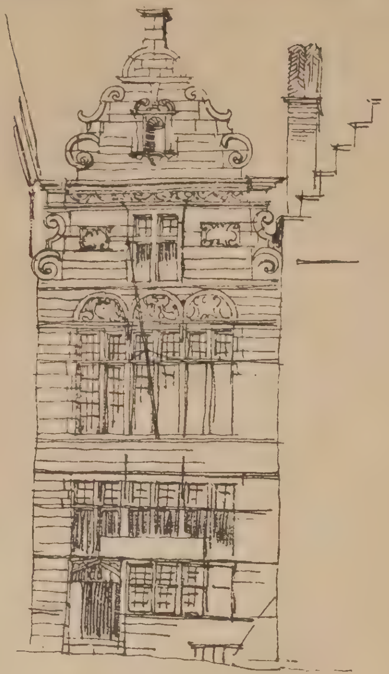
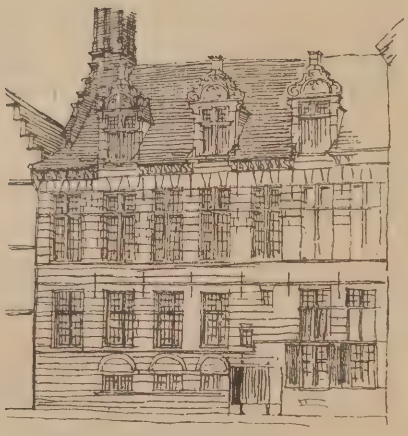
The base and foundations of the west wall of the palace were found to continue northward, taking finally a double turn eastwards in two sharp finely-preserved angles. The foundations themselves are on this side composed of small blocks—apparently unique in structure—and inner lines of the same construction, which support part of the north-western area of the building, attain the surprising depth of 23ft. The outer wall, after its turn eastward, takes a further and quite unexpected turn to the north, enclosing a distinct quarter of the palace grouped round a small paved piazza with an inner portico of its own. This piazza, already partly excavated last year, was found to give access on the west to a spacious bath or tank, lined with fine gypsum slabs nearly 7ft. in height and approached by a double flight of steps flanked by a breastwork and columns, of which the bases only remained. The basin is analogous, but on a larger scale, to that already found in the Room of the Throne, and another smaller has since come to light in the south-eastern quarter of the site. Two similar basins have now been found by the Italian explorers in the prehistoric palace at Phæstos, and these baths or tanks must, therefore, be regarded as a distinctive feature of early Cretan architecture. It is remarkable that in no case is there any visible inlet or outlet for the water, but slave labour may have been employed to empty them, and for their filling, too,



RENAISSANCE BUILDING, MALINES (NOW USED AS AN ACADEMY)





THE CONCIERGERIE, YPRES.

so far as it was not effected by the supply of rainwater from the housetops.

Magazines.

A terrace wall divides this northern region of the bath and piazza from a considerable interior area of the building that lies between this and the zone laid bare by my last year's excavations. In this area, which includes the whole north-western angle of the palace, have now been uncovered a further series of large magazines opening on the Long Gallery already discovered. These freshly-excavated magazines are ten in number, bringing the whole tale up to eighteen, and several of them proved to be exceptionally rich in their contents. In the southernmost of these the huge store jars stood in double or single rows in unbroken order from end to end of the long chambers. Interesting evidence was forthcoming of the existence of at least one upper storey above these magazines, and on the upper floor level were found fragments of painted vases in a style which for combined beauty and largeness of design surpasses any known ceramic fabrics of the Mycenæan age. Near the north-western angle of the wall, and also certainly belonging to the upper storey, were found various remains indicative of the former existence of an important feature of the building at this point. Here was found a continuous piece of stone frieze, or dado, with triglyphs and half rosettes in relief, together with other architectural fragments. Here, too, fallen from the walls, were parts of fresco paintings containing in their original design a series of zones with human figures from about a fourth to an eighth of the natural size and of special interest as supplying a wholly new version of the costumes of Mycenæan Crete.

Of contact with Egypt a highly important monument has come to light, dating from about the same period—the early part of the second millennium B.C.—as the diorite figure found here last year. It is the lid of an alabaster vase very finely engraved, with a cartouche containing the name and divine titles of Khyan.

This lid lay beneath a later Mycenæan wall and floor level, and it is perhaps not an accidental coincidence that about three yards from the same spot there came to light a fine Babylonian cylinder of lapis-lazuli mounted with gold and representing mythological subjects. It seems to be of pure Mesopotamian fabric belonging to the class that supplied the immediate predecessors of certain "Hittite" types of Northern Syria. This is, I believe, the first authentic instance of the discovery of a Babylonian cylinder in the Ægean world.

The Northern Entrance Way,

partly excavated last year, was found to descend to a much greater depth, and fine walls of masonry, showing as much as eight courses, have here been exposed to view on either side. To the east of this and of the great court on which the Throne Room and other chambers open a further extensive palace region is now coming to light. These remains extend to the south side of the same court, which is now seen to be a spacious interior piazza. The buildings on the east side of this court include a series of small magazines, where considerable stores of plain clay vessels of various kinds lay in piles and nests.

The Palace a Town.

It becomes more and more evident that the Palace of Knossos, like Indian palaces at the present day, was a small town in itself, with a considerable population of slaves and artisans, who were employed on various arts and industries for the benefit of its lords. Various indications point to the fact that many of the beautiful *intaglios*, the clay impressions of which have occurred here so abundantly, were produced by engravers working within the building. In several chambers were found the paints and pounded gypsum used by the artists who executed the noble frescoes and reliefs that adorned the walls. In a room on the brink of the eastern slope was made a discovery that shows that the sculptor's art also flourished on the spot. Here was found a magnificent three-handled "amphora" of veined marble-like stone, with spiraliform bands and reliefs round its mouth and shoulders, of such calibre that it took eleven men with ropes and poles to remove it from the site. This fine work was complete, but beside it stood another smaller vase of the same material and general outline, but only roughly shaped out. The sculptor was apparently at work on it at the moment of the destruction of the palace.

A Remarkable Discovery.

Above this *atelier*, on the floor of a larger chamber, a find of a truly surprising character was made. Detached pieces of ivory and crystal began to appear, which were found to belong to a large board more than a yard long. It had been somewhat crushed and contorted, but the chief component parts were still in their places, though lying on the loose earth; and by means of framing and underplastering it was possible, after nearly three days' careful work, to get out the whole as it lay. In the magnificent object thus recovered we have undoubtedly the royal draught-board. The framework was of ivory perhaps originally supported on wood, the board having perhaps also acted as the lid of a box to contain the men. The surface of the board formed a kind of mosaic of ivory, partly coated with gold, and crystal bars and plaques backed with silver and blue enamel—the Homeric Kyanos. At one end was a series of medallions arranged like those of the Egyptian draught-boards, such as that found in the tomb of Queen Hatshepsut, already known from the Enkomi example to have been imitated by the Mycenæans. This is followed by a kind of labyrinth of ivory and crystal, to which again succeed four large elaborately-jewelled medallions and nautiluses of ivory and crystal. The whole was enclosed in a frame of marguerites in relief wrought in the same materials.

Among the most interesting discoveries of the present season have been the large number of clay impressions of Mycenæan gems and signet-rings—some of them used for securing the boxes in which the inscribed tablets were originally deposited. The subjects of some of these are of striking novelty, such as a lady with a swallow at the end of a string, which seems to be serving as a lure to another swallow flying towards it. But what are we to say to a creature with the forepart of a hoofed, calf-like animal, and the legs of man, seated on a kind of throne? If this be not the Minotaur, it is surely the Minocalf. That the local monster of the later Greek legends should thus have received illustration in Mycenæan times is a strange and significant phenomenon.

The Scene of a Shrine.

Excavations just south of the Throne Room on the western border of the central court have brought to light other interesting seal impressions, several of them with religious subjects, which tend to show that there was a shrine in this vicinity. From a series of more or less fragmentary impressions it has been possible, indeed, to put together a whole scene of ancient worship, in the centre of which a goddess akin to the later Rhea or Cybelê stands on her sacred rock guarded on either side by heraldically posed lions. In front of her is a votary in the act of adoration, while behind is a small temple with two consecrated pillars. The broad steps that ascend from the Central Court near the spot where the seals were found seem to have led to a spacious "Megaron", or hall, resting on basement rooms, into which part of its original pavement had fallen.

Wonderful Sculpture.

At the south end of the same central court remains are at this moment coming to light which show that on this side, too, rose a hall adorned with painted reliefs of human subjects.

GABLE ENDS, YPRES.

An admirably modelled thigh and leg of a man, and an arm and breast, perhaps belonging to the same figure, must certainly be taken to represent the highest level ever reached by Mycenæan art. There is, as usual, a tendency somewhat to exaggerate the muscular display, but the human form is here seen as it was never again portrayed till the greatest age of Greek sculpture some ten centuries later. In this brilliant combination of the modeller's and painter's skill we may recognise the masterpieces of the craft associated with the legendary name of Daedalus. Round the breast and shoulders is a kind of chain of honour. the alternate links of which take the form of lilies; but another fragment supplies insignia of still more royal purport. It displays the upper part of a head wearing a crown which terminates above in a row of five sloping lilies of varied metal-work, with a higher one rising erect in the centre. That the *fleur-de-lis* of our Edwards and Henrys should find a prototype in prehistoric Greece is a startling revelation; but it was perhaps fitting that, as last year's excavations in Knossos brought to light "the oldest throne in Europe," so the more recent researches should produce its most ancient crown.

NEW LIVERPOOL CATHEDRAL.

THE OPINION OF MR. GEORGE BRADBURY.

THE Liverpool Cathedral question, of which particulars have been published in these columns from time to time, is again to the fore, and is now attracting considerable local attention. Mr. George Bradbury, diocesan surveyor, past-president of the Liverpool Architectural Society, and the architect of Church House, has expressed the following opinion:

In selecting a site for the new Liverpool Cathedral I think the following points should be carefully considered.

(1) That it should be placed upon a site a little apart, away from the noise, dirt and bustle of the heavy traffic of the Liverpool streets.

(2) That it should be as near the centre of the city between north and south as possible. The north of Liverpool I take as the boundary of Bootle, and the south including the whole of Garston, for, whether that district is incorporated with Liverpool or not, it is really part of the city, and very extensive building operations are going on there.

(3) If a portion of the cathedral is to be built within the next twenty years the question of the cost of the site is a most important one. If the committee have to spend £150,000 to £200,000 in purchasing buildings, then all the money at present subscribed and for the next few years would probably be expended without the laying of a single stone.

(4) The question of foundations. The cathedral should be built on the rock, so as to properly sustain the high towers or spires, and avoid the disasters that have befallen so many of our ancient cathedrals by the towers and spires falling and destroying large portions of the transepts and naves. The cost of foundations in the lower parts of the city would be something enormous.

(5) The question of architectural effect. And as this is one upon which there may be great difference of opinion I do not think I can do better than quote from the highest possible authority. Mr. Ruskin, on the subject of building on sloping ground, says: "The fact is that the apprehension of the size of the natural objects, as well as of architecture, depends more on fortunate excitement of the imagination than on measurements by the eye, and the architect has a peculiar advantage in being able to press close upon the sight such magnitude as he can command. There are few rocks even among the Alps that have a clear vertical fall as high as the choir of Beauvais; and if we secure a good precipice of wall or a sheer and unbroken flank of tower, and place them where there are no enormous natural features to oppose them, we shall feel in them no want of sublimity of size."

TONLIEU OR CUSTOM HOUSE, BRUGES.

From notes that have appeared in the papers I understand the committee are considering three possible sites: St. Luke's, Bold Street; Monument Place, London Road; and St. James's Mount, Upper Duke Street; and a Mr. Robert Gladstone appeals with confidence to every architect in Liverpool to confirm his opinion with regard to St. James's Mount, I have ventured to lay before you a few facts with regard to the above situations.

St. Luke's Church site has a length, from the steps to the wall in Roscoe Street, of 290ft., with a breadth of 170ft.; it would be too small for a cathedral unless six houses in Rodney Street were purchased, when the site would then have a length of 480ft. by a breadth of 170ft. Judging this site with regard to its quietness, it is exceedingly bad; tram-lines run on two sides almost incessantly, including Sundays, and the traffic is something enormous. The church originally had an exceedingly handsome oak timber roof, but subsequently, owing to the very defective accoustic properties, the internal plaster groining was placed below.

This site cannot possibly be considered as a quiet spot. It is well in the centre of Liverpool.

With regard to the cost of the minimum site, it would probably amount to £20,000, without considering the question of the vested rights of the incumbent or the trustees, and without buying the land up to Roscoe Street.

No doubt good foundations could be obtained if the present St. Luke's were entirely removed, but it would be very difficult to obtain proper levels. If the chancel were put on a level with Rodney Street, the fall to the top of Bold Street would be something like 40ft. I cannot think that public opinion would ever allow the handsomest church in Liverpool to be pulled down and removed; it cost about £60,000, some say £80,000, of public money to erect, and I think it should be left as it is to carry on its enormously successful parish work. And, as a whole, this church has a fine architectural effect, and on that ground it would be a great pity to have it removed.

I have traced from the ordnance surveys the three sites mentioned; they are all to the same scale, and upon each I have placed the design which, I understand, was placed first in the competition held for the Liverpool Cathedral in 1886. All the plans sent in at that time gave a cathedral approximately 450ft. long by 230ft. across the transept. Unless the property on the south side of Bold Place, extending to Roscoe Street, and an additional seven houses in Rodney Street, as well as the new property in Berry Street, were purchased, the cathedral as designed by the competitors could not be placed upon St. Luke's site without very seriously curtailing its length and breadth, and the purchase of all the above property, which would probably amount to £130,000, would render it an impossibly costly site, even if the vested interests, dirt and noise were not taken into consideration.

Monument Place site has a frontage of about 130ft., and, at the back, a width of about 370ft., and from front to back a depth of about 480ft. The site cannot possibly be considered "a quiet place"—the electric trams, the noise of the traffic, would make it almost impossible to hear anything of a cathedral service. Only those who live in houses facing on to a road where the electric cars run can really estimate the noise they cause. On the question of cost this site, in my opinion, would involve the expenditure of £130,000 in land and buildings, and a further £50,000 as trade compensation—total, £180,000 at least. A comparatively new bank, large business premises, valuable shops and a church would have to be removed. The foundations no doubt would be found satisfactory.

With regard to the architectural effect, it could be seen on three sides, and would have a very imposing appearance, but, owing to the large amount of very small property with which it would be surrounded, it is doubtful whether the week-day or Sunday services conducted in that district would be largely attended by those who are able to support cathedral services.

The same cathedral plan very nearly fills the Monument Place site, and future extension for houses of residence would become very costly; nor is this a neighbourhood where we could reasonably expect our archdeacons or canons to reside. For the reason therefore of the noise and the enormous cost of the St. Luke's and Monument Place sites, I think they are both entirely unsuitable.

St. James's Mount has till quite recently been considered quite unsuitable, except in connection with St. James's Cemetery. It is not at all necessary that the early ideas of building a bridge across the cemetery to Hope Street, or putting the cathedral upon huge arches, should be considered. St. James's Mount is in itself sufficiently large to admit a cathedral without even disturbing the boundary railing of the cemetery, or the mortuary chapel, nor need a single grave or stone be disturbed. The dimensions across the site at its widest part are, as given by Mr. Gladstone, about 248ft., with a length of 1,020ft.

HOTEL DE VILLE (LATE PORTION), GHENT.

There are only six houses on the Mount of any size. The other three are merely small cottages or a lodge. The houses could probably be bought for a comparatively small sum. This site ought, therefore, to be acquired, with all the houses upon it, for about £20,000; and this sum, compared with the cost of other sites, ought not to prevent the commencement of the erection of a cathedral within a very short period.

From a very careful survey I have made of the cemetery, I think the original rock would be found at a reasonable depth below the surface of St. James's Mount. Wherever the cathedral is built, the spread of the foundation walls will necessarily cause them to have to be carried down a considerable depth. The cost of the foundations of this site would probably be far less than of any other site in Liverpool. The walls would stand upon the solid undisturbed rock, and in this way there would be no danger of any accident in the future.

The architectural effect, as regards situation, would, in my opinion, quite equal, if it did not surpass, anything we have in England. The cathedral would probably stand on a perfectly level platform about 13ft. above St. James's Road, at its north end. The nave floor would, therefore be about 150ft. above the level of high-water mark, and about the same level as

Hope Street, facing Gambier Terrace. The view of the cathedral for the whole length of that part of Hope Street, viewed across the pretty hollow of the cemetery, would be something almost unique in England, and of great magnficence.

It would stand in an open space nearly a quarter of a mile long by 200yds. wide, and in my opinion Mr. Ruskin must have had such a site in his mind when he wrote the words quoted at the commencement of this letter. The St. James's Mount site is, in my idea, the only one in the whole of Liverpool that meets the conditions of a Liverpool Cathedral.

NEW BOARD SCHOOLS AT CRADLEY.

NEW Board Schools are to be erected at Colley Gate, Cradley. The tender of Messrs. H. Dorse & Co., Cradley Heath, the contractors, is for £3,970. Messrs. Meredith & Pritchard, of Kidderminster, are the architects. The Colley Lane schools are to be erected upon building sites on the north-east and south-west sides of Colley Lane, and are designed to accommodate 190 infants and 240 girls. The school on the north-east side of the highway is for infants, with approaches from Colley Lane and also from the Ragged School Lane. The arrangement of this school consists of wide tile-paved corridors and lock-up cloakrooms, enclosed with metal lattice screens, with accommodation both for the scholars and the teachers, and with the most recent lavatories. The rooms, each of which opens directly from the corridors, consist of schoolroom 34ft. by 24ft., classroom 22ft. 9in. by 20ft. and babies' room 22ft. 9in. by 20ft., the whole with wood block floors, pressed brick dados and plaster ceilings with carved wood trusses. The girls' school, which is placed on the south-west side of Colley Lane, has similarly designed corridors, cloakrooms and lavatories as the infants' school, with two classrooms, each 30ft. by 22ft. and two 24ft. 4in. by 24ft. 3in., three of which are capable of being thrown into one by patent movable partitions, forming a room 84ft. 4in. long. Both schools will be well lighted and ventilated, and warmed by the latest low pressure system on the American radiator principle. Large playgrounds are provided for both schools, and have the most modern sanitary appliances. Both plans have been designed for and show how future extensions may be made when required, and the cloakroom accommodation for the extensions is provided in the plans now decided to be carried out. The original design of the architects for the elevations was of rather an imposing character, but the estimate of £4,670 was considered by the Board to be more than ought to be spent, and the architects were desired to cut out all ornamentation and keep the cost below £4,000. This has now been done.

John Milton's Bust, by Mr. Frampton, which is to be placed in the Cripplegate Institute, is not the only memorial of the illustrious poet to be found in this parish. In the church of St. Giles, where, with his father, he lies buried, a bust was erected as long ago as the year 1793 by Samuel Whitbread, the friend of Sheridan, and there is also a monument, by William Benson, to be seen in Westminster Abbey. Daniel De Foe, a bust of whom is also to be placed in the same institution, was born in the parish of St. Giles.

The Registration of Architects.—A meeting of architects, convened by the council of the Society of Architects, London, was held last week at Edinburgh—Mr. T. Walter L. Emden, L.C.C., president of the Society of Architects, being in the chair—to consider a paper by Mr. Ellis Marsland, hon. secretary of the Society of Architects, on "The Statutory Registration of Architects." A resolution stating that the meeting approved the principle of the statutory examination and registration of architects, and was of opinion that it was desirable to promote a Bill in Parliament for the attainment of this object, was unanimously adopted.

Views & Reviews.

THE ARCHITECT AS ARBITRATOR.

A COMPREHENSIVE treatise, clearly defining the position of an architect or engineer in his dual relationship to client and contractor—with their frequently conflicting interests—has long been wanted, and we therefore welcome this book as a useful and practical work dealing with a somewhat complicated subject.

Mr. Gregory is well qualified to set forth both the professional and legal aspects of the architect's or engineer's position, for not only has he practised for more than twenty years as a civil engineer, but he has also been engaged for a similar period as a barrister-at-law in connection with litigation arising from railway and canal construction, and as an arbitrator or referee in such matters. Under these circumstances, Mr. Gregory can sympathetically appreciate the onerous position oftentimes occupied by an architect or engineer, whilst at the same time bringing considerable legal experience to bear upon the numerous knotty points arising in actual practice.

The author introduces his subject with a full explanation of the position in which the engineer or architect stands towards the employer and the contractor respectively, and his remarks place it in the clearest possible light. The following extract gives a good general description of the architect's status from the legal standpoint:—

"In accepting an appointment from the employer, the engineer or architect undertakes responsibilities to the employer under the contract, but to the contractor only under the law. To the employer he may be liable for an error in the performance of his duties; but to the contractor only for a fraud committed or aided by him, in the performance of his functions under the contract, or otherwise. As fraud and deceit are *mala in se*, and in the performance of functions under the provisions of a contract, as in every other transaction, a person is under the legal obligation to be a party to no fraud, and to make no false statement for the purpose of it being used to another's injury, the employer's direction or request to the engineer or architect as to the performance of his duties under a contract is no justification for a fraudulent performance of them. That his functions shall not be exercised in bad faith, is the extent of the engineer or architect's obligation to the contractor with whom he has no privity of contract; while to the employer he may be under the obligation to duly perform all the duties which, by his acceptance of the appointment, he undertook to perform."

The ordinary powers which appertain to an architect or engineer under building contracts are then dealt with in detail, including such as the definition of work to be performed by the contractor; the approval of work; progress certificates; final certificates; course of action in the case of delay on non-completion of works; enforcement of penalties or fines; extras, &c.

Throughout the work the author's explanations and definitions respecting the precise legal construction to be placed upon each point under consideration are supported by references to well-known cases in which a definite decision has been given in the law courts. At the same time we are surprised and disappointed to find no mention of any decisions which have been given within the last few years; in fact, none of the leading cases which have occurred since 1892 are noticed, although several are of considerable importance.

The subject matter of the book is carefully arranged in a concise and simple form, and includes many sound and practical suggestions. A thoughtful perusal of Mr. Gregory's work cannot fail to give the architect or engineer a very clear conception of the legal duties and responsibilities involved in the active exercise of his profession.

T. E. C.

"The Engineer or Architect as the Arbitrator between the Employer and the Contractor; and his other Functions, under Building Contracts." By C. C. Gregory, A.M.I.C.E., barrister-at-law, &c. London: W. Clowes & Sons, Ltd., 7, Fleet Street. Price 12s. 6d.

New Patents.

These patents are open to opposition until July 8th.

1900.—Siphon-Flushing Cisterns.—7,870. C. Darrah, junior, Miller Street, Manchester. The object of this invention is to subdue the noise which occurs when the cistern empties. For this purpose a pipe of about ¾in. diameter is fixed to the lower part of the siphon, its bend being above the top of the cistern. On the downward limb a float is mounted. This float sinks as the water is discharged, and just when an opening at its lower end is about to be uncovered, the float descends over it, allowing air to leak in, however, and so destroying the vacuum. As the cistern fills the float rises.

Sewage Treatment.—9,819. R. H. Reeves, Cedardale, Putney Bridge Road, Putney, S.W. The chemicals required for deodorisation are mixed with the sewage before it arrives at the precipitation tank. The necessary precipitating material is then sprayed on to the sewage in the tank. By these means the percentage of precipitation obtainable is increased. The effluent is passed through a jet and issues as spray. This is done to effect complete oxidation.

Groynes.—11,007. E. M. L. Case, 39, Victoria Street, Westminster, S.W. This invention relates to an improved method of constructing groynes and breakwaters. It consists of sections of planking or metal sheets braced together and fitted with end-projecting plates forming boxes to receive the ends of other sections; the whole enclosing supporting piles.

Paint Mills.—11,518. F. W. Follows, Froxmer Street, Gorton, Lancs. The surface of the grinding cone has long and short teeth tangent to a common circle so as to form taper feeding grooves, while the driving shaft of the cone is made in two parts so that the height of the cone relatively to the hopper may be adjusted without disturbing the gearing.

1901.—Water-Closets. 6,421. H. Smith, 3, Lambeth Hill, Queen Victoria Street, E.C. The top of the trap is square, with a dome rising above the ordinary line. This dome provides an air chamber which prevents siphonage when a series of closets are fixed to the same pipe; moreover, there is no need to fix a vent pipe to each trap.

The following specifications were published on Saturday last, and are open to opposition until July 15th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—6,464, Pancoast, roof ventilators. 8,612, Whitehead & Ulbrich, ornamentation of tiles, panels, &c. 8,831, Mouchel, building blocks, caissons, piers, &c. 9,047, Melvin & Mann, apparatus for collecting mud, dust and other street refuse. 10,595, Wilkinson, non-slipping treads. 11,046, Burmeister, treatment of town's sewage. 11,378, Ware, door and gate fastenings. 12,116, Clifton, circular saws. 15,683, Edwards, ventilators. 17,385, Heller & Wenzel, automatic locking devices for door and window leaves, and all kinds of roller-doors. 23,383, Thomas, fittings for shop blinds. 23,658, Byers & Abbey, machinery for boring a number of holes in wood or other material.

1901.—634, McKinnon, windows. 1,356, Selby, means for minimising the evil effects produced by the expansion of road or pavement coverings. 4,522, Pintsch, generation and supply of gas for power purposes 4,859, Horsley, taps or faucets. 5,097, Ostertag, locks. 5,255, Heilman, sewer ventilation and disinfection. 6,058, Zimmer, waterproof protective coating for metal, stone, wood, &c. 6,834, Phillips, fans. 7,081, Schougaard & Evans, manufacture of artificial stone. 7,294, Hooper, water-closets. 7,324, Thompson (*Dodge*), treatment of lime. 7,387, Bloxam (*Klönne*), portable folding bridges.

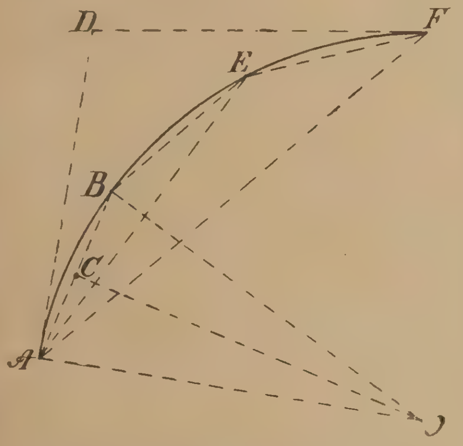
A New Public Hall in East Dulwich, which will include large and small halls, masonic temple and club rooms is to be completed in time for the coming winter season.

SETTING OUT CURVES.

BY G. A. T. MIDDLETON.

IF curves have been previously laid down on plan, whether they be simple or complex they are easy to set out on fairly level and unobstructed land so long as no extreme degree of accuracy is necessary—as, for instance, in the majority of cases where ordinary house property, streets and paths alone are concerned. A series of tangential lines to the curve, either at the points of junction with straight lines as at A and B, or at other points as at C, can be readily pencilled on the plan, and offsets scaled from these lines to points on the curve; and these lines and the offsets can almost as readily be set not on the ground. The correctness of the work depends only on the accuracy with which the instances along chain line and length of the offsets has been scaled, if the surveyor is already capable of correctly setting out a series of straight lines.

Obviously chords may be employed in the same way as tangents, and sometimes with advantage when the curve is a slow one (and its radius considerable), and sometimes of necessity when a tangent line would be obstructed or pass on to land upon which it would not be desirable to trespass.



CURVE RANGING BY MEANS OF THE "TANGENTIAL ANGLE."

It often happens, however, that chain lines cannot be used at all, and yet both extremities of the curve can be seen from any point in it, as when setting out a curved causeway across a sheet of water. If the curve be a segment of a circle, the first thing in such a case is to determine its included angle, which is constant at all points of the curve. Scale the chord A B and rise F C (or versed sine) of the curve. Then $AF = \frac{AB}{2}$ and

$$\frac{AF}{FC} = \tan ACF.$$

This determines the angle A C F, by consulting a table of natural sines, and also the angle A C B, which is double the angle A C F, and the angle A C B is equal to the angle A G B and to the angle subtended by the chord A B at any point in the curve, and is known as the included angle of the curve.

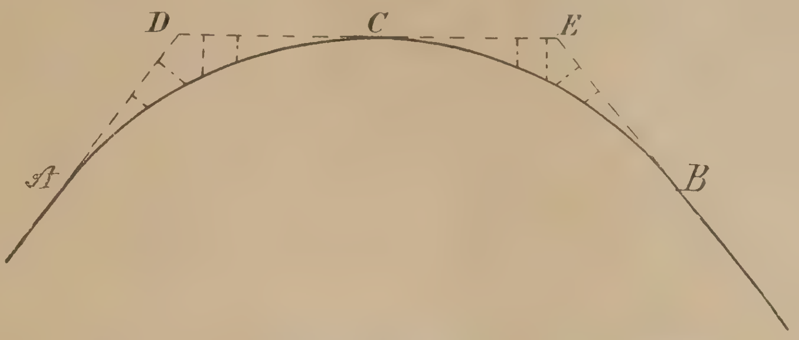
If a box-sextant be used, such as that patented comparatively recently by Mr. Steward, which will accurately observe angles up to 180degs., the instrument can now be adjusted to the ascertained included angle of the curve, and the observer can move about, if on land by walking and if on water by rowing, until he is able to see points A and B directly over one another through the instrument. Whenever this occurs the instrument is located on the required curve, and the position can be marked either by means of a stake or an anchored buoy. When the water is deep, or subject to varying tides, such buoys cannot be depended upon for accuracy, but positions thus fixed are generally near enough for broad foundation work to proceed; the curve being more accurately adjusted when the water level has been reached.

Occasionally it is necessary to accurately determine a point, such as G, lying in water. In such a case it is best to calculate the angles B A G and A B G, and to station two observers, each with a theodolite, one at A and one at B, opening these to the calculated angles, and directing from them the movements of a boat; or, if on land, of a man holding a pole.

It is possible in this way to range any number of points in a curve, the sum of the angles B A G and A B G being constant if it be a segment of a circle, but varying for any unusual or irregular curve—provided, of course, that all points in the curve can be seen from both A and B. Work thus set out is of extreme accuracy, and the possibility of thus exactly determining any point in a curve is sometimes one of extreme value; while the objection which many might naturally raise, that two operators and two instruments are required, does not necessarily apply, as a series of radial lines can first be set out with poles or stakes from A, and the theodolite then moved to B, when the pole-holder would keep himself in the radial line A H by his own "boning" along the stakes to A during the first observation from B, and on the line A J during the second observation, and so on.

The method most commonly employed, however, for setting out regular segments of circles is that of what are called "tangential angles," it being especially applicable to broken ground, while it is practically the only serviceable method for use in tunnels. By its means chords of one chain each in length are set out rather than an unlimited number of points in the curve, but this has been found to suffice in ordinary slow curves of considerable radius.

The points of tangent between straight line and curve, and the radius of the curve, have to be selected, and then the angle between the tangent to the curve and the first chord of one chain has to be determined by calculation. It has been found that if the number 1719 be divided by the radius in chains, the result is this tangential angle in minutes; while a reference to the accompanying illustration will show how it can be ascertained by trigonometry.



SETTING OUT CURVES BY MEANS OF TANGENTS AND OFFSETS.

The chord A B is bisected at C, and O (the centre of the curve) is joined to C, making A C O a right angle. Therefore, the angles C A O and C O A together equal a right angle, and so equal the angle D A O. Take away the common angle C A O, and the tangential angle D A B is equal to the angle C O A.

$$\text{Now} \quad \frac{AC}{AO} = \sin COA$$
$$= \sin DAB.$$

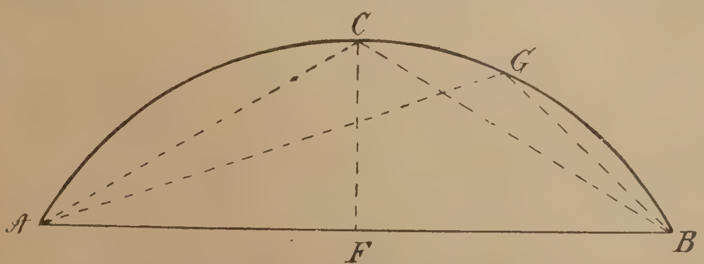
Therefore, half a chain or 50 links (half the chord), divided by the radius, is equal to the sine of the tangential angle.

The theodolite is now erected at A, adjusted, and directed along the tangential line towards D, with the vernier clamped to the main plate. When this is fixed, the vernier is released and adjusted to read the tangential angle. A chain, or a steel tape, is now carefully swung round from a centre fixed at A till its further extremity is cut by the cross hairs of the instrument, when this further extremity will be exactly at B, a point in the curve required having a chord A B one chain in length.

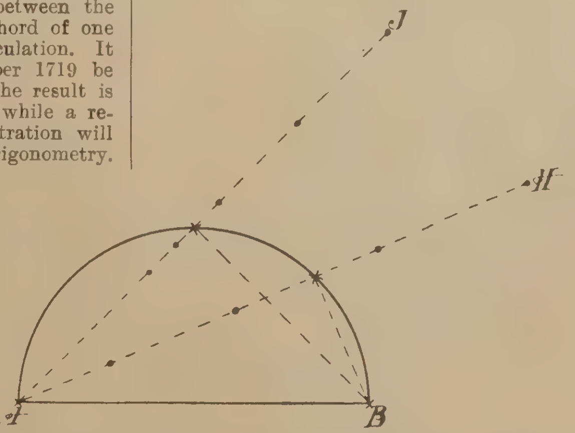
A little further consideration of the accompanying diagram will show that the angle D A E is twice and the angle D A F is thrice the tangential angle D A B, if A B, B E and E F are equal chords. Therefore, if the vernier be adjusted to read double the tangential angle, and the chain or tape be swung from the centre B until its further extremity is cut by the cross hairs, the point E will be fixed, and so on as long as there is no obstruction.

Suppose, however, that no point beyond F on the curve can be observed from A. Note on the diagram that the line D F, tangential to the curve at F, is necessarily equal to the line D A; therefore, the angle D F A is equal to the angle D A F, or to thrice the tangential angle. Set up the theodolite at F, sight back to A, and open the vernier to thrice the tangential angle, giving the angle D F A. You are now sighting along a tangent to the curve, and can swing your telescope over vertically, or else horizontally to the extent of 180 degs., and start afresh as if you were at A.

The explanation probably appears complicated, but the operation is not so in reality, and careful surveyors have been enabled to do work of extreme accuracy by this means.



DETERMINING POINTS IN A CURVE BY MEANS OF THE BOX SEXTANT.



SETTING OUT CURVE BY RADIAL LINES WITH ONE THEODOLITE.

Builders' Notes.

At Broghead Brickworks, near Armadale, belonging to Messrs. Muir & Sons, Ltd., new plant for the manufacture of bricks by machinery was recently inaugurated. The material for the making of the bricks is from a large bing on the estate of Boghead, which is not expected to give out for several years. The rate of manufacture is ten per minute, or about 10,000 per day. Sixty tons of material can be ground in one machine, and turned into bricks in one day.

Competition for Woodwork.—The Worshipful and Ancient Companies of Carpenters and Joiners of the City of London have announced the result of this year's competitions in their respective crafts. Competitors must be English-born and possess their masters' certificate for good conduct. Among those who entered were three apprentices of Messrs. Harry Hems & Sons, ecclesiastical art workers, of Exeter, and all three took high honours. Thomas Milford Butcher, aged seventeen, only son of Mr. William Butcher, of 40, Haldon Road, Exeter, has been awarded the silver medal and £5 5s., the highest prize for any newly carved work. Fred George Knapp, aged twelve, oldest son of Mr. W. Knapp, of 17, Bridge Street, has also been awarded a medal and first prize of £2 in the competition for apprentices under eighteen for three carved panels in oak. Joseph Bransby Hoskins, aged eighteen, third son of Mr. Fred Hoskins, of 3, Oxford Road, St. Sidwell's, has won the second prize and a bronze medal for the best library armchair of oak without upholstery, but ornamental. Such a success by three apprentices to the same master is remarkable.

Berlin Fire Congress.—In acceptance of a pressing invitation from the German Government to attend an International Fire Congress, to be held at Berlin this week in connection with the Fire Exhibition which was opened last Saturday week, the British Fire Prevention Committee will be represented by a deputation comprising Mr. Edwin O. Sachs, chairman; Mr. Max Clarke, A.R.I.B.A.; Mr. F. R. Farrow, F.R.I.B.A.; Mr. F. Hammond, F.R.I.B.A., district surveyor, Hampstead; and Mr. Ellis Marsland, district surveyor, Camberwell. The deputation will be taking the opportunity to examine the general arrangements as to the working of the building law at Berlin, as well as the influence of the new theatre, factory and workshop regulations upon modern structures in that capital; and they will, on their return journey, visit Hamburg, with a view to studying the general fire protective arrangements of the port and the more recent forms of warehouse construction which have been adopted in that city. The observations of the deputation, both at Berlin and Hamburg, at the Exhibition, and in attendance at the lectures of the Fire Congress, will be embodied in an exhaustive report, each member of the deputation taking up a special chapter dealing with that part of the subject with which he is particularly conversant. The report will be published in due course. The arrangements of the deputation show an exceedingly busy week's work travelling, interspersed with several flattering receptions and entertainments. The party left yesterday, viâ Ostend and North Express, for Berlin, and after paying some official visits to-day, and inspecting various buildings, will view the Exhibition, and attend an informal reception in connection with it. On Thursday the deputation will attend the opening of the Congress, which will be an important Government function, attended by the Ministers of State, and held in the new Houses of Parliament. Of the four opening addresses, one will be by Mr. Edwin O. Sachs, on the organisation of the Committee and its investigations in fire-resisting materials. The afternoon will be occupied with visits to electrical factories; and in the evening the deputation will attend the banquet at the Exhibition. On Friday forenoon a number of lectures will be attended, among which those of interest in England will deal with protection in warehouses, with cotton fires and fires on board ship. In the afternoon the deputation will visit the Royal Palace and attend a parade of the Berlin Fire Brigade. In the evening the party will be entertaining a number of public officials to dinner at the Hotel Bristol in return for the courtesies enjoyed, and will afterwards visit an evening fête at the Zoological Gardens. The whole of Saturday will be spent in visiting warehouses, shop property, theatres and other public buildings, as well as the testing station of the Royal Technical College at Charlottenburg, whilst in the evening the deputation will be received by the Mayor and Aldermen of Berlin. After the intervening Sunday the visitors will visit Hamburg, where their attention will be particularly devoted to modern buildings in the harbour and to fire protective arrangements in connection with the free port. The professional part of their visit will terminate on Monday night; and the result of the observations made, as embodied in a report, should prove highly instructive reading.

Surveying and Sanitary Notes.

Change of Address.—The Institute of Sanitary Engineers (Incorporated) has transferred its offices from 63 and 64, Chancery Lane to 19, Bloomsbury Square, W.C.

A Park for Hoole.—A Local Government Board enquiry was held recently into the application of the Hoole Urban Council for sanction to raise a loan of £4,500 "for purposes of public walks and pleasure grounds."

Street Improvements at Sunderland.—The Local Government Board have granted a provisional order giving Sunderland Corporation powers for the purpose of widening, opening, enlarging or otherwise improving the streets called Smyrna Place and Hendon Road.

Improvements at Colwyn Bay.—The Colwyn Bay Urban District Council are about to extend the promenade from Colwyn Bay to Rhos-on-Sea. When concluded, it will be one of the finest promenades in the kingdom, extending for a distance of three miles.

Road Improvement at Barry.—Gladstone Road, the proposed main thoroughfare connecting Barry with the Cadoxton entrance to the town on an easier gradient than the Western Hill route, has been constructed as far as Court Road from Holton Fach, where the glimpses of old Barry are quickly disappearing. The Local Government Board have now given formal consent to the borrowing of £4,700 for the construction of the remaining portion at the bottom end of the town, and in addition to that sum £470 is to be procured for building two houses to replace houses to be demolished when constructing the roadway.

Sydenham Wells Park was dedicated to the public use last week. The park is 17¾ acres in extent, and is close to the Upper Sydenham Station of the South-Eastern and Chatham Railway. The price paid was £7,000. The grounds as laid out present a series of slopes intersected by broad footpaths and ornamented by plantations and a succession of small lakes and rivulets. Tennis courts and a quoit pitch have been provided, and it is intended to form a bowling green. There is also a considerable area of turf available for children's recreation. The whole of the works have been carried out by the Parks Department of the London County Council, at a total cost of a little over £5,000.

Improvements at Hull.—At a recent meeting of the Property Committee of the Hull City Corporation, Mr. Joseph Hirst, city architect, submitted a scheme for the creation of a large central square, close to the Monument Bridge, by pulling down the block of property in Waterworks Street, Junction Street, St. John Street and Chariot Street. The scheme also provided for a public hall, retiring rooms, three large reception halls, and thirty-four new shops, some with ground floor and basement only, and others with four floors. The square would measure 272ft. from north to south and 216ft. from east to west, and would form an open space in the very heart of the city of a little over an acre in extent. The approximate estimate for erecting the buildings, including the purchase of necessary land, was 92,000. The estimated rentals from the new shops was £6,836, and for the public hall £1,014; nett revenue, £8,247. The scheme was unanimously approved, and it was also resolved to widen Charlotte Street.

Rhyl's New Promenade.—The extensive works of the West Promenade at Rhyl, which have been constructed at a cost of between £5,000 and £6,000, were formerly opened last week. This provides the missing link wanted to complete a grand circular drive of 4 miles round the town, and gives a total length of asphalted promenade of 2½ miles, or an acreage of 6¾.

Gladstone Park was recently thrown open to the public. The park, which comprises about ninety-six acres and is situated at Dollis Hill, was formerly the residence of the Earl of Aberdeen, and it was here in the 'eighties that Mr. Gladstone frequently spent his week-ends when Parliament was sitting. The population of Willesden in 1871 was only 15,866, and at the recent census these figures had grown to 114,815. This rapid growth of population made it desirable to preserve as far as possible the open spaces left, and in 1887 Queen's Park, situated between the London and North-Western Railway and the Hampstead Junction Railway, and comprising thirty-eight acres, was secured at a cost of £3,000 to perpetuate the jubilee of Queen Victoria. In 1895 a second park—Roundwood Park, comprising twenty-six acres—was dedicated to the public. It cost £25,956. The cost of the most recently acquired park—Gladstone Park—was £50,000 exclusive of a sum of £6,683 expended in drainage, fencing, gymnasium and paths.

A NEW CATHOLIC CHURCH IN LIVERPOOL.

THE new Roman Catholic Church of Our Lady of Lourdes and St. Bernard, which has been erected next to St. Bernard's Schools, off Kingsley Road, Prince's Park, was formally opened last week. The church, which has cost about £5,500, is constructed of St. Helens bricks, with red Runcorn stone for the windows and other elaborated parts, the roof being covered with Welsh slates. The interior consists of nave and aisles with baptistery and porches at the western ends, and a chancel with two chapels, the sacristies and the three confessionals being placed on the epistle side of the church. Space has also been left on the side for a presbytery which will be built, it is hoped, at some future date. The nave, which measures a total length of 82ft., consists of five bays, in four of which the centre space is divided from the adjoining aisles by an arcading with stone shafts and moulded caps and bases, the fifth bay being occupied by the organ gallery. The body of the church is lighted by means of four-light traceried windows in each bay, and by two similar three-light windows, with a circular window above, in the western wall. The west end, facing Kingsley Road, is the principal elevation. Two storeys of windows, one below and one above the gallery, occupy the chief portion of its surface, whilst in the centre is placed a niche with a statue of the Blessed Virgin, in whose honour the church is dedicated, which has been given in memory of John Constantine M'Manus. The chancel, square-ended and flanked by a chapel on each side, is lighted by means of two side windows, and also by a rose window in the gable, the latter being filled with stained glass depicting the Apparition of Our Lady of Lourdes to Bernadette; whilst a second window, representing Our Lord with St. Bernard and St. Mary Alacoque, has been placed in the north chapel, both being the gifts of generous donors in memory of Thomas and Margaret Maguire and of John Vincent Taylor. The floors of the baptistery and porches are laid with brown tiles; but in the rest of the church they are of wood. The church and sacristies are furnished throughout with the electric light. The general fabric has been erected by Messrs. Roberts & Robinson, contractors, Liverpool, and the whole of the building carried out from the designs and under the superintendence of the architects, Messrs. Pugin & Pugin, of London and Liverpool.

A New Primitive Methodist Chapel at New Boultham, to cost over £1,000, is being erected. The architects are Messrs. W. Mortimer & Son, and the contractors Messrs. S. & R. Horton. The chapel front will be partly in the Gothic style. The floor will be paved with wood blocks. The rostrum will be at the west end, with the choir gallery and organ chamber at the back.

Bricks and Mortar.

APHORISM FOR THE WEEK.

The perfection of all works depends on their fitness to answer the end proposed and on principles resulting from a consideration of Nature herself, and they [the Greeks] *approved those only which, by strict analogy, were borne out by the appearance of utility.*—VITRUVIUS.

Our Plates. THE plates of the interiors in the New Empress Club are in illustration of the article on p. 344 of this issue, and the sketches in Flanders illustrate Mr. James Lochhead's article on p. 332.

Historic Paris in Danger. THERE are rumours afloat as to the intentions of the officials, who, having a final voice in the matter of street improvements, hold the destinies of Paris in their hands. The worst of these rumours is to the effect that it is proposed to pull down a corner of the Institute of the Palais Mazarin, in order to allow of the prolongation to the quays of that most monotonous of modern thoroughfares, the Rue de Rennes. It would seem to be impossible that this should be seriously contemplated. The Palais Mazarin, which dates from the middle of the seventeenth century, occupies the site of the famous Tour de Nesle, and is the home of the five branches of the French Institute; it is a stately pile and an essential feature of the aspect of the Seine at one of the most characteristic and admirable points on the river on its passage through the capital. To deprive the Palais Mazarin of one of its wings would be to ruin irretrievably the physiognomy of an historic corner of Paris. All this is for the benefit of people in a hurry, a type almost unknown in Paris a comparatively few years ago. The Parisian, from sedentary, has become nomadic, mercurial, mobile. People used to remain in the quarter in which they lived. A mania for gadding about now possesses the Parisian. The extraordinary success of the Metropolitan Railway is evidence of the change. The common opinion was that the "tube" would do no business, and it is certain that the authorities, who shared this view, would never have had the courage to build it but for the prospect of the Exhibition. As it is the railway can barely cope with the traffic. The consequence is that, for the moment, the one cry is for improved means of locomotion. The Galerie des Machines, which, by masking the École de Guerre, spoils what ought to be one of the finest views in the capital, is not to demolished, as promised, and the Champ de Mars, it is rumoured, is to be cut up into building plots.

Kew Church. SOME further improvements and extension of the parish church of St. Anne at Kew are in contemplation, partly as a local memorial to Queen Victoria. It is proposed to add new vestries for clergy and choir and to renovate the quaint old western porch and portico. Kew Church affords an example of the adaptation of an eighteenth century building of no particular style to the modern requirements of church worship. It was originally built in 1715 on a site presented by Queen Anne, and in 1837 it was enlarged at the cost of King William IV. by Sir Jeffrey Wyattville. In 1884 an important addition was made to the east end, by which the church was lengthened some 40ft. A quasi-chancel was formed, surmounted by a low circular dome, a most unusual feature in an English parish church. An apse was carried out beyond, and an extra bay was added to the nave and aisles, while an organ chamber and south porch were provided. Upwards of £5,000 was expended on the work, which involved the moving farther east of the Cambridge mausoleum. Gainsborough was buried in the churchyard, and there is a tablet to his memory in the church.

Llanrhidian Church. THE ancient parish church of Llanrhidian, in the largest of the Gower parishes, has been reopened after restoration. Llanrhidian Church is said to have been founded as far back as the sixth century by St. Rhidian, but since that time has undergone some changes. In 1858 it was reopened, after being closed for some time, and a stone tablet over the porch records the fact. Within this past three years the ancient edifice has again been restored at a cost of about £350. The restoration includes a new roof to the chancel, a new ceiling to the nave, repainting and decorating throughout, repairs to the tower, pointing of the masonry work outside, &c. The chancel has had a new tessellated floor laid down, and a communion table and teakwood choir stalls added. The Rev. D. J. Davies, rector of Llanmadoc and Cheriton, popularly known as the "Gower Historian," came forward too in an interesting role. Filling up his spare time between his pastoral duties and history writing, the rev. gentleman takes off his coat and puts in many hours at wood carving and joinery work, and has carried out the whole of the carving of the new ceiling of the nave. Mr. Davies also acted as architect. There are a number of new stained glass windows. Mr. John Williams, of Pantyglas and Mr. John Williams, of Llanderwg, carried out the joinery and masonry work, and Mr. Thomas Dartnall, of Llanrhidian, did the painting and decorating.

"Queen Eleanor Crosses." ONLY three of the crosses which once marked the series of halting-places when the body of Queen Eleanor, wife of Edward I., was borne about 159 miles in state from the scene of her death, at Harby, Nottinghamshire, to Westminster Abbey, yet remain, namely, the crosses of Northampton and Geddington, in Northamptonshire, and Waltham, in Hertfordshire. These crosses were probably twelve in number. The march began on December 4th, 1290, the last pause before entry into the great Abbey being at the spot still named Charing Cross. The crosses were erected between the years 1291 and 1294. John de la Bataille was the architect of the Northampton cross, whilst William de Ireland was chief craftsman. The cross has been frequently repaired since it was erected. In 1840 Mr. Blore, the celebrated architect, in renovating the structure for the third time, renewed one of the pinnacles, and almost entirely replaced the cresting of the first storey; a broken shaft was also placed at the summit. In 1884 the steps, which had been renewed in 1762 in local stone, were taken away, the foundations made secure and new steps of a harder material added.

Haddon Church Restored. HADDON CHURCH has just been reopened after restoration. The ancient aspect of the church is preserved—the old plastering even being retained. After the walls had been cleaned and several layers of whitewashing removed a number of frescoes were discovered on the east walls, but unfortunately the treatment to which they had been subjected has made them indecipherable. The heads of two aureoled figures can still be faintly traced on the walls, and it is conjectured that these had some connection with a monastic cell hard by, the remains of which are now incorporated in a farmhouse. In other respects also, the church is now in much the same condition as it may have been when first erected in the thirteenth century. It consist of chancel, clerestoried nave, aisles, south porch, and embattled tower with typical lancet windows. Early English is the prevailing style of architecture, except in the chancel arch, which is the only piece of Norman work to be found. In the recent restoration a new oak roof with lead covering has been placed on the nave and north aisle. (The south aisle was similarly treated some four or five years ago.) A wood block floor has been laid in the nave, and the chancel, which was badly restored many years ago, renovated. The tower has also been placed in substantial repair, and has been furnished with new roof. The whole of the work has been carried out by Mr. S. F. Halliday, of Stamford, from designs and particulars prepared by Mr. J. C. Traylen, of the same town. It has cost about £830, of which the rector, the Rev. F. M. Alderson, has yet to raise £250. The east window of the chancel has been filled with a stained glass widow and depicts the Crucifixion, St. George and St. Michael. It is by Kemp. Miss Alderson has designed and carved an oak cover for the font.

Tintoretto at Venice. A VENETIAN newspaper, the "Gazzetta degli Artisti," states that there is an intention to "restore" the famous series of pictures by Tintoretto in the Scuola di San Rocco, and the project is being discussed attacked and defended with the passion that is frequently imported into these questions in Italy. A meeting of artists and critics has been held, under the presidency of Signor Molmenti, the well-known writer on art, and, after an examination of the present state of the pictures, it was there decided, on the initiative of Signor Bressanin, painter, and Professor Cantalamessa, director of the gallery of the Accademia, that it was desirable to reline and carefully to restore and to revarnish the pictures, the meeting pledging itself that such restoration should be of a conservative character. The report of these proceedings is followed by a letter, signed by Dr. Frattin, who bears the title of "Guardian Grande" of the fraternity of San Rocco, pointing out what the confraternity has already done and what are the difficulties in the way of the course proposed. To this the "Gazzetta" adds a somewhat angry reply, committing itself definitely to the view of the artists, that the pictures—which have certainly darkened very greatly with time—should be restored. The course proposed is without doubt hazardous. These very large pictures, some fifty in number, are among the most precious in the world, and their preservation interests not Venice only but the educated world at large. Dr. Frattin makes one common-sense suggestion that the authorities should wait until the pictures have been examined by Professor Cavenaghi of Milan, a practical picture restorer who, by the common consent of experts all over the world, has a better understanding of the way to treat Italian pictures than any other Italian. It would probably be well to abide by Signor Cavenaghi's opinion, and to leave it to him to say whether the cleaning of these masterpieces could be safely undertaken.

A German Art Experiment. THE Grand Duke Ernst Ludwig of Hesse, says a correspondent of the "Standard," has achieved a unique position among German sovereigns as a promoter of art. Unlike some of his contemporaries, who appear to regard art mainly as a medium for the glorification of their dynasty, this young ruler is employing his patronage and wealth, without any thought of self, in the effort to crystallise some of the leading tendencies of the period into a distinctively German style. It is in the so-called Secessionist School that he finds the promise of his faith, and in the departments of applied art that he seeks its realisation. Penetrated by the conviction that a favourable environment, free from worldly care, is essential to the full development of the artistic nature, the Grand Duke determined two years ago to found in the City of Darmstadt a colony of artists who should be at liberty, under his ægis, to create untroubled by the demands of the market. He accordingly selected, chiefly from Munich and Vienna, five young artists, distinguished by their performances in the industrial arts—Peter Behrens, Hans Christiansen, Ludwig Habich, Patriz Huber and Joseph Olbrich. For their use he reserved the "Mathildenhöhe," near the Grecian chapel erected for the use of the Russian Emperor and Empress. From this hill, which is situated on the northern periphery of the city, magnificent prospects may be commanded of the Odenwald; and there in the course of the past two years the artists have been busily engaged, at the expense of their royal patron, in the delightful task of carrying into actual fulfilment their individual ideals in the way of ateliers and dwelling-houses. The results of the experiment have now been thrown open to the inspection of the public, in the hope that people may be inspired to construct their own homes on similar German lines. The exhibition bears the title, "A Document of German Art." The claim contained in this title is justified by the fact that none of the houses contain a single article of foreign origin. Down to the smallest details, such as cups and saucers, spoons, and door handles, these homes have been constructed in accordance with the personal directions of their artist owners.

A Museum of Modern Sculpture.

THE German Emperor is stated to intend founding at Berlin a museum of casts from masterpieces of modern sculpture, the nucleus of the new collection to be formed by the casts and plaster sketches (*maquettes*) which are to be sent to the Fine Arts Exhibition to be held next year at Dusseldorf. Such a collection would be of inestimable advantage to all students of modern art, and to the public. No doubt it would be made to include all schools of sculpture during the nineteenth century and onwards. Such a museum, especially if it accompanied a selection from the works of the most notable painters of the nineteenth century, would be of unique interest, as giving permanently what hitherto has only been afforded by great international exhibitions. The Luxembourg has made a beginning in this direction, confining itself hitherto to French sculptors and medallists, but in the section of painting including not only such modern Frenchmen of fame as have not been translated to the Louvre, but the protagonists of modern art of all countries. Berlin has, not without much protest and criticism from the elder and more conventional school connected with the Academy of Fine Arts, admitted to the honours of its National Galerie such foreigners of commanding influence as Puvis de Chavannes, Manet, Claude, Monet and Renoir—including also Rodin among the sculptors to be honoured. The Dresden Gallery has hitherto exercised its patronage of modernity only in purchasing some masterpieces of nineteenth-century German art.

NEW WESLEYAN CHAPEL AT SOUTHSEA.

A NEW Wesleyan Chapel has been erected in Albert Road, Southsea, almost at the foot of the Highland Road bridge. Mr. T. Wonnacott, of Merton Road, Southsea, was the architect. The building is in the Classic Corinthian style, with a tower at the south-west corner 80ft. in height, fashioned to the model of the campanile at Venice, and on the opposite corner there is a subordinate turret. The materials are red brick with Bath-stone facings. The main entrance is in Beach Farm Road. The seats are in varnished pine. In the interior the Doric style is followed, the gallery on three sides of the building being supported by fluted Doric columns. The seats are placed in the shape of a crescent, on a slope, so that all the congregation sit facing the rostrum, at the rear of which is the choir platform. Accommodation is provided for 800 persons, while the two-storeyed schoolroom, to which is attached a kitchen, will seat 600 children in the five classrooms. The chapel is heated with hot-water apparatus, and electrically lighted. In his aim to make egress easy, the architect has provided an entrance 35ft. in width, so that it will be possible to clear the building in one minute, while all the doors, which open outwards, are fitted with patent panic bolts. The entire cost of the building is estimated at £6,000.

Law Cases.

Stealing Houses: An Extraordinary Case.—At the County of London Sessions recently George Henry Richards was convicted of having stolen about a ton of zinc from the roof of No. 32, Hoxton Square. On July 23rd last year he called on a house-agent with reference to three houses, then unoccupied and advertised to let, situate at No. 32, Hoxton Square, and Nos. 23 and 25, Hoxton Street. They were adjoining premises at the corner of two thoroughfares. Richards produced a neatly-printed card, upon which he styled himself as a member of a firm who were "builders and contractors, sanitary engineers, plumbers and decorators." Their head office was in St. Ann's Road, Tottenham, and their yard and stores in the immediate vicinity. He told a story of a prospective tenant anxious to view the vacant residences, and was allowed to have possession of the keys. These were given to him on the understanding that they were to be returned in the evening. This, however, he failed to do. As events showed later, his only object in getting the keys was to obtain entrance with the dishonest intention of dismantling the place. With the assistance of other men—one of whom was ordered nine months' imprisonment later—Richards stripped the roof of about a ton of zinc, worth £5 as old metal, and in addition considerably damaged the building in the process, besides exposing the upper rooms to the ill-effects of bad weather. The sheets of zinc were rolled up into a more portable form and placed ready for removal at the entrance door. At this stage a policeman saw Richards and another man leave the house and presumably go in search of a van to remove the stolen property. The policeman's suspicions were aroused, and he investigated matters by climbing over a wall and entering the premises. Detective-sergeant Hook subsequently arrested Richards. Asked as to whether he was ordered twelve months' hard labour at the Sessions in December, 1898, Richards caused some laughter by remarking, "Do you mean when I stole two houses?" The chairman said he remembered the extraordinary incident well. The prisoner, seeing that no one was in charge of two houses in North London, deliberately set up a hoarding and razed both to the ground. The materials he disposed of. Parliament had never dreamt of a man being so exceptionally audacious, and he could not be indicted for the theft of the houses. He, however, was convicted of appropriating the bricks, &c. Warder Chesterton proved also that Richards had suffered three months for lead stealing, and five years' penal servitude for fraudulently obtaining building requisites. Detective-sergeant Hook added that in the summer of last year the prisoner, having ascertained a few particulars from an agent in the city, descended on Chandos House, Albert Street, South Norwood. Without the slightest authority he pulled the place down. Witness was given the address, but he could not find the house. There was only the ground it had stood on and just a little of the four walls remaining. He had disposed of the bricks, the doors, windows, stairs, balusters, water-pipes and gas-fittings. He was not a man of any substance, and his "head office" consisted of two small rooms with not a sovereign's worth of furniture, and his storing yard was an exceptionally small backyard. The learned judge now ordered Richards three years' penal servitude.

A Dispute about Laths.—The case of *Hollis Brothers & Co.* v. *Gibbs Brothers* was heard recently at the Leicester County Court. It was begun in the King's Bench Division of the High Court, and remitted to Leicester. The plaintiffs, who are timber merchants of Leicester, claimed from the defendants, who are builders' merchants of Loughborough, £135 8s. 3d., the price of 2,500 bundles of C.R.W. laths at $11\frac{3}{8}$d. per bundle, plus storing and warehousing charges. On October 9th last the defendants wrote to the plaintiffs asking a price for plaster laths. Plaintiffs replied on the following day, and agreed to supply 5,000 bundles at $11\frac{3}{4}$d. per bundle. The defendants agreed to the price, and plaintiffs wrote saying they would supply the laths within three weeks, subject to safe arrival at Hull. In that time the markets had fallen, and that was the reason the defendants wished to get out of the contract. The defendants stated that the plaintiffs had not given them notice of arrival at Hull, as they should have done. Plaintiffs, however, wrote on October 19th saying that the laths were due at Hull. The defendants agreed to take half the bundles, and they did so, but absolutely declined to take the balance. The laths came over in two ships, one containing 2,200 bundles, and it was that cargo made up to 2,500 bundles that the defendants took. The other 2,500 bundles were stored at Hull, and the action was brought to recover the cost of these laths and the rental. Defendants' counsel urged that the fact that plaintiffs did not give notice of the arrival in Hull put an end to the contract. Mr. Lawrenson, builders' merchant, of Loughborough, stated that he had had twenty-five years' experience of the building trade, and he knew it was the custom to advise arrival of laths or timber. It was a well-established rule to give notice of arrival of goods sold. If that was not done he should not think that put an end to the contract.—His Honour said he should find for the plaintiffs. He did not think the custom must be adhered to in each case. Every case must fall or stand on its own merits, and he thought in this case the defendants had had sufficient notice of arrival. That was proved by the fact that on October 20th the defendants wrote to say they did not expect the laths so soon, and, further, said they would send orders. He thought, therefore, the defence failed. Even if it did not, it would not put an end to the contract, but would merely be a case for a counter-claim. Verdict for plaintiffs for £134 9s.

NEW BATHS AT SELBY.

THE new public baths which have been built by the Selby Urban District Council at a cost of nearly £6,000 were opened recently. The structure is erected in the south-east corner of the park, within a short distance of the railway station, and practically in the centre of the town, the roads to the buildings being public highways. It consists of one large swimming bath, 84ft. by 43ft. 6in., with a water measure of 75ft. by 30ft. There is ample dressing-box accommodation, and also a spectators' gallery. There are ten slipper bathrooms, which will be used for first- and second-class baths, and ladies' baths when required. These are situated on either side of the front entrance, two being fitted with vapour baths and needle douche, with separate w.c. accommodation. In the centre of the front is the pay-office section, with first- and second-class entrances, and corridors on either side, while immediately overhead is the caretaker's house. The laundry and boiler-house, which are on the ground-floor level, are placed on the right-hand side of the building, the former being fitted up with the most recently improved machinery. The chimney from the boiler-house is placed at the rear of the building. The greater portion of the basement comprises an open crypt, where all the pipes for circulation and waste are exposed, so that any repairs or damages may be seen and executed at any time without the customary digging and cutting of walls. Provision is left on the site for the erection of a small or first-class swimming bath, which may be found necessary in the future. The buildings are of the best red brickwork, with stone heads and sills and other dressings from Tunswell quarries, Morley; and the gables are finished in stucco and half-timbered work with overhanging eaves. The internal walls of all the buildings are lined to an average height of 3ft. with glazed bricks, principally white; and the remainder of the height in pressed red and buff bricks, neatly pointed with a white joint—plaster and woodwork being avoided wherever possible. The floors are almost entirely of concrete, with smooth and even face. The roofs are open to the top in ironwork and dressed timber, with Louvre skylights on the top, which are made to open for the full lengths for natural ventilation, and are covered with patent glazing without putty. The roofs are covered with the best Welsh slates and red tiles. The ventilation, heating and drainage have received especially careful consideration. Messrs. Walter Hanstock & Son, of Batley and Leeds, were the architects.

ELECTRIC POWER IN BUILDINGS.*

By W. A. AGNEW.

I PROPOSE to describe how the electric current is produced commercially, and how it may be applied in buildings to the working of passenger and goods lifts, and ventilating fans, and also to the artificial heating of rooms.

Although electricity may be produced in many different ways, the only commercially successful way so far is that in which the current is generated by dynamo-electric machines, the same type of machine being employed as a motor. In order to understand the action of the dynamo-electric machine, whether used as a generator of electric currents or as a machine for transforming electrical into mechanical energy, it becomes necessary to consider the fundamental laws which govern its design and construction, and to examine progressively the experiments and apparatus of the early experimenters.

Early Experiments.

In 1820 Oersted, using a voltaic battery as a source of current, discovered that a pivoted compass-needle could be deflected by the passage in close proximity of an electric current, and in the same year Michael Faraday discovered the rotation of a current-carrying conductor round the pole of a magnet, and constructed several pieces of apparatus of this type, in some of which the conductor revolved round the magnet, while in others the magnet itself revolved.

In 1825 William Sturgeon constructed the first electro-magnet. Continuing his investigations, Faraday in 1831 discovered that electric currents could be produced in conducting circuits by moving them relatively either to a magnet or to a circuit carrying a current, and, following out this idea, constructed an apparatus in which a copper disc revolving between the poles of a powerful magnet generated a current which was collected by wires rubbing on the axle and edge of the disc.

This may be regarded as the first instance of the continuous production of electricity by the movement of a conductor in a magnetic field, and it is on this principle that all modern continuous-current machines are constructed. Following in the footsteps of these early experimenters came a host of inventors, and numerous forms of electric-generators were constructed, in most of which a steel magnet revolved before fixed coils of wire, or the coils revolved while the magnets were stationary.

It was soon recognised that electro-magnets possessed decided advantages over the permanent steel magnet usually employed, and about 1867 machines were constructed in which the current generated by the machine itself was employed to energize its own magnets. This principle of self-excitation was discovered almost simultaneously by Varley, Wheatstone and Werner Siemens, and the term "dynamo-electric" was first used by Wheatstone to distinguish self-exciting machines from those in which permanent steel magnets produced the field.

In 1870 Gramme introduced a form of armature which showed a distinct advance on all others, and shortly afterwards his machines were sold commercially. This type of armature, with some modifications, is in use at the present day, and possesses considerable merit for certain purposes. In 1872 Von Hefner Alteneck introduced the drum-wound armature, a construction which in a modified form is used on almost all first-class modern machines.

These improvements, together with the increased attention given to the theoretical side of the matter by Maxwell, Hopkinson, Kelvin and others, have gradually brought the dynamo-electric machine to its present excellence, and each year sees larger machines constructed and further improvements made.

Dynamos driven by Gas Engines.

It would be beyond the bounds of this short lecture to pursue these improvements to their end, or to fully discuss the complete equipment of modern electric-supply stations, but it is interesting, perhaps, to note that in large buildings and institutions where a considerable amount of current is consumed it becomes necessary to consider the advisability of erecting a private generating plant instead of procuring current from the supply company's mains.

By driving dynamos by gas engines it is often possible to generate current at a considerably lower rate than that demanded by the local supply corporation. Modern gas engines using town gas require about 50 cubic ft. per unit of electricity generated, and by using heavy fly-wheels to the engine, together with a battery of accumulators, a perfectly steady supply can be obtained. (One unit = 15 lamps of 16 c.p. lit for one hour.)

Messrs. Drake & Gorham, whose large experience with isolated installations enables them to speak authoritatively on this point, issue the following table of costs: First cost includes the complete installation with accumulators sufficient to maintain half the number of lamps for nine hours after the engine has been stopped :—

No. of 8 and 16 c.p. lamps.	40	66	100	130	190	260	330	530	800
First cost -	£320	430	560	750	900	1150	1460	2302	3270
Annual working cost.	£16	23	30	33	47	65	80	120	168

Oil, Steam and Water Power.

Petroleum engines have been greatly improved during the last few years, and are extremely useful for country situations where coal is expensive. They require little attention, and are very economical in running, as they use only about 1¾ pts. of oil per unit generated.

In large installations steam power is most generally used; and where as many as 2,000 lights are installed the total running cost may be reduced as low as 1·1d. per unit.

In country situations it is often possible to utilise water power, and many instances occur where this plan has been adopted with signal success. With modern turbines fitted with improved governors it has been found quite practicable to run the installation without using a storage battery, thus effecting a considerable saving in first cost and maintenance. At Bramore, Ross-shire, no accumulator is used, and the entire plant is entirely automatic in action. As an instance of an up-to-date water-power installation mention may be made of Ardross Castle, Ross-shire, where two Gilkes' turbines of 25 h.p. each are coupled direct to Crompton dynamos.

As no accumulator is used, these machines are fitted with automatic governors, and the machines start and stop themselves automatically. About 350 lights are installed in the Castle, and about twenty-nine rooms have been fitted with electric heaters, which have proved very valuable in saving labour and coal (the cost of the latter at Ardross is about 30s. per ton). The farm machinery is also driven by a 15 B.H.P. motor. In addition, the church (situate about 600yds. from the Castle) is lit and heated electrically. Crompton heaters are employed. It is found that the current costs about ·55d. per unit, a most remarkable result and one worthy of serious attention by those deciding on country-house installations.

Electrically-Driven Goods Lifts.

Perhaps the most familiar application of electric power in buildings (next to the electric light) is the passengers or goods lift, and considerable trouble has been taken by engineers in bringing this apparatus to its present high state of perfection. It is in such work that the economy of the electric motor is most manifest, as it only consumes current in strict proportion to the work on hand, and has absolutely no stand-by losses when at rest. Contrast this with the hydraulic lift, which absorbs the same amount of power for each journey, however loaded, or with lifts driven by gas or steam engines, where the machinery has to be kept constantly in motion, and the advantages of the electric lift will be at once apparent, especially when the freedom from noise, compactness of motive gear, and general handiness are also taken into account.

In order to economise space as much as possible, it is usual to couple the motor direct to the winding gear, thus dispensing with all belting and pulleys, and the whole gear is usually designed so that it may be fixed either in the basement or directly over the top of the lift shaft. In the electric lifts made by Messrs. Cribbes & Ross, Beaverhall Works, Edinburgh, the motor is coupled direct to worm-gear and transmits its motion to the winding-drum through single-reduction gear. The controller is mounted on the same bedplate, and consists of a barrel reversing switch coupled to a sliding-contact resistance so devised as to make it impossible for the attendant to switch the current on too rapidly, or to reverse the motor before the cage comes to rest. Immediately the current is cut off the motor is brought to a standstill by means of a brake.

Messrs. Archibald Smith & Stevens, Janus Works, London, manufacture a lift gear in which the pull on the hand rope actuates a multi-contact reversing switch, the cutting-out of the starting resistance being accomplished by ratchet gear worked from a "wave-wheel" fixed on the drum spindle. On pulling the controlling rope to stop the cage, the resistance is automatically reinserted ready for another journey.

Messrs. Waygood & Co.'s lifts are made either of the belt-driven type or direct coupled. The controlling gear consists of a reversing switch worked by the hand rope and fixed in conjunction with a resistance switch which slowly cuts out the resistance when starting. An arrangement which avoids the necessity of a hand rope passing through the cage consists of a small switch fixed in the cage which operates the main controller by means of a "pilot" current.

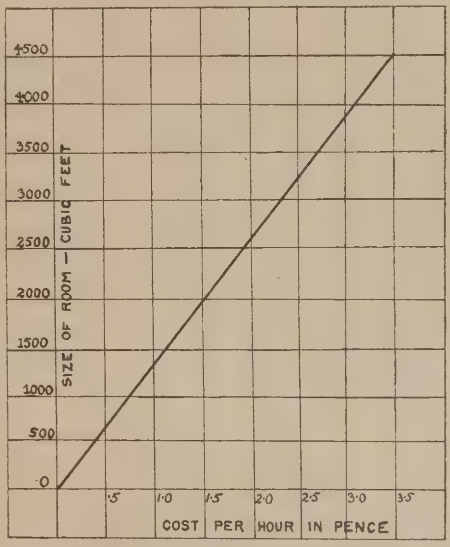

FIG. 1.—COST OF ELECTRIC HEATING AT 1·5D. PER UNIT.

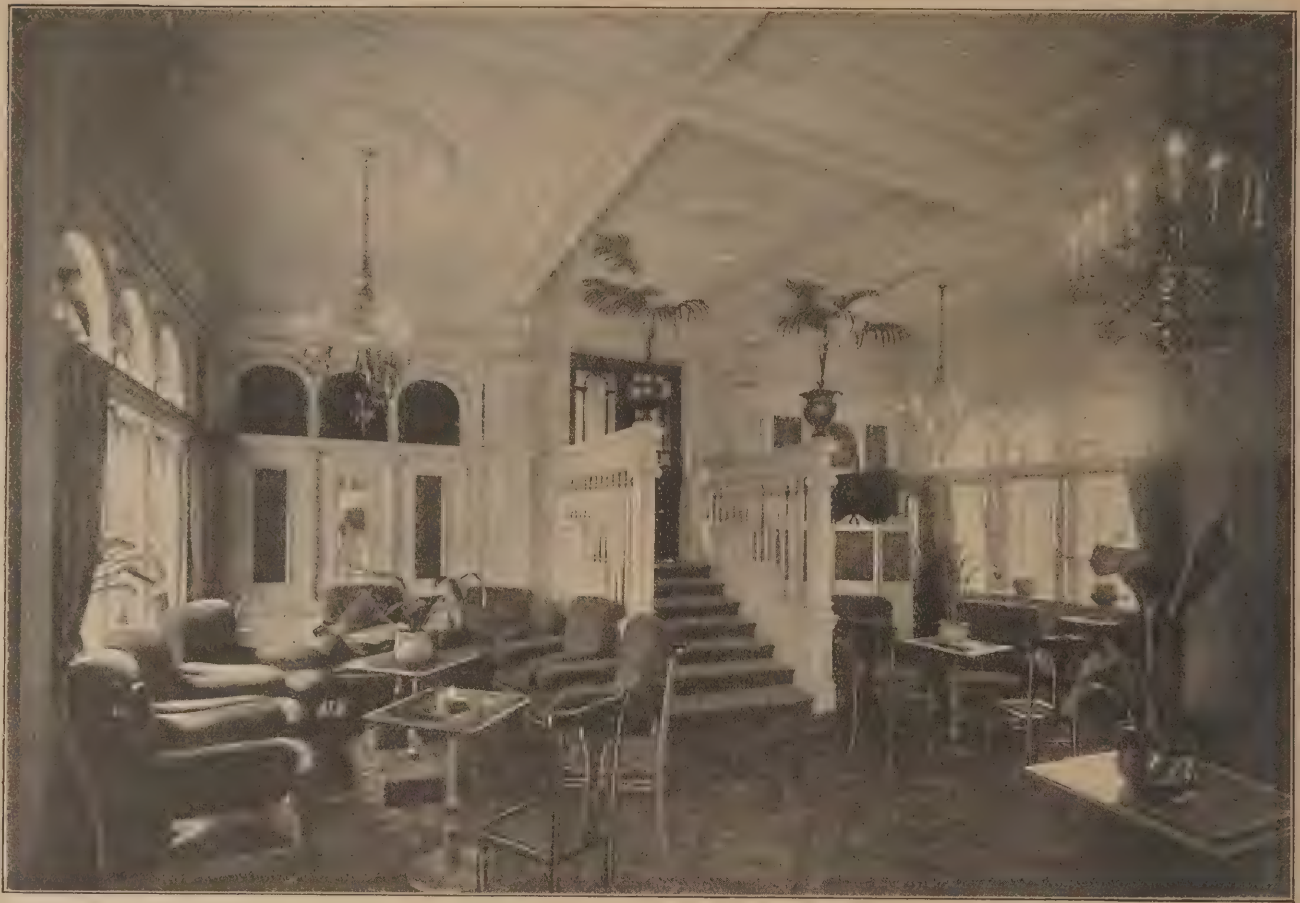
Automatic Lifts.

The electric lift may also be made purely automatic in action, so that by pressing one of several buttons fixed in the cage the car travels to the corresponding floor and stops there automatically.

The Cutler Hammer systems of lift control are two in number: (1) Where the lift is operated *mechanically* from the car; (2) where the lift is operated *electrically* from the car. In the latter arrangement, which is applicable for very high buildings, where the handling of the ordinary hand rope would be difficult on account of the excessive length, the controller is connected (by means of an insulated cable) to a switch fixed in the car, which is worked by hand. In the first system a hand rope is employed, on pulling which a reversing switch is rotated through 60 degs. on either side of the centre, thus lifting off the mechanical brake on the motor shaft. Further movement brings all the armature resistance into the starting position and also closes a solenoid circuit, thereby switching on the main current and starting the motor slowly. The armature resistance is then allowed to switch out of circuit slowly, being controlled by a dash-pot. In stopping the lift the hand rope is pulled the reverse way, first introducing all the armature resistance into circuit, and then sharply cutting off the main current by the solenoid mentioned above. The mechanical brake comes into action and the car

---

* A lecture delivered before the Architectural Society of Edinburgh.



PART OF THE RENAISSANCE LOUNGE, NEW EMPRESS CLUB, DOVER STREET, W. WIMPERIS AND ARBER, Architects.

is brought to a standstill. The field-magnet coils are allowed to discharge through incandescent lamps, thus preventing damage to insulation.

Heating by Electricity.

One of the commercial uses to which the electric current has lately been applied has been the artificial heating of air in rooms, and while the average cost of current is still too high to permit any very extended use being made of this method of heating, yet the safety of the apparatus, its cleanliness, and the readiness with which the heat may be turned off and on, are factors which are attracting great attention, and its use in offices, theatres and rooms not continuously in use is becoming more extensive every day.

Fig. 1 shows graphically the cost of electric heating in Edinburgh, where current cost 1½d. per unit.

In the Crompton electric radiator the heat is obtained by the passage of a current through thin resistance wires embedded in a coating of strong vitreous enamel of high insulating properties, and capable of withstanding the heat of the wire itself. In the Prometheus radiator the heat is obtained by the passage of the current through thin strips of resistance, and the radiator is made more cheerful-looking by means of a ruby lamp placed inside. In the Apollo radiator large glow lamps consuming about 200 volts each are used, and give off a cheery glow with considerable heat.

Another application of electric power in buildings is that of ventilating fans. Usually the motor is mounted direct on the fan spindle and runs almost silently.

It is important to ascertain the best position to secure maximum effect and also to prevent the motor from being overloaded by back draughts.

The Ancient Parish Church of Broughton-in-Furness has had a new tower and new peal of bells added. The tower is a handsome structure designed by Messrs. Austin & Paley, of Lancaster, and is in keeping with the Norman architecture of the church. The new bells are eight in number.

THE NEW EMPRESS CLUB.

THE New Empress Club in Dover Street, W., has been erected from designs by Messrs. Wimperis & Arber, architects, and entirely decorated by Messrs. Hooydonk & Co., Ltd., decorative artists, of 25, Old Burlington Street, W. (We are indebted to the latter for the accompanying illustrations.) This club offered wide scope to the decorator; the main staircase, carved in marble, and panelled out with a reproduction of an old Italian brocatelle designed in Gobelin blue, is very dignified. The rooms are decorated in various styles, from the light French Louis XV. reception room to the stately Georgian dining-room. The general scheme of colouring is pure white, sufficient contrast being obtained by the silk panelling on the walls, and curtains, furniture and carpets. Messrs. Hooydonk have employed their patent "Dækoria" for columns, pilasters, mantelpieces, overdoors, &c.

THREE TOWNS ARCHITECTURAL SOCIETY.

AT the fifth annual meeting, held recently at Plymouth, the president of the Three Towns Branch of the Devon and Exeter Architectural Society, Mr. Henry George Luff, A.R.I.B.A., occupied the chair, and amongst those present were Mr. Charles King, F.R.I.B.A., Mr. E. W. Lister, Mr. W. H. May, M.S.A., Mr. E. Coath Adams, M.S.A., Mr. M. Alton Bazeley, C.C., Mr. A. E. Lethbridge, C.C., Mr. Arthur Heath, Mr. J. H. Dwelly, W. Hitchins, S. Griffin, and Mr. B. Priestley Shires, A.R.I.B.A., hon. secretary and treasurer of the branch. The chairman announced that the annual meeting of the parent society would be held at Plymouth this year, on Saturday, June 1st. Mr. Shires, presenting the report, stated that during the year the library had been fairly started, under the management of Mr. W. H. May, and already good use had been made of it. A list of books in the library, together with a copy of the rules, had been sent out to each member. During the past year the Society had been materially strengthened by the accession of new members as follows: one honorary member, three members, three associate members, and five associates—in all, twelve; whilst, on the other hand, the council regretted to record the decease of one of their members, Mr. Chastel de Boinville, the result of an unfortunate accident. Efforts were made by the council to dine together as last year, but owing to the small response the function was abandoned. In June last the annnal exhibition of R.I.B.A. prize drawings was held at the School of Art, Princess Square, and was appreciated by many. An invitation by the ex-president of the society, Mr. Charles King, F.R.I.B.A., to high tea and a visit to Cotehele, through the kindness of the Earl of Mount Edgcumbe, had, on account of the general election, to be postponed. Mr. King, however, kindly promised to renew the invitation, when it was hoped a goodly number will avail themselves of the opportunity of being present. On November 21st last, Mr. Tait, the president of the parent society, kindly paid them a visit and delivered a lecture on the architecture and sculpture of Greece, which was highly appreciated. The council took the opportunity of expressing a hope that more lectures would be forthcoming during the winter session, and it was also hoped that further contributions would be made to the library. Mr. Shires also presented the financial statements, which, after making a liberal allowance to the Society's library, showed a good balance in favour of the Society. The reports having been adopted, the election of officers to serve on the council resulted as follows:—Chairman, Mr. Charles King; committee, Messrs. Parker, E. Coath Adams, W. H. May, M. A. Bazeley and A. E. Lethbridge; honorary secretary and treasurer, Mr. B. Priestley Shires; librarian, Mr. W. H. May. In a discussion that followed it was maintained that architectural work in connection with the public bodies of the town should be more evenly distributed.

The Erection of a New Royal Residence at Cromer is looked on as a certainty. Lord Suffield has been spending Whitsuntide at Cromer, and, subject to the King's approval, the site for such a residence has been selected. It lies between the Royal Links Hotel and Lord Hillingdon's fine house, and is near the famous golf links.

THE A.A. DINNER.

THE annual dinner of the Architectural Association was held at the Criterion Restaurant on Friday evening last, Mr. W. Howard Seth-Smith presiding. The company numbered nearly one hundred, and included Sir George Young, Major-General Sir H. Trotter, Mr. William Emerson, Mr. Aston Webb, Mr. John Slater, Mr. E. S. Prior, Professor Simpson, Mr. A. W. Soames, M.P., Mr. R. M. Beachcroft, Mr. F. T. Baggallay, Mr. Henry T. Hare, the Master of the Plumbers' Company, Professor R. Elsey Smith, Professor T. Roger Smith, Mr. G. L. Gomme, Dr. Isambard Owen, Dr. W. J. Collins, Mr. R. W. Schultz, Mr. E. Guy Dawber, and Mr. Francis Hooper. After the toast of "The King and the Royal Family" had been given, "The Church and the Legislature" was proposed by the president. In responding, Mr. A. W. Soames said he thought he was the only member of the House of Commons who represented art in any degree. This was a reflex of the attitude of the nation towards art. He thought, however, that latterly there had been a very decided improvement as regards the manner in which various Governments had dealt with this question. He considered that the plan adopted by the Government for the new offices in Whitehall was a right one; in his opinion it was best to select one man and to give him a free hand. When we had an educated artistic public, then we would have an educated artistic parliament. Mr. John Slater proposed the next toast, that of "The Army and Navy," and, in doing so, he said that the connection between the army and architecture was not quite so remote as might be imagined. The War Office had a great work to do in providing buildings such as barracks, and the training appurtenant to such work was excellent. Mr. Ingress Bell had received his training in the War Office. Major-General Sir Henry Trotter replied. Mr. Baggallay proposed "The Royal Academy and the Royal Institute of British Architects." These two bodies, he said, so subject to sporadic criticism, were the guiding lights of architecture, and a great deal was due to them for the valuable assistance they rendered to the architural profession. In responding, Mr. Aston Webb remarked that there was one subject which both bodies had equally at heart—that of education. Of the thousands who thronged the galleries of Burlington House every year, few remembered the work which was going on under their feet, but after the brilliant three months were over the education still continued of those young men and women whose ambition it was to fill the galleries above with their works. The Architectural Association was starting a new scheme of day classes, and he thought they would be successful. They would not necessarily produce good architecture. But good architecture was founded on knowledge, and he did not think anyone would deny that knowledge in architecture was not needed just as much as in any other subject. The danger lay in the number of courses being started in various parts. If these could be concentrated it would be very advantageous. He would like to see the scheme of the Architectural Association and that of the Academy working conjointly on harmonious lines. Mr. William Emerson, who also responded to the toast, spoke of the rapidity in work required of an architect practising at the present day. The toast of the evening, "The Architectural Association," was proposed by Mr. W. J. Locke, and replied to by Mr. H. T. Hare and the president. Other toasts were, "The London County Council," proposed by Sir George Young and seconded by Dr. W. J. Collins; "Lecturers and Instructors," proposed by Professor Simpson and replied to by Professor F. E. Hulme; "The Guests," proposed by Professor T. Roger Smith and replied to by Mr. G. L. Gomme and Dr. Isambard Owen; and "The Committee and Officers," proposed by Mr. F. T. W. Goldsmith and responded to by Mr. G. B. Carvill. During the evening songs were sung by Mr. S. Constanduros, and humorous sketches were given by Mr. Harrison Hill. A photograph was taken by Messrs. Fradelle and Young.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Right to Insert Window in Wall.

FAREHAM.—J. H. M. writes: "I have a dark passage and want to put a small fixed light in the outer wall so as to secure light. My wall is 7ft. clear of my neighbour's property. Can he oppose my doing so?"

No. You can insert a window in your outer wall if you so desire, but your neighbour may construct a hoarding on the boundary of his property immediately opposite the new window, so as to prevent you obtaining any right of light from his property. T. E. C.

Payments to Adjoining Owners.

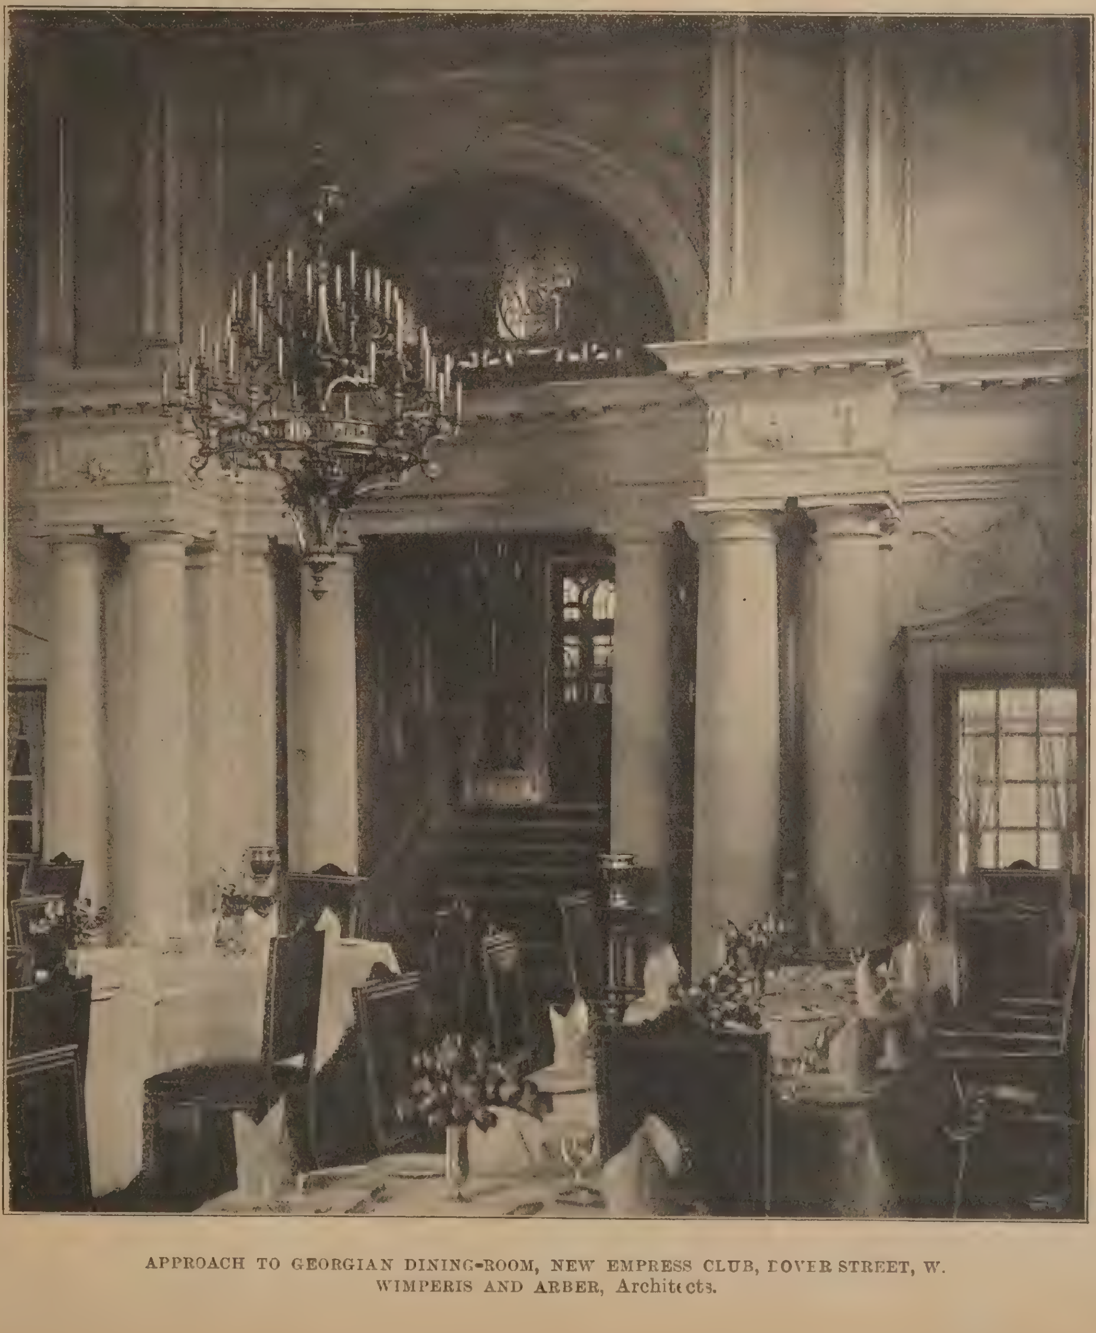
LONDON, E.C.—J. W. R. writes: "In a party-wall case, decided within the past six months, the building owner rebuilt his premises larger than before. He applied for part-payment from the adjoining owner for the rebuilt party wall, but the adjoining owner refused to contribute. The court upheld him. Kindly express an opinion on this matter."

The decision is perfectly sound. The adjoining owner cannot be made to pay for work undertaken without his consent. A. O. H.

Hot-Water Supply.

LONDON, S.W.—G. A. P. writes: "In a case where the circulating tank or cylinder is placed near to and heated by the kitchen range boiler —(1) Is it sufficient for the level of bottom of cylinder to be just clear of the top of the boiler? If not, what should be the least height at which cylinder is fixed above the boiler? (2) At what exact height in cylinder should flow from boiler enter same? (3) At what exact height in cylinder should the return to cylinder enter same?"

(1) Yes. The greater the height the more rapid the circulation, and *vice-versa.* (2) and (3)



APPROACH TO GEORGIAN DINING-ROOM, NEW EMPRESS CLUB, DOVER STREET, W.
WIMPERIS AND ARBER, Architects.

There is no fixed law or rule. It is more a question of convenience. The return should be at the bottom of the cylinder and the boiler: the flow from the top of the boiler to any convenient part of the cylinder. A pamphlet entitled "Heating by Hot Water," by Mr. Walter Jones, is published by Messrs. Crosby, Lockwood & Son, 7, Stationers' Hall Court, E.C., at 2s. 6d. nett (post free 2s. 9d.). This will doubtless be of use to you.

Cost of Buildings.

BURY.—SAPPER writes: "Are there any books giving particulars for determining approximate estimates quickly, *i.e.*, different classes of building per ft. cube or other unit, hospitals per bed, infirmaries per inmate, &c.?"

Querist cannot do better than consult an article on "The Cost of Buildings" on p. 48 of our issue for August 22nd last. For full pricing, see Stephenson's "Estimating" (to be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C., price 5s. 6d.).

Books of Detail Drawings and Books on House Drainage.

LONDON, S.W.—QUERIST writes: "Kindly recommend the best books containing detail drawings (to scale) of the following styles of architecture peculiar to England: Greek and Roman orders as described by W. H. Leeds, Norman or Romanesque, Early English or First Pointed, Decorated or Middle Pointed, Perpendicular, Florid or Third Pointed. Kindly also mention a good book on house drainage and sanitation."

Colling's "Details of Gothic Architecture" (nett £2 2s.); "Churches of the Nene Valley," by Edmund Sharpe, John Johnson and A. H. Kersey (£2 4s.); Gotch's "Architecture of the Renaissance in England" (£8 8s. nett); Triggs' and Tanner's "Architectural Works of Inigo Jones" (25s. nett); Abbey Square Sketch-Book (3 vols.), Architectural Association Sketch-Book (several volumes, £1 1s. each). Middleton's "House Drainage" (3s.) and Coleman's "Sanitary House Drainage" (6s.) are both useful books. These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Construction of Large Water Tanks.

LONDON, E.C.—J. E. writes: "Since the accident to the large cast-iron tank at the West Ham Workhouse I have been desirous of studying the construction of large wafer tanks built of cast-iron flanged plates, but I find a great dearth of information on this subject. In Laxton there is a reference to the weight of plates and the width of flanges, and in Molesworth's pocket-book (p. 314 of 24th edit., 1900) are some equations and formulæ. Could you name a book which gives full particulars of the construction of these tanks?"

The writer cannot recall the title of any book giving information on designing large tanks, and his "Molesworth" is an earlier edition than the one referred to. There was an article by P. Hutchisen in "The Practical Engineer" for December 30th, 1898, on cast-iron tanks, giving some useful information and formulæ applicable to tanks of medium size. Tanks of large area require carefully supporting, so as not to have unequal settlements to rack the joints, and tanks of great depth require considerable judgment in placing and apportioning the size of the ties. HENRY ADAMS.

Examination Questions.

NEWCASTLE-ON-TYNE.—RYE HILL writes: "Kindly answer the following questions, set at various R.I.B.A. Intermediate Examinations: Define velarium, monopteral, merlon, bratishing, and parclose screen. In studying classic ornament, what indications have you seen that its forms were influenced by such practical considerations as weathering?"

These columns are only intended to give aid in problems of special difficulty, and it is too much to expect us to give answers to examination questions, particularly like those above. The desired information can easily be found by consulting the ordinary text-books or reference books.

Cost of Cement-Concrete Heads and Sills.

BLACK DYKE.—J. T. writes: "What is the cost per lineal foot of 10in. by 7in. cement heads and sills for 3ft. and 4ft. openings, to stand all kinds of weather? Also the cost of 2½in. cement flags per super yd.?"

This enquiry is not sufficiently definite, as the cost is so greatly dependent upon the cost of materials and the distance of carting them, wages, proportions of aggregate and matrix, finish, and shape. Querist cannot of course mean "cement" heads, sills or flags; cement-concrete is always used. As an instance of the difference in cost of aggregates we may mention that granite and stone chippings, furnace slag, coke-breeze, sand, broken tiles, &c., are all (and generally) used. The rough actual cost in your district of concrete heads and sills 10in. by 7in. for 3ft. and 4ft. openings, made in the proportions of about one part of cement to three of slag or sand, would be about 1s. 6d. per ft. run; 2½in. concrete slabs would cost about 5d. to 6d. per ft. super., if made to wear well.

Colouring Tracings.

PERPLEXED writes: "Is it best to colour drawings before mounting them on strainers, or after? If the latter, how can one obtain a rest to steady the hand, it of course being impossible to lean on the stretched paper?"

It is best to colour drawings after mounting them on strainers. A mahl stick can be used as a rest for the hand. With tracings on cloth the colouring is always done on the opposite side to that on which the ink is used; it is therefore somewhat difficult to avoid the colours or ink running, but the secret of success is to use a stiff starch on the mount, and apply thinner starch with a flat camel-hair brush to the tracing, *never touching any part a second time with the brush;* the tracing should be layed down on the shortest side and dabbled into position, but when once laid it must not be moved, or smudging will result.

Hinges for Church Door.

REDDITCH.—C. D. writes: "Would double-action helical spring hinges and blanks be suitable and strong enough for 2½in. framed and ledged **V**-jointed battened doors, hung folding, for churches? If not, what make would you suggest?"

The helical spring hinges are good springs considering their cheapness, and we have seen several used for internal doors in churches. These springs are not, of course, so good as more expensive floor and overhead check springs, and the helical springs constantly break where subjected to rough wear, such as by the doors being swung violently back; but this would hardly happen in a church. The springs with noiseless checks do not slam the doors, however; they are expensive, and cost between 25s. and 40s. each (according to quality) for doors of the size you require (4ft. by 7ft. 6in.).

Churches to Measure for R.I.B.A. Examination.

LONDON, N.—E. writes: "Can you recommend St. Giles in the Field, High Street, Bloomsbury, as a suitable church for measuring and drawing for the R.I.B.A. examination? If this is not a good church for the purpose, name one which is."

Probably Hawksmoor's great church of St. George, Bloomsbury, would be better, as being the principal work of one of Wren's pupils, but it is doubtful whether either is of sufficient importance or magnitude if it be intended to compete for the "measured drawings" prize, while they are larger than would be necessary if mere "testimonies" for the final examination be intended. Both churches should be first carefully inspected with an eye to the possibility of measuring them without the use of expensive scaffolding, and the vicar of the one selected should then be consulted for permission and any information in his possession obtained. G.A.T.M.

Architectural Training.

REQUIRE writes: "I am desirous of studying the art of architecture and the 'classics,' also the construction of certain parts of buildings calling for special skill. Kindly recommend what course to adopt and what books to study. I desire to go in for first-class work."

There is no book that will teach you how to design well, although many purport to do so; architecture depends so much upon site, situation, material and ideals and traditions that the best study is buildings themselves. However, to give some method to one's study, the following books are helpful: Ruskin's "Seven Lamps of Architecture" and "Stones of Venice," the chief articles in Viollet le Duc's "Dictionnaire Raisonné de l'Architecture," Walter Crane's "Bases of Design," Ferguson's "History of Architecture" and Blomfield's "Renaissance Architecture." Rivington's "Building Construction" is of course a standard book on the subject. See the answer to an enquiry under the heading "Theoretical Mechanics" in our issue for March 20th last. Mr. B. T. Batsford, of 94, High Holborn, W.C., publishes a useful list of standard books upon particular subjects.

Right of Light.

SUNDERLAND.—ANXIOUS writes: "I want to build on a corner site which has never been built upon. The properties on two adjoining corners are more than twenty years old and are two storeys high, with a half basement above the street level, and windows facing my corner from basement to first floor. Could I be sued for obstructing the adjoining light if I built my property three storeys and a half above the street level?"

The owner of the adjoining properties (marked B on querist's sketch, not reproduced) could certainly bring an action for infringement of his rights of light; but it is by no means so certain that he could sustain it. In order to obtain either an injunction or damages he would have to prove that his light would be materially affected to the injury of his trade or business, or that in some way material damage having a definite money value would be done to him. This, having regard to the width of the roads, it would be most unlikely that he could succeed in doing. If, however, an action should be brought, it would be better to compromise it in some way, if it could be done by some small money payment, than to be put to the trouble and expense of contesting even a presumably sure case. G. A. T. M.

Cemetery and Mortuary Buildings.

CARDIFF.—NEVAR writes: "Which is the correct position for the bier in a small cemetery chapel to accommodate 100 persons, and in what position would the mortuary be placed, and the size of same?"

In most cemetery chapels the bier is placed so that the coffin rests longitudinally, with feet towards the east, in the very centre and in front of the communion rail. Seats in many cases are ranged along the N. and S. walls, but it is becoming more usual that they should also face eastwards and be reached from the wide central passage in which the bier stands, while the bier often consists of movable trestles. Another recent improvement has been that the bier should rest in a transept separated from the chapel itself by a glazed screen, and this is especially useful where several interments may take place simultaneously, as it can be made large enough to accommodate as many as eight or ten coffins at once without incommoding the congregation. The mortuary, if a separate one be provided, is only needed for the resting of a body which has been brought from some distance till the mourners arrive, and, as a rule, need not have room for more than about two and the bearers. It should be placed so that the coffin can be readily taken in from a covered carriage-way, and as readily transferred to the chapel. F.

Qualifications for a Land Surveyor and Estate Agent.

DUMPY LEVEL writes: "What are the necessary qualifications for entering, and the duties in, the office of a land surveyor and estate agent to a large railway company?"

The estate agent of a large railway company has the management of its always large property in houses, lands, &c., the collection of the rents, supervision of repairs, and the negotiations for purchases and sales, which are often upon a large scale. The "agent" himself is generally a man who has risen from the bottom of his own department, and he has the right of appointing and dismissing his subordinates, so that a personal introduction to him is almost necessary to anyone who may wish to enter his office. As a rule lads are preferred who can enter as copying clerks or office boys at some such salary as 10s. per week. From this they can rise slowly from grade to grade, but "only" a very few of the most capable can ever expect to receive more than £200 a year, in addition to the free passes on the line both for residence and holidays which are enjoyed by mutual arrangement between the companies by all railway officials. G. A. T. M.

The Refusal of Plans by Local Authorities.

NIL DESPERANDUM writes: "I am obliged for your reply to my query. Unfortunately, there is a misunderstanding, and no doubt it will alter your opinion. The house that I want to erect stands in the same urban district as the sewer, and the pavement is also in the same district; but the roadway is a highway, and in the adjoining rural district. The pavements within the urban district have been laid with cement slabs, and they refuse to have them disturbed. Are not the urban district obliged to pass my plan if I show the drain under roadway (highway) and ask to cross the pavement and connect to sewer in the usual way? If so, do you think the Local Government Board would consider my application favourably, if the adjoining rural district refuse me permission to run under the highway?"

From a consideration of the additional facts submitted, it would appear that you have good grounds for claiming permission to carry your drainage into the adjacent sewer. If the sanitary authorities still refuse your application, then lay full particulars of the whole case before the Local Government Board, at the same time forwarding a plan (drawn to scale) showing the district boundaries, the distance from the proposed house to the sewer, and other similar details directly affecting the question.

T. E. C.

GODALMING.—J. H. N. writes: "In his reply to 'Nil Desperandum' on page 308 of your issue for May 22nd, has not 'T. E. C.' forgotten section 22 of the Public Health Act, 1875? An owner or occupier *without* the district of a local authority has the *right* to cause his drains to communicate with the sewer of the local authority on agreed terms, or, in case of dispute, on terms to be settled, at the option of the owner or occupier, by a court of summary jurisdiction or by arbitration in the manner provided by the Public Health Act."

I am obliged to "J. H. N." for the correction. The precise terms of the clause in question were not before me at the time of writing. To avoid any misconception, section 22 of the Public Health Act, 1875, is now given in full: "The owner or occupier of any premises without the district of a local authority may cause any sewer or drain from such premises to communicate with any sewer of the local authority on such terms and conditions as may be agreed on between such owner or occupier and such local authority, or as in case of dispute may be settled, at the option of the owner or occupier, by a court of summary jurisdiction or by arbitration in manner provided by this Act." T. E. C.

Examination for Clerks of Works.

TUNBRIDGE WELLS.—GNEISS writes: "Is there any examination held by the R.I.B.A., or another body, for clerks of works?"

The Carpenters' Company hold an examination (next month, we believe). Full particulars can be obtained from Mr. Stanton William Preston, clerk to the company, Carpenters' Hall, London Wall, E.C.

Another Roman Pavement at Dorchester has been found. It was only recently a splendid specimen was found on the outskirts of the borough, and it has been carefully relaid in the County Museum. The latest find is of scarcely less interest, the floor being about 22ft. long and 7ft. broad. It was laid bare during some excavations in a road known by the name of Icen Way. The pattern is not very elaborate, but the colouring is good.

NORTH-EASTERN HOSPITAL.

THE original North-Eastern Hospital consists of a group of temporary buildings hastily erected in 1892, in face of an epidemic of scarlet fever, and intended only to last for one year. The area of the site was then 19 acres, but additional land has since been purchased, and the total is now about 33 acres, including a recreation ground, not shown on the accompanying plan, situated on the south side of the railway.

The new buildings which form the first section of the proposed permanent hospital are shown black on plan. They consist of an administrative block, laundry, staff quarters, medical superintendent's and steward's houses, porter's lodge, receiving and discharge rooms, mortuary, dispensary, four diphtheria and enteric blocks, two isolation blocks, and tank tower.

The normal number of beds in the reconstructed hospital will be 548. The new buildings provide for diphtheria and enteric patients and eight isolation beds. They also include accommodation for the entire staff of the future hospital. The buildings have been designed by Messrs. A. & C. Harston, architects, 15, Leadenhall Street, E.C.; and erected by Messrs. McCormick & Sons, whose contracts include all engineering work except kitchen and laundry fittings. The contract amounts were: Main contract, £113,642; laundry, £8,865.

The kitchen fittings were provided by Messrs. C. Kite & Co., whose contract amounted to £1,050; and the contract for laundry fittings has recently been let to Messrs. Bradford & Co. at £4,580. The medical superintendent's residence was built by Messrs. Wm. Johnson & Co., of Wandsworth Common, at a cost of £1,968.

The North-Eastern Hospital is about six minutes' walk from West Green Station (G.E.Ry.), and about nine minutes' walk from St. Ann's Road Station (Midland Ry.).

It was inspected by members of the Metropolitan Asylums Board on May 18th.

Engineering Notes.

A New Bridge over the Tyne at Haddington, named in memory of the late Queen Victoria, was opened recently.

The City Infectious Hospital, Coventry, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Portsmouth Tramways.—The Mayor and other members of the Corporation at Portsmouth, having had an interview with the officials of the Local Government Board with respect to an application for a loan of £600,000 for the purchase of the new electric trams, report that the consent of the Board will be received very shortly.

Bridge Improvements at Cardiff.—One of the improvements which the Cardiff Corporation has in contemplation is the widening and straightening of the bridge known as the Hayes Bridge, at the top end of Bute Street. Property has been purchased in order to run Bridge Street into Mill Lane without the awkward angle which now exists. The borough engineer, Mr. Harpur, has designed the ironwork of the parapets in patterns in the style of the Celtic or pre-Norman period. In his report Mr. Harpur said: "The curator of the museum, Mr. John Ward, F.S.A., has called my attention to the fact that His Majesty's Board of Education had made extensive grants to the museum for the acquisition of casts of pre-Norman monuments, with the view of their application to local art, and suggested that some municipal works should be carried out in the Celtic style. After considering the matter I concluded that this style would lend itself to cast-iron construction, and I have therefore adopted it for the parapets and end pillars of this bridge."

Street Lighting.—The Kitson Lighting and Heating Syndicate, Ltd., have fixed street lamps in Portland Place, W., on a new system. The Kitson Light is produced by combustion of petroleum in a lamp designed for the purpose, in which the calorific value of oil is converted into light by means of ordinary incandescent mantles. The reservoir from which the oil passes by means of a metallic tubing, may be placed at any convenient distance from the lamp, or it may be close to it. The conducting tubes are very small, varying from $\frac{1}{16}$in. to ¼in., and are encased in wood coverings in a similar manner to electric light wires. The chief advantage claimed for the system is its cheapness. It is stated that while an electric light of 1,000 candle-power costs 1⅔d. per hour, a Kitson light of the same intensity costs only $\frac{5}{10}$d. A feature is made of the fact that as each lamp-post contains its own reservoir, the nuisance caused by the constant tearing up of the roadway for the repairs of gaspipes and electric wires is done away with, and that in this alone a very large annual outlay could be saved by a general adoption of the new system of oil lighting. The lamps in Portland Place are twelve in number, and they replace some forty gas lamps, with which the thoroughfare was formerly illuminated.

The Engineering Trade in 1900.—The Amalgamated Society of Engineers attained its jubilee in 1900, and the annual report for that year has just been issued, showing a membership of 87,672, and over £400,000 in funds. Mr. George N. Barnes, in the remarks as general secretary with which he prefaces the report, states that the year was one of uninterrupted prosperity to the society's trade. He further remarks: "By its support to trade and public movements the A.S.E. has materially contributed towards that equality of opportunity which is the aim of all industrial and social reform; and by the expenditure of vast sums of money in sick, unemployed, and other benefits it has spread over the broad back of the many burdens which might otherwise have fallen with crushing effect upon the shoulders of the few." The income of the society last year was £333,555, and the expenditure £234,194, showing a saving on the year of £99,361, and a total balance at the end of the year of £406,529, which is said to be "probably the largest sum ever held by any trade union." Of that balance, £127,143 stands to the credit of the superannuation fund, leaving £279,386 for benefit and trade purposes. The exports of steam-engines, machinery and millwork in 1900 did not quite reach the total in 1899, which was the highest on record. They represented a value of £19,621,557, or £32,000 less than in 1899. The only class which showed any considerable decrease of exports was textile machinery, which fell off during the year by nearly £600,000—namely from £6,803,948 to £6,211,918. The exportation of locomotives last year amounted to no less than £1,500,909, or double the value of such exports in 1894.

Correspondence.

Examination Questions in Building Construction.

To the Editor of THE BUILDERS' JOURNAL.

CARDIFF.

SIR,—I am greatly pleased to see a protest raised against what is, to say the least of it, a very unfair examination—I speak of the examination in building construction held on May 11th. I went in for it, feeling fairly confident in my knowledge of the work set out by the syllabus, having been working hard for three months every evening, but my efforts were wasted: and in this I am but voicing the opinions of the majority of the students at the Cardiff Technical Schools. The fault lies with the gentleman who set the papers. I am sure we are all greatly indebted to him for the thoughtful way he put the questions. The only thing was he became a little muddled after he had written them, and dropped a few honours questions in the advanced paper, and a few advanced questions in the elementary paper. I might venture to suggest perhaps that a petition should be started in each large town in the kingdom with the object of lowering the standard of the examination. I do not think we would be asking too much that anyone obtaining 60 per cent., or even 50 per cent., should be awarded a first-class certificate; while 45 per cent. should be quite high enough to obtain a second-class certificate. I quite foresee, however, that there are great difficulties to the scheme. We do not wish a paper to be easy: all we require is that it shall be straightforward, not tricky and ingenious.—Yours truly,
A STUDENT
(CARDIFF TECHNICAL SCHOOLS).

To the Editor of THE BUILDERS' JOURNAL.

SOUTHPORT.

SIR,—I fully concur with your correspondents respecting the examination in building construction. As to the time allowed, four hours may have been long enough originally, but for such questions as those set this year I think that time rather too short, especially for students in the advanced and honours stages. Another point I would like to mention is that, in my opinion, the student in and about London (and the south generally) seems to have an undue advantage over the Lancashire or North of England student. Everything seems to be looked at from the London standpoint by examiners. For instance, take a stock brick as known to the Science and Art Department and one as known and used in Lancashire, and note the difference; and numerous other examples could be cited. I think they should, as it were, meet halfway.—Yours truly,
ONE MORE STUDENT.

To the Editor of THE BUILDERS' JOURNAL.

DUBLIN.

SIR,—On reading "Another Student's" letter on page 319 of your last issue, I must confess I fail to see what grievance he has. He states that the questions are getting difficult to understand. Well, I trust the science of building is progressing, and not remaining at the Science and Art standard of, say, twenty years ago. Again, why object to a student being able to draw (correctly, I presume) the plan, section and elevation of a door in almost any position? As regards "Another Student" (No. 2), I think most persons will agree that a candidate presuming to be able to work an Honours paper who cannot determine whether the height of a shop front is 12in. or 12ft., owing to a misprint or otherwise, deserves to fail. This student states that tables are required to work chimney-shaft questions. I say, No. I admit three constants are required for the cases usually occurring, but constants are required for every question of strength. With reference to the roof question, I am unable to express an opinion, as I have not seen the paper. It may not turn out so formidable as "Student" imagines. There may be something to be said against the syllabus not embracing the questions set; still these examinations should be looked at from a higher point of view than merely securing a "pass"—they should be considered as aids to professional education.—Yours truly,
S. E. D.

Masters and Men.

The Strike at Yarmouth has been settled by a compromise, the masters giving an advance of ½d. per hour.

The Masons' Dispute in Arbroath has been amicably settled. The dispute arose over the intimation of the masters' intention of reducing the present wage from 8d. to 7½d., and their refusal to sign the by-laws of the Operative Masons' Society. The masters have now agreed not to make any reduction in the present wage.

The Strike at New York has been settled. After a conference with the Arbitration Board the Bricklayers' Unions and the Masons' and Builders' Association announced that the lock-out and strike which began on May 17th were mutually declared to be at an end, the employers making certain concessions.

The Strike at Newark of operative bricklayers and builders' labourers, which commenced on May 1st, is still proceeding. About 200 men are affected. The bricklayers withdrew their demands for an increase of ½d. per hour, and the employers agreed to sign a code of working rules for the district. With regard to the builders' labourers this section insisted upon an advance in wages of ½d. per hour, viz., from 5d. to 5½d. per hour; and the employers agreed to a code of working rules for the district. A meeting between representatives of both sides failed to arrive at a settlement, and the strike has been carried on with vigour and determination by both sides. The bricklayers are reported as working with non-society labour, where it has been introduced, although some fifty are unemployed owing to the labourers continuing the strike. Three firms are working, having conceded an advance of ½d. per hour to the labourers; two others are reported as partially employed. Most of the firms are, however, standing. The labourers are connected with the Federated Society of Builders' Labourers of Great Britain.

Keystones.

A New Presbyterian Church at Acrefair has been built at a cost of £1,100. A new organ has also been provided at a cost of about £125.

New Liberal Club Premises at Woolston are being erected from plans drawn by Mr. J. H. Blizard (Messrs. Lemon & Blizard). The builders are Messrs Hinton Bros.

A Memorial to General Wauchope has been erected at Niddrie, in the shape of a Celtic cross of Aberdeenshire granite, in front of Niddrie Mill School.

Mr. W. J. Morley, F.R.I.B.A., of 269, Swan Arcade, Bradford, has taken his son, Mr. Richard Morley, into partnership, and his practice will be carried on in future under the style of W. J. Morley & Son.

The Louvre Museum, Paris, has had five new rooms added to it, in which has been grouped a magnificent collection of French furniture of the seventeenth and eighteenth centuries. The articles have been drawn from the relics of the Palaces of Versailles, Saint-Cloud, Bellevue, Meudon, Fontainebleau, Compiègne, the Louvre itself, and the Chateau de Louveciennes, which was the home of Madame Du Barry, and have consequently a great historic value. One of the rooms is devoted to the period of Louis XIV., another to Louis XV., and the other three to the period dating from the end of the reign of that monarch to the Empire, and which is generally termed Louis XVI. style.

A New Market Hall at Ilfracombe has just been erected at a cost of £7,000.

A New Liberal Club at Baxenden, Accrington, has been erected at a cost of nearly £2,000. Mr. Haywood was the architect.

A New Hotel at Buxton has been opened by Messrs. Spiers & Pond, Ltd. This building—the Empire Hotel, as it is named—on a commanding site to the west of the town, is the largest establishment of the kind in Buxton. It possesses accommodation for upwards of 300 guests.

A New Grand Public Hall for Dulwich is being erected on a freehold site in Grove Vale, East Dulwich. The building, which will include large and small halls, masonic temple, club-rooms, &c., is to be completed in time for the coming winter season, commencing in November next. The hall is to be called the New Imperial Hall.

A Monument to Rosa Bonheur has been unveiled at Fontainebleau, near the hamlet where she lived for many years. It consists of a bronze bull—an enlarged facsimile of one of her sculptures—standing on a pedestal decorated with bas-reliefs representing some of the painter's best known work, and her portrait. The monument was executed by Rosa Bonheur's brother, M. Isidore Bonheur, and her nephew, M. Peyrol.

The Famous Weaving Factory of the Gobelins in Paris is about to begin one of the largest and most important pieces of tapestry that has ever been made. It is a work destined to decorate the Mairie of the Thirteenth Arrondissement, and it is estimated that it will take ten years to finish. M. Jean-Paul Laurens has executed the design, which represents the "Triomphe de Colbert," Louis XIV.'s all-powerful Minister.

Keighley Public Library Competition. — Mr. Leonard Stokes, F.R.I.B.A., has completed his task of adjudicating upon the 146 competitive designs for the new public library. The first premium of £50 is awarded for the design submitted by Messrs. Arthur E. McKewan & James A. Swan, of Newhall Street, Birmingham; the second, of £30, for that of Mr. J. S. Gibson, 4, Gray's Inn Square, London; and the third, of £20. for that of Mr. Thomas Davidson, A.R.I.B.A., Great Ormond Street, London. In adopting the awards, the Free Library Committee recommend the Council that the premium for the first set of designs shall not be merged, as intended, in the architect's commission, and that the successful set shall be adopted.

A New Church for Newington, Hull, to be dedicated to SS. Peter and Mary, is being erected on the Hessle Road, near Hawthorn Avenue. The church consists of nave and aisles, with porches at each end, facing the Hessle Road, and there is also to be a baptistery at the west end. The chancel is intended to be finished with a circular apse, and has a large double vestry on the north side, and on the other side the organ chamber. The church when completed will accommodate 558 adults, but at present the funds only admit of the completion of the nave and aisles. The church is to be built of red bricks with terra-cotta dressings, and is to be roofed with Broseley red tiles, and the style selected is Norman. The architects are Messrs. Brodrick, Lowther & Walker, of Hull and Bridlington.

Durham's New Technical College.—The new Johnson Technical School, which has been erected in South Street, Durham, was opened recently. Messrs. George Gradon & Sons, of Durham, were the contractors, their tender being £4,642. A site was obtained at the bottom of South Street, and here the new school was erected. The new school occupies a space of 77ft., with a width of 46ft., and is built of red brick, with red tiled roof, the entrance doorway being of stone. From the roof rises a turret which also forms the ventilating shaft, which has been carried out on Boyle's system. There are in all three storeys. Facing South Street are several large bay windows, with a large oriel window facing the river. The top storey is intended for art, the middle floor for chemistry and engineering, and the basement for physics, cookery, &c. In the basement there are a kitchen, store-room, physical laboratory, dark-room for photographic purposes, science class-room, heating chamber, &c. The whole of the rooms are approached by a cement staircase from wide corridors. The building throughout is heated by hot water.

The German National Monument to Prince Bismarck was unveiled last Monday.

The Memorial to the Late Dean Ingram, of Peterborough, is proposed to take the form of the completion of the restoration of the Cathedral west front.

A New Church for Milton, Sittingbourne, is being erected, to be dedicated to St. Mary. The cost will be about £2,200. The architect of the church is Mr. W. Philip Day, and Mr. Harry Gardler, of Milton, is the builder.

A New Foresters Hall at Cranswick has been erected opposite the village green, and not far from the railway station. The inside measurements of the hall are 70ft. by 29ft., and it has an entrance, ticket offices and a small gallery. The roof is of open timber work. The front elevation is of Accrington red bricks, with stone dressings, a deep panelled frieze of stone running across the front.

German Sculpture.—A great marble statue of Emperor William I. has just been finished and will be placed in front of the new university of Strasburg. It is the work of Zambusch, the eminent Viennese sculptor. It is proposed to erect a Shakespeare statue opposite the celebrated double monument to Schiller and Goethe, near the theatre at Weimer. This is suggestive of the extent to which Germans have come to regard Shakespeare as a possession of their own.

A Russian People's Palace.—The erection of the "Czar Nicholas II. People's House" in St. Petersburg is the latest attempt of the Russian Government to provide the masses with an antidote to the drinking shops. The Russian institution is said to have been modelled on the lines of the People's Palace in London. The building contains a theatre, with room for 2,500 persons, in which "dramas of historical patriotic character" are to be performed The entrance fee is ten kopecks for civilians and five kopecks for soldiers.

The Cornish Craft Guild is the name of an organisation which has just been formed, and the members have for their aim the designing and creating of beautiful objects possessing practical utility. It is not in the ordinary sense a commercial concern. The capital required to start has been lent gratuitously, and after deduction of necessary expenses the whole of the money obtained for the finished articles will be divided among those whose skill and labour have created them. At first the guild will give its attention almost entirely to working in wood, brass. copper and silver, and will be pleased to submit designs and estimates on receiving statements of requirements. The hon. secretary of the organisation is Dr. Roberts, Hayle, Cornwall.

A New Town Hall for Batley.—The borough surveyor of Batley, Mr. O. J. Kirby, has received instructions from the general works committee to raze the Market Hall to the ground, and to lower the Market estate in order to provide a site for the new town hall, which is to be erected at a cost of about £50,000. About 80,000 loads of soil, exclusive of the stone and débris, will have to be removed, and it is to be conveyed in trucks on a specially-erected railway, over a bridge 18ft. high, into the valley on the low side of the football field. The new road to Mount Pleasant will thus be made contemporaneously with the clearance of the Market estate. This will be the beginning of a number of public improvements estimated to cost the ratepayers of Batley about £120,000, including the outlay on electric tramways.

The Proposed Charlotte M. Yonge Memorial.—The following suggestions as to the proposed memorial were considered recently at a public meeting: A reredos in the Ladye Chapel of Winchester Cathedral; the completion and equipment of the new Southern Cross (Melanesian Mission) ship; sanctuary furniture for the same; the endowment of Otterbourne Schools; a reredos windows or an organ for the church of St. Matthew, Otterbourne; and a scholarship at Keble College, Oxford. It was unanimously resolved that a worthy memorial should be placed in Otterbourne Church, and a substantial majority also voted in favour of the proposal that a reredos should be placed in the Ladye Chapel of the Cathedral at Winchester. For these two schemes, therefore, an appeal will eventually be made to the public.

A New Congregational Church at Harringay, N., to cost £5,000, is being built at Allison Road, Green Lanes.

Mr. Edward A. Gruning, vice-president R.I.B.A., has been appointed by the council of the Institute to fill the seat on the Tribunal of Appeal left vacant by the death of Mr. Arthur Cates.

A Bishop on Church Reparation.—The Bishop of Winchester, through his secretary, writes to a correspondent that he "is not of opinion that public opinion in England desires to see the usefulness or dignity of our cathedrals impaired; and the present condition of funds in most of the cathedral chapters is such as to cause serious apprehension as to what the issue may be."

Abbey Dore Church, Herefordshire, is proposed to be repaired. The church is a unique example of a Cistercian presbytery, and forms the eastern section of the Abbey Church, founded in 1147 for the White Monks. Mr. Roland W. Paul, who has been consulted, states that the main walls are sound, but that some portions of the building are in a dangerous state, the upper part of the tower being seriously out of position.

The New Church of St. James's, Muswell Hill, was consecrated last week. The original church was a somewhat uncomely building, and in recent years has become too small for the rapidly increasing population around it. It was, therefore, decided to erect a better and larger building in its place, and at right angles to it, more room being obtained by the transference to the Ecclesiastical Commissioners of a portion of the vicarage garden. The new building consists of the chancel, organ chamber and vestries, morning chapel, and two bays of the nave. A sum of about £8,000 has been spent upon it, and it will require another £7,000 to complete the building, a work which will be taken in hand as soon as the old church is demolished.

The New Street from the Strand to Holborn will cause the demolition of a famous mansion on the west side of Lincoln's Inn Fields, which the London County Council have just come into possession of. It adjoins Sardinia Street, and was built in the reign of Charles II. for the Earl of Lindsey, from the designs of Inigo Jones. The right-hand room on the first floor was taken by Charles Dickens as the scene in "Bleak House" of the assassination of Sir Leicester Dedlock's lawyer, Mr. Tulkinghorn, but the painted ceiling, with the Roman soldier whose truncheon pointed downwards to the prostrate body of the lifeless solicitor, was thoughtlessly covered with whitewash a few years ago.

Presbyterian Church, Muswell Hill, N.—The design under motto New Era submitted for this church in a recent competition limited to five architects has been adopted, and the authors of the design, Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5 Clement's Inn, Strand, W.C., have been instructed to proceed with working drawings. The style adopted is a free treatment of the Perpendicular period of Gothic architecture. Externally the building is to be faced with whole white flints, the dressings being of red Costessey work. A bold square tower, terminating in a quaint spirelet, forms a prominent feature at the angle of the block, the site being at the corner of two roads. There are three bold and richly-moulded doorways in front, flanked by buttresses, and a seven-light traceried window in the central gable, and traceried work in the apex. The plan approximates in form to a Greek cross. The ceiling internally will be vaulted in wood, the large central vault being carried up higher than others for effect and better ventilation, and being carried upon clustered green marble columns, with moulded stone vases and carved stone capitals, and these support four main moulded arches and other smaller ones spanning to the wall. The windows will all be filled in with ornamental lead lights. Electric lighting and low pressure hot-water heating apparatus will be used. There will be seating accommodation on the ground floor for 750 persons, and in the front gallery for 100, making a total of 850, or a mixed congregation of about 1,000 persons. The estimated cost, exclusive of boundary walls and gates, is £7,218.

Trade and Craft.

Ironwork at the Glasgow Exhibition.

Messrs. Walter Macfarlane & Co.. of Saracen Foundry, Glasgow, have a noteworthy exhibit of art ironfounding at Stand No. 519 in the Machinery Hall at the Glasgow International Exhibition. Its minarets and central dome command the attention of everyone entering the Hall. Taking the form of a rectangular pavilion, it is supported by twenty ornamental pillars of varied design, which carry a variety of spandrels and arches. The treatment between the coupled columns at corners and centres, as well as the frieze, is harmonised, merging in richly-developed foliage—a reference to the Thistle, Rose and Shamrock. The upper portion of the exhibit rises from a moulded cornice, and consists of pediments, minarets and large central dome. The treatment of the pediments varies in each case. Crowning the one at the north end is an example of ornate casting, specially adapted to embrace a monogram and crest, while to complete the two sides there are signboards in wrought and cast iron. To relieve these and secure an effective terminal finish in the centres, a casting of the Royal Arms in full heraldic colours surmounts the one side, while a statuette of her late Majesty, supported right and left by the British lion, dominates the other. With a touch of the "Oriental" at the corners, rise four ornamental minarets formed of delicate open scrollwork, and enriched by fringed ornament, while the spire of each displays various types of the firm's finials. The main or central dome can only be adequately seen from beneath. The design and colouring of the painted and stained glass are pleasing. The internal effect of this central feature is enhanced by a combination of cast and wrought iron railing, panels, terminals, &c., and from this a series of electric-light fitments are suspended. The exhibit further embraces a variety of individual castings for various uses, such as railings and gates for villa and mansion, verandah and conservatory castings, lamp pillars and brackets for oil, gas and electric light. One example in this class is the base portion of the London County Council's new electric light pillar, specially designed for the Victoria Embankment. Among many other examples, a staircase with scroll railings, newels and lanterns occupies a central position on the stand. In addition there are sectional examples of iron drain pipes, bends, traps and gulleys, treated by the glass enamel process. Stable fittings are also shown ; and in this connection it may be mentioned that this firm have furnished the model farm buildings in the Exhibition grounds with their fittings, specially suited for farmhouse and ordinary stabling, and also with the "Byre" fittings. Besides the exhibit within the Exhibition buildings, Messrs. Macfarlane & Co. have erected on the site of the Old Fairy fountain in the grounds an example of their structural work in the form of a decorative or memorial fountain, having on it four life-size figures of Art, Science, Literature and Commerce. Their ornamental spiral stairs are found in various parts of the buildings, whilst throughout the grounds about sixty complete electric-light pillars and brackets are erected, having been lent to the Executive by the firm, who have also provided several drinking fountains for the use of visitors.

A Mechanical Potter.

Messrs. Rowley, Adams & Till, of Swadlincote, Burton-on-Trent, are introducing a very simple and ingenious machine for moulding lavatories, water-closets, sinks and similar goods. It consists chiefly of a rotary forming roller specially made to follow the irregular curves of the various appliances for which it is required. These rollers are used singly or in series, placed horizontally, vertically or obliquely. The rate of production is limited by the speed at which clay can be fed to the machine—the rolling is practically instantaneous. The clay is pressed up better than by hand work ; articles can be made by the machine which could hardly be produced otherwise, and all work is uniform in thickness, with a consequent saving of loss in the ovens. In making a lavatory basin on this machine the ordinary mould is placed upon the travelling table and covered with clay, and is then moved automatically beneath the plaster forming roller. The article is found on emerging from beneath the roller to be thoroughly well made. In the manufacture of smaller articles, such as oval and flat dishes, &c., a number of moulds are placed upon the travelling table together, the quantity produced by one revolution of the forming roller being therefore proportionate to the size of the table ; in some cases one or two dozen might be made at one movement. The value of labour-saving appliances is becoming more and more apparent, and this "mechanical potter" should therefore find an extensive market. Already it has been taken up by several leading firms.

New Companies.

Paving Co., Ltd.

Registered May 14th to carry on any financial, commercial, industrial or other businesses usually carried on by contractors for public works, &c. Capital £10 in £1 shares.

Hounslow Artizans' Dwellings, Ltd.

Registered May 15th. Capital £600 in £1 shares. The first director is P. E. T. Hibbert. Registered offices : 28, Victoria Street, S.W.

Contract Cartage Co., Ltd.

Registered May 14th to acquire the business of a carman and cartage contractor carried on by R. Cunningham at Gallyhill Brickworks, Church Crookham, Winchfield, Hampshire, as Thompson & Co., and to carry on the business of general carriers, railway and forwarding agents, contractors, horse dealers, &c. Capital £1,000 in £1 shares.

Colonial Ferro-Concrete Syndicate, Ltd.

Registered May 21st to acquire patent rights relating to improvements in the construction of buildings, warehouses, bridges, quays, embankments, &c., by means of steel or other metals embedded in or used in concrete and other substances. Capital £4,000 in £10 shares.

Luscombe & Son, Ltd.

Registered May 14th to carry on the business of builders, contractors, decorators, merchants, dealers in timber, hardware and other building requisites, &c. Capital £2,000 in £1 shares. The first directors are J. Chudleigh, E. G. S. Luscombe and E. R. Vincent.

Newey & Son, Ltd.

Registered May 17th to acquire the business of architectural wood and iron workers, metal craftsmen and electrical engineers carried on at 94, Vyse Street and 66 and 68, Upper Hockley Street by A. H. Newey. under the style of Newey & Son. Capital £10,000 in £1 shares. The first directors are W. J. Taylor, A. H. Newey, W. H. Booth and H. T. Buckland Registered office : 94, Vyse Street, Birmingham.

Lewis Lighting System, Ltd.

Registered May 17th to acquire and turn to account any patents, inventions, &c., relating to improvements in the production of acetylene gas. Capital £15,000 in £1 shares. The first directors are Major C. H. Tye and G. Goodland, C.E. Registered office : 57, Moorgate Street, E.C.

A New Primitive Methodist Chapel at Ryde, I.W., is being erected. The new buildings are situated at the conjunction of Well Street and High Street. There will be a new schoolroom under the chapel, providing accommodation for 350 to 400 children. There are also to be five well-lighted class-rooms. The chapel will seat 450 to 500 persons, all the sittings being on the ground floor. The contract price is £2,300, the purchase and retention of the land £700, which, with the furnishing, will bring the total up to about £3,300.

AN OPPORTUNITY.

EVERY Annual Subscriber to the "Builders' Journal" can insure his life for nothing ; and he should lose no time in doing so.

There are **Three Schemes** connected with our Papers, guaranteed by the Ocean Accident and Guarantee Corporation, Ltd., and all readers who have not yet sent for particulars should do so at once.

There are many readers whose names and addresses we do not know, as they subscribe to the Journal through the bookstalls or newsagents. Every Reader who has not received one of our Insurances should write at once for Particulars.

Scheme No. 1 is a free Accident Insurance of **£500.**
FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages :
Premium, 1/-
£250 for Permanent Total Disablement.
£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages :
Ordinary Risks, Premium, £3/-/-
Hazardous Risks, Premium, £3/10/-
£500 for Permanent Total Disablement.
£6 per week for Temporary Total Disablement.
£1 10s. per week for Temporary Partial Disablement.
£30 Annuity.
£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

THE MANAGER OF THE
BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

COMING EVENTS.

Wednesday, June 5.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Dr. W. de Gray Birch, F.S.A., on "Some Aspects of the Life and Times of Alfred the Great," and Dr. Russell Forbes on "The Tribunal Prætoris at Rome," at 8 p.m.

GEOLOGICAL SOCIETY OF LONDON.—Meeting at 8 p.m.

CARPENTERS' HALL, LONDON WALL, E.C.—Exhibition of Works in Wood opens. Presentation of Prizes to successful exhibitors by Mr. C. Purdon Clarke, C.I.E., F.S.A., director of the Victoria and Albert Museum. 8 to 10.30.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Special Meeting at 8 p.m. Professor Baldwin Brown on "Durham, Hexham and Chesters."

ROYAL ARCHÆOLOGICAL INSTITUTE.—Professor W. Boyd Dawkins, F.R.S., F.S.A., on "The Exploration of a Sepulchral Cave at Gop, near Prestatyn, Flintshire," and Mr. E. W. Brabrook, C.B., F.S.A., on "Mediæval Lavatories," 4 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary Meeting at 8 p.m.

SOCIETY OF BIBLICAL ARCHÆOLOGY.—Professor A. H. Sayce, President, on "Recent Discoveries in the East." and Professor Dr. Wiedemann, on "Bronze Circles, and Purification Vessels in Egyptian Temples," 4.30 p.m.

Thursday, June 6.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m. Ballot for the Election of Fellows.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Second Conversazione at the Galleries of the Royal Institute of Painters in Water Colours, Piccadilly.

CHEMICAL SOCIETY.—Meeting at 8 p.m.

ROYAL INSTITUTION.—Professor Dewar, F.R.S., on "The Chemistry of Carbon," III., 3 p.m.

Saturday, June 8.

NORTHERN ARCHITECTURAL ASSOCIATION.—Outdoor Meeting at Hexham.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Council Meeting at 1.30 p.m. General Meeting at 2 p.m.

BRITISH INSTITUTE OF CERTIFIED CARPENTERS.—Visit to Kew Gardens at 3 p.m.

Monday, June 10.

CLERKS OF WORKS ASSOCIATION.—Meeting at Carpenters' Hall at 7.30 p.m.

Wednesday, June 12.

INSTITUTE OF SANITARY ENGINEERS.—Meeting at New Offices, 19, Bloomsbury Square, W.C., of General Purposes and Finance Committee at 4 p.m., and Half-Yearly General Meeting at 7 p.m.

Thursday, June 13.

SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Dr. Phené, V.P., F.S.A., on "Our Highly Refined Forefathers in Pre-Roman Britain."

Friday, June 14.

INSTITUTION OF ELECTRICAL ENGINEERS.—Conversazione at Natural History Museum, Cornwall Road, S.W., 9 to 12. p.m.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
June 7	Leicester—Stabling, &c.	Midland Railway	Company's Architect, Cavendish House, Derby.
„ 7	Whamtown, near Carlisle—Farmhouse	D. Johnstone	71 Broad Street, Carlisle.
„ 7	Leeds—Excavation	School of Art	Bedford & Kitson, Greek Street Chambers, Leeds.
„ 7	Jagger Green, Stainland—Farmhouse	—	F. F. Beaumont, Southgate Chambers, Halifax.
„ 8	Uxbridge, Middlesex—Electricity Generating Station	Electric Supply Co., Ltd.	W. A. Bird, 1 Vine Street, Uxbridge.
„ 8	Camborne, Cornwall—Reseating, &c.	—	G. Tonkin, Barripper, Camborne.
„ 8	Llandaff—Alterations, &c., to Police Station	Glamorgan County Council	T. M. Franklen, Clerk, County Council Offices, Westgate St., Cardiff.
„ 8	Melksham, Wilts—Stabling, Coach House	Frome United Breweries Co., Ltd.	W. G. Brown, Architect, Park Road, Frome.
„ 8	Henfield—Police Station	West Sussex County Council	W. B. Purser, 4 Worthing Road, Horsham.
„ 9	Tylorstown, Wales—Houses	—	Duke of York Hotel, Tylorstown.
„ 10	Blackburn—Wing	Guardians	F. O. Ruddle, Union Offices, Cardwell Place, Blackburn.
„ 10	Blaenycwm, Wales—School	Ystradyfodwg School Board	J. Rees, Hillside Cottage, Pentre.
„ 10	Resolven, Wales—Alterations, &c.	—	J. Ll. Smith & Davies, Architects, Aberdare.
„ 10	Helmsley, near Alnwick—Alterations, &c.	J. R. Carr-Ellison, J.P.	M. T. Wilson, Architect and Surveyor, Alnwick.
„ 10	Bristol—Shed Superstructure	Docks Committee	W. W. Squire, Engineer, Cumberland Basin, Bristol.
„ 10	Manchester—Blue Bricks	Corporation	Secretary, Rivers Department, Town Hall, Manchester.
„ 11	Barking, Essex—Lodge, &c.	Urban District Council	C. F. Dawson, Public Offices, Barking.
„ 11	Carlisle—Buildings, &c.	Corporation	Gas Offices, Victoria Viaduct, Carlisle.
„ 11	Denbigh—School Buildings	County School for Boys	A. Foulkes-Roberts, Clerk, Local Governing Body, Denbigh.
„ 11	Holyhead—Chapel	Committee of Ebenezer Chapel	Chapel Vestry, Kingsland, Holyhead.
„ 11	Oldham—Wall, &c.	Electricity Committee	A. Andrew, Gas and Water Offices, Greaves Street, Oldham.
„ 11	Stretford, Manchester—Brick Gas Holder Tank	Gas Company	H. Kendrick, Engineer, Stretford, Manchester.
„ 11	Usk, Mon—Cottage	Great Western Railway Company	Engineer, Newport Station.
„ 11	West Ham—Three Transformer Chambers	County Borough	Borough Engineer Office, Town Hall, West Ham, E.
„ 11	Port Glasgow—Slaughterhouse, Offices, Fire Statn., &c.	Town Council	Stewart, Tough & Alexander, 2 Hamilton Street, Greenock.
„ 12	Draycott, near Derby—Isolation Hospital	Shardlow Isolation Hospital Committee	F. S. Antliff, Architect, Draycott.
„ 12	Leeds—Extending Fence	Corporation	City Engineer, Municipal Buildings, Leeds.
„ 12	Gt. Darland, Rochester—Cottage Homes and Schools	Guardians of Medway Union	G. E. Bond, Pier Chambers, Chatham.
„ 12	Bradford—Blocks, &c.	Corporation	J. H. Cox, City Surveyor, Town Hall, Bradford.
„ 12	Chiswick—Double-Fronted House	—	F. & W. Stocker, 90–91 Queen Street, Cheapside, E.C.
„ 12	Greenwich—Urinal	Borough Council	Borough Engineer & Surveyor's Office, Town Hall, Greenwich.
„ 12	Killarney—Additions to Asylum	Committee of Management	J. F. Fuller, Brunswick Chambers, Dublin.
„ 12	Leytonstone, N.E.—Mortuary and Post-Mortem Room	West Ham Union Guardians	F. E. Hilleary, Clerk, Union Workhouse, Leytonstone, N.E.
„ 12	Grimsby—Court House, Police Station, &c.	Lindsey Standing Joint Committee	J. Thorp, 29 Broadgate, Lincoln.
„ 12	Hexworthy, Princetown—Enlarging Inn	Duchy of Cornwall	R. C. Merson, Architect, Hollybank, Yelverton.
„ 12	Beccles—Infants' School	School Board	A. Peels, Architect, London Road, Beccles.
„ 13	Southminster—Police Station	Essex County Council	F. Whitmore, Architect, Duke Street, Chelmsford.
„ 14	Exeter—Buildings	Town Council	D. Cameron, City Engineer and Surveyor, Exeter.
„ 14	Llanfihangel-y-Creuddyn—New Turret	School Board	Rev. J. P. Evans, Vicarage, Llanfihangel-y-Creuddyn.
„ 14	Tisbury—Wesleyan Chapel and Schools	—	E. Deweyn, High Street, Tisbury.
„ 15	Southall, Middlesex—Repairs, &c.	Burial Board	Superintendent's Lodge, Southall Green.
„ 15	Canterbury—Infants' School Buildings	Managers	W. J. Jennings, 4 St. Margaret's Street, Canterbury.
„ 15	Christchurch—Nurses' Home at Workhouse	Union Guardians	A. Druitt, Clerk, Workhouse, Christchurch.
„ 15	Glasgow—New General Hospital	Parish Council	J. Thomson & R. D. Sandilands, 241 West George Street, Glasgow.
17	Wenlock—Reservoirs, Cottages, &c.	Madeley & Broseley Joint Water Committee	Municipal Offices, Ironbridge, Shropshire.
„ 17	Worksop—Infirmary Buildings	Guardians	H. C. Scaping, Court Chambers, Grimsby.
„ 18	Edmonton, N.—Chimney Shaft, &c.	Union Guardians	T. E. Knightley, 106 Cannon Street, E.C.
„ 18	London, E.C.—Alterations to Underground Convenics.	Corporation	Engineer to the Corporation, Guildhall, E.C.
„ 19	London, N.—Renovation of Methodist Chapel	—	W. Knight, 1 Langdon Road, Upper Holloway, N.
„ 19	Marsh Green, Dagenham—Mixed School	Dagenham School Board	Harrington & Ley, 65 Bishopsgate Street Without, E.C.
„ 21	Winchester—Alteratns. & Additns. to Public-houses, &c.	Messrs. Welsh & Co.	T. Stopher, 57 High Street, Winchester.
„ 25	Walthamstow—School Buildings	School Board	G. E. T. Laurence, 22 Buckingham Street, Adelphi, W.C.
	ENGINEERING:		
June 7	Farnworth, Lancs—Tramway Overhead Equipment	Urban District Council	Lacey, Clirehugh & Sillar, 2 Queen Anne's Gate, Westminster, S.W.
„ 7	Rochdale—Tramcars	Corporation	Lacey, Clirehugh & Sillar, 2 Queen Anne's Gate, Westminster, S.W.
„ 8	St. Petersburg—Embankment	—	St. Petersburg Town Council (Stadtamt).
„ 8	Rio de Janeiro—Electrical Machinery	Brazilian Government	Commercial Department, Foreign Office, S.W.
„ 8	Ipswich—Boilers, &c.	Corporation	W. Bantoft, Town Clerk, Town Hall, Ipswich.
„ 8	Batley—Temporary Wooden Bridge	Town Council	O. J. Kirby, Borough Engineer, Batley.
„ 10	Egremont, Cheshire, Widening, &c., Ferry Pier	Wallasey Urban District Council	Ferry Manager, Egremont Ferry, Cheshire.
„ 10	Rochford, Essex—Water Mains, &c.	Rural District Council	J. Mansergh, 5 Victoria Street, Westminster.
„ 10	Burnley—Injectors, &c.	Electricity Committee	R. Birkett, Borough Engineer, Aqueduct Street, Burnley.
„ 10	Leamington—Weir	Corporation	W. de Normanville, Town Hall, Leamington.
„ 10	Preston, Lancs—Fuel Economiser, &c.	Guardians	Whitwell, Engineer, Fulwood Workhouse, Preston.
„ 10	Glasgow—Electricity Meters	Corporation	W. A. Chamen, 75 Waterloo Street, Glasgow.
„ 10	Dartford, Kent—Laundry Machinery, &c.	Metropolitan Asylums Board	T. D. Mann, Clerk, Board's Offices, Embankment, E.C.
„ 10	Darenth, Dartford, Kent—Machinery, &c.	Asylums Board	Office of the Board, Embankment, E.C.
„ 10	Wakefield—Destructor, &c.	Corporation	City Electrical Engineer, Electricity Wks., Calder Vale, Wakefield
„ 10	Prestwich, Lancs—Ejectors	Urban District Council	Council Offices, Chester Bank, Prestwich.

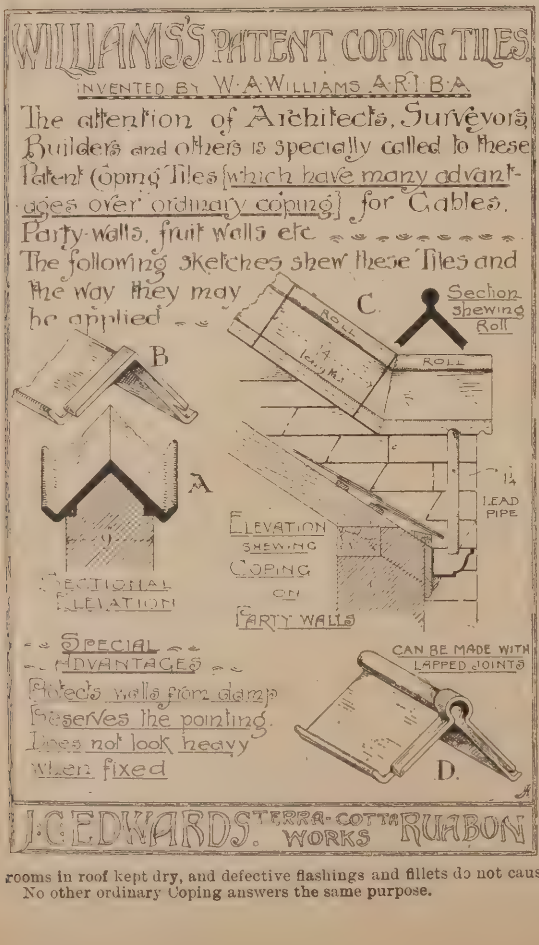
IMPROVED COPING TILE

(PATENTED)

For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES
INVENTED BY W·A·WILLIAMS A·R·I·B·A
The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc
The following sketches shew these Tiles and the way they may be applied
B
C.
Section shewing Roll
ROLL
ROLL
A
1¼ LEAD PIPE
SECTIONAL ELEVATION
ELEVATION SHEWING COPING ON PARTY WALLS
SPECIAL ADVANTAGES
Protects walls from damp
Preserves the pointing.
Does not look heavy when fixed
CAN BE MADE WITH LAPPED JOINTS
D.
J·C·EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

DIENER'S METAL CEMENT.

An excellent material for Embedding Iron Stanchions, Fixing Holding-down Bolts, Luting Pipe Joints, &c., &c.

Far superior to, and, at the same time, showing a saving of 56 per cent. in cost as against Lead.

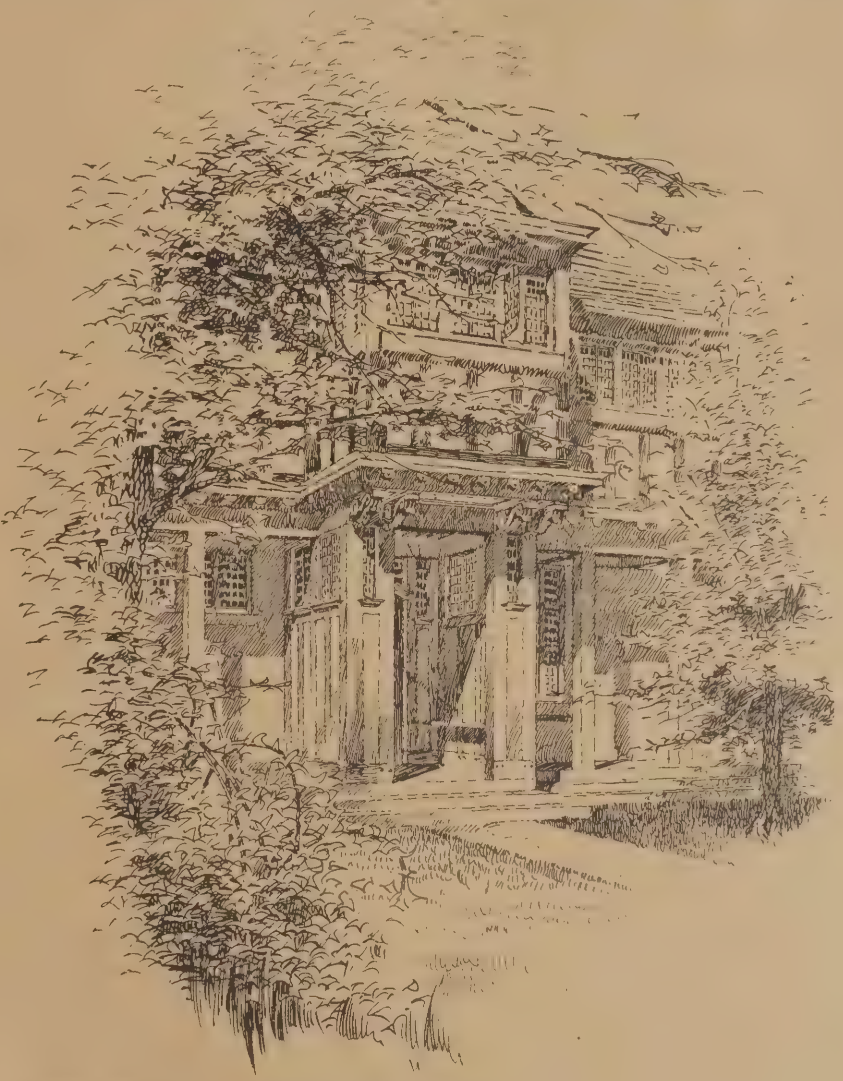
An Architectural Causerie.

The Architectural Money-Market. OWING to the anticipation of a heavy rise in materials, there was little demand for Newton country-houses at £3,000–£5,000, though the action of a certain section of the profession resulted in a momentary hardening in Baillie Scott - beam-and-post - ultra-mediævals, which speedily lapsed to their former position. In the face of cogent arguments to the contrary, Mountford town-halls were firm, several being disposed of at a 10 per cent. advance, but Pite memorial bridges were uninfluenced, though they showed signs of rising soon. Belchers exhibited considerable vitality and strength, and Mawsons rallied. Business in libraries was brisk, Mountfords again holding the market, but tending to become a little weaker with the heavy competition. A little excitement took place in railway stations, where Ricardo no-style-all-styles led the way, but, as was expected, this was only temporary. Bateman & Batemans were down ¼, and Brewill & Bailys looked like taking a similar turn, when Niven & Wigglesworth-plenty-of-bay-windows-and-leaded-lights came rapidly forward, keeping the market from shrinking, though not before Bedford & Kitsons had started on the downward movement. Matcham theatres showed little signs of improvement, being comparatively stagnant. The tendency of the new-all-new school was the reverse of cheerful, owing to the lack of cohesion; Wilsons, however, looked up a little, and there was a fairly brisk demand for Prior colleges. At £2,500, *f.o.b.*, Voyseys were easy, though not quite so easy as generally supposed. A moderate enquiry was experienced for Bodley churches, with or without towers, Oldrid Scotts also commanding a ready sale, especially those fitted with the new buttresses. The tone of the Government market was good. Aston Webb museums rose a little, but there was not much movement in new War Offices: Sir John Taylors were steady—very steady. Emerson commercial buildings remained unchanged, but the finest Macartneys were eagerly sought after. Collegiate-Champneys were quiet. Owing to the disappearance of fears of a corner in L.C.Cs. the demand for Holborn-to-the-Strands was strong, Runtz theatres and restaurants being especially brisk. No Norman Shaws were offered, and no official reports were forthcoming, though much in request. Session houses were settled. Architecture manufacturers reported a good volume of work for early execution, and buyers sent in specifications more freely. Home demands were satisfactory and prices were firmer, with an upward tendency in some branches. A confident tone prevails consequent on enquiries for supplies during the summer. Towards the close the market was glutted with unsuccessful competition works, which were going at low figures, owing to the fall in merit. Quennells were restive, and speculatives gave way fractionally. Notwithstanding American advices, cribbing was constant. Public baths, since the reduction of rates, improved a point: Saxon Snells were steady. Memorials created a great flutter and fell heavy on the profession. Towards the end the market showed signs of flagging, especially among the eschew-all-tradition sections, and it is difficult to foresee what devolopments will take place: it is however fairly certain that jerrys and the surveying-and-designing-done-here combination will retain a firm hold.



DESIGN FOR A HALF-TIMBER PORCH. SIDNEY V. NORTH, A.R.I.B.A., Architect.

Half-Timber Porch. THE porch by Mr. Sidney V. North, A.R.I.B.A., illustrated on this page, is intended to be constructed of half-timber, Stockholm tarred, with rough-cast panels. In order to afford protection from the weather the projection is made deep, the front partly closed, and the opening further protected by a wide projecting top.

Architectural Dinners: A Hint. IF brevity be the soul of wit, long speeches are the soul of ennui. This fact has been strongly impressed on us lately by the annual dinners of two prominent architectural societies. On both occasions too many toasts were chosen, and too many speakers set down to propose and respond to them—a mistake which had the result of boring one to death after six or more of the speakers had stopped their flow of oratory. At the last of the two dinners to which we particularly refer no fewer than ten toasts appeared on the list, necessitating *twenty-two* speeches. It is apparent that such a list must become wearisome, and, as a proof of it, we may mention that at the dinner in question when some of the later speakers rose to their feet three-quarters of the company had left. We would therefore urgently advise those who are responsible for such functions to see that their labours are not spoiled by the exceeding great length of the toast list.

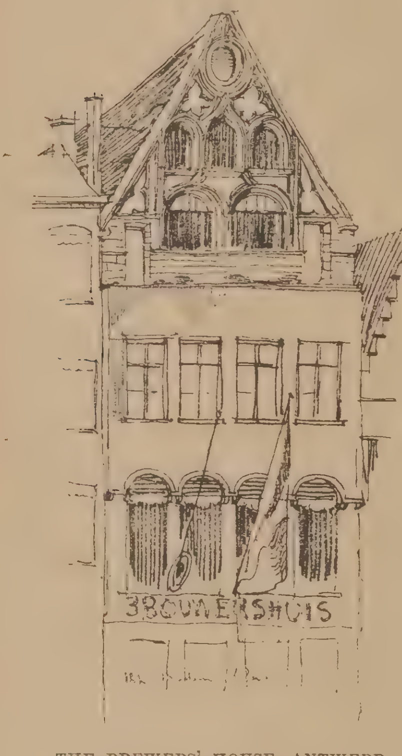
Berlin International Fire Exhibition. THE attention of the British Fire Prevention Committee having been called to the fact that the curious lack of enterprise on the part of the English fireproofing and fire-appliance trade had resulted in this country being scarcely represented at the Berlin International Fire Exhibition, steps have been taken to see that Great Britain is at least represented by some scientific exhibits. A large stand has, in fact, now been retained by the Committee to show photographs, plans, &c., of such materials and systems of construction as have been before the Committee for investigation, and a number of models are also being sent to Berlin. Although the British Fire Prevention Committee has, from patriotic motives, tried to step into the breach at short notice with exhibits arranged from a scientific point of view, the lack of enterprise on the part of the trades concerned is highly regrettable. If individual firms do not see their way to participate in exhibitions, the petty jealousies and rivalries should at least be so far overcome as to allow of an economical "collective" exhibit, so that the credit of our industries is upheld and a loss of trade prestige avoided.

FLANDERS—COMMERCE AND ARCHITECTURE—II.

By JAMES LOCHHEAD, A.R.I.B.A.

(Concluded from p. 332 of No. CCCXXX.)

IN addition to the mere mass of detail in these Flemish buildings, and what might be termed mere prettiness, the *scale* appeals to the careful observer; and if, by virtue of no proper means of comparison, the notion of size of some of the buildings illustrated has not been adequately conveyed, it is impossible in the majority to ignore the fact that *good proportion* is one of their characteristics, the scale being, as a rule, well adjusted to the site, size and object of the buildings. One can learn in a very emphatic way the extent to which sizes of materials assist this element, because of the smallness of the stones and bricks, which increase the apparent size of the building. In some cases the stones do not run thicker than 5in. or 6in. even in many of the great buildings, while 2in. is quite a common thickness in brickwork.



THE BREWERS' HOUSE, ANTWERP.

Especially at Oudenarde Hotel de Ville I consider this element of scale beautifully applied, and from a combination of this with another inherent virtue, that of grouping, this building, in common with others, derives a value which is worth analysing.

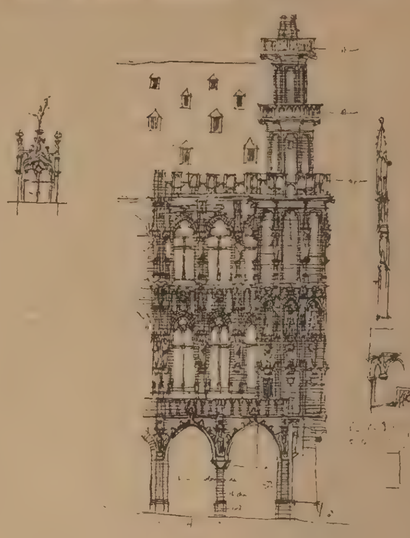
Grouping, either applied to the component parts of or to the building itself in combination with others, is attained by masterly expedients; and although in the later examples much breadth has been sacrificed in too ambitious efforts after picturesque effect, for the most part the mass of these edifices attained by good scale and judicious grouping is admirable. Some time ago an American journal had a series of articles upon the massing of buildings on which effects were sought to be gained by certain arbitrary rules, but it seems to me that no formula other than that of a mind well trained in the art of proportion, grouping and scale, is necessary for this result. The magnificent mass of the Cloth Hall at Ypres is attained, not by an agglomeration of restless features, but by the admirable scale and breadth. This breadth is assisted, too, by the great roof surface, and in these Flemish buildings the treatment and importance given to the roof forms one of the outstanding features of the age. "I view, then," says Sir Gilbert Scott, "the high roof as partly the result of climate, and partly of the æsthetic tendency of the style." Some of the examples have indicated the peculiarity in the direction of dormer windows, which rise tier upon tier from the wallhead to near the ridge, without disturbing the general breadth, and expressing the sense of economy of space to which, in a public building especially, the roof could be put. And not only the roof, welded to the architectural virtue alluded to, but its outward expression in the gable, forms one of the salient features and contributes to the general picturesqueness of the country. In this latter quality the Flemings were masters; and for varied treatment, diversity and elegance of forms, and juxtaposition, forming attractive groups, whether erected in wood, stone or brick, these features of Flemish architecture are probably unique, and in themselves an instructive and pleasant study, their charms heightened by their situation by deserted canals and arising in unexpected and accidental perspective. But the regular disposition of façades and the prominence given to the more important buildings, by their being erected as component parts of a Public Square or Grand Place, a feature of every Flemish city and expressive of its national life, show that mere picturesqueness was not always aimed at when more dignity was desirable. The constant recurrence of the square, with its civic and important buildings grouped together, induces comparison and hopes that some of our own cities, though burdened with the ubiquitous obstacle to architectural grandeur, cost of land, made more of this institution, by the use of which architecture and the sister arts can exist together, nature and art side by side, the whole forming an embodiment of art and civic life.

Decoration in these buildings—I refer to that externally, though perhaps not always refined, sometimes redundant, and often reminiscent of Ruskin's dictum that "ornament cannot be overcharged if it is good, and is always overcharged if it is bad"—has at least a moral good, because at all times it is earnest and spontaneous, an expression of the workman's joy in his work, and a testimony to Matthew Arnold's discernment that—

> "What poets feel not, when they make
> A pleasure in creating,
> The world in its turn will not take
> Pleasure in contemplating."

And on this account we can probably pardon the bad statuary and sometimes meaningless ornament.

One other distinctive feature which impresses one is the open spire, and which, applied to civic as well as ecclesiastic buildings, seems peculiarly appropriate, centralising, dominating and dignifying the structure, its open and diversified character—especially that at Brussels—being in complete harmony with the nature of the facade itself, which would, I think, have resented anything with less sympathy. There are occasions when a tower with unbroken wall-space is wanted to act as a foil to a facade, but in the nature of things in this and other instances, more affinity seems desirable, and anything else with less treatment might have appeared to separate instead of binding the buildings together.



HOTEL DE VILLE, BRUSSELS.

It is perhaps a matter for regret that some of this labour was not extended to the beautifying of the interiors, which for the most part, not even excluding some of the churches, are lamentably barren and quite justify Grant Allen's advice in many cases "not to go inside." In this respect the civic buildings exhibit in too marked a degree the purpose, for no doubt the severity was born of a desire to add no feature which was not compatible with a purely utilitarian object. If the reticence—if we may call it so—had been less thrust on one's notice, it might have been a virtue, but as it exists it is a too emphatic expression of purpose.

On the whole, it will be granted that these buildings do express their *raison d'être*, and that in a style of architecture which is often supposed to be inconsistent with secular use, and more properly applied to ecclesiastical creations.

This raises the question for us of expediency, and one pauses to reflect upon the comparative merits of Gothic and Classic without considering that in the present case there was no choice in the matter. One of the champions of mediæval architecture, Sir Gilbert Scott, expresses himself clearly on this subject in his lectures; and his

OLD HOUSES. ANTWERP.

views, taken and considered in opposition to those of as eminent a Classicist, the late Greek Thomson, provide an instructive and interesting mass of confounding opinion.

In a well-known lecture delivered by the latter to the old Glasgow Architectural Society in 1866, in which he holds forth on the unsuitableness of the style adopted by the former authority for the new University buildings, then in their inception, some of the most able arguments which could only have emanated from such an enthusiast are adduced, which in the present case form very apt reading.

Certain of his theoretical objections apply certainly to the nature of the buildings themselves, as applied to a seat of learning, which in our case do not apply, but his arguments where tenable and applicable to any Gothic building, especially unecclesiastic, while revolving round the archæological and traditional ideas that the style is not national, that the Christianity it represents was not of the purest type, that it is founded on erroneous principles of construction, the product of uneducated men, that it does not teach us the higher ideals of architectural art, and is inconsistent with the best examples of sculpture and painting, are all broadly summed up in the belief that it is not compatible with the expression of the regular and evenly-balanced repose necessary in a public building. To quote his own words in reference to this particular instance, "The general scheme and aspect is Classic, while the minor features are Gothic and somewhat confused."

CHURCH OF ST. PAUL, ANTWERP.

When doctors differ, who can agree; and when Sir Gilbert pleads on behalf of secular buildings that Gothic architecture, which, he says, "produced the stately municipal buildings of the great manufacturing cities of Mediæval Europe," has pre-eminent claims to our most loving and enthusiastic admiration, that it is capable of absolute freedom of planning and absolute subordination of external design to the practical requirements of the interior, that there was no love of irregularity for its own sake among mediæval builders, as shown, he says, by "the great market halls of Bruges and Ypres, the latter of which has a front 450ft. long, without one deviation from uniformity, simply because the practical requirements of each wing were identical"; that its external features, such as windows, for the first time in the history of architecture, could be made of a size which position and utility might dictate, wide or narrow, more or less numerous, arched or square-headed, and strictly according to the demands of the rooms. When pros and cons are expressed, each convincing in its way, one feels that it is imperative to view the question from a higher standpoint. And it seems to me that Sir Gilbert unconsciously solves the problem when he says that "honesty of treatment, that characteristic which all are agreed upon, does not belong exclusively to Gothic but to all true architecture. I feel that it matters not what style is adopted so long as this is kept in view, and that one style is suitable for any building just as the caprice, intelligence and earnestness of the individual dictates, leavened by what Mr. Lethaby calls "the critical use of past tradition."

In Flanders we see the fulfilment of this, in the spectacle of men working under a condition which necessitated application and earnestness—the condition of isolation. Notwithstanding the intercommunication with other nations, it was only to a limited extent that foreign influence was manifested upon its architecture, because there was little or no knowledge of past styles, of Greek or Roman, such as could be disseminated by the means of printing and illustration, consequently they went on working at things in their own groove, having no temptation to do otherwise, but at the same time betraying, if unconsciously, to succeeding generations those hidden symbols of their inspiration, begot of circumstance and desire, which one may discern beneath the outer and tangible remains of their handiwork.

ANTWERP CATHEDRAL.

We see the expression of liberty and freedom in the very nature and extent of their buildings, the spontaneous expression of the delight in life, untrammelled by considerations architectural or for the time politic, working as they thought best themselves.

We see the expression of respect for posterity, "of raising cities for future nations to inhabit," of building for all time, and realising that their edifices were to benefit not only those who were with them, but those who came after them.

We see the expression of historical purpose in their monumental character, for, as Ruskin says, "it is in becoming memorial or monumental that a true perfection is attained," and history is so indelibly written upon the face of these buildings that it gives them a kind of immortality.

We see the expression of contentment, that they built well in the desire to remain in their natural sphere, to invest with the dignity of contented manhood the small habitation as well as the large, and enjoy the contemplation of the work of their own hands.

We see that architecture is, in its higher sense, the outward expression of the condition and character of the nation which produces it; and, to go further, as Walter Crane moralises, the expression of "the language of life, the richer, the fuller, the life, the more harmonious will be the forms of its outcome in art."

We discern these various feelings and more in the contemplation of the works of a nation who built in one style, whose interests were net unduly divided, whose love of country was pure, and whose freedom and honour were valued.

When these ceased to be, the art degenerated, or at least became less national, and the Flemish decline, produced by the cause which gave it birth—commercialism—is governed by the same law; "for when a great state," says Bacon, "grows to an over power, it is like a great flood that will be sure to overflow, for commonly such states are grown rich in the time of their degenerating."

"Commerce is able to work veritable miracles," says another, "bringing into contact the extremes of civilisation, enlarging and disseminating ideas, and helping forward towards that universal brotherhood of man, that universal peace and goodwill which is and must be the highest ideal of humanity."

The commercial maxims of the Hansa towns, however, were always narrow and selfish; monopoly was their watchword, their grand aim; and it was largely in consequence of this narrow policy, hastened by the declining commercial conveniences, that their ruin overtook them. "They perished," Helen Zimmern tells us in her history of the Hansa towns, "of that disease whereof corporations are apt to perish, namely, *egotism*, the centrifugal force which is perpetually tending to rend asunder all human society, and must inevitably do so when not restrained by some powerful antagonistic action."

When this decline set in, a wider art change, as we remarked, had also made its appearance: the Renaissance had come; and between the two causes the architectural monuments of Flanders ceased to be.

Art does not run in nations so much as in individuals, and it expresses itself in direct relation to the communities' desire for it. So that, being a matter of supply and demand, when the desire for art gives place to more sordid interests, the supply ends, and, what is more, under a wider architectural influence the nature of it changes because opportunity for free choice presents itself. "The moment free choice comes in," says Mr. Statham, "among a civilised and educated people who know all the architecture of the world, personal taste comes in, architecture becomes a personal art, and the idea of having a spontaneously practised national style always the same, and recognisable everywhere, is for us a mere chimæra."

That this cause and effect can be applied to Flemish architecture cannot be doubted, and it was the change in the nation's prosperity succeeding its high attainments in this direction which affected the desire for emulation in this personal art, which otherwise, and under favourable conditions, might have still produced good architecture. For a time the aftermath was rich and plentiful, as we have seen from the earlier Renaissance buildings, some of which exhibit that feeling for proportion, dignity and grace which characterises the best period, but at length the decaying influence could no longer be resisted, and the average present day architecture, with happily some exceptions, drags one with it to that depth of monotony from which the student is alone rescued by the elevating and inspiring evidences of what may be produced under a favourable combination of two ofttimes diametrically opposed elements—commerce and architecture.

MAISON DU ROI, BRUSSELS.

THE PLANNING OF HOSPITALS.*

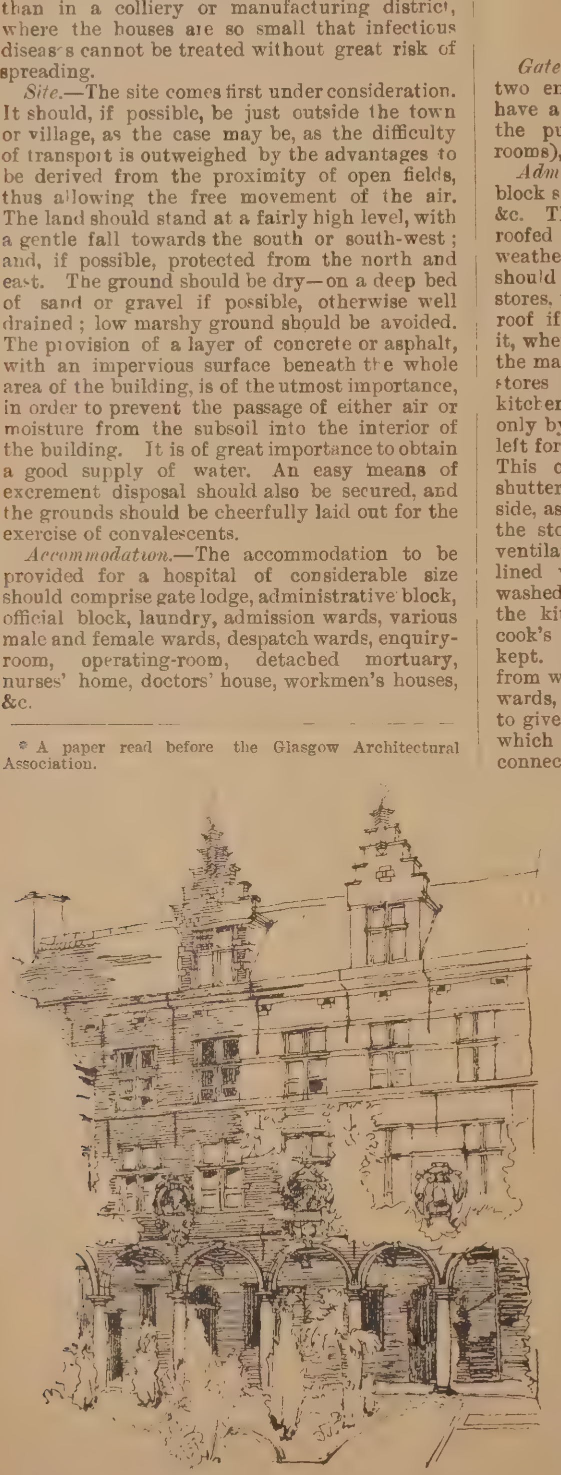
BY R. DOUGLAS SANDILANDS.

ALTHOUGH Acts have long ago been passed empowering local authorities to acquire land, and to provide and maintain hospitals for infectious diseases (the expense to be defrayed by a local rate), it is only of late years that the general public have realised the absolute necessity for such institutions; and owing to this fact little progress was made for a very considerable time after the passing of the Act. Now, however, county councils all over the country are doing their utmost to provide the various districts with buildings for the isolation of infectious diseases.

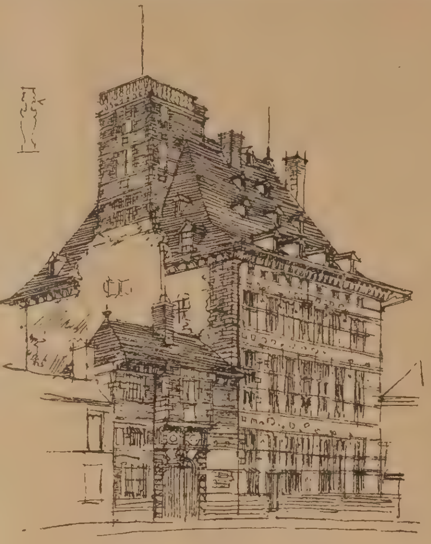
The size of infectious hospitals must be in proportion to the population which they are intended to serve. This, generally speaking, may be put at one bed per 1.000 inhabitants; but the requirements necessarily vary with the character of the population. Thus, in well-to-do localities the accommodation needed will be less than in a colliery or manufacturing district, where the houses are so small that infectious diseases cannot be treated without great risk of spreading.

Site.—The site comes first under consideration. It should, if possible, be just outside the town or village, as the case may be, as the difficulty of transport is outweighed by the advantages to be derived from the proximity of open fields, thus allowing the free movement of the air. The land should stand at a fairly high level, with a gentle fall towards the south or south-west; and, if possible, protected from the north and east. The ground should be dry—on a deep bed of sand or gravel if possible, otherwise well drained; low marshy ground should be avoided. The provision of a layer of concrete or asphalt, with an impervious surface beneath the whole area of the building, is of the utmost importance, in order to prevent the passage of either air or moisture from the subsoil into the interior of the building. It is of great importance to obtain a good supply of water. An easy means of excrement disposal should also be secured, and the grounds should be cheerfully laid out for the exercise of convalescents.

Accommodation.—The accommodation to be provided for a hospital of considerable size should comprise gate lodge, administrative block, official block, laundry, admission wards, various male and female wards, despatch wards, enquiry-room, operating-room, detached mortuary, nurses' home, doctors' house, workmen's houses, &c.



PLANTIN MUSEUM, ANTWERP: THE COURTYARD.



THE MONT PIÈTE, LIÈGE.

Gate Lodge.—The gate lodge should overlook two entrances, infected and non-infected, and have a good-sized office, with waiting-room for the public, also kitchen and scullery (two rooms), pantry, coal-house and w.c.

Administrative Block.—The administrative block should consist of general stores, kitchen, &c. The stores should have a goods entrance, roofed over to protect the goods from the weather while being unloaded. This entrance should open direct into the main hall of the stores, which should be lofty, lighted from the roof if possible, with a gallery running round it, where all light goods can be kept. Round the main hall there should be a number of small stores for oils, bread, beef, milk, &c. The kitchen should be separated from the stores only by a wall, in which an opening should be left for goods to be passed direct to the kitchen. This opening should have a door, or hung shutter, which can be locked from the stores side, as the storeman only should have access to the stores. The kitchen should be lofty, well ventilated, lighted from the roof, and the walls lined with tiles so that they may be easily washed down and kept clean. Entering from the kitchen there should be a scullery, also cook's storerooms, where cold meat, &c., can be kept. There should also be a despatch-room, from which all the food is sent to the various wards, &c. The kitchen should be so placed as to give easy access to the various wards, and to which it may, "if considered advisable," be connected by covered passages.

Official Block.—This block should be convenient to the entrance, and provide the following accommodation: Entrance hall, porter's room, office, waiting-room, matron's parlour and bedroom, doctors' business-room, board room, dispensary, medical laboratory, and the necessary accommodation for the medical staff.

Laundry.—The laundry should be divided into two sections--patients', officers', and foul wash-house, each having receiving-room, wash-house, drying-room, ironing-room, and delivery-room. The drying should be done by means of heated air driven through the drying-room by a fan. There should also be a disinfector and store near the foul wash-house for patients' clothes. Here the clothes of patients who have just arrived may be disinfected and stored until the patient is leaving. The disinfector should be of sufficient size to receive a bed. It is also advantageous to have the steam boilers for heating purposes placed here, as, steam being required to drive the laundry machinery, it will allow all the stoking to be done from one point.

Admission Wards.—The admission wards should be two in number—one for scarlet fever and one for diphtheria and enteric fever. They should be placed convenient to the infected entrance, and as near as possible to --but not adjoining --the wards of their respective diseases. Each ward should contain a good-sized receiving-room and well-lighted examination-room, with a bathroom adjoining. Provision should also be made for the warming of blankets and gowns. The patient, after being bathed and examined, is taken to the ward, and clothes are disinfected, then washed, and placed in patients' clothes-store, which should be near the discharge-rooms.

Main Wards.—The first point to consider in dealing with the main wards is the number of beds which ought to be placed in each. In determining this it would be necessary to ascertain the number of patients a charge-nurse and her assistant are able to attend to efficiently, and to plan the ward for the maximum, as multiplying the wards means increasing the adjuncts and, therefore, the expense. Most authorities on this subject hold that the number of beds in a fever ward should be twenty, and in a diphtheria and enteric fevèr ward twelve, and I think we may accept this as a satisfactory basis to go upon. This being fixed, we will now consider the size of the ward. The cubic space per bed has been fixed for us by the Local Government Board at 2.000 feet, and for diphtheria this might, with advantage be increased. We then have three very important items to consider—the linear wall-space per bed, the floor-space per bed, and the height of ceiling. I would suggest that the minimum for these should be—linear wall-space, 12ft.; height of ceiling, 13 feet. If we take the minimum width of ward at 26ft., this will figure out at 156ft. of floor space and a cube space of 2,028ft. per bed. But for diphtheria and enteric wards the linear wall-space should be increased, although it will be unnecessary to add to the height of ceiling, as for all practical purposes a height of 12ft. would be quite sufficient. I put the height at 13ft. because, the wards usually being large, 13ft. gives a better proportion. It is a very important point that the wards should run north and south, or perhaps incline to north-east and south-west, and, if possible, with the distal end of the ward to the south. It is also very essential to have a window between each bed, and also between the last bed and the wall, so as to allow good cross ventilation; and this can easily be secured with a linear wall-space of 12ft. This segregation by cross-ventilation, with ample floor and cube space, is much better than segregation by walls and partitions. It is almost unnecessary to state that all vertical angles of the walls, the horizontal angles of the junction of floors and walls and of walls and ceilings, should be rounded, as well as all angles of door panels and of the windows; and in the finishing of the doors and windows rounded fillets only should be employed, no recessed mouldings being used anywhere. The ward adjuncts are a nurses' room, scullery, side-room, day-room, linen-room, w.c.'s, bathroom, and, if the ward is two storeys high, fire-escapes should be provided at the distal end of the ward, that is to say, at the opposite end from the staircase.

Nurses' Room.—The nurses' room should be so placed that by means of small windows the ward, the side-room and the day-room can be overlooked. It should also be fitted with a small kitchen range, a dresser and a cupboard.

Scullery.—The scullery should be as convenient as possible to the nurses' room, and should be provided with a hot plate, washing and rinsing sinks, and a plate rack.

Side-room.—There should be a side-room for each ward for special cases which require to be separated from the patients in the main ward. It should adjoin and be overlooked from the nurses' room. It should have cross-ventilation, a separate w.c., slop sink with hot and cold water, and a cross-ventilated passage similar to the large ward.

Day-room.—The day-room will be used by patients who are convalescent as a dining-room and sitting-room, and needs little description except that it must be convenient to the ward, cheerful and well lighted.

Linen-room.—The linen-room should be large or small according to the size of the ward it is intended to serve, and should be fitted with linen presses and shelves.

W.C.'s and Bathroom.--The w.c.'s and bathrooms are usually placed in small turrets at the distal end of the ward; the space between them is generally roofed to serve as a verandah for convalescents. These turrets should be separated from the wards by cross-ventilated passages. It might be convenient to place the w.c.'s and sinks in one turret, and the bath and wash-hand basins in the other. The w.c.'s and sinks might be of the bracket type, standing clear of the floor, while the doors and partitions should be 4in. above the floor. The walls should be lined with tiles to a height of 6ft., and the upper walls should be plastered with Keen's cement. The floors should be of terrazzo. The baths should be glazed fireclay, and standing 4in. clear of the floor on glazed fireclay feet. The wash-hand basins should be of the bracket type, with one or more at a lower level for children. Heated towel-rails should also be used. The walls should be finished as already described for w.c.'s turret. There should be a separate w.c. for the nurse; also a robing-room to enable the nurses to change their home dresses for those used in the ward, and *vice versa*. As to the floors, we are so much accustomed to wood that we have difficulty in getting away from it; but as it is so liable to shrink and leave open joints where dirt will at once accumulate, I have no hesitation in recommending terrazzo for all infectious-diseases hospitals. It is sometimes argued that it is cold, but in practice this is never complained of. Regarding the finishing of the walls, tiles or glazed bricks are recommended by some, but there are so many joints in this method that is does not seem to me to be satisfactory. There are a great many other systems, but, after considering all that have come under my notice, I have adopted Keen's cement. At the same time great care must be taken in laying it, as it is liable to crack in drying, so that it would be advisable to put on the finishing coat only when the ground is thoroughly dry, if time will permit. This I think will best fulfil the requirements of a ward interior, namely, that it should be impervious and easily cleaned.

---

* A paper read before the Glasgow Architectural Association.

THE QUAY AND MONT PIÈTE, LIÈGE.

GUILD HOUSES, GRAND PLACE, BRUSSELS.

Despatch Ward.—This should be near the gate lodge, and should consist of an undressing room (where the patients remove the hospital clothes), from which there should be a door to the bathroom, where the patient will have a bath, and another door leading from the bathroom to the dressing-room. where he will receive his own clothes, which during his illness have been disinfected and kept in the patients' clothes-store.

Enquiry-room.—At Ruchill there is a very well arranged enquiry-room for patients' friends. It is not connected with any infectious buildings. There is a raised platform about 4ft. high round the sides, divided from the remainder of the room by a glazed screen having casement windows with numbers painted on them corresponding to the numbers of the wards in the hospital. The friends come at stated hours, and the nurse is sent for from the ward, and, from the raised platform and at a safe distance from the visitor, answers questions relative to the patient.

Operating-room. — The operating theatre should be placed in a central position, and convenient to all the wards, to which it should, if possible, be connected by a covered way, the patient to be first taken to the anæsthetic room, where chloroform will be administered. This should communicate direct with the operating-room, to which the patient will next be taken. This room should have a good north light, and be fitted with all the modern appliances, including wash-hand basins—the hot, cold and waste being worked by foot levers. There should also be a splint room and sterilising room; also a bedroom adjoining the operating-room, where the patient can be taken if too weak to be removed to the ward, or if likely to succumb after being operated on.

Mortuary.—The mortuary should be so placed that funerals can take place without coming into view of the patients, and should consist of mortuary, post-mortem room, "with north light," laboratory, pathological-research room, photographic room, dark-room and waiting-room for relations, from which, through a window, friends can see the body, which will be placed on a raised slate slab in a small room adjacent to the mortuary.

Nurses' Home.—The nurses' home should be placed in a position convenient to the wards, and facing south. In the home there should be a small kitchen, a dining-room, a recreation-room, sitting- and bedrooms for assistant matron and night superintendent; also a sufficient number of bed-sitting rooms and bedrooms. There should also be a large boxroom either in the basement or attic. The servants (male and female) may be accommodated here or in the administrative block. If at the home, they should be on the top floor with separate entrances (male and female), a staircase being provided at each entrance, and a dividing partition placed between the male and female sides of the building. A few large sick-rooms might also be provided for nurses.

Doctors' House.—The doctors' house should be a better-class villa, and therefore needs no description. It should be near the entrance, and, if possible, so placed that visitors can call without entering the grounds.

Workmen's Houses.—The workmen's houses should be of two kinds—one with two rooms and a kitchen, and the other with three rooms and a kitchen. They should be placed on the boundary of or outside the grounds, so that the children need not come in contact with the nurses or patients. It would be well also to provide stabling and coach-house, where an ambulance van or a brougham can be kept.

Drainage.—Every hospital, and more especially hospitals for infectious diseases, should have a most efficient system of drainage. Therefore, all drains should have the most perfect system of flushing and ventilation; and to prevent infection being communicated from the enteric wards to the others by means of the excreta, a disinfecting apparatus should be provided to separate and disinfect the soil drainage from the enteric fever wards before it connects with the remainder of the system. It is also of importance to separate the drainage of the laundry from the other drains wherever it can be managed, as there is always a large volume of hot water draining from the laundry, which tends to raise the temperature inside the drains. The above refers entirely to the drainage of a large hospital, but architects are often called upon to design small fever hospitals for rural districts where no proper system of drainage exists. In this case I would recommend the use of earth-closets, as they are not liable to get out of order; and although they necessitate some labour, this at the same time prevents any feeling that might arise in the minds of the inhabitants in the vicinity that infection may reach their houses through the sewers. Where earth-closets are used there should also be a cesspool in the grounds, but as far removed from the buildings as possible, to which all slops from the scullery, laundry, &c., will be drained. This should be built in open brickwork, and, if in a sandy soil, the most of the liquid will drain into the sand, necessitating only the removal of solids deposited. I might also mention here that where water has to be paid for by meter it would be an economy to catch the whole of the rain-water from the roofs, where the hospital is a large one, and drain it to a large underground tank, whence it can be pumped to a tank to serve for laundry and other purposes.

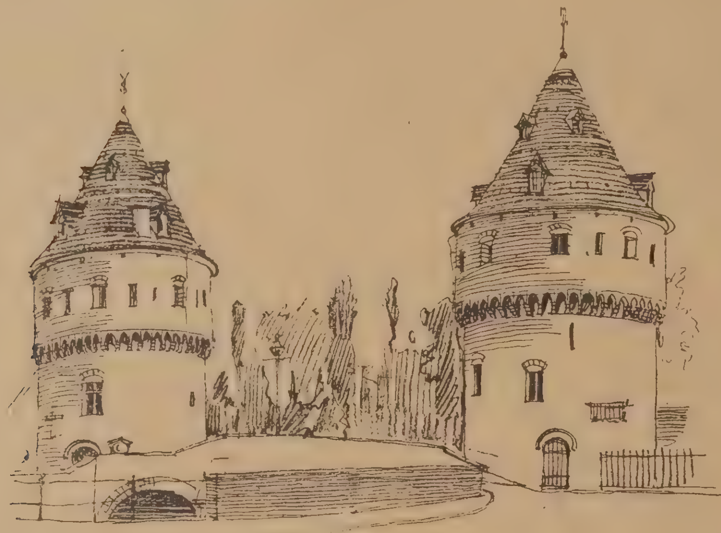
Lighting.—For the artificial lighting of hospitals I would recommend electric light wherever it can be used. as it is much more convenient in every way, and also much healthier for the patients than gas, which consumes the oxygen and gives off poisonous fumes. The lights should be so arranged that one switch would put on the necessary lights for the proper administration of wards by the nurses. Another would serve for movable lights to be placed at the head of every alternate bed for clinical purposes. Another switch would be used for turning on a few lights to allow the nurse to perform her duties during the night.

Heating and Ventilation.—The heating and ventilation of hospitals should be considered together, and the great importance of the free circulation of pure air throughout the wards must be borne in mind. The nurse should, in spite of the remonstrances of her patients, see that the temperature of the ward is kept between 60 degs. and 65 degs., and never allowed to exceed 70 degs., unless so instructed by the doctor. Should the hospital be in a town, I would recommend that the plenum system should be used; but as most hospitals for infectious diseases are built in the country the system most likely to be suitable would be low-pressure hot-water pipes going round the buildings in channels under the floors, which channels should be about 3ft. 6in. by 3ft., so that a man can go in to make repairs without lifting any of the floor. From these pipes, branches should be taken to radiators placed in window bossings, the water being heated by steam taken through pipes in subways from steam boilers at the laundry. The steam boilers should be placed at the lowest level, so that all condensed steam from the calorifiers will run back by gravitation to them, thus economising the whole of the water and a great part of the heat without the necessity of pumping. The whole of the water pipes, telephone wires, &c., should be carried in these subways and channels for convenience of repairs. Fresh air should be admitted through gratings in the walls, and passed through radiators to be partly heated before entering the ward. The foul air should be drawn off at the ceilings, whence it should be carried to the roof and extracted by means of air-pump ventilators. Two double stoves should be placed in a ward of twenty beds. These stoves should be of the Shoreland "Manchester" stove type. They have descending flues, and thus do not obstruct the nurses' view down the

CATHEDRAL. BRUSSELS.

ward. They are also of the ventilating type, fresh air being brought in from the exterior through glazed pipes, and passing behind and around the fire stove, thus being heated before entering the ward.

Consumptive Hospitals.—A special hospital which, in all probability, will demand a great deal of attention in the near future is the hospital for consumptive patients. Medical science of late years has made rapid strides in this direction, and we are much indebted to such men as Pasteur and Koch for the discoveries they have made, discoveries which have quite revolutionised the treatment of this disease. Formerly, consumptive patients were sent for treatment to mild sheltered districts, but now it is considered that only sites standing at a hhig altitude should be considered. After the site has been fixed, abundance of air and sunlight is imperative. The wards should be exceptionally well lighted and ventilated; and in laying out the grounds care should be taken to have plenty of open airing-grounds, where patients can sit out in the open air all day, and it would be well also to provide a number of kiosks with opening sides, of which two sides only can be closed at once. In these the patients can sit out all day, protected from the wind by the two sides which are closed. The floor of these kiosks should be at least 6in. above the ground, with free air-space underneath to prevent the damp rising.



BRIDGE TOWERS, COURTRAI.

I may say that in preparing this paper I have been indebted to a number of authors, and amongst others to an excellent paper read by Mr. T. N. Aldwinckle before the Royal Institute of British Architects on February 25th, 1895.

House at Streatham Park, S.W.—The house illustrated on the opposite page is now in course of erection in Aldrington Road, Streatham Park, S.W., from designs by Mr. William H. Burt, architect, of 10, Bush Lane, E.C. The facings are of red Crowborough bricks, and the roof is covered with Broseley tiles. Messrs. E. P. Bulled & Co., of Croydon, are the contractors.

A School for the Deaf.—The Yorkshire Institution for the Deaf, Doncaster, propose to erect new classrooms from plans prepared by Mr. J. Greenhalgh Walker, architect. Messrs. H. Arnold & Son's tender for £2,875 has been accepted. The building will consist of a central hall 59ft. long by 27ft. wide, with eleven classrooms grouped around and opening out of it. These rooms range in size from about 25ft. by 15ft. to 18ft. by 14ft., one of the larger being specially fitted up and lined with white glazed bricks for teaching cookery. All the rooms will have glazed brick dados, and will be heated by radiators. The front and side elevations will be of red bricks relieved by string courses, coping, &c., in Darley Dale stone. The whole of the floors will be formed with pitch-pine wood-blocks on cement concrete.

THE NATIONAL GALLERY.

AN AMERICAN EXPERT'S REPORT ON THE DANGER OF FIRE.

THE protection of the National Gallery against fire is a subject which is constantly attracting attention, by reason of the fact that its present condition, despite all assurances, is far from satisfactory. Mr. Spielmann, the well-known art critic, is the latest advocate for reform. Writing to the "Times," he says:—

A Bill, which it is hoped will be unopposed, is shortly to be presented to Parliament. But its provision is wholly inadequate, doing little more than to arrange for elbow-room for the firemen when the actual catastrophe occurs. This is something; but as to making the catastrophe impossible, that is altogether beyond the intention of the Government.

A few months ago I received a communication from Mr. Edward Atkinson, president of the Boston Manufacturers Mutual Fire Insurance Co. (U.S.A.), informing me that he had instructed his representative and fire expert, Mr. Sherman, to come to London from Liverpool in order to examine the actual situation and surroundings of the National Gallery, and to report to him. This report discloses very great and entirely remediable dangers. Mr. Atkinson, who holds an authoritative position as a fire expert, says:—

"1. In respect to the building itself. Windows guarded by iron shutters are not considered safe by us. The iron warps and twists at a moderate degree of heat, keeping the firemen out of the building and letting the fire in.

"2. A monitor roof with many windows like that upon the top of the old part of the Gallery is very hazardous, especially when dominated by a dangerous and combustible building higher than the Gallery itself. Shutters would serve but little to protect the windows in this monitor, even if they were of the latest and most improved type, namely, of wood faced on each side with Sackett Wall Board and then enclosed in metal; the Sacket Wall Board being one of the most perfect fire retardents yet invented, composed of alternate thicknesses of felt and magnesia plaster.

"3. The lead roofing of this building would not be tolerated longer than the time necessary to substitute a safe roofing, which on such a building ought to be of copper. In case this building should be dominated by a fire in the next block the lead would melt, endangering the roof beneath and preventing effective service of the firemen in their effort to get to the roof.

"But these dangers are aggravated by the bad neighbourhood. It may be assumed that the old infantry barracks will be removed. But the large building (Hampton's, &c.), occupied for various purposes in the distribution of very combustible goods, will be a menace to the National Gallery. Even if a passage way 40ft. wide should be cut through, that block will dominate the building, and in case of its being on fire the damage inside the Gallery may be very great. In a recent instance in the city of New York the burning of a building occupied in a similar way next to a high and so-called fireproof building greatly injured the walls, and, passing by unguarded windows, destroyed the contents of the upper storeys. There can be no permanent safety to the National Gallery unless that dangerous building is removed and the whole square (*i.e.*, plot of ground) devoted to the purpose of the Gallery, which it now so largely occupies."

ANNUAL MEETING OF THE SURVEYORS' INSTITUTION

THE annual general meeting of this institution was held on June 3rd at the premises in Great George Street, Westminster. Sir John F. Rolleston, M.P., the president-elect, occupied the chair in the absence, through illness, of Mr. John Shaw, the retiring president. The annual report, read by Mr. Rogers, the secretary, stated that the Institution now, probably, included in its list of members most of the surveyors of standing in the United Kingdom, and it had a total in the various classes of 3,200 compared with 3,096 a year ago. The total investments, calculated at current prices, represented a sum of £13,724 19s. Of 142 candidates who sat for the last preliminary examinations 111 passed, and of 362 who went up for the different professional examinations 246 passed. As was the case last year, professional examinations were held contemporaneously with the English examinations both in Scotland and in Dublin. The cost of the construction of the new premises was £30,337, to which had to be added architects' commission, law charges, &c., making a total of £34,198; while the outlay on new furniture and fittings amounted approximately to a sum of £1,000. The whole outlay had been met out of the accumulated funds. and no debt whatever remained upon the building. There had been large additions to the library during the year, and a further outlay would shortly be made on the purchase of books. The present number of volumes was approximately 8,000. During the session the council had promised financial support to, and had nominated two of their members to act on, a joint committee of the Surveyors' Institution and the Royal Institute of British Architects, appointed for the purpose of collecting and tabulating information from all parts of the country as to damage to buildings resulting from lightning; to discover, if possible, how far buildings were rendered lightning-proof by modern systems of protection; and to ascertain what improved methods might be adopted. The council also decided during the session to co-operate with the Royal Institute of British Architects on a joint committee with reference to the amendment of the law and practice as to ancient lights. The committee had since decided to draft a Bill for introduction into Parliament. Mr. E. H. Blake formally moved, and Mr. M. P. Holmes seconded, the adoption of the report, which was agreed to. The chairman, replying to a vote of thanks passed to the late president and members of the council, said the council was representative of the various branches of the profession. While regretting the retiring president's absence and its cause, he thanked them for the honour they had conferred upon him in electing him as his successor. He felt that to preside over an institution which was so important, popular and widely distributed as that, was an honour of which anyone might be proud. The chairman was then invested with the president's chain of office, and he afterwards presented the prizes gained during the past session In 1881 the candidates numbered two; now they totalled 362, the total number who have entered for the professional examinations since 1881 being 2,894. The principal award this year—the "Penfold" gold medal—went to William Edward Trent, who, in the building sub-division of Division IV., headed the list of Fellowship candidates with a total of 802 out of a possible 1,000 marks.

The "Institution" prize, worth fifteen guineas, went to M. P. Holmes, the "Special" prize to F. S. Daniell, the "Penfold" silver medal and "Driver" prize to D. L. Paton, the "Crawter" prize to H. A. C. Warmington, and the "Preliminary" prize to W. C. Clemens and A. Salwey bracketed equal.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

PRESIDENT'S VALEDICTORY ADDRESS.

THE annual meeting of this society was held at Plymouth on June 1st, the president, Mr. C. J. Tait, occupying the chair. It was resolved that a subscription of three guineas and a donation of two guineas be made in response to the special appeal for the Architects' Benevolent Fund. In the course of his address as retiring president, Mr. Tait said that upon anything that occupied a position so near to us as the Victorian era it was impossible to utter the final note of criticism. This could only be accomplished when a sufficient period had elapsed. Four centuries ago saw a classic renaissance in art and letters, and we could to-day judge of its character and achievements. When we were enabled to view the Victorian age from a perspective point—its hopes and aims for art —we should agree that these also found expression in a re-birth,

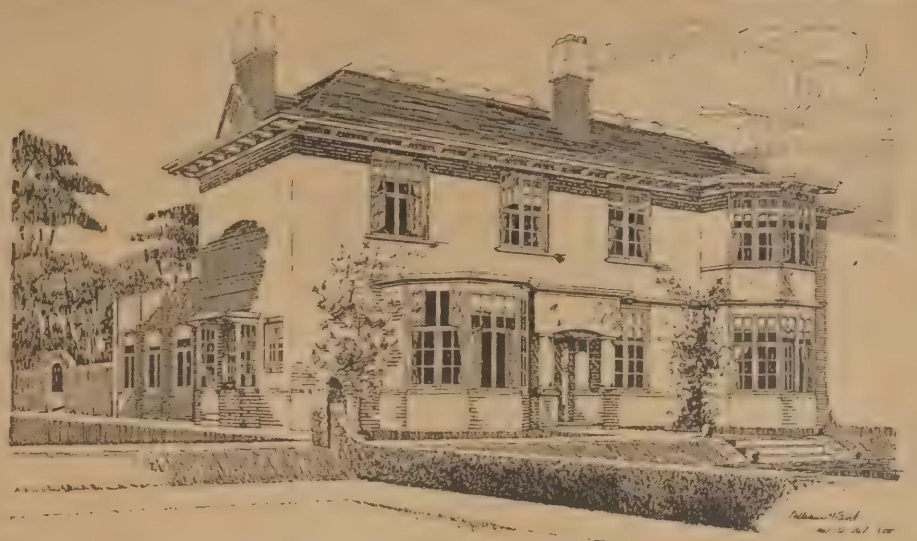
The Re-birth of Romanticism.

This romantic note was heard in its deepest tones, perhaps, at Oxford, and occasioned that upheaval of feeling that is spoken of as the Oxford movement. In so far as this was a church movement—and indirectly affected church architecture—it assisted to bring to the front such men as Augustus Welby Pugin, George Gilbert Scott and Edmund Street. But the springs of this movement lay deeper in art than perhaps in anything else, and found therein a more complete expression. Edward Burne-Jones and William Morris, both young Oxford undergraduates and destined for the Church, left the University without their degrees and devoted themselves—the one to painting and the other to architecture. And outside the walls of the University they met with a more paramount influence still—that of Dante Gabriel Rossetti—and the enthusiasms of young men like themselves. such as Madox Brown and Millais.

Through the painters, with places for exhibition at their disposal, the new movement gradually reached the public, which was finally convinced, much against its will, and not without a hard struggle. To William Morris, in particular, architects owed more than he could say. He (Morris) insisted on the importance of colour in architectural accessories; and his commercial undertakings slowly enabled him to force the fashion, that doorway by which alone society was accessible to new ideas.

Meanwhile Burges, Norman Shaw and E. W. Godwin were grafting a fresher growth on to architecture. But architecture transformed itself with difficulty. Styles had resistant materials to deal with. They were long growing, and they were "an unconscionable while a-dying." They further demanded specific needs for their true development; and these needs, while our social conditions were in that rapid fluctuation in which we find them to-day, were superseded before they had time to arrange themselves in definite form.

Further, this renaissance of the mediæval, of the romantic sentiment, revealed to us our true position—the position we held as inheritors of both classic and mediæval tradition. The claims of Gothic architecture were strong. Nothing could, however, be representative, nothing could be lasting, that did not give expression to all preceding influences—a something which combined the refinement of the classic with the freedom of the Gothic. Such a union was no fancy. Something of the kind was achieved by Tudor architecture; and he ventured to think that it was also by the combination of these qualities that the most striking successes in modern design had been realised. If this was a principle, as he held it was, then it behoved every architect to cultivate a catholicity of taste. His appreciative powers would be quickened, and he would find his life in all respects both fuller and broader. He might be told that specialism was more remunerative. To have your name intimately connected with some particular and limited want or department was the surest way to be recognised by a public who thought little, and whose memory was bad. But the age was not without signs that specialism and cranks in general had enjoyed their most profitable period, and that it was not so patient of the formalist and the pedant as it used to be.



HOUSE AT STREATHAM PARK, S.W. WILLIAM H. BURT, Architect.

Strand Improvement Competition.

Quitting the events of a century for those of a year, Mr. Tait spoke of the Strand improvement scheme, which resulted in a competition that called forth about half a dozen very interesting designs. It was to be noticed with regret that the London County Council sought to engage the services of the competitors upon most unreasonable terms, inasmuch as it would give no guarantee that the successful architect should execute his own design; and it was in every way so cavalier in its dealings with the Royal Institute, whom the Council had itself approached, that the Institute was obliged to decline further co-operation. Another fact to be noted was that the County Council had no clear intention as to what it actually required; and hoped, with Mr. Micawber, that amid the surprises of competition "something might turn up." To think that you needed to include a municipal building among shops and offices, but were not sure, could lead to no very definite competitive result.

The Queen Victoria Memorial.

Another competition, and one of national importance, had occupied the public interest — the proposed memorial to the late Queen. It appeared to be generally regretted that this endeavour was not put upon broader lines. The least defensible part of it was undoubtedly the placing whatever sculpture should be employed in the hands of a single sculptor. The only apology that might be made by the initiators of the scheme was that they considered sculpture of such minor importance as to render any multiplication of ideas unnecessary. This, he thought, would hardly recommend itself to those who realised the part played by sculpture during the best periods of monumental art.

Negotiations had for long been carried on between the Royal Institute and the Builders' Association with a view to a common understanding upon a form of contract acceptable to both architect and builder. His hearers were doubtless aware that these negotiations had been broken off with their object still unfulfilled. The cause of the failure was apparent. Unless the Builders' Association could obtain a form of contract that was distinctly favourable to it, its members knew that they were more safely situated in the hands of the architect directing the work, and preferred to leave matters as they were. The negotiations had, however, been successful in producing an exceedingly fair and thorough arbitration clause directing that the architect should be sole arbitrator, and one between which there was no half-way house.

After the president had concluded his address, the following elections were made for the ensuing year: President, Mr. H. G. Luff; vice-president, Mr. John M. Pinn; honorary secretary, Mr. Harbottle Reed; honorary treasurer, Mr. Octavius Ralling; members of the Council, Mr. Alton Bazeley, Mr. Charles Cole and Mr. C. E. Ware.

ROUND TOWER, ABERNETHY.

THE Edinburgh Architectural Association recently visited Balmanno Castle and the Round Tower, Abernethy. At the castle, built between 1577 and 1581 by George Auchinleck, of Balmanno, Mr. William M. Page acted as leader, and he read a paper comparing the plan to that of Balvaird, an adjoining castle. Balmanno is surrounded by a remarkable moat, and has a vaulted ground floor, large rooms on the first floor, and a private stair in the thickness of the wall. The Round Tower, Abernethy, was visited under the leadership of the Rev. Dugald Butler, M.A., minister of Abernethy. The tower is a memorial of the antiquity and early ecclesiastical importance of the place. The first church of Abernethy was probably the result of St. Ninian's preaching among the Southern Picts. Abernethy was at one time the capital of the southern Pictish kingdom, and is also described in the Scotichronium as the "capital of the whole kingdom of the Picts." The church was dedicated (according to the Pictish chronicle) in 460 A.D. to St. Bride of Kildare, and endowed with large territories by Nectard, King of the Picts. The church was restored by St. Columba in 590 A.D. For two centuries at least it was a Columban monastery, closely connected with Iona, and was a missionary centre of religious life to the country round. About 716 the king of the period conformed to Rome, and the Columban clergy were expelled, and conformists to Rome took their place. About 844 another revolution happened and the Columban clergy were restored. Abernethy once more assumed its ancient importance, and from about 850 to 908 A.D. became the metropolitan church of the whole kingdom of the Picts. Dr. Skine avers that the Round Tower, which could only have been the work of the Irish clergy restored by Kenneth MacAlpine, was erected at this time (between 865 and 908 A.D.), and this is all the more probable as it is undoubtedly of an older type than the Round Tower at Brechin, the date of the building of which can be placed with certainty late in the succeeding century. Its main work is Celtic, although the upper windows are additions, propably of the eleventh or twelfth century. The doorway contains no symbolism as at Brechin, and the door faces the north. The present wooden stair is a recent addition, and originally there were internal platforms. Like the other round towers, it served the purposes of (1) a bell-keep, (2) a signal tower or beacon, (3) a place of defence and preservation in time of attack by the pillaging Danes. For about twelve courses from the ground the stone is a hard grey sandstone; the rest of the structure is of a bright buff-coloured freestone, much weather-worn at the joints. The period of the Round Towers generally dates from the ninth to the eleventh century.

A New Infectious Diseases Hospital at Berwick is to be erected of stone, to contain sixteen beds, at an estimated cost of £5,500, exclusive of furnishing and site.

THE LATE MR. BRYDON'S WORK AT BATH.

AN APPRECIATION BY W. J. LOFTIE.

IN an article in the "Bath Chronicle," speaking of the late Mr. J. M. Brydon's work in Bath, Mr. W. J. Loftie says:—

It was not easy, as many had found to their cost, to take up the art of building where the Woods and Baldwin had laid it down. For some reason, with which I am not acquainted, the revived Gothic of Pugin and Scott never took root in Bath. The two principal buildings in that style, St. Michael's Church in Broad Street and the Roman Catholic Chapel in South Parade, are in very conspicuous situations and act satisfactorily as foils to the fine old tower of the Abbey in its well-proportioned dignity. But when Brydon went to the rescue, Bath was in danger of becoming a prey to what we in London know as the South Kensington style. In the Colonies they call it "the Exhibition Building" style; at Manchester it does duty as "Gothic" because there they point the arch. In Bath I think it was known as "Romanesque," and they did not point the arch. But it was everywhere the same, anomalous; and it would have been nothing less than a public misfortune—a misfortune that is not confined to Bath, but to be regretted by all England—if it had succeeded to any great extent in affecting the general view of your most beautiful city. From this danger Brydon saved Bath. We are all liable to what our religious teachers call "declension." The learned style implied both incessant care and incessant improvement. No other art can be overlooked or neglected by the architect; and if to his knowledge he can add a little classical learning so much the better for his designs. This implies taking pains, and no "declension" can be allowed. It is all, to use another comparison, "collar work." As distinguished from anomalous building or even the Gothic of Street and Burges, the Palladian architecture of Inigo and Wren, of Wood and Chambers, can never become common. Mr. Norman Shaw first expounded it to the architects of the nineteenth century, and of all those who have followed him John Brydon will always be reckoned the foremost.

It is sad to think how long he worked without recognition. He had attained a success in the estimation of many who were practical workers in the same field as far back as 1870. But there he remained. Younger men came to him for counsel and passed him in the race, and at forty-five the general public had heard little or nothing of him. An opportunity came when he made his exquisite designs for Whitefield's Chapel in Tottenham Court Road. Other counsels prevailed. After unaccountable delays, most wearing to a sensitive mind, the present pagoda was preferred and erected, and London lost the offer of a beautiful building. But his designs had been published, and all the more learned of the art critics knew that when a better opportunity arose the man to answer to it would not be wanting.

That chance came when you in Bath determined to improve your municipal buildings, by which I mean not your Guildhall alone, but the rooms adjoining your warm springs and the old Roman bath—the great glory of your ancient city. A similar chance occurred some time before to the people of another old Roman town, remarkably like Bath for beautiful architecture. If any of your citizens would see and judge for himself how well Bath fared in this respect at the hands of John Brydon, let him in his next Continental tour visit Nimes and see how the French architects have treated the ancient remains at La Fontaine. The problem was a difficult one. "Restoration," to use in its modern sense a word which has become odious, was not only impossible—that would have been a small matter with Sir Gilbert or Mr. Pearson—but unpopular. As solved by Mr. Brydon the difficulty has but increased the success. Nothing has been falsified. The learned visitor has before him suggestions and reminiscences of the usages described by the classical historians and at the same time can see how far they were carried out at Aquæ Solis. The unlearned visitor also finds himself interested and unexpectedly informed without too great a mental effort as to what is ancient and what has been added to set it off and preserve it.

Of the new concert-room it is difficult not to exaggerate my feelings of admiration and wonder. I do not think it over stating the case to say that since Sir Christopher Wren built St. Stephen's, Walbrook, no other interior worthy of comparison with it has been erected. Since I saw the concert-room last January I have urged many of my architectural friends to go to Bath. One and all have returned saying what I have just said, and generally adding, "Without an inch of ornament for its own sake."

The additions to the Guildhall are equally good. Fully to understand and sufficiently to appreciate them it is well to place before our eyes the photographs of what High Street was like before Mr. Brydon came and since. The gallery and library in Bridge Street depends solely, but certainly not in vain, on the delicate proportions; but it would be impossible in a short notice to point out that to Brydon a space of blank wall, carefully and laboriously calculated to a square inch of stone surface, was in itself more ornamental than all the panelling and lattice work on the river front of the Palace of Westminster. Westminster brings me to the last words I venture to offer you now. It should—and will, no doubt—always hereafter be a credit to the people of Bath that Brydon's work here obtained for him the great triumph of his life—the appointment to design the new Government offices. It is no secret that when his name was mentioned the powers that be took the sensible course of sending to see what he had done at Bath, and that it was in consequence of the report returned that he was appointed.

ARCHITECTURAL ASSOCIATION OF IRELAND.

A GENERAL MEETING of this Association was held at Dublin on May 30th, the president (Mr. Frederick Batchelor) occupying the chair. This meeting was the concluding one for the session 1900-1, and the reports of the various classes were read and the results of the several competitions announced.

The class of design was very satisfactorily attended during the session, and good work is recorded. The prizes in connection with this class were gained by Mr. W. Connolly (first prize) and Messrs. J. K. Vinycombe and H. J. Leask (tie for second prize). The hon. secretary of this class was Mr. G. G. Lynes. The architectural history class (Mr. R. M. Butler, hon. secretary) was also well attended, and proved a most useful innovation. In this class the progress and changes in architecture were traced by the lecturers and illustrated by lantern views of typical examples. In the building construction class the first prize was won by Mr. H. J. Lundy and the second by Mr. W. Connolly. Mr. W. H. Ward was secretary to this class. The report of the design club is not so encouraging, and it is hoped that in future better attendances will be maintained.

Probably the most satisfactory of all reports was that of the technical demonstrations subcommittee. The necessity for giving architectural students an opportunity of studying practical details and of discerning between good and bad materials and workmanship is one which had not been met hitherto, and early in the session steps were taken to inaugurate what proved to be a most successful series of practical demonstrations, for the arrangement of which the president and the hon. secretary of the sub-committee, Mr. H. Allberry, are largely responsible. The master-craftsmen of Dublin most readily and generously co-operated in the work, personally conducting the members of the Association over their yards and workshops, and explaining, lecturing and demonstrating upon the different materials and manners and methods of work. The value of these demonstrations was so very evident that many gentlemen became members of the Association in order to avail themselves of them. Prizes were offered for the best series of notes taken, and were awarded in order of merit to Messrs. L. O'Callaghan, H. T. O'Rorke and F. Morley. The members of the Association have reason to be particularly grateful to those contractors and master-craftsmen who so generously assisted in the work.

The librarian, Mr. J. Geoghegan, submitted a very satisfactory report. In addition to the very valuable library which Sir Thomas Drew has so kindly placed at the disposal of the members of the Association, a lending library has lately been started, the volumes in which have been presented by several gentlemen or purchased from a fund which has been opened for the purpose.

The A.A. Travelling Studentship of ten guineas was won by Mr. J. A. Rockett, whose measured drawings of St. Patrick's Cathedral were adjudged by Mr. A. E. Murray, A.R.H.A., as the best of those submitted in competition.

The Royal Institute of the Architects of Ireland offered a prize of £10 10s. for a design to be competed for by members of the Association. The subject set for design was "A Technical School," and seven members submitted drawings, under motto, which were kindly assessed by Mr. W. H. Lynn, R.H.A. (Belfast). Mr. W. Kaye Parry read the assessor's award, which placed first the design submitted under motto "Cui Bono," and upon the president openingthe envelope bearing that motto it was announced that the successful competitor was Mr. C. P. Powell.

Mr. W. F. Beckett's prize of £2 2s. for the best sketch of the campanile in Trinity College was won by Mr. L. O'Callaghan.

The result of the ballot for the officers for the ensuing session (1901-2) was announced as follows: President, Mr. C. J. McCarthy; vice-presidents, Messrs. T. E. Hudman and E. P. Sheridan; committee, Messrs. H. Allberry, F. Batchelor, R. M. Butler, T. Coleman, F. G. Hicks, J. Holloway, C. H. Mitchell, L. O'Callaghan and R. C. Orpen; hon. treasurer, Mr. J. H. Webb; hon. librarian, Mr. J. Geoghegan; hon. secretaries, Messrs. E. Bradbury and G. F. Beckett; hon. auditors, Messrs. M. J. Buckley & J. P. McGrath.

The retiring president (Mr. Frederick Batchelor) delivered a short valedictory address in which he reviewed the work of the Association during the past session and expressed hopes for the future. He referred to the series of day classes recently inaugurated by the London Architectural Association, and trusted that something of a similar nature, though on different lines, might be started in connection with their Association. Mr. Kaye Parry, in an able speech, proposed a hearty vote of thanks to the retiring president for his valuable services during his term of office, which was seconded by Mr. C. J. McCarthy and carried with applause. A vote of thanks to the retiring hon. secretary, Mr. F. G. Hicks, was proposed and seconded by Mr. H. Allberry and Mr. R. M. Butler respectively, who, as past secretaries, were able to appreciate the arduous nature of his duties. The vote was carried with acclamation, as was also one to Mr. J. H. Webb, hon. treasurer, proposed by Mr. T. E. Hudman and seconded by Mr. E. Bradbury. Mr. J. Rawson Carroll having congratulated the Association upon the work done during the past sessions, the meeting terminated.

Masters and Men.

A Strike of Crieff Masons has occurred because the masters proposed to reduce their wages from 8d. per hour to 7½d. with no change on country allowances.

Edinburgh Joiners' Dispute.—Mr. Charles Scott Dickson, K.C., M.P. (the Solicitor-General for Scotland), the arbitrator appointed under the reference between the Edinburgh and Leith Masters Builders' Association and the Edinburgh and Leith District Joiners' United Trades Committee. Upon the proposed reduction of the wages from 9d. to 8d. per hour; the words "Portobello excluded" to be deleted from the working rules; under rule 4 one hour's grinding time to be allowed to workmen for putting their tools in order instead of, as at present, two hours to workmen who had worked fifty-one hours; rule 6, which prohibited piece and task work, to be deleted; and the date of expiry of notice changed from the 15th April to the 6th June. Mr. Dickson found that the rules should stand as at present without change.

Tilbury Cottage Hospital has been enlarged by the addition of a new ward for eight additional beds, making sixteen altogether, at a cost of £2,000.

ːHORISM FOR THE WEEK.

Art is man's refuge from adversity.

MENANDER.

Our Plates. THE residence for Mr. J. H. Turner is now being erected at arborough from the designs of Messrs. Penty Penty, architects, of York. The materials iefly used are sandstock facing bricks (2½in. ick) with rubber arches and quoins, and finely oled Gazeby stone for dressings. It is intended cover the roofs with sea-green Westmorland ,tes, laid in courses which diminish in size om the eaves to ridge, the coverings to ridge d hips being of lead. The internal finishings d decorations will be designed by the archi- ;ts.—The block of three cottages at Crescent rm, Sidcup, by Mr. E. Harding Payne, R.I.B.A., was erected last year for the Hon. ırsham Townshend at a total cost of £885, :luding drainage and fencing, by Messrs. ebbings & Pannett, Shirley Works, Sidcup. ound floor and bedrooms plans of the cottages ll be found on page 361 of this issue.—As ;ards the design for a garrison church by r. H. Fuller Clark, of John Street, Bedford ›w, W.C., owing to the steepness of the site, e nave would be approached at the western trance by two stone staircases each 5ft. wide. e tower would be 116ft. high from the ground that point to the cornice, and similarly the :stern facade would be 105ft. high. The ıole would be constructed of Chilmark stone th Broseley tile roofs, the crucifix and kneeling ures at tower and the bands at western trance being of bronze.

Church Spires. MR. WILLIAM ANDREWS, writing in the "Church Bells," rs : "The exact time when the spire was introced into church architecture is not known. In e fourteenth century church-building reached highest state of perfection, and to this century long our most famous spires. Some districts e noted for their spires : Northampton is led 'the county of squires and spires.' The ne valley from Northampton to Peterborough known as the 'Valley of Spires,' and has thin its borders some really fine examples. nnyson has given a world-wide fame to the l spires of Coventry. The spires of Lichfield, own as 'the Ladies of the Vale,' are much nired. The Salisbury and Norwich spires are ted for height, Louth for beauty of outline, l Grantham for elaborate details. The tallest re in this country at the present time is isbury. It runs from the centre of the main nsept to the height of 410ft. Old St. Paul's s 520ft., and the one at Lincoln, destroyed 1548, reached 524ft. After the storm of)3, Salisbury spire was, under the direction Wren, braced with iron to repair some damage tained. On June 21st, 1741, it was struck by ɿtning, and set on fire, but did not suffer any ious damage. It underwent expensive repairs 1827. The name of the architect is not own, nor the date of its erection, but it most ›bably belongs to the earlier years of the rteenth century. In the latter half of the rteenth century Bishop Percy raised the noble re of Norwich. It is a notable feature in the stern Counties, and may be seen at a distance twenty miles. It has also suffered from ıtning, being struck about a century after erection. In 1629 the upper part of it s blown down, and rebuilt four years later. e spire of Chichester Cathedral was 271ft. height, and was erected in the fourteenth tury over a rotten substructure. On the ht of Wednesday, the 20th of February, ;5, a heavy gale occurred. The next day, ›ut twenty minutes past one o'clock, the re was observed to suddenly lean towards south-west, and then to right itself again. n after it disappeared into the body of the hedral, sliding down like the folding of a ·scope. Only the coping-stone and the weather ıe fell outside ; the rest of the masonry formed uge cairn in the centre of the edifice, which s practically cut into four portions by the :ck. The present spire was completed in 7. The spire of St. Mary Redcliffe, Bristol, e pride of Bristowe and the Westernland,' 300ft. in height. This church has some ıous literary associations, the chief being those gathered round the name of the poet Chatterton. Louth spire in Lincolnshire rises to 294ft. in height. In 1843 it was struck by lightning, but steps were at once taken for its restoration, and it was completed three years later. Grantham, also in Lincolnshire, is 295ft. in height. It has a light and graceful appearance, and is richly ornamented with sculpture. It has twice suffered from lightning, namely, in 1797 and again in 1882. After the latter year sixteen feet of masonry had to be taken from the summit and rebuilt."

Old Houses in Cripplegate. DEMOLITION of the Quest House and the four shops belonging to the parish of St. Giles', Cripplegate, for the improvement of that particular part of Fore Street, is pending. When eventually the buildings are removed, they will throw open to the public view the church of St. Giles', which now is entirely hidden ; indeed, at the time of their construction two of the windows of the church were completely blocked. These windows, it may be observed, will when reopened bear memorials of the escape of the church from the Great Fire of 1666, and from that of three years since. Without doubt the Quest House was built before 1564, as in that year mention is made in the hustings deed of the Corporation record of the "Common Hall" of the parish, whilst eighteen years later it is distinctly alluded to by name. As no reference is made in the parish records to the rebuilding of the Quest House, it may be taken for granted that the original building is the one still to be seen, though it has from time to time been repaired. With regard to the shops the origin of their existence is peculiar. In 1654 the parish seems to have had an adequate amount of money for benefactions to the aged poor, but no provision for the clothing of poor children. Having in some way realised £260, the vestry determined to supply the want. Part of the churchyard was eligible as a building site, and four shops were erected on it and let at a rental of £6 apiece, with a fine of £10 for three and of £14 for the fourth, the income derived from this source constituting the children's charity. The gateway, on which may be seen hour-glasses and skulls and bones, is to be preserved, though it will have to be removed for that purpose. There were many oil paintings of various parochial celebrities in the Quest House, but these, together with various prints and views, have been removed to the vestry-room at the Cripplegate Institute, which is now the parochial centre of business.

The Housing Problem. THE Workmen's Housing Council arranged a delegates' meeting of their various affiliated societies last week to hear an address from Mr. Raymond Unwin, architect, of Buxton, on the housing question, with special reference to the planning of houses for artisans. Mr. Unwin opened by a reference to the influence of ground values upon the problem, and recommended that as a general policy artisans' houses should be built in the suburbs. Fresh air for all the rooms was essential. No house should have the living rooms facing north, and this would necessitate the making of streets running east and west. Quadrangles were preferable to streets, so that everybody would benefit by the space usually wasted in back courts. To make a woman spend her life gazing into a backyard was a cruel mistake. The prime consideration of the plan should be a large living room without any obstruction of sunlight. Everything should be sacrificed to attain a good living room ; and to secure the utmost possible air space and sunlight he would abolish passages and landings, have an open staircase in the room, and there should be no projections in the building. A strong believer in co-operation, Mr. Unwin would establish a common laundry for each block or quadrangle. One of the benefits of Mr. Unwin's system would be the saving of the cost of yards and fences.

The R.I.B.A. Officers. THE following officers of the Royal Institute of British Architects have been elected for the ensuing year : President, Mr. William Emerson ; hon. secretary, Mr. Alexander Graham, F.S.A. ; vice-presidents, Messrs. John Belcher, A.R.A., T. E. Collcutt and John Slater, B.A. Lond. ; members of council, Messrs. F. T. Baggallay, G. F. Bodley, W. D. Caröe, W. M. Fawcett, Ernest George, J. A. Gotch, G. E. Grayson, E. A. Gruning, E. T. Hall, H. T. Hare, E. W. Mountford, Professor Beresford Pite, G. H. Fellowes Prynne, P. G. Smith, Leonard Stokes, R. Phenè Spiers, Paul Waterhouse, Aston Webb ; associate-members of council, Messrs. R. S. Balfour, W. H. Bidlake, J. S. Gibson, H. V. Lanchester ; representatives of allied societies, Messrs. J. J. Burnet (Glasgow Institute of Architects), Frank Caws (Northern Architectural Association), C. H. Channon (York Architectural Society), A. Clyne (Aberdeen Society of Architects), Sir Thomas Drew (Royal Institute of the Architects of Ireland), F. H. Oldham (Manchester Society of Architects), S. P. Pick (Leicester and Leicestershire Society of Architects), F. W. Wills (Bristol Society of Architects), Butler Wilson (Leeds and Yorkshire Architectural Society) ; representative of the Architectural Association, Mr. W. H. Seth-Smith.

Exhibition of Works in Wood. AN exhibition of works in wood and wood carving submitted in competition for prizes offered by the Worshipful Companies of Carpenters and Joiners was opened last Wednesday at Carpenters' Hall, London Wall, E.C., and remains open until Tuesday, June 18th (inclusive), from 11 a.m. to 6 p.m. : and, in addition, on Friday and Monday next from 7 p.m. to 9 p.m. The constructional work exhibited is far superior to the art attempts in wood carving, &c. ; indeed, failure accompanies almost every attempt at artistic effect. The models of constructive carpentry are most neatly and accurately made to scale, but one feels that the exhibitors must nearly all be joiners with very little acquaintance of actual carpentry work, executed in unplaned, roughly hand-sawn and framed work. The models are almost like cabinet work, and show an expensive and wasteful use of material. The prizes have been distributed in seven divisions, the first for constructive carpentry, the second for ornamental carpentry, the third for joinery, the fourth to "the trade" for cabinetmakers and art woodwork manufacturers, the fifth, sixth and seventh for hand carving. In division 1 a special gold medal is rightly awarded to Mr. J. Colburn for a model of an elaborate, yet simple, centering for a masonry arch. The majority of the other examples of centering are needlessly elaborate. The models of roof trusses are on the whole good, but include many examples of wasteful cutting away of material from larger sizes than required, this being especially noticeable in the King posts, and of excessive morticing and tenoning. There is a good model of a derrick for two cranes by Mr. F. S. Judd which gains a first prize, but the ties being so large would be weakened by jointing. The designs for wooden and half-timbered dwellings shown are not at all good in proportion or mass. In division 2 Mr. W. E. Saunders gains a special gold medal for a model of vaulting. In division 3 there are several examples of rounded work, of course unsuitable to wood. Mr. C. E. Hadlow gains a first prize in class 2, division 3, for a sash frame, weightless and with lock ventilation, ingenious but possessing the disadvantage that the sashes can never be opened more than half-way top and bottom. In class 3 Mr. G. Ellis gains first prize for a French casement with new weather-proof joints, which, however, would be sure to sag in time and swell with wet so as to cause sticking—the common failure with wood casement joints. The wood carving in general, while it exhibits an attempt to imitate Nature, is not conventional in rendering, so that it necessarily fails. The nature of wood is not generally considered in the designs ; thus we have corn stalk, leaves, &c., in wood, which would break off with a slight touch, and the decoration is often carried over the architectural lines. In fact, this part of the exhibition is very disappointing, and want of taste is everywhere in evidence. A good collection of old examples of work is shown. In concluding, we may say that these two City companies are doing excellent work by holding these competitions which are sure to be of value in encouraging good work ; the judges, too, have ably performed their duties.

THE ASSYRIAN ELEMENT IN GREEK DECORATIVE ART.

BY FREDERICK S. SALISBURY, B.A.

IN the decorative application of sculpture and colour the habit of the Greeks was diametrically opposed to our own; and the explanation of this difference lies largely in the climatic environments of the two peoples. Under the cloudy heavens of Northern Europe the greater part of most men's time, when not hurrying along the street on business or engaged in exercise, is spent indoors, and internal decoration, therefore, is far more elaborate and costly than external. Under the sunny skies of Greece the opposite was the case, and accordingly much more attention was devoted by them to exterior adornment.

A striking illustration of this is to be noticed in the use of friezes. In Greek temples they are found outside, either on the central member of the entablature or around the top of the cella wall. The frieze of an Ionic temple is brought to England and arranged round the interior walls of a room in the British Museum; here it is studied, and in this position is reproduced below the cornice of a spacious hall or gallery. Briefly, it has been transferred from the outside to the inside. This may be called the domestic aspect of the question, and it goes hand in hand with the fact that, whereas in England private houses of large dimensions and noble architectural proportions are fairly numerous, in ancient Greece they are mainly conspicuous by their absence.

Working in the same direction is the influence of artistic considerations. Feminine costumes enliven the crowd at any large open-air function with all the colours of the rainbow, and while the sun shines the sight is gay indeed. But a passing cloud obscures his light, and lo! the picture is all blurred, the shades and tints grow indistinct, and the hitherto pleasing picture is wrapped in a shroud of gloom. It is not worth wearing those dresses under the dull grey sky. And that which is true in little holds also in larger things. Apart from its economic aspect, external decoration in colour would in this country be largely thrown away; and, were it to gain a footing, would tend to die a natural death simply from inanition.

And the same argument applies to the play of light and shade over a surface sculptured in relief or a group of figures in a pediment. The subtler shadows in the finest work are lost unless it can be seen under a brilliant light; and because the Panathenaic frieze from the Parthenon was, in its original position, entirely in the shade, and 39ft. from the floor of a colonnade only about 10ft. to 11ft. wide, we must not jump to the conclusion that Greek taste regarded this as an ideal position for such a decoration, nor smother reason by blindly following a famous precedent.

And here, perhaps, a word may be fitly spoken from the economic point of view. To the exterior sculptural decoration of Greek temples was devoted some of the best talent at command. The Pediment group of the Parthenon, the temple of Æsculapius at Epidaurus, and of Athena Alea at Tegea, were probably executed by subordinates; but there is little doubt that they were carved from the models of Phidias, Timotheos and Scopas, and these masters may even have given the finishing touches to work which they certainly superintended. To expose such productions as these to the mercy of English weather would be a species of improvident vandalism, and even protection from rain and storm would only avoid one, and perhaps not the worst, of two evils. The numerous works of art recently raised from the sea about the island of Cerigo, at the south of Greece, have suffered great damage from water, but the contaminated air of our great cities is probably a corroding agent hardly less effective.

The influences on decorative treatment of climate and the resulting habits of life, and of atmosphere, and the consequent tone of taste have been briefly passed in review; but the main purpose of this paper is to consider, in the case of the ancient Greeks, a third element—the influence of Oriental tradition.

Greek art, particularly in its earlier stages, was very largely influenced by the art of Assyria. Now Assyrian art was chiefly decorative, and we shall therefore expect to find its presence principally in this department.

The city of Ecbatana, the capital of ancient Media, was surrounded by seven concentric walls. Built as it was upon a conical hill, the upper courses of all the seven walls were visible at once, and each was coloured a different hue. The highest and inmost wall was gilt; the next was plated with silver; the third was painted orange; the fourth, blue; the fifth, scarlet; the sixth, black; and the lowest and outermost, white.

The public buildings of the city were also marked by the same gorgeous magnificence, and the ceilings, beams and rafters of the royal palace were overlaid with gold and silver. Everything is costly, brilliant, splendid, sumptuous—that, not beauty, is the ruling aim. In fact, Ecbatana is a fairly complete example of the notions which we are wont to associate with the word Oriental.

On the other hand, the art of Greece is marked by chaste simplicity. There is no striving after effect; no forced display. If it is costly, it is only so because it is solid and good throughout. Its end is beauty, and above all simple beauty. Elaborate beauty, vastly planned, achieves magnificence. That is the goal of Oriental effort. It dazzles, but it does not satisfy. The goal of Greek endeavour was the Ideal, and to this they found the only royal road—simplicity. Dio Chrysostom declared that he who visited the temple of Jupiter at Olympia and beheld the Zeus of Phidias, no matter what sorrow and anguish had fallen to his lot in life, would find forgetfulness of all his pains in gazing on that divine and tranquil face. Such art ministers peace; such beauty satisfies.

But this perfection belongs to those two momentous centuries which succeeded the life and death struggle with Persia. That struggle marked a complete rupture with the East, in art no less than in politics. Previous to B.C. 480 the traces of Oriental influence are numerous; and not the least striking example of this is to be found in the application of brilliant colours to architectural decoration.

M. Cavvadias, of Athens, while excavating among the débris left by the destruction of that city by Xerxes, unearthed to the south of the Parthenon a group of pediment sculpture representing Zeus hurling thunderbolts at the three-headed, triple-tailed monster Typho. The work is in a markedly archaic style, and the characteristic smile which the turned-up corners of the lips give to Typho's three faces makes him appear as though he was positively pleased at the energetic attentions of the Father of the Gods. But it is not with style that we are specially concerned now. The group is of importance here as a remarkable example of the application of bright colours to sculpture.

Typho presents us with a vivid anticipation of the cruel Chevalier Raoul, the Blue Beard of the familiar French story. His hair was coloured a bright blue; the flesh was painted red, as in early times was the body of a victorious Roman general when celebrating a triumph; and the ball of the eye was yellow, with the iris green and the pupil black. The reasons for this colouring were twofold. The coarse grey tufa which the sculptor had used presented a dull and unpleasing surface that invited concealment, and the contours, wanting the crystalline glitter of marble, would often be lost in the shadow of the cornice unless picked out with vivid contrasts of colour. But if artistic exigence had much to do with their use, there is little doubt that it merely suggested a case for the application of an already familiar tradition; and the source of that tradition was the East. With the exception of the green we find all the colours on the seven walls of Ecbatana.

This example must suffice on the question of polychromy. But our description of Ecbatana suggests another form of architectural decoration which leaves many traces in early Greek building. We refer to the use of metal, chiefly silver and gold, or, where gold was too costly, bronze.

Of this Homer gives us several examples. Telemachus, accompanied by the son of Nestor, journeys to the house of Menelaus at Sparta, seeking tidings of his father Odysseus. Homer (Od. iv. 43) describes how, as they were conducted into the palace of the god-descended monarch, they marvelled at its splendour, for its glitter was like that of the sun or of the moon. And the explanation, clear enough already, is given a few lines further on. Telemachos, as Pope translates, or rather paraphrases him, thus addresses his companion:—

> "View'st thou unmoved, O ever-honoured most!
> These prodigies of art, and wondrous cost!
> Above, beneath, around the palace shines
> The sumless treasure of exhaustless mines;
> The spoils of elephants the roof inlay,
> And studded amber darts a golden ray."

Well, this is very fine, but Homer does not say that the ivory was inlaid in the ceilings. He merely speaks of "the gleam of bronze throughout the echoing halls, of gold and amber, of silver and of ivory"—two yellow and two pale materials.

Still more complete is the description of the house of Alcinous in the fabled isle of the Phæacians, the chosen children of the sea-god. The threshold is made of bronze. Of bronze also are the walls that enclose the large front hall of the palace, and round them runs a frieze in a pattern of blue glass.* Silver doorposts stand on the bronze threshold, and the lintel above is of silver, while the doors themselves are gold.

In the Iliad the houses of the gods are several times mentioned. The house of Poseidon is made of shining gold, imperishable for ever; that of Hephæstus, built by the god himself, is fashioned of bronze; and so are the halls of Father Zeus, where the assembled gods were seated on thrones set out upon a golden floor. And further examples, legendary and otherwise, are found outside of Homer. Pausanias records the tradition that one of the earliest of the buildings which preceded the stone temple of Apollo at Delphi was constructed of bronze; and the same writer says that he saw at Argos the bronze chamber in which Acrisios shut up his daughter Danaë, and where Zeus visited her in a shower of golden sunbeams.

For the most part this use does not survive the Persian wars, though the gold and ivory statues by Phidias and others are in a measure its continuation. But Oriental influence leaves a great witness in the Ionic frieze. The Bronze Gate of Balawât, erected in the ninth century B.C., represents in long lines of low relief the victories of Shalmaneser II. Had Homer sung the exploits of the Assyrian monarch instead of the Siege of Troy, the Iliad would have presented an exact literary counterpart to the Balawât Gate. The Iliad and Odyssey date from the time when, as we have already seen, Oriental influence was very powerful in Greece, and if their genius is Hellenic, they are modelled on an Eastern plan.

After the Persian wars the epic in Greek literature is a thing of the past, but its spirit survives in the continuous Ionic frieze, which is fitly applied to the Ionic temple, with its Oriental tendency to elegance as distinct from simplicity. The Ionic order in architecture savours, however faintly, of the East. The true expression of the Hellenic spirit is embodied in the simple, unaffected beauty of the Doric order. Its style is as dignified and chaste as a play of Sophocles, while the ornaments of the Ionic reflect the elaborate grandiloquence of an official Assyrian record. Its plainness is that of an undraped athlete statue from a Peloponnesian studio, as contrasted with the costly elegance of "garments of needlework, wrought about with divers colours." And as if to make the antithesis more complete, just as Homer is represented by the Ionic frieze, so the frieze of metopes in the Doric order has its counterpart in the acts and scenes of a Greek drama, each forming part of a series with its neighbours on either side, but each presenting in itself a complete artistic whole.

It should, however, be remarked that the analogy between an Ionic frieze and an Assyrian record is only external. The archives of the kings of Assyria go on unrolling for ever, and have artistically neither beginning, climax nor conclusion. Greek art, on the other hand, while adopting the tradition, has made it conform to its own cardinal sense of balance and symmetry; in this, as in all else, manifesting the vigorous originality which pervades every department of Hellenic activity. The Lucretian maxim, *Ex nihilo nihil fit*, is true of all things material and intellectual; but if the Greeks borrowed perforce from other sources the elements of their arts and letters, the manner in which they employed and applied them was essentially their own.

---

* A frieze of this kind was discovered by Schliemann in his excavation at Tiryns in the Argolid.

CONCRETE SUBWAYS FOR UNDERGROUND PIPES.

A PAPER on the above subject was read by Mr. Arthur Taylor Allen before the Society of Engineers on June 3rd.

In introducing the subject the author referred to the construction of the first subway in England for underground pipes, which took place about the year 1860, in the city of London. This was followed a year or two later by one in the city of Nottingham. He noted the lack of progress there had been in the extension of these new arterial thoroughfares, for, beyond one being constructed at St. Helen's in 1898, very little had been done in that direction to minimise the evil resulting from the continuous breaking up of roadways for access to the numerous pipes laid under every thoroughfare. He gave a long list of streets broken up in the course of one year for obtaining access to pipes. He also pointed out the danger and inconvenience likely to arise from roadways being laid over a number of gas pipes.

The author referred to the sections of the various Acts in force empowering public companies to break up streets after due notice, causing the total or partial blocking of a thoroughfare, interfering with traffic and operating temporarily to the prejudice of business houses, the owners having no claim for any loss sustained thereby. He then alluded to the increasing number of underground pipes, and the possibility of the provisions of the Rivers Pollution Acts being more rigidly enforced, and in the near future throwing upon some authorities the necessity of separate sewers for surface or storm water. The author then described the subways in London, Nottingham, and St. Helen's. To relieve doubt as to the possibility of a severe frost affecting the water mains in the subways he gave satisfactory thermometrical readings taken in the Albert Street subway, Nottingham.

Turning next to the utility of subways, the author stated that by their construction access could be readily obtained for the purpose of inspection, alteration, or addition to any of the pipes at present hidden and placed beyond inspection. He drew attention to the fact that after works of great magnitude had been undertaken in obtaining a pure water supply, to ensure the health and safety of the population, the pipes conveying the supply were hidden. Thus, a defective joint or a burst might remain undiscovered for a length of time, as was the case some years ago, when the first intimation of a leakage in the borough water mains was reported to him by the sewer men when repairing a sewer in close proximity to the mains.

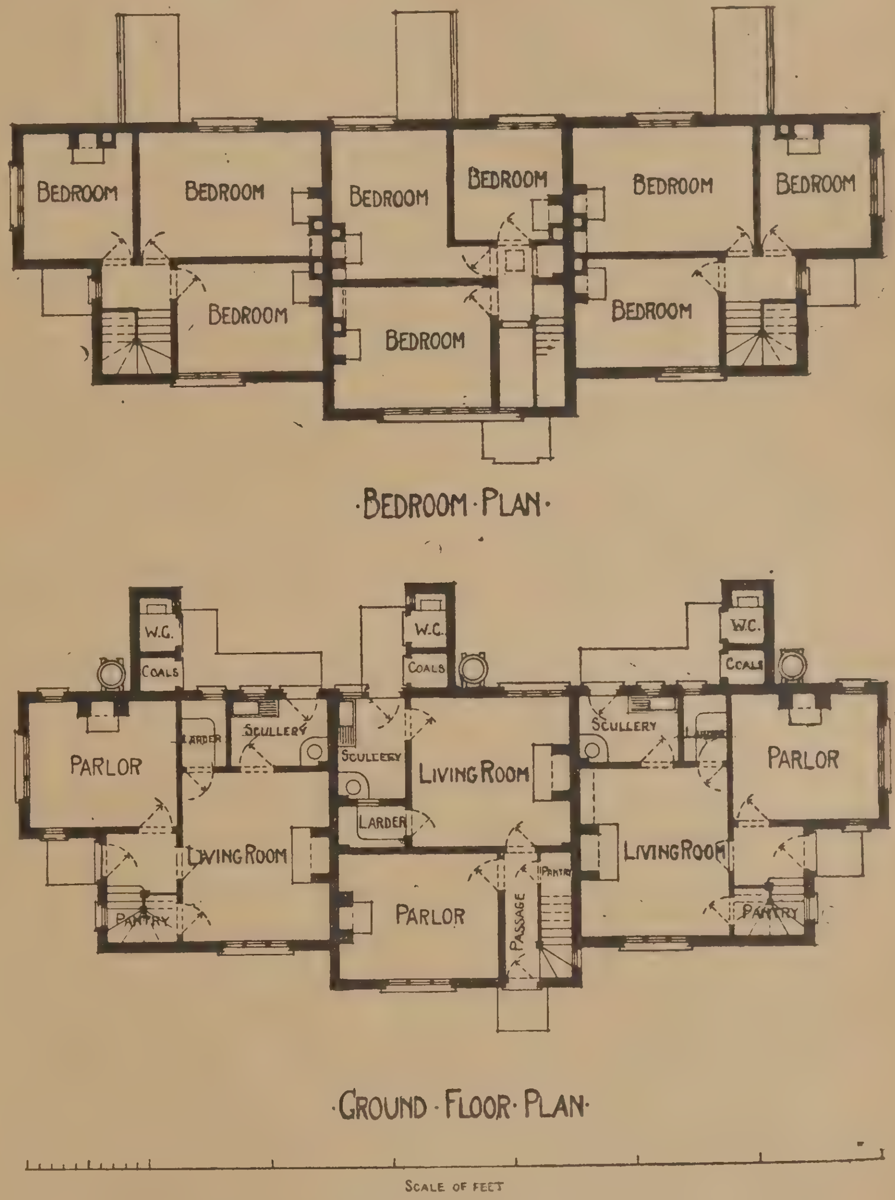
An efficient system of detection and prevention of water pollution or waste would be provided for by subways, and the life of iron pipes would be considerably increased. Electric and telegraph wires need no longer run along poles and roof fixtures; they could be put underground, thus rendering them less dangerous and more reliable and permanent. Having regard to economy of cost, capability of resistance, and rapidity of execution, the author suggested concrete as the most suitable material for such works, and referred to its practical value as exemplified by its extensive use in connection with works in general.

In dealing with subways for large cities and busy thoroughfares where foot passengers experienced difficulty in crossing the street in safety, the author recommended that, in conjunction with the subway, underground conveniences should form a part of the scheme. Entrances would be erected in the centre of the street, so arranged that an easy and ready access (although private) could be gained from the first landing. This might be regarded as a peculiar suggestion, but he alluded to the revenue it was possible for it to bring in, as much as from £200 to £2,000 per annum having been cleared as profit for such accommodation.

With regard to subways for suburban districts the author considered all large subways should have lateral ways about 3ft. wide by 4ft. 6in. high for the purpose of access and conveyance of gas, water and other pipes, and he advocated making use of every available space by a specially designed iron bracket for the pipes. The author submitted a proposal for a subway under each footpath of all new streets to receive the water, gas and other pipes, the subways to form part of the laying out of the new street. He considered it necessary that the gas and water mains should be in duplicate; the concrete wall nearest the house would be perforated with 2in. and 2½in. holes for the house services, thus obviating the construction and expense of lateral ways.

The sewer would be laid under the road with the usual manholes on the principle adopted in the present day, but with the addition of elongated eyes every 20ft., extending to each subway. The chamber (common to all house drainage) to be constructed in the bottom of the subway by and at the cost of the owner when requiring to connect with the sewer. This method he contended would ensure the surface of the road being kept free from interference.

The author gave the cost of some subways constructed in London as £15 per lineal yard, Nottingham £10 per lineal yard, and St. Helen's £7 2s. 4d. per lineal yard. He pointed out, however, that the information was of but little practical value, and must be accepted with the greatest caution, it being impossible to make a useful comparison between the cost of construction at other places without a knowledge of the conditions of each case. Although the initial cost would prove heavy, he pointed out that there might be some compensation if the excavated materials proved suitable for the concrete work. The auther considered that the cost of constructing subways should be borne by a loan for a period of fifty years, as the works come under the category of permanent works.



COTTAGES AT SIDCUP. E. HARDING PAYNE, A.R.I.B.A., Architect.

SOUTH-EASTERN RAILWAY IMPROVEMENTS.

A New Railway Station at Tattenham Corner.

A NEW station situated at Tattenham Corner, immediately overlooking the Epsom Racecourse, has been opened by the South-Eastern and Chatham Railway. From London the new line runs by way of East Croydon, through the Chipstead Valley. Stations have already been opened on this railway at Chipstead, Kingswood and Tadworth. The station, commanding an excellent view of the greater part of the course, stands 500ft. above the sea level. It covers a large area of ground, and is not yet wholly utilised. Six platforms, ranging from 550ft. to 700ft. in length, have been brought into use, and there is ample room for the introduction of others, as the traffic may develop. In the siding refuges space is available for at least 24 long trains, and the whole of these can be started in quick succession, without the least confusion. It is in contemplation to erect permanent station buildings, but, in the first instance, large timber structures, including booking offices, refreshment-rooms, waiting-rooms, parcel and telegraph offices, have been provided.

As soon as the company find it possible to complete the numerous changes which are in progress on the Metropolitan sections of their system, the ordinary service to and from the Chipstead line is to be much improved.

Facilities are about to be afforded for the ever-increasing volume of what is known as the *grande vitesse* goods traffic, consisting of fruit, flowers and other perishable or fragile goods, which, coming from the Continent, as also from Kent, requires the quickest possible transit. At the present time, this branch of traffic is dealt with in the low-level station at London Bridge, which formed part of the old Greenwich Railway; but it is about to be transferred to a station which has been specially erected near Blackfriars Road, and the low-level station at London Bridge will thereafter be converted into a passenger station of the most approved type. The new station covers an area of 13,000 sup. yds., or about two and two-third acres, and contains solidly-built covered platforms so arranged that goods may be taken out of railway trucks at one side, and at the other transferred to carts for delivery to the distributing agents. Together, the platforms have a total length of 1,216 lin. ft., which will enable as many as sixty-four railway trucks to be unloaded simultaneously. Between the platforms there is a cart road, 460ft. long and 40ft. wide, laid at a level of about 25ft. above the street. The station is approached from Blackfriars Road by way of George Street, through an avenue 800ft. long and 24ft. wide, with a gradient of one in 18½ft., and from Southwark Street by a road possessing a similar gradient. Trains will enter the station at one end from the main line of the South Eastern, and at the other, by means of the Blackfriars Junction, from the Chatham section, as likewise from the Northern systems. Two warehouses have been provided at the depot—one on the platform level, and another which will be entered from Gravel Lane. There is also accommodation for loading horses, and it is proposed to use the stations for sending away guns and munitions of war. The premises further contain a small locomotive depot, with a turn-table large enough to receive the powerful engines now being supplied to the Company, and, beyond supplying local requirements, this table will relieve much of the congestion experienced in dealing with the traffic in and out of Cannon Street Station.

A third improvement is the reversal of the old Greenwich lines, which for half a century have been worked inversely to the principle obtaining over the rest of the system, a widening of the original railway effected in 1850 having necessitated the construction of a line on the wrong side of the road, in which position it has ever since remained. The points have now been altered, and each pair of metals put in its proper position, so that the company will now be at liberty to widen the viaduct on the north side, and thus render possible efficient working over the busy section between London Bridge and Surrey Canal Junction.

The viaduct between Charing Cross has been widened to the Borough Market. The widening between St. John's and Orpington has advanced considerably. This improvement includes the reconstruction of the stations at Hither Green, Grove Park, Chislehurst and Orpington, together with the erection of an intermediate station, to be known as Elmstead Lane, situate between Grove Park and Chislehurst, which last-mentioned station is, for a time at least, to be regarded as the outer limit of the company's suburban traffic. A large amount of new stock has during the past twelve months been supplied to the South-Eastern and Chatham system, and much of this will be available for the summer traffic. The whole of the passenger stock, new and old alike, is being fitted with the electric light. Many new engines have also been provided, more powerful than those of the old design.

The improvements enumerated do not represent all the details of the elaborate scheme to which the directors are devoting attention. Much has still to be undertaken on the Chatham and Dover section, and the latest proposal is to construct an overhead electric railway between Cannon Street and London Bridge, immediately above the existing line. Plans for this project have not, however, as yet taken definite shape; but the proposal is to work the overhead route on the same principle as that sanctioned by a Select Committee of the House of Lords in connection with the contemplated mono-railway from Manchester to Liverpool. A frequent service of trains would be provided between Cannon Street and London Bridge, and the existing congestion at the former station would thus, it is claimed, be completely removed.

GLASGOW ROYAL INFIRMARY.

Dr. Rowand Anderson replies to the Committee.

THE latest phase in the discussion relative to the reconstruction of the Royal Infirmary at Glasgow is the publication in the "Glasgow Evening Citizen" of a letter from Dr. Rowand Anderson (the assessor in this competition). In this letter he flatly contradicts some of the remarks made in the public statement of the Executive Committee, of which a full report was given on page 321 of our issue for May 29th last. In his letter Dr. Rowand Anderson says:—

The committee, in referring to me, say that my function, as I frankly acknowledge, was to "guide, and not to select." Sir David Richmond stated publicly that I was engaged as "technical adviser, and not assessor." My appointment, as stated in the minutes, is in the following terms. "The sub-committee thereupon agreed to appoint, and hereby appoint, Dr. Anderson as assessor to the committee." In the printed terms and conditions of competition issued to architects, it is stated that the committee "will appoint a neutral architect of standing as assessor, and will give the fullest consideration to his advice."

The committee then proceed to say that one of the two plans which most closely conformed to the sketch plans issued for the guidance of competitors was not included by me in the short leet, and "that further interviews with me satisfied them that its exclusion arose from no failure on the part of the selected plans, in regard to vital or essential particulars, but chiefly from a difference of opinion in regard to the style of architecture and the general elevation, matters on which the executive committee ventured to think they were quite entitled to follow their own opinion, and the minority cordially acquiesced in the selection of the majority."

From the above statement, it appears that the Executive Committee considered themselves quite competent to judge, not only of the technicalities of the building as an infirmary, but also of its architecture. That being so, one naturally asks why they called in an assessor.

In proof of their competency to judge and decide on all matters connected with the building, they state that the minority cordially acquiesced in the selection of the majority, which majority consisted of one. This majority would have been converted into a minority but for most unfair canvassing of the committee before I gave my final explanation.

Had I known of this in time, I would have thrown up my commission.

It is entirely wrong to lead the public to believe that it was solely on account of the architectural treatment of the design they selected that I did not include it in the short leet. I gave the most minute and searching examination to every plan submitted in the competition, and, in arriving at a decision, I attached supreme importance to those qualities which constituted, according to my view, a scientific building, and one adapted to its purpose, and I maintain that the one I placed first embodies a greater number of merits than any of the others.

The committee believe that they have shown discretion in approving the architectural style of the adopted plan, and they say "it is distinctively Scottish—the national art of the fifteenth and sixteenth centuries, of which we have examples in Heriot's Hospital, Holyrood, Linlithgow, and Falkland Palaces, and in our own college lately in the High Street. It is, therefore, not only appropriate to the historical associations of the site upon which stood the castellated Bishop's Palace, but permitting as it does a limited use of Gothic forms, as in Heriot's Hospital, Edinburgh, it is more in harmony with the cathedral itself than any classic or modern style." Ranker architectural nonsense than this was never penned, and whoever composed it is absolutely ignorant of the meaning of the terms he uses. I fail to see what associations there can, or should be, between a building dedicated solely to the relief of suffering humanity, and one erected in a semi-barbarous age, and built with appliances for dealing death and suffering outside and cruelties and torture inside.

If the relief of the sick and the hurt is to be the one paramount object of this building, that can only be accomplished by utilising to the utmost the beneficent and curative forces of Nature and the teachings of science, and not by erecting and wasting money on the ghastly absurdity of a baronial infirmary.

Engineering Notes.

The New Orphanage, Bontnewydd, Carnarvonshire, is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The New North London Underground Railway, which will bring Finsbury Park within about ten minutes of Moorgate Street, is being pushed forward rapidly. The contractors expect to finish the tunnelling by the end of the year. The tube will be 2⅝ miles long and 16ft. in diameter—the largest in London, the Central London Railway being 11ft. 8in. The Great Northern and City Railway, as the new line is called, will be the first tube in London to take full-size rolling-stock. It is expected that its terminus in Moorgate Street, opposite the South London Railway's terminus, will ultimately become the City terminus of the Great Northern Railway. The engineers are Sir Douglas Fox and his partners, and the contractors Messrs. S. Pearson & Son, who made the Blackwall Tunnel.

New York Harbour is being improved. The east channel at the entrance of the harbour is to be made 2,000ft. wide and 40ft. wide; its course will be straightened and shortened, and there will no longer be a danger of grounding off Sandy Hook. The contractor has caused two large dredges to be specially constructed for the purpose. A contract has also been made for widening and deepening Bay Ridge and Red Hook channels, both of which are to be made 1,200ft. wide and 40ft. deep. There is a further project for giving the same width and depth to Buttermilk Channel from Red Hook Channel to the East River. Man-o'-War Rock in the East River is to be removed, and the channel off the battery is to be deepened to at least 26ft. It is calculated that the island of Manhattan has already over fifty-five miles of pier line, and that the improvement in question will give large additional facilities.

NEW PUBLIC OFFICES AT WHITLEY.

NEW offices have just been finished for the Whitley and Monkseaton Urban District Council. The walls are faced with deep-red pressed bricks, the oriel and other windows and cornices being of dressed stone. Upon entering the spacious entrance hall, the offices of the clerk and the rate collector are found on the right hand, and those of the surveyor and the sanitary inspector on the left. Each of these offices is about 18ft. by 16ft., and attached to the clerk's office is a strong room for important deeds and other documents. At the back are a living room and a kitchen, with a scullery and other accommodation for the caretaker. On the upper floor is the council chamber, 30ft. long by 18ft. 6in. wide, and 15ft. high. It is constructed with a coved and panelled ceiling, and fitted with two handsome fireplaces and carved oak mantelpieces. Behind the council chamber is a waiting room, with lavatory and other accommodation. These rooms take up the space on one side of the staircase, and on the other side, connected with the the council chamber by a cloak room, are two committee rooms, one about 18ft. by 15ft., and the other about 16ft. by 15ft. Above these rooms are three attic bedrooms for the caretaker. The above comprises the main block, but there are, besides, two separate outbuildings, one being the fire brigade house and the other to provide storage. The whole works have been designed by Mr. J. P. Spencer, architect, of Newcastle-on-Tyne and North Shields, under whose supervision they have been carried out by Mr. James Douglass, contractor, of Cullercoats. The furnishing has been done by Messrs. Gullachsen, of Newcastle, and the total contracts, including furnishing, amounted to £3,400, which will cover the entire cost, as it is expected there will be no extras. This sum does not include the cost of the site, as the ground already belonged to the council.

EDINBURGH ARCHITECTURAL ASSOCIATION.

Some Particulars of the Annual Excursion to Durham and Hexham.

THE annual excursion of the Edinburgh Architectural Association will take place on June 14th and 15th. On the first day Durham will be visited. The cathedral was a church of the Benedictine Monastery, begun by Bishop Carileph in 1093, and practically completed about 1130. The Chapel of the Galilee at the west end was added by Bishop Pudsey about 1175. The Chapel of Nine Altars, replacing the original apsidal termination, was begun in 1242. The chapter-house was demolished in 1796 and restored in 1895. After the cathedral, the deanery will be visited, where the ancient kitchen is still in use.

Then the library. This was originally the refectory and dormitory of the monastery. It contains a valuable collection of MSS., among others some of pre-Conquest date. A large number of Roman altars and sculptured stones are to be seen, as well as an important series of Anglian memorial crosses and grave covers, and the remains of the coffin made to contain the body of St. Cuthbert in 698, together with various articles found in the grave of the saint in 1827.

The next place to be inspected will be Durham Castle, which was built by William the Conqueror in 1072 on his return from Scotland. Of his work there remains the very interesting chapel. The castle contains the two halls built about 1160 by Bishop Pudsey, with the magnificent doorway of the lower hall; the later great hall was built by Bishop Bec (1283-1311), enlarged by Bishop Hatfield (1345-81), and curtailed by Bishop Fox (1494-1501), whose very complete buttery-hatch between the hall and kitchen (Pudsey) remains intact.

At 7 o'clock on Friday evening the members will dine together in the Royal County Hotel. After dinner there will be time to visit St. Giles' Church in Gilesgate, St. Mary-le-Bow in North Bailey, St. Mary-the-Less in South Bailey, St. Oswald's Church in Church Street, and St. Margaret's Church in Crossgate.

St. Giles' Church was founded and dedicated by Ralph Flambard in 1112. The original north wall of the nave and the original font remain. The church was used as a military stronghold, and sustained sieges in 1141 and 1144. The chancel was built by Bishop Pudsey about 1180. A fragment of a gravestone with Norman ornaments may still be seen. The church of St. Mary-le-Bow is the oldest foundation in the city. It probably stands on the site of the old White Church in which rested the body of St. Cuthbert during the building of the cathedral of Aldhun. The present church was built in 1685, the tower being erected in 1702. The church of St. Mary-the-Less has a Norman arch in the porch, and a Norman chancel arch. The reredos panelling is from the cathedral. St. Margaret's Church was built about 1100, the north aisle in 1190, the tower and north and south aisles to chancel towards the end of the fifteenth century. The nave and chancel are original. There is an elliptical chancel arch. St. Oswald's Church stands on the site of the church built by Bishop Carileph, who died in 1095. Part of the cross of the original Saxon church may be seen in the cathedral library. The chancel was rebuilt and the aisle windows added in the fourteenth century; the two west bays of the nave were erected later. The tower and clearstory are of the fifteenth century. North and south porches were destroyed. The south aisle portion of the chancel, clearstory, &c., was rebuilt in 1834, when fine old roofs were lost. The original roof remains on the north aisle.

On Saturday Hexham Abbey will be visited. The interest which attaches to this fine monastic church, and the remains of the conventual buildings in connection with it, cannot well be exaggerated. It is on the site, and still retains in its crypt the superstructure, of the church begun in 673 by St. Wilfrid, which was in all probability the largest and most ornate of such buildings erected by the Angles. Its architectural history is both curious and unique, and forms a most fascinating study. As a specimen of mediæval architecture, Hexham Abbey Church forms a connecting link between the great Yorkshire abbeys and the contemporary work in Scotland. The choir is a valuable example of the period when the transition from Norman was merging into the Early English style. The transepts are of extreme length and great beauty, and contain the best remaining example of the night-stairs to the dormitory. The ruins of the domestic buildings include the gate-house, the chapter-house, the calefactory and the lavatory, with a mere fragment of the frater-house. The lavatory is a most beautiful and perfect composition of the Geometrical Decorated period. The church contains the more ancient of the only two remaining sanctuary seats in England, and also possesses an abundant store of woodwork, furniture and paintings on panel. In the aisle of the north transept are a number of fragments of interest—crosses, grave covers and carved details of many periods. There are five monumental effigies. One is that of Prior Leschman (1480-91), vested in the habit of his order. Two others are of knights habited in mail. The other two are of a civilian and a lady.

The Roman camp at Hexham will also be inspected, and should time permit the party will visit Limestone Bank to see the deep cuttings through the basalt of the ditches of wall and vallum. Fine views are obtainable from this point, including a considerable portion of the valley of the North Tyne, with the well-preserved typical border pile of Chipchase Castle, with its seventeenth-century additions, nestling in the valley. In ascending Limestone Bank the lines of the wall in the fields on the right hand and those of the vallum on the left are seen. This long stretch of the wall is many courses high; in it are the remains of a turret, the best preserved in the whole line, known as Blackcarts Turret.

After luncheon the party will drive to Chesters, the residence of Mrs. Clayton (additions by Mr. R. Norman Shaw), returning to Edinburgh the same evening.

Mr. William M. Page, 16, Rutland Square, Edinburgh, is the hon. syllabus and excursion secretary.

Correspondence.

The Henry Angel Memorial.

To the Editor of THE BUILDERS' JOURNAL.

CITY OF LONDON COLLEGE.

SIR,—You are doubtless aware of Mr. Angel's almost tragic death, from a paralytic stroke, in February last, while in the active discharge of his duties. As one of his earliest pupils, and a late colleague of many years' standing, may I enlist your sympathy and active support in founding a prize or scholarship to his memory at the City of London College? For many years Mr. Angel taught steam, applied mechanics, and practical plane and solid geometry with signal success both here and elsewhere. In spite of natural infirmities, he was ever most accessible as a teacher, and would put himself to an endless amount of trouble in order to help his students to master difficult problems. By such unceasing labours he gained the high esteem and love of all with whom he came in contact. Of him it may be truly said, he was a grand teacher and a thorough gentleman. Subscriptions to any amount will be thankfully received and acknowledged by Mr. P. J. Gillbard, hon. secretary of the Henry Angel Memorial Fund, City of London College, White Street, E.C.—Yours truly, ISAAC S. SCARF.

Examination Questions in Building Construction.

To the Editor of THE BUILDERS' JOURNAL.

BLUNDELL SANDS.

SIR,—On p. 348 of your last issue I noticed a letter from a correspondent signing himself "S. E. D." who admits that he has not seen the examination papers on the above subject, and yet considers them "fair." As a student I beg to differ from him, for there is not the slightest doubt that the papers set were extremely unfair and quite outside the requirements of the South Kensington authorities, especially the paper in the elementary stage, which only a student with an exceptionally smart intellect could have possibly done in the four hours allowed. Undoubtedly the science of building is progressing, but the elementary principles—*i.e.*, the principles set forth in the various text-books—do to a large extent remain the same, so that if the examiners, when setting the papers, have been keeping pace with the times, it is fairly obvious that an injustice has been done to students generally.—Yours truly,

R. M. WAUGH.

New Patents.

These patents are open to opposition until July 15th.

1900.—Ornamental Tiles.—8,612. J. WHITEHEAD, 42, Anglesea Street, Lozells; and W. ULBRICH, 99, Vyse Street; both of Birmingham. Imitation jewels, glasses or paste stones are used to heighten the brilliancy of the design.

Blocks for Caissons, &c.—8,831. G. L. MOUCHEL, 124, Holborn, London. According to this invention the blocks are constructed hollow, and consist of a comparatively thin shell of concrete rammed in between a strengthening metal framework. The latter is self-supporting without the concrete, but not necessarily so under the load which the finished block is designed to carry.

Stair Treads.—10,595. C. H. WILKINSON, Barlborough Place, Milnsbridge, near Huddersfield. The tread consists of lead, leather or india-rubber in which steel wires are embedded to afford a foothold.

Door Fastenings.—11,378. J. A. WADE, 19, Old Hall Street, Liverpool. This invention relates to the automatic bolting and unbolting of a pair of folding doors. By means of a sliding bolt and a toggle lever the opening of one door automatically withdraws the bolt of the other, and *vice versâ.*

The following specifications were published on Saturday last, and are open to opposition until July 22nd. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—9,088, PLAISSETTY, incandescent gas lighting. 9,318, SMITH, closet seats. 9,492, DOUGLAS, ceiling-roses. 9,601, SEEFELS, fire-resisting and ventilated floors, ceilings, &c. 10,486, WURM, bolt fastenings. 11,303, JOHNSON, ventilators. 11,705, KAY, flooring cramp. 11,942, FENLON, geysers. 12,262, MERRYWEATHER & HARRIS, pumps. 12,513, LAKE (*Wachtel & Co.*), manufacture of artificial sandstone. 12,663, BRISTOW, method of transporting timber. 12,864, GOLDING, construction of walls and partitions. 12,945, BUTLER, paper hangings. 13,257, HARRASS, manufacture of veneers. 13,259, HILL, mantles for incandescent lighting. 13,278, RANSOME, concrete walls and structures. 13,279, RANSOME, concrete constructions. 13,544, RANSOME, concrete floors. 14,385, WOOD, combined snow-sweeper, water-cart and rail-groove cleaning appliance for tramways. 16,832, HARVEY, stair-rod eyes. 17,265, STRODE & CLARK, exhaust from an engine for heating purposes. 18,602, NELSON, smut-catchers for gas brackets. 19,923, FRÖHLICH, steam-heating apparatus. 20,948, PARKER, manufacture of coated wire. 23,612, OCHWAT, shaft furnace for the destruction of refuse.

1901.—772, GOEHST, wood floors. 1,758, LAKE (*Betts*), refining lead. 4,316, KESSLER, hardening plaster and other porous substances, and for fixing colours on them. 4,716, LE DUC, Venetian blinds. 5,748, PAGE (*Universal Metal Lath and Patent Co.*), expanded metal for lathing. 6,341, THOMPSON (*Verinigte Maschinenfabrik Augsburg und Maschinenbaugesellschaft Nürnberg A.-G.*), construction of foundations. 7,308, NEWTON (*New Jersey Wire-Cloth Co.*), fireproof floors, ceilings, &c. 7,494, HERBERLE, ball crushing-mills. 7,561, STORP, tiles, plates, slabs, &c. 7,706, PALMER, channel connection for conveying water from waste pipes to the drain trap. 7,901, LAKE (*Knight*), sash-balances for windows. 7,904, LAKE (*Knight*), sash-balances for windows. 7,908, LAKE (*Knight*), racks for the sash-balances of windows.

SOUTH KENSINGTON EXAMINATIONS.

QUESTIONS AND ANSWERS IN BUILDING CONSTRUCTION.—Elementary Stage.

[As so much attention has been directed to the recent examinations in building construction held at South Kensington, we have considered it of interest to publish answers to the questions set. The advanced and honours papers will be dealt with in separate articles to be published as soon as possible. It should be noted that the accompanying illustrations are not reproduced to the scale required, being only intended to indicate what is expected of the candidate. Four hours were allowed for the elementary paper given below. It was permitted to answer only seven questions.]

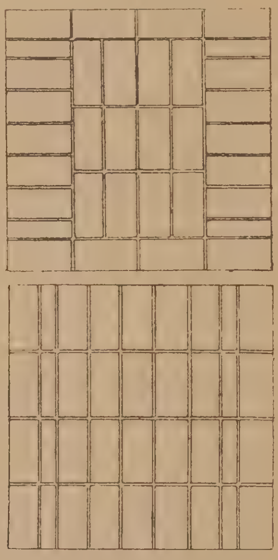
1. *Why is a brick made so that its breadth is less than half its length? Can you explain any advantage in "perforating" bricks? What are gauged arches?*

a. The length should equal two breadths + a mortar joint.

b. They dry quicker in backs, burn better, hold better in the wall, are lighter for size (an advantage in handling), cut more easily for closures, and are sometimes found convenient as ventilating bricks.

c. Those built with bricks shaped to radiate accurately in accordance with the dimensions of the arch. The term is commonly restricted to the circumstances where bricks of the ordinary shape are cut and rubbed to radiate so as to show neat close joints.

2. *Draw, to the scale of $\frac{1}{16}$, the plans of two courses of a brick pillar in English bond: the pillar to be square in section, four bricks in the side. To what height could you safely build a pillar of this section, assuming the safe load on a course of bricks to be 8 tons per sq. ft. and taking the weight of a cubic ft. of brickwork at 120lb.—neglecting wind-pressure?*



SOLUTION TO QUESTION 2.

a. See accompanying illustrations.

(Either of these two plans will satisfy the question if the successive courses are turned through 90 degs.; or the two may be used in combination.)

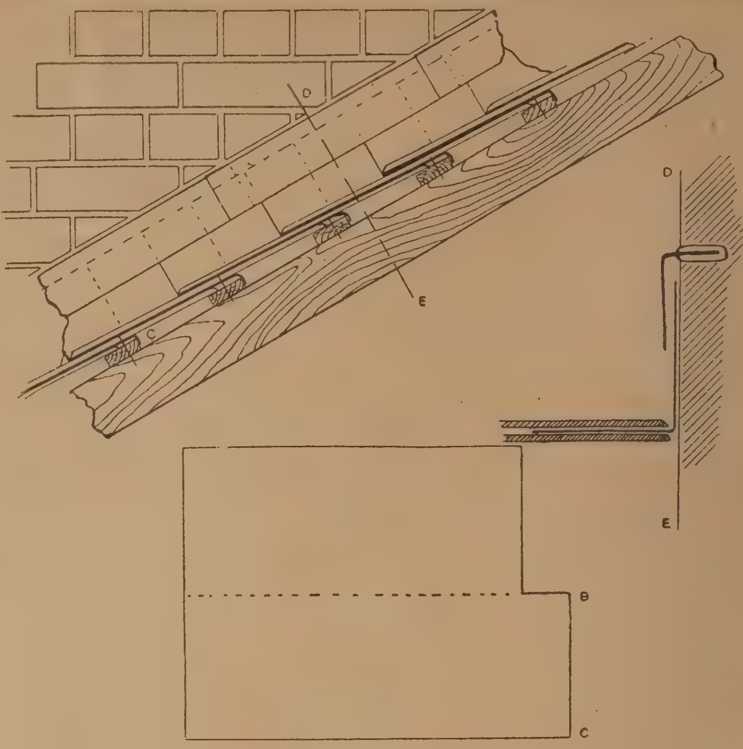
b. The height of such a pillar will be equal to the number of cub. ft. which will make 8 tons:

$$\frac{8 \times 2240}{120} = 149\tfrac{1}{3} \text{ ft.}$$

3. *What are—a skew arch; a skewback; a pillar; an abutment; a column; weathering of a window sill; weathering of stone; voussoirs; chamfer; plinth?*

a. When the plane of the spandrels or face of the arch cuts the centre line of the sheeting cylinder obliquely, particularly when the coursing of the sheeting is helical, so as to meet the face as nearly as possible at right angles.

b. The top of an abutment or pier ready for the first course of sheeting.



SOLUTION TO QUESTION 5.

c. Used loosely; heavier in proportion to height than a column (see column). Columns are frequently called pillars, as "Pompey's pillar."

d. Masonry carrying the springing of a single arch or of the end arch of a series.

e. Consists of base shaft and capital; base and capital may be rudimentary or may disappear.

f. The shape to which the top of a stone is dressed to give a fall for rainwater; particularly when it is so dressed to prevent water washing into the joints.

g. Scaling or wasting of stone in a building by the action of wetting, drying, frost, wind carrying sand, &c.

h. Stones properly dressed to fit in the sheeting of an arch.

i. The corner dressed off to replace the angle with two, more obtuse, angles.

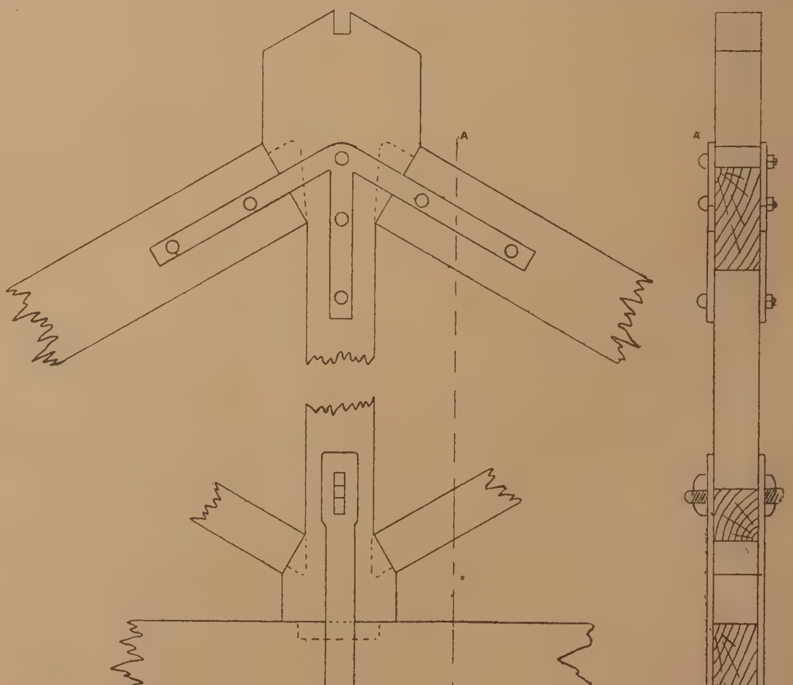
j. A projecting band just above ground level; a projecting band in any analagous position.

4. *A rubble wall with half-round concrete coping: draw it to the scale of $\frac{1}{16}$, showing the stones and mortar.*

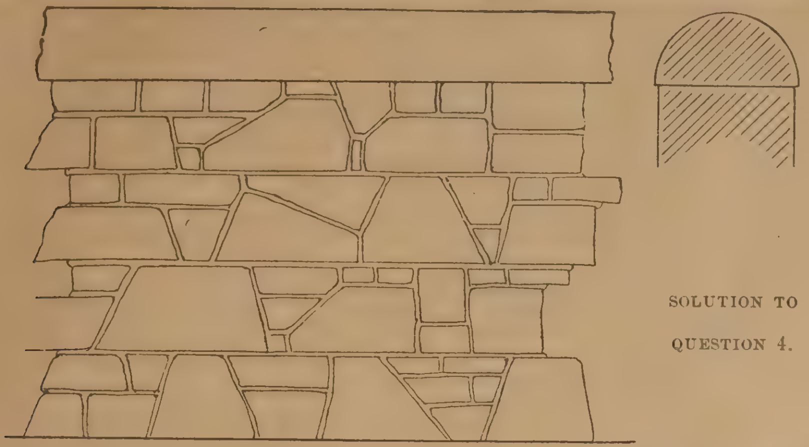
(See accompanying illustrations.)

5. *Show three soakers with cover flashing in position against a brick wall—slates 24in. long. Show clearly to the scale of ¼ all details, with such drawings and sketches, accompanied by explanations and dimensions, as you think sufficient.*

(The detail shows how soakers should be cut, without loss, so that there may be a projecting edge B C to be turned down over the top edge of



SOLUTION TO QUESTION 7.



SOLUTION TO QUESTION 4.

the batten at C; it need not be nailed. The drawing shows straight cover flashing. It is usual to step this, housing it in the joints of the brickwork, but if brickwork is in cement-mortar it will be found to be better to cover flash as shown.)

6. *Draw or sketch, to the scale of* $\frac{1}{4}$—(1) *A tenon and housed joint, mortised piece 4in. by 4in., tenoned piece 3in. by 4in.;* (2) *a tusk-tenoned joint, 9in. by 3in. timbers;* (3) *a dovetailed notch, timbers* $4\frac{1}{2}$*in. by 3in.*

(See accompanying illustrations.)

7. *Draw or sketch, to the scale of* $\frac{1}{8}$, *the top and bottom of a king post showing attachments of principal rafters and of the struts and tie-beam, and showing ironwork—rafters 8in. by 4in., shank of king post 6in. by 4in., struts 4in. by 4in., tie-beam 12in. by 4in.*

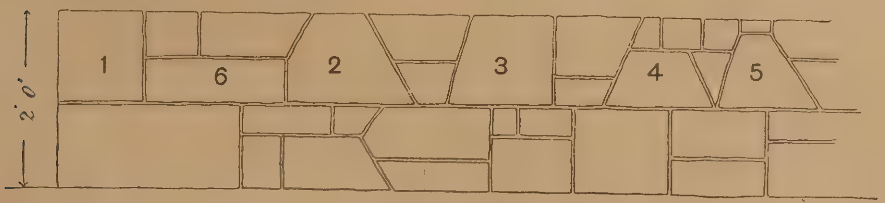
(See accompanying illustrations.)

8. *A skeleton drawing of an iron roof truss. The rafters are formed of* L *irons. Draw, to the scale of* $\frac{1}{2}$, *the joint at the apex. Repeat the diagram on your paper, and putting reference numbers to the different members, sketch cross-sections of them.*

(See accompanying illustrations.)

9. *Draw or sketch, to the scale of* $\frac{1}{4}$, *a cross-section showing bottom rail of sash, wood sill of window frame, stone sill, and window back; showing elbow. The window back is 2ft. high and the wall of the recess is 10in. thick.*

(See accompanying illustration.)



SOLUTION TO QUESTION 12.

10. *Draw or sketch, to the scale of* $\frac{1}{8}$, *cross-section of eave extending 4ft. up to the roof showing slates resting over a cut stone eave-course: the wall is 18in. thick, rafters 5in. deep, without roof trusses—ceiling joists at wall plates; slates 20in. long. Explain fully.*

(See accompanying illustration.)

11. *Draw, to the scale of* $\frac{1}{16}$, *the inside elevation of a ledged and braced door, and door frame; the door is 7ft. by 3ft. Show hinges, latch, stock lock; sketch cross-section showing jambs (wall* $1\frac{1}{2}$ *bricks thick).*

(See accompanying illustrations.)

12. *Two courses of masonry: how would you describe it? Sketch these two courses on your paper, and put reference numbers on the stones of the top course showing the order in which you think a mason would set them, giving reasons.*

a. Coursed rubble.

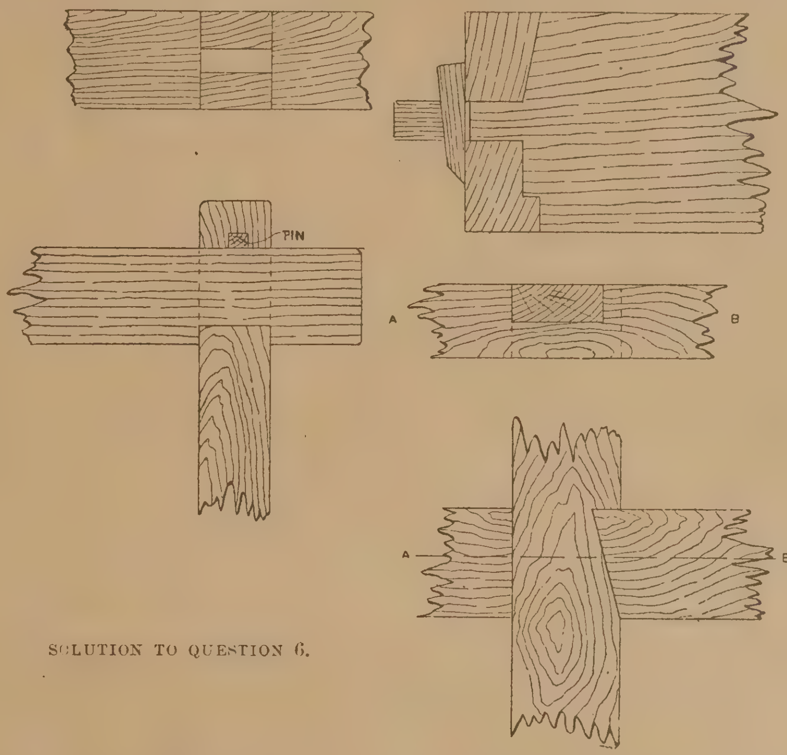
b. There is not a definite order; the stone marked 6 might be set before 3 or 4 or 5: the important rule to be observed by the mason is that he shall set his large well-bedded stones so as to cover the upright joints of the course below and to fill in between with closers. In the example shown the mason would put up his quoin No. 1 first and set his line from this stone. He would put up another good stone the height of the course at some other point, for his line, and he would set the large stones probably in the order numbered. He would not go further along than 5 till he had levelled up his course, because he does not go away from his mortar board and the supply of stones on his scaffold.

13. *Draw, to the scale of* $\frac{1}{8}$, *elevation of a double casement or French window 6ft. by 3ft. 6in.; draw cross-section of bottom bar of window and sill of frame; sketch hinges and fastening bolt. What is this kind of bolt called?*

(See accompanying illustrations.)

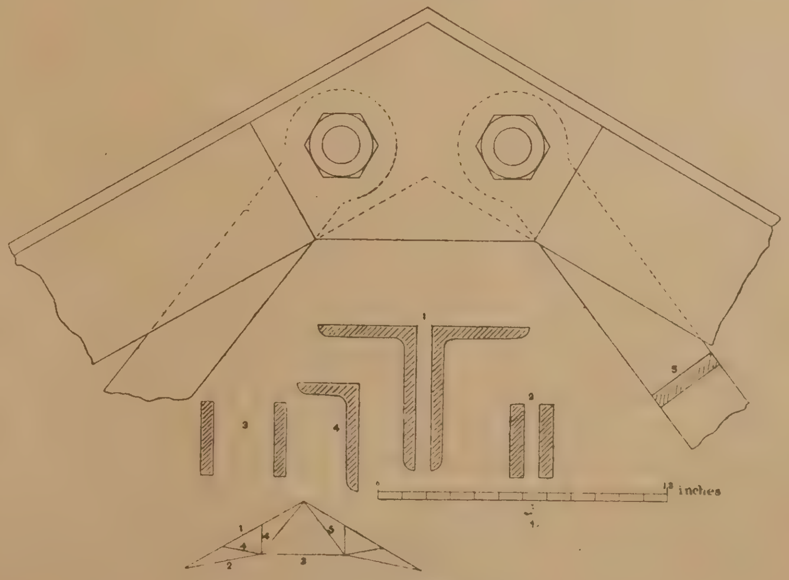
The question appears to ask for the name Espagnolette bolt, the common fastening for a French window.

14. *A floor of fir timber, joists lathed and plastered below to form ceiling of lower room. Draw plan, to the scale of* $\frac{1}{48}$, *showing by single lines complete joisting, figure scantlings. Draw, to the scale of* $\frac{1}{8}$, *cross-section through hearth reaching above camber-bar of fireplace. Show details of bearing of joists and of trimmer.*

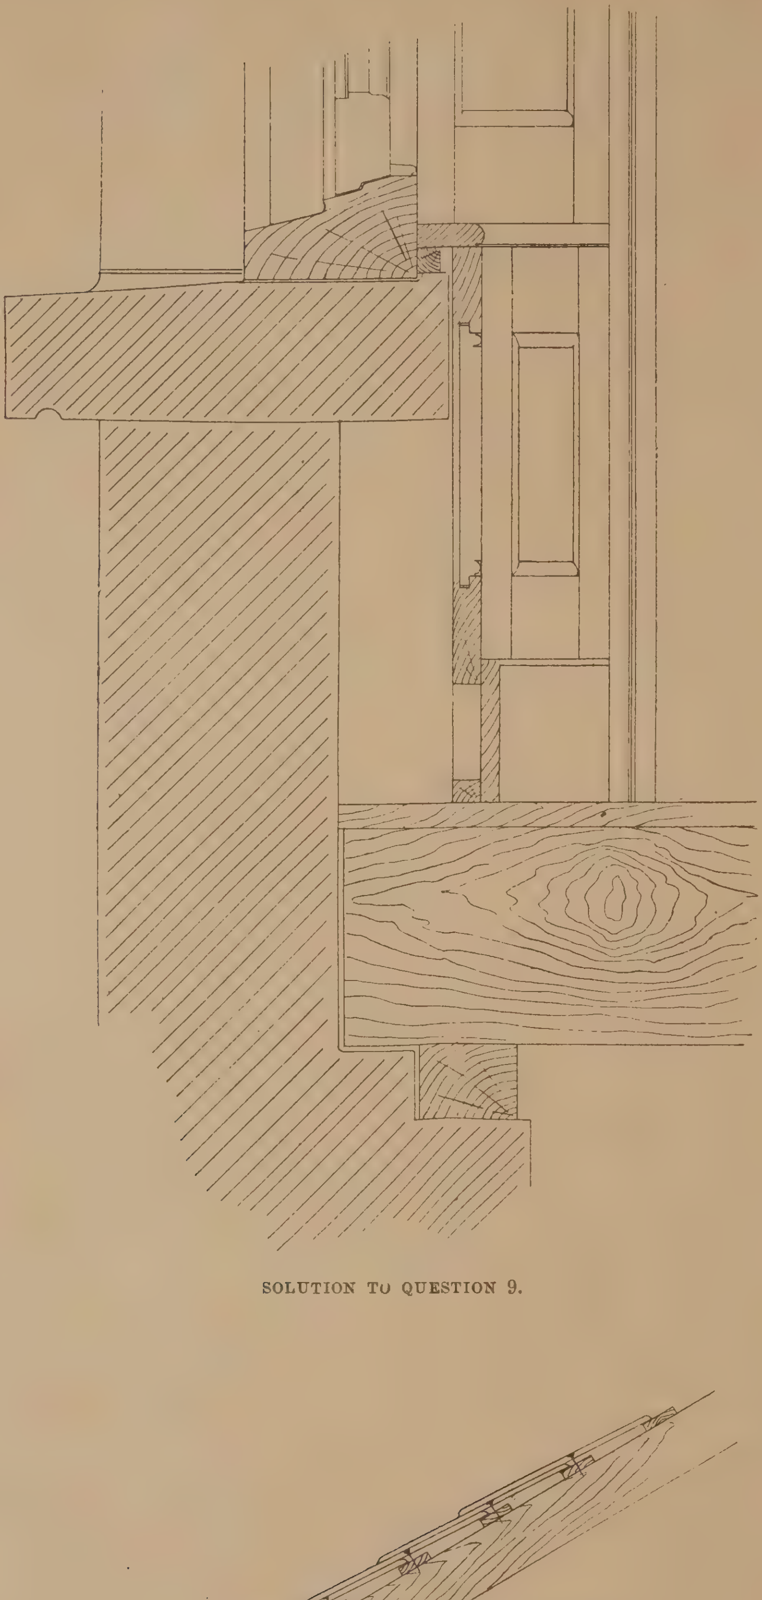


SOLUTION TO QUESTION 6.

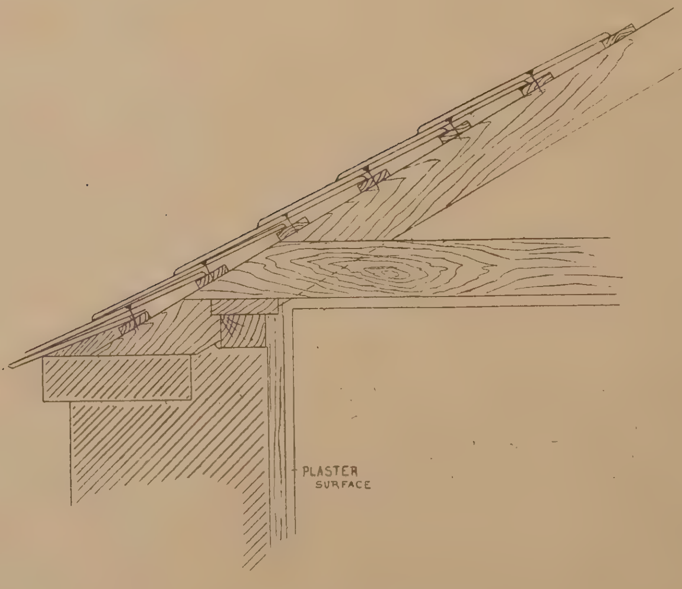
C, one row of herring-bone strutting, or there may be two rows with advantage. F, joist, 11in. by 2in.; A, trimming joist 11in. by 4ins; B, trimmer 11in. by 3in. or 11in. by 4in.; D, pieces 3in. by 2in. to carry oak margin to hearth; E, pieces 3in. by 2in. to carry flooring boards.



SOLUTION TO QUESTION 8.



SOLUTION TO QUESTION 9.



SOLUTION TO QUESTION 10.

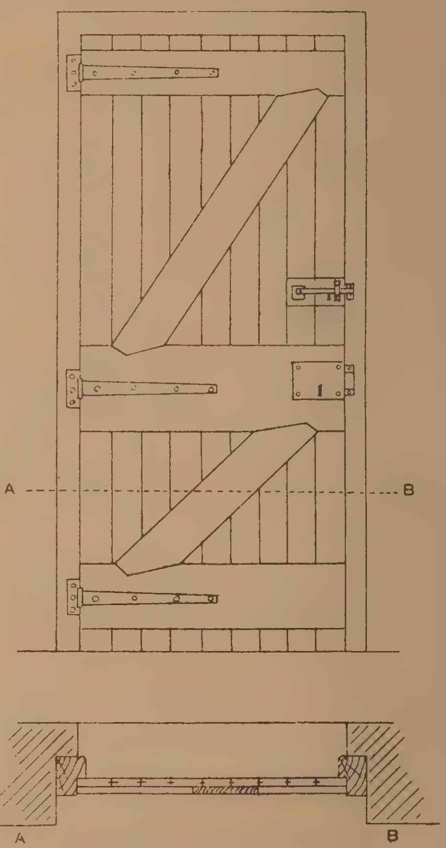
PROF. AITCHISON ON THE NEW GOVERNMENT OFFICES.

PROFESSOR AITCHISON writes to the "Times" as follows :—

It is most unfortunate that the two distinguished architects who were to build the new Government offices are both dead when the foundations alone have been completed ; and I daresay that no model of either of these great public monuments exists. I believe that all the principal buildings of the world, at least since Justinian's time, were built from models ; and by the precaution taken by the Pope to have a model made we have now Michelangelo's dome at St. Peter's.

For many of the buildings that have won the admiration of mankind two architects were employed, to ensure, I suppose, that the approved design might not be lost by the death of its designer. The Parthenon had Ictinus and Kallikrates for its architects. Anthemius, of Tralles, and Isidorus, of Miletus, were the architects of Sta. Sophia at Constantinople.

At St. Peter's Bramante was seconded by B. Peruzzi, and afterwards by Antonio da San Gallo the younger. Raffael had Giuliano da San Gallo and Fra Giocondo as aids, and after their deaths A. da San Gallo the younger was first architect ; he had Peruzzi as his second. There was no second architect to Michelangelo, although he had Vignola and Pirro Ligorio as aids.



SOLUTION TO QUESTION 11.

We were lucky in the strength and long life of Wren, who finished our great Protestant Cathedral, and in Sir Charles Barry, who finished the Houses of Parliament ; but Elmes, the architect to that triumph of classic architecture, St. George's Hall at Liverpool, died before it was finished, though he was fortunate in having so great a master as Professor Cockrell to finish it.

But should the proper completion of great public monuments be left to chance? The French Government, I am given to understand, always appoint a first and second architect to all their public buildings, the second being fit to carry out the first architect's design in case of his death.

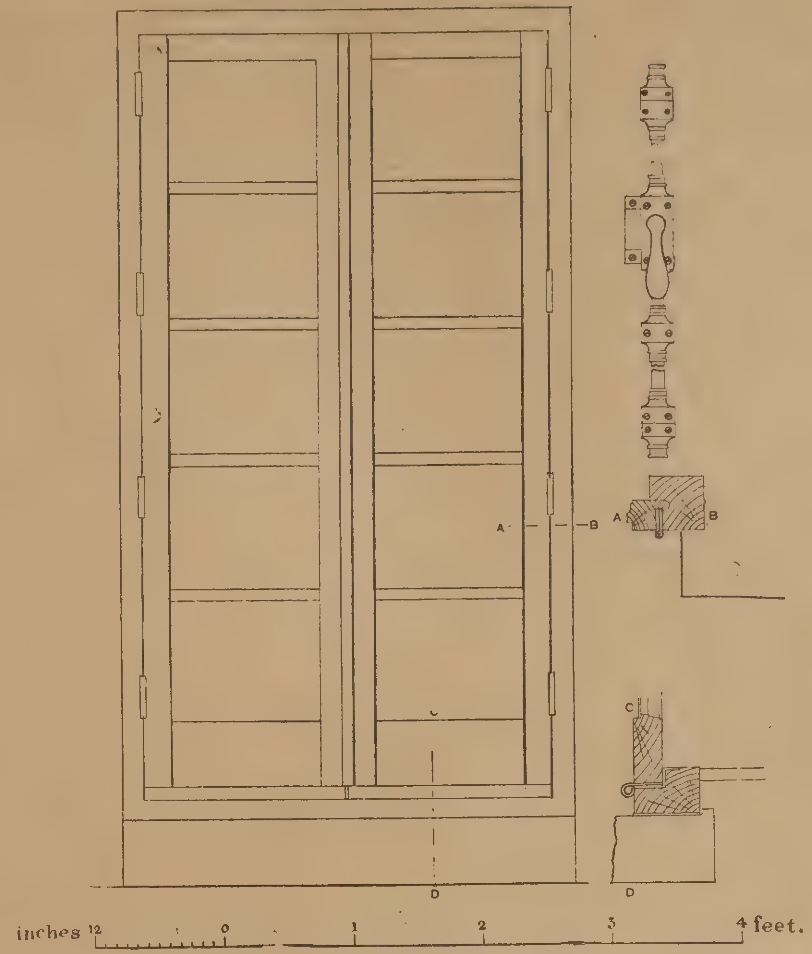
I am afraid the English people are not aware that architecture is the record of the artistic skill of each epoch and tells the state of cultivation of the nation from which all else may be deduced, or else they would not be so regardless of the possible fate that a monument may meet with in case of the death of the original designer —that is, they do not care if a bad history of their time is handed down to posterity.

NEW THEATRE AT ST. HELENS.

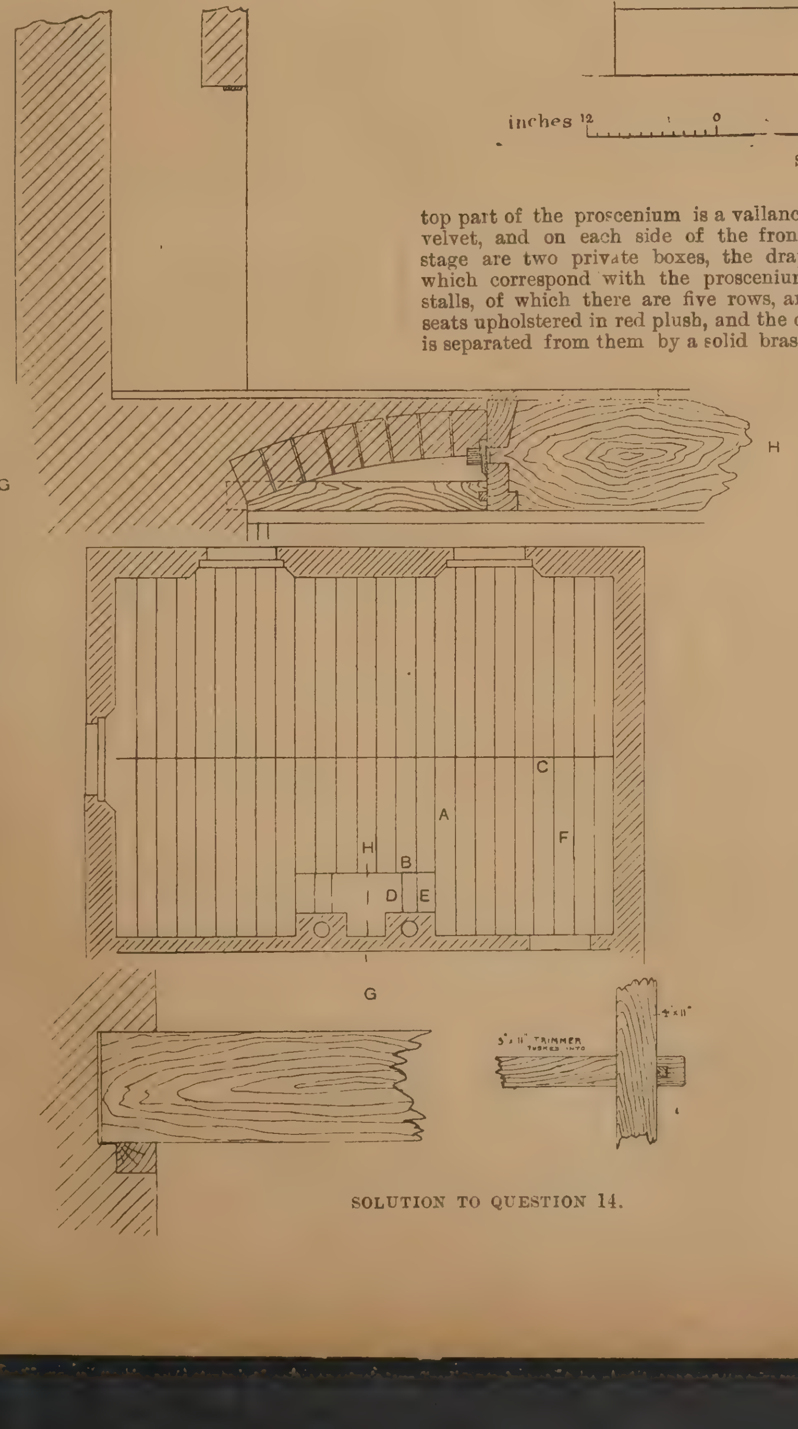
THE New Theatre Royal, in Corporation Street, was opened recently. The old theatre was unfortunately burnt to the ground on October 13th, 1899. Mr. Frank Matcham, the architect of the original building, prepared the designs for the rebuilding. Mr. Matcham, while retaining the old lines of the St. Helens theatre, has made several important alterations both in the construction and the arrangements. These include extra retiring rooms for ladies and gentlemen, and an increase of the seating accommodation, which may now be reckoned at something over 2,000. The dress circle is seated for 106, the orchestra stalls for 95, the upper circle for about 300, the pit stalls for 200, the pit for 500, the amphitheatre for 200, and the gallery for 600. The dress circle and the upper circle have been brought forward from the old position, so as to give more accommodation, and the gallery has also been brought forward about 4ft. 6in. The prevailing colour of the decorations is pale terra-cotta enriched with cream and gold lines, and the general design is in the style of the Louis XIV. and XV. periods. In the centre of the ceiling is a fluted dome, carrying Stott's patent ventilator and sunlight. Around the dome are four panel groups of figures painted in the Bartolozzi style and representing music, literature, sculpture and science. The proscenium has a rich frame of cream and gold. In the centre, immediately over the curtain, is the borough coat-of-arms. Running up the sides are columns of marble. The act-drop is from the brush of Mr. W. T. Hemsley. Underneath the top part of the proscenium is a vallance of red velvet, and on each side of the front of the stage are two private boxes, the draperies of which correspond with the proscenium. The stalls, of which there are five rows, are tip-up seats upholstered in red plush, and the orchestra is separated from them by a solid brass rail, on which are hung curtains of the same colour as those which adorn the boxes. Behind the orchestra stalls are the pit stalls, and beyond these again the pit. The whole of the walls of the pit are tiled up to 5ft., the remaining part being covered with a red paper. The chairs in the dress circle are upholstered with similar material to that used for draping the other parts of the house. At each end of the dress circle there is an alcove, in which hangs a framed mirror, heart-shape. The upper circle is immediately behind the dress circle, and it is upholstered in red plush; the floors are covered with thick cork carpet; the walls are hung with red flock paper, the ceiling being decorated with lincrusta. On the tier above the dress circle is the amphitheatre, upholstered in strong American cloth, and beyond is a spacious gallery from which a wide stone staircase runs down to the street.

Another improvement in the building is the installation of the electric light. Both before and behind the curtain this is to be the sole illuminant. From the central ceiling hang eight sprays of three lamps each, and at the side two sprays of five lamps each, while sprays of three lamps each are spread in front of the galleries and over the boxes. Altogether there are over ninety electric lights in the auditorium. To reduce the danger of fire to a minimum, the structure of the auditorium is built of concrete and iron, and all staircases and passages are fireproof. The heating of the building is effected by hot water pipes, and hydrants, fully equipped, are provided in the most desirable positions. A fireproof curtain completely divides the stage from the auditorium, and the whole of the timber of the stage has been covered in asbestos paint. The doors are fitted with Briggs's patent panic bolts.

The stage is a large and well equipped one. A feature of the arrangements here is that all the lighting will be electric, even for the footlights. By an ingenious arrangement on the principle of liquid resistance the footlights can be raised or lowered, so as to brighten or darken the stage. Above the stage are five adjustable rows of electric lights for the illumination of the stage. In these red, white and blue lights alternate, and the different colours can be used for stage



SOLUTION TO QUESTION 13.



SOLUTION TO QUESTION 14.

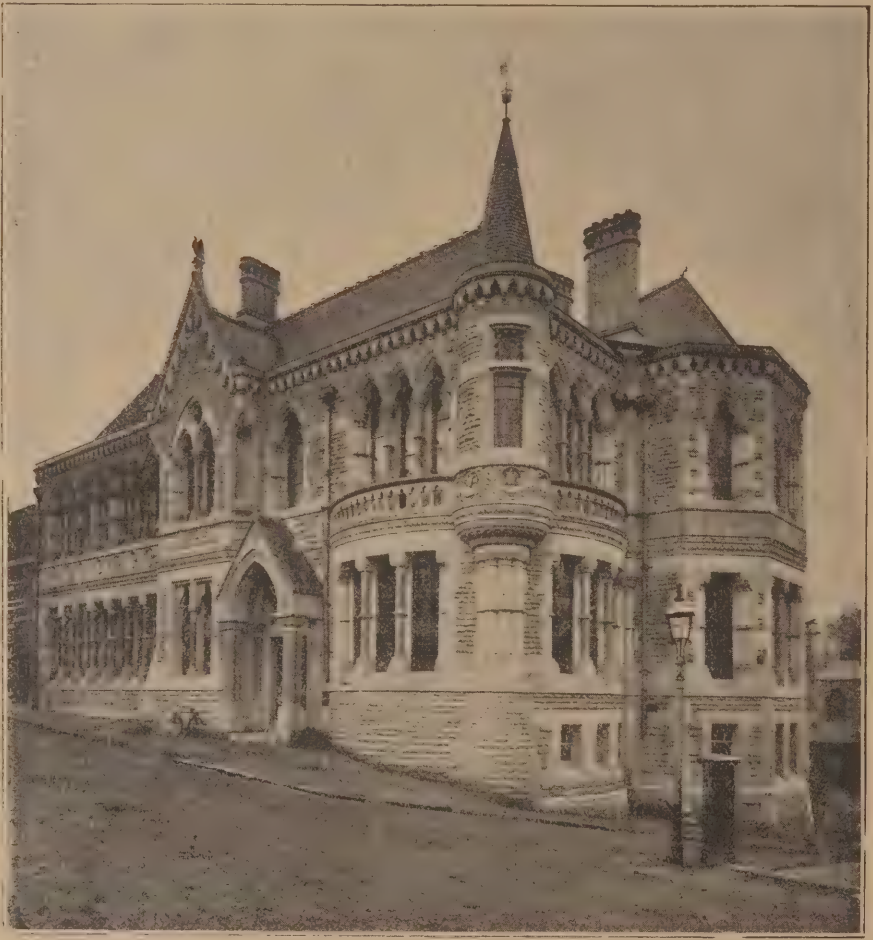
effects of sunrise and sunset, &c. A complete set of dressing rooms, lit by electric light, carpeted, warmed, and fitted with mirrors and all conveniences, has been constructed for the artistes.

The contractor for the building was Mr. P. Tickle, St. Helens. The fibrous plaster and decorations have been carried out on an independent contract by the well-known firm of De Jong; and the stalls and dress circle seating are by Messrs. Lazarus.

A New Public Park at Vale of Leven is being made. The enclosing fence is to be supplied by A. & J. Main & Co., Ltd., Clydesdale Ironworks, Possilpark, Glasgow. The laying out of the grounds is to be in the hands of Mr. Neil Leitch, Rothesay. A lodge or superintendent's house is to be erected at the south-east corner of the park; the style is to be Baronial, from the plans supplied by Mr. Millar, Glasgow, the architect of the Glasgow Exhibition.

SCHOOL OF SCIENCE AND ART, STROUD.

THE School of Science and Art illustrated on this page and the next has lately been erected at Stroud at a cost, including the site, of about £10,000. Mr. John P. Seddon, F.R.I.B.A., of London, and Mr. W. H. C. Fisher, of Stroud, were the joint architects. The upper floor is used for the art school, and provides an elementary room 35ft. 6in. by 20ft., an antique room 36ft. 6in. by 20ft., two painting rooms 27ft. 6in. by 20ft. and about 29ft. by 22ft., a modelling room 20ft. by 20ft., a small library and an art-master's room. The windows of the antique and painting rooms have a northern aspect, and are of the full height of the rooms, namely, 16ft. and 12ft. by 10ft. wide respectively. Opaque blinds are so arranged that the light is under complete control, or, if necessary, can be entirely excluded. The ground floor and basement are devoted to the museum and school of science. On the ground floor is the museum, lecture room, a classroom, physical laboratory and science master's room; and in the basement are the chemical laboratory and balance-room, with accommodation for a custodian. The site slopes so rapidly from the front (south) towards the north that although a height of 14ft. is given to the laboratory its floor is still above the external surface at the rear. A heating chamber is constructed beneath the basement landing, the building being heated by hot-water pipes and radiators; but the rooms are also provided with the usual open fireplaces. The fume closets in the lecture-room and chemical laboratory are connected by a flue beneath the floor of the latter with the smoke flue from the boiler, a small pilot fire creating the required draft at such times when the boiler may not be in use. Provision is made for ventilation by means of special air flues from each room, communicating with an air trunk in the roof, which in its turn is connected with the air shaft surrounding the smoke flue from the boiler. The work is executed in local freestone from the inferior oolite, the face being polled, with dressings of Box Ground stone from the superior oolite. The window jambs are finely moulded, the shafts of the mullions being of Bristol pennant, as are also those at the entrance porch. It is interesting to note that Mr. Seddon's appointment to this building was through a doctor of Stroud who was a friend and fellow-traveller of Viollet-le-Duc.



SCHOOL OF SCIENCE AND ART, STROUD. JOHN P. SEDDON, F.R.I.B.A., AND W. H. C. FISHER, Joint Architects.

The Competition for a School at New Brompton in Richmond Road for the Gillingham and Grange U.D. School Board has been decided in favour of Mr. J. D. Pearson, of 27, Chancery Lane, W.C., who has been appointed to carry out the work. Messrs. Newton, Son & Lawson, of Morcambe, won second place; Messrs. Greenhalgh & Brockbank, of Broad Street House, E.C., won third place; and Mr. F. M. Kirby, of Greenhithe, was fourth.

The Programme of the R.I.B.A. Visit to Glasgow is as follows: Thursday, October 3rd, R.I.B.A. dinner. Friday, (1) Lunch in the Exhibition grounds given by the Glasgow Institute of Architects; (2) Visit to the Glasgow University (tea); (3) Conversazione given by the Corporation of Glasgow; Saturday, Visits to Exhibition, &c. At all Friday's functions the presence of ladies will be welcome. Application for tickets should be made to the secretary R.I.B.A., 9, Conduit Street, W., if possible, before July 1st.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Answering R.I.B.A. Examination Questions.

CARLISLE.—BORDER writes: "Owing to the short time allowed for some subjects in the R.I.B.A. Intermediate Examination, would it be better to say a little on each question, or take up most of the time with one?"

It is best to answer as many of the questions set as possible, writing each one clearly and concisely, and not giving too much time to any single answer. Each question is allotted a certain number of marks. A sufficient aggregate cannot therefore be obtained by answering one question only. P. R. S.

Church Halls.

LONDON, S.W.—J. S. writes: "I have a client who is desirous of erecting a church hall in a small town, and therefore anxious to see some existing up-to-date buildings of this class. Could you give me any names of halls and their situations?"

The Vestry Hall, St. Mark's, Battersea Rise, by the late Mr. William White, and the Parish Hall, Holy Trinity, Upper Tooting, are both well-planned examples and of recent date.

P. R. S.

Boundary of Building Plots.

CORBRIDGE-ON-TYNE.—J. A. H. L. writes: "I have a piece of land that I wish to build upon. There is a thorn hedge, the centre of which forms my boundary. I understand that in some cases it is contended that the boundary is 3ft. beyond the centre. Is this so?"

Under ordinary conditions, the ditches constitute the actual boundaries of a piece of ground, and it is a well-worn land-surveying phrase that "the hedge carries the ditch." In other words the ditch—together with the adjacent bank or hedge—belongs to the field which is situated on the *opposite* side of the hedge to that on which the ditch is dug, and the true boundary of the property is that edge of the ditch which is furthest removed from the bank or hedge. Whilst the foregoing explanation represents the general principle as to average hedge-row boundaries, no hard-and-fast rule can be given, as very much depends on local or private circumstances, especially in the case of old enclosures. When a property adjoins a highway, it sometimes happens that the wayside ditch has been cut by the local authority entirely for road-drainage purposes, so that only an intimate knowledge of the particular road and property could definitely determine the actual boundary. If there is a ditch on both sides of the hedge, then—in the absence of other evidence—it may usually be assumed that the centre of the hedge forms the property boundary. Similarly, if there is no ditch on either side, it is generally understood that the centre of the hedge indicates the actual boundary. When making a survey of agricultural land, instead of the surveyor attempting to trace the line or edge of the various ditches (which are not always easily defined), it is usual in many districts to make an allowance of six links (or 4ft. approximately) from the centre of the hedge to the outer edge of the ditch as representing the field boundary. In other localities an allowance of 3ft. is given, but such approximations, whilst being convenient, do not necessarily indicate the true boundaries. It may be mentioned that in the Ordnance Survey (which was originally undertaken chiefly for military purposes) the measurements are taken to the centre of the hedge, bank or fence, as the case may be, so that these maps indicate the position of the physical divisions between the different enclosures, and not the actual property boundaries.

T. E. C.

Free Library Fittings.

Newport, Mon.—Pupil writes: "Could you give me some idea as to what fittings are necessary in a filing room for newspapers, &c., in a free library?"

"Library Construction," by F. J. Burgoyne (George Allen, 6s. nett), will give you full particulars and most useful advice upon the planning and construction of libraries.

Testing Cement Briquettes.

Newcastle.—M. W. writes: "How many lbs. per square inch is a fair test for cement after a seven days' immersion in water; and is there any special care required in moulding the briquettes for testing? Can you use too much water, and does the cement need to be pressed into the moulds? The cement is to be used for floors."

400lbs. per sq. in. at the age of seven days is a fair test for Portland cement. Too much water weakens a cement. In gauging briquettes for testing purposes the water should be only sufficient to rise to the surface when smoothed over with the trowel. The best results are obtained when the water rises to the surface of the briquette on ramming and shaking. The briquettes should not be pressed.

London, S.E.—T. S. writes:—"Are there any books on cement-work and testing? Have any articles on the subject appeared in your columns?"

"Portland Cement: Its Manufacture, Testing and Use," by D. B. Butler (Spon, 15s.), and "Lime, Mortar and Cement" (Sanitary Publishing Company) are good books. An article on Portland cement appeared in our issue for March 14th, 1900.

Panels in Glass Doors.

Wisbech.—Novice writes: "The accompanying rough sketch (not reproduced) shows a central diagonal panel in the upper half of a glass door. Kindly explain in your columns the proper method of jointing-up. I am recommended to use wood pulp for pugging wood partitions, &c. What is this material and its cost, and where can I obtain it?"

The bars of the diamond-shaped centre are mitred, and morticed at the mitres. the other bars being tenoned into them. We do not consider, however, that such a design should be used at all; it is weak, expensive and not suited to wood construction (which should be as simple and straight as possible). Adopt either a single pane of glass, straight bars across or perpendicular, or, if the pane is too large and does not look well, use leaded lights. We have not heard before of wood pulp being used for pugging, but presume the ordinary kind as made by paper manufacturers would be employed. We would not, however, advise its use; it would probably rot and, if subjected to damp, would be attacked with fungus growth; it would also harbour vermin. Slag wool is by far the best, being sound-, fire- and vermin-proof.

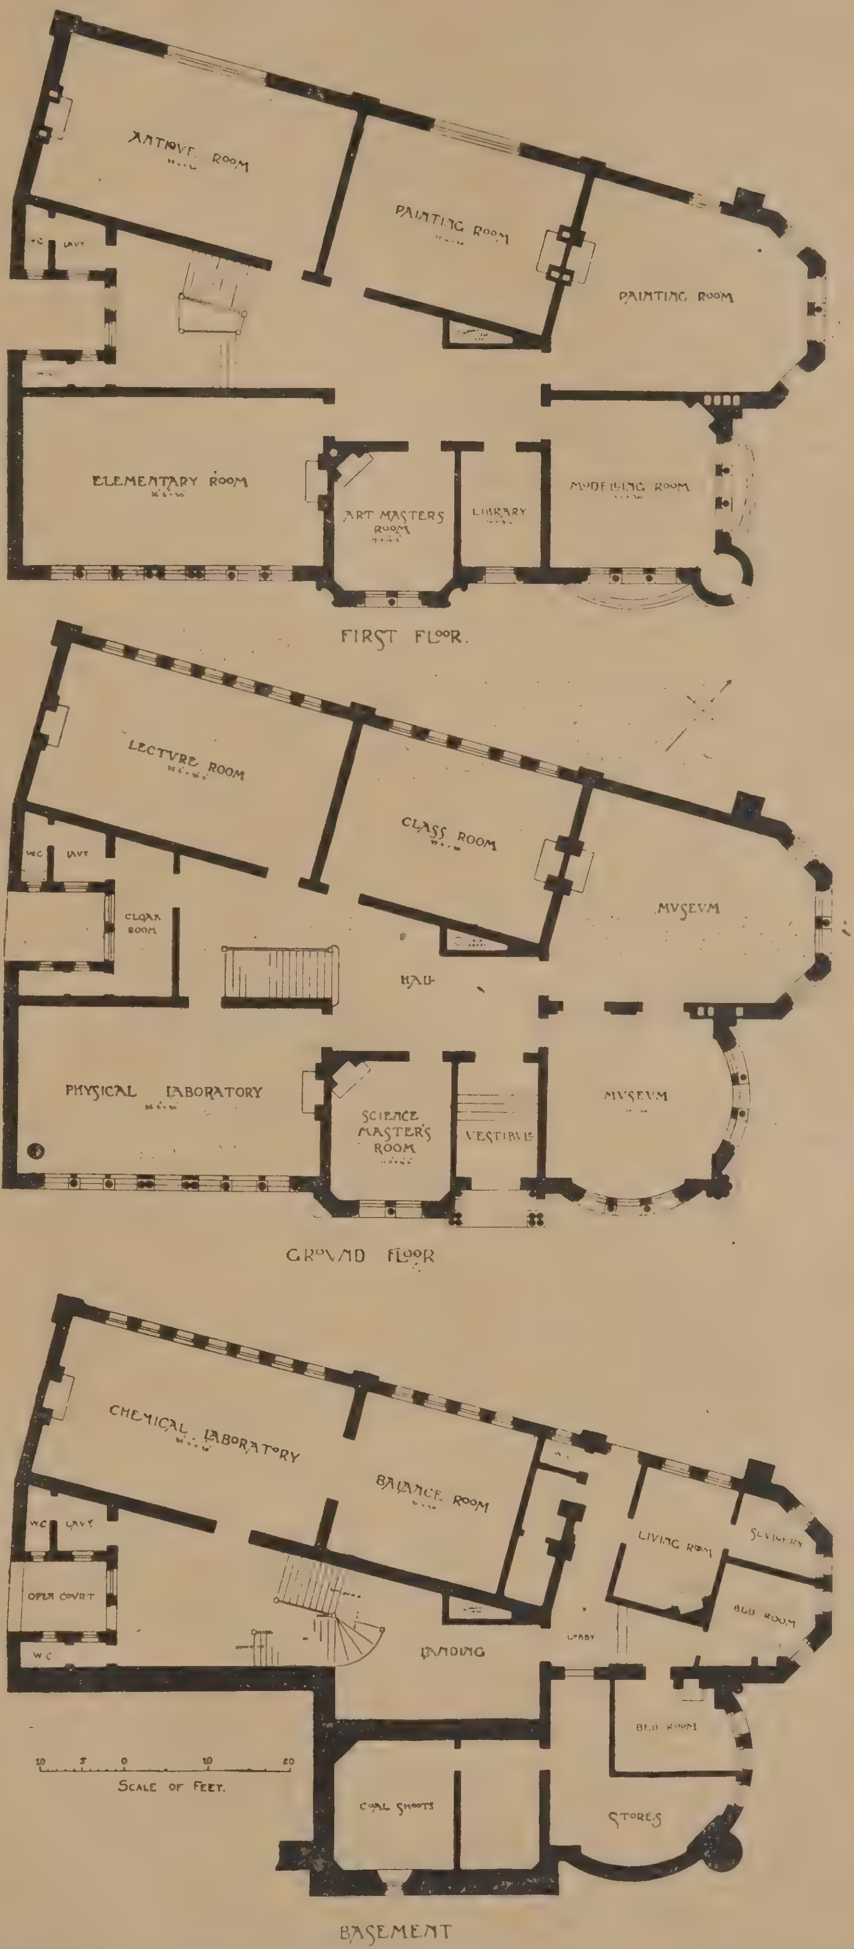
Calculating Weight of Timber Beams.

Montacute.—An Enquirer writes: "On p. 308 of your issue for May 22nd, in reply to 'Formula,' you state that 'w = breaking weight in cwts.' In 'Strength of Materials and Structures,' by Sir John Anderson, one reads (p. 180): 'Breaking weight in lbs. =

$$\frac{\text{breadth in ins.} \times \text{depth squared in ins.} \times \text{constant},}{\text{length in feet.}}$$

Does w = breaking weight in lbs. or in cwts?"

The formula is ultimately dependent on the values assigned to the constant c. Sir John Anderson adopts values for the constant 112 greater than Hurst's, thus making it equivalent to reducing the cwts. calculated by Hurst to lbs. by multiplying by 112. Thus Hurst adopts 3 as the constant for elm, while Anderson uses 337. The two formulas are, therefore, both correct each with their separate constants.



SCHOOL OF SCIENCE AND ART, STROUD. JOHN P. SEDDON, F.R.I.B.A., AND W. H. C. FISHER, Joint Architects.

Nuisance Inspectors' Reports.

CREDITON.—J. E. B. writes: "Does the report of a nuisance inspector written in his journal constitute a written application (or complaint) under section 41 of the Public Health Act, 1875?"

Section 41 of the Public Health Act, 1875, states that "on the written application of any person to a local authority, stating that any drain, water-closet, earth-closet, privy, ash-pit, or cesspool on or belonging to any premises within their district is a nuisance or injurious to health (but not otherwise) the local authority may, by writing, empower their surveyor or inspector of nuisances, after twenty-four hours' written notice, to enter such premises, with or without assistants, and cause the ground to be opened, and examine such drain, water-closet, earth-closet, privy, ash-pit, or cesspool. If the drain, water-closet, earth-closet, privy, ash-pit, or cesspool on examination is found to be in proper condition, he shall cause the ground to be closed, and any damage done to be made good as soon as can be, and the expense of the work shall be defrayed by the local authority. If the drain, water-closet, earth-closet, privy, ash-pit, or cesspool on examination appear to be in bad condition, or to require alteration or amendment, the local authority shall forthwith cause notice in writing to be given to the owner or occupier of the premises, requiring him forthwith, or within a reasonable time therein specified, to do the necessary works.". As an expression of opinion, it is considered that the report of a nuisance inspector written in his journal would not constitute a written application as required by the Act. Under ordinary circumstances, the complainant or occupier should make the written application. T. E. C.

Right of Council to erect Mortuary.

AN OLD SUBSCRIBER writes: "May an urban district council, which, acting as a burial board, has recently purchased land for a cemetery with moneys borrowed on the security of the poor rates, now erect a public mortuary on a convenient small piece of land, and defray the expense out of the general district rates?"

Under the Public Health Act the local authority has power to provide a mortuary. Hence the urban district council are within their right. A. O. H.

Theoretical Mechanics.

GRAYS.—R. J. T. writes: "Kindly name a book dealing with the cardinal principle and theory of construction, which will enable me to solve the following questions set at the last S. K. Honours Examination in Building Construction: What is meant by saying that the height to which a pyramid of any building material may be raised is three times the height of a column of uniform section? Show how, by attending to a cardinal principle of construction, you can build a tower of brick or stone of very great height. With reference to the previous question, a brick tower of efficient design is built on a square base 60ft. by 60ft.; it is 500ft. high. Allowing six tons per sq. ft. as the *safe* load on a cross section, and taking 120lbs. as the weight of a cub. ft. of brickwork, what is the area of the top? What weight in tons may be safely placed on the top?

The principle referred to is the same as that for foundations, &c., namely, that of distributing the pressure over a larger area of ground; the stress by good bonding being deflected over a large enough bearing to resist crushing or shear. The volume of a cylinder (or cylindrical column) = area of base × perpendicular height, whereas the volume of a pyramid = area of base × $\frac{1}{3}$ perpendicular height. It can be seen therefore that the pyramid can be raised to three times the height of the column for the same weight of material that will cause crushing. The area of the top of the tower is calculated from the formula for the frustum of a pyramid, namely, if a = area of one end, a^1 = area of other end, and h = height of frustum. Volume $= (a + a^1 + \sqrt{a . a^1}) \times \frac{1}{3}h$. The ordinary text-books will enable you to solve these questions, but the book dealing most theoretically with them is Rankine's "Manual of Applied Mechanics" (Griffin & Co., 12s. 6d.). The questions and answers set in the above examination will be published shortly in our columns.

Builders' Notes.

Mr. Joseph Shaw, joiner and builder, of Douglas Terrace, Holmfirth, died recently at the age of sixty-six years.

Mr. G. E. Wallis, builder, of 215, Boxley Road, Maidstone, died recently. He was head of the well-known firm of Messrs. G. E. Wallis & Sons, builders, of Maidstone, and alderman of the Maidstone Council.

Valuable Deposits of Jasper, of a deep-red colour, have been struck at Careg-y-Plas, in the parish of Aberdaron, South Carnarvon. The lodes are said to be from 10yds. to 40yds. in width, and practically exhaustless. A demand for the stone is anticipated for memorials to the late Queen. It can be cut in blocks tons in weight.

Mr. Joseph Harry Bradley, builder, of Barnsbury, died recently at the age of thirty-six years. Mr. Bradley was born in Islington, educated at the High School in Barnsbury Street, apprenticed to Dove Brothers, and, in time, passed all the necessary examinations in building construction, sanitary science, &c., and became a master.

Paying Wages in Public-houses.—At the Kilmarnock Sheriff Court last week Thomas Young, joiner and contractor, Carment Drive, Stevenston, was charged with a contravention of the Payment of Wages in Public-Houses Prohibition Act by having, on 30th March, within a public-house at Ardeer Ironworks Square, Kilmarnock, paid wages to three of his workmen. He pleaded guilty. It was stated in extenuation that the offence was a very technical one. On the date in question there had been a severe snowstorm, and the men stopped work at ten o'clock. Learning that Mr. Young and his foreman were in the public-house, they went there and asked for their wages, as they wished to go home to Irvine, and the foreman gave them the money to save them walking to the office. The sheriff said that as this was the first prosecution under the Act in Ayrshire, or perhaps in Scotland for anything he knew, he would not inflict any penalty, but he warned accused to be more careful in future.

Keystones.

A New Church of St. Colombo at Middlesbrough is being erected in Cannon Street at an estimated cost of about £7,000.

A New Public Hall at Port Ellen is being erected in Gothic style. The architects are Messrs. Sydney Mitchell & Wilson, of Edinburgh.

Tetbury Church is to be restored. Mr. Jenkins's tender for raising the floors of the chancel and the choir preparatory to the erection of choir stalls in the latter have been accepted. Already over £820 is being spent on the work.

A New Works at Willesden, N.W., has been erected for the Standard Soap and Perfumery Co., Ltd., an American firm who manufacture the "Royal Standard" soap. The builders were Messrs. Collins & Cook, who also provided the plans.

New Members of the R.I.B.A. have been elected as follows: As Fellows—Messrs. J. C. Hall, London; H. B. Measures, London; E. H. Pritchett, Swindon; and N. Y. Armstrong Wales, of Dunedin, New Zealand. As Associate—Mr. J. A. Minty, Leyton. As Honorary Corresponding Member — M. Sainte-Marie Perrin, of Lyons.

The Church of St. Mary, Washfield, about three miles from Tiverton, has just been extensively restored. The tower of the church has been re-pointed, a new parapet erected on top, a new roof put in, and the base of the tower has also been repaired; the five bells have also been recast and re-hung, whilst a new tenor has been added. The latter weighs 10½ cwt. The cost of the masonry work was £250, and that of re-hanging and casting the bells £250, and £15 for extras, making a total of £515.

A New Cottage Hospital has been erected at Blairgowrie.

A New Fire Station at Tonbridge is being erected in the Castle Ground with an entrance from Bank Street, from designs by Mr. W. L. Bradley, C.E., the town surveyor.

Royal Society of British Artists.—The following have been elected members of this society: E. W. Davies, H. Chadburn, J. E. Goodall, J. H. Borglum, Shirley Fox, J. D. Fergusson, John W. Allison and Carton Moore Park.

A Stained-Glass Window at St. Mary's Church, Chard, the fourth of a series, has just been erected in the north aisle. The window contains three single figures, in the centre St. Mary B.V., and on either side SS. Mary Magdalen and Mary, wife of Cleophas, and is from the studios of F. Drake & Sons, of The Close, Exeter.

A New Infirmary and Nurses' Home at Richmond is being erected by the local guardians at a cost of £40,000, and will contain accommodation for eighty-one males and eighty-one females. A special feature of the building, the site of which is close to Richmond Park, will be the provision which is made for the open-air treatment of consumption.

A New Church of St. Peter, at Rugby, has been erected of corrugated iron upon brick foundations, with red brick pillars, by Messrs. Hollowell & Son. The interior has been matchboarded, and in the nave the walls are tinted green, whilst the chancel is painted white. The edifice provides accommodation for 300 worshippers. The total cost of the building has been about £800.

M. Ernest de Sarzec, the French archæologist died recently. Born in 1836, he was Vice-Consul at Massowah from 1872 to 1875, and afterwards at Basra. Encouraged by M. Waddington, Minister of Foreign Affairs, and by the Louvre Curators, he carried on excavations, with his wife's assistance, at Tello, which threw much light on Chaldean history and enriched the Louvre with a valuable collection.

A New Foresters' Hall at Cranswick has been erected by the village club at a cost of between £800 and £900. The hall measures 70ft. by 29ft., and kitchen accommodation, a gallery and ticket offices are also provided. The front is of Accrington red bricks, with stone dressings, and a deep panelled frieze of stone runs across it. The architect was Mr. Joseph Shepherdson, and the contractor Mr. John Dunn, both of Driffield.

Archæological Discoveries in Turkestan.—Dr. Stein, writing from Khotan on April 22nd, reports the latest results of his excavations in Northern Chinese Turkestan. He has unearthed a large number of fine stucco sculptures closely resembling the Greco-Buddhist relics of the North-Western Punjab, probably belonging to the first century of the Christian era. Great difficulty is being experienced in excavating the colossal Buddhas, but valuable photographs have been taken of them, while the smaller pieces have been removed. Dr. Stein has now a fine illustration of what the big Stupa with its chapel and court was like in Khotan at the time of the Han dynasty.

Liverpool Cathedral: Recommendation to adopt St. James's Mount Site.—Important decisions were arrived at by the Lord Bishop's Cathedral Committee on June 3rd. It was resolved: "That this committee, having carefully considered the various suggested sites for the erection of a cathedral, recommend the Lord Bishop of Liverpool to adopt the site of St. James's Mount; further, that they have pleasure in placing at his lordship's disposal, for the erection of the cathedral, promised contributions amounting to £125,000." A vote of thanks was passed to Mr. T. Shelmerdine, the city surveyor, for the valuable assistance he had rendered. The committee and the council of University College, feeling that the interests of both the cathedral scheme and the university for Liverpool scheme would be best served by a mutual arrangement that one should take precedence over the other in appealing to the public, have agreed that a public meeting on behalf of the building of a cathedral should be held on June 17th, and that a meeting to further the proposed university should be held not earlier than October next.

Sir Thomas Drew, R.H,A., P.R.I.A.I., has been presented with a gilt silver cup and cover by the members of the Royal Institute of Architects of Ireland as a mark of esteem on his receiving the honour of knighthood.

The Nonconformist Grammar School at Bishop's Stortford has had new Science buildings added at a cost of £1,500. Messrs. J. L. Glasscock & Son were the builders. The materials used are red bricks and yellow stone dressings, and the building contains physical and chemical laboratories and lecture-room, each 30ft. by 20ft., also a preparation-room, stores, &c.

New Casual Wards for the Holborn Guardians are to be erected on the site of the old Holborn workhouse in the Gray's Inn Road, at a cost of £11,000, from competitive plans by Messrs. Smith & Coggins. The three other architects who had entered into competition and submitted plans were Mr. L. H. Isaacs, Mr. Lewis Solomon and Mr. Saxon Snell, who were respectively awarded £25, £15 and £10.

Working-Class Flats at Great Yarmouth have been erected on Kitchener Road, by the Corporation, under the Housing of the Working Classes Act. There are eight flats, each of two rooms, in the block, and the rental is half-a-crown per week for each tenement. The building is of red bricks, divided in the centre by a stone stairway with glazed white-tiled walls which conducts to a sort of balcony on the first floor, whence entrance is obtained to the upper tenements. At the back of the building is a concreted yard with offices. The rooms provided are moderate in size, but one of each couple is fitted with a cooking range. It is only intended that two persons shall live in each flat.

Herr Josef Engel, the sculptor, died recently at Buda-Pesth, aged eighty-six. The deceased artist, who was patronised by Queen Victoria and Prince Albert, studied at Pressburg and at Vienna, where, in 1837, he obtained a first prize for a statue of Apollo. He then went to Paris, and finally to London. Some of the standard bearers on the facade of the Houses of Parliament were modelled by him, as well as the statue of King John. It was not, however, till his busts of the Queen and Prince Consort attracted attention that more important commissions were given to him, including that for his "Battle of the Amazons." In 1846 the Queen sent him to Rome, where he executed the "Battle of the Amazons" on a larger scale; and this group is now at Osborne. After his return to England he received commissions for groups and statues from the Prince of Wales, the Lord Mayor and others; and his fame reaching his native country, he returned, in 1866, to finish the Tszechenyi Monument and a number of busts and statues.

Sir Martin Conway has been appointed Slade Professor of Fine Art at Cambridge. He is an enthusiastic explorer and mountaineer, and was formerly Art Professor at Liverpool University.

The Artist-Decorators of Paris have founded a society for the purpose of defending their interests and for organising exhibitions of every class of decorative art. Already there are 250 members, and the society hopes that amateurs and the public will aid it in its endeavour to raise the standard of decoration and to imbue the people with an appreciation of the value of art in their homes.

The Alexandra Hospital, Woodhall Spa, has been extended by the addition of a new ward at a cost of £2,000, and will provide for ten more beds. The new wing is situated on the south side of the hospital. It consists of a large day-room for the men. The roof of the men's sleeping-room has been raised, and the size has been increased. One additional bed has been added in this portion of the hospital, and the new ward which has been added will provide four beds. On the first floor two small wards have been converted into one. The alterations were carried out under the supervision of Mr. Temple Moore, architect; and the builders were Messrs. Sherwin & Son, of Boston.

A New Drill Hall at Grimsby is to be erected for the 3rd Battalion of Lincolnshire Rifle Volunteers at an estimated cost of £3,000. The architect is Mr. F. W. Croft. The site is situated on the west side of Doughty Road, and contains 1,384 sq. yds. The ground floor will comprise two spacious entrances from Doughty Road, giving access to drill hall from either end, and sufficiently wide to enable the men to march out fours deep; also orderly room, ladies' and gentlemen's cloak-rooms, heating vault, kitchen, scullery, stores, magazines, armoury, covered rifle range and sergeant's house. The drill hall floor has an area of 116ft. by 55ft. 6in., and the height is 32ft. From the drill hall is entered the rifle range, which is 104ft. long by 10ft. wide, and abuts on Peppercorn Road. The first floor comprises officers', sergeants' and men's mess-rooms, and band practice room, and a balcony is arranged around three sides of drill hall. The sergeant's house is arranged on the north corner of site, fronting Peppercorn Road, and comprises on the ground floor sitting-room, kitchen, scullery, and out-offices, and on the first-floor three bedrooms. The floor of drill hall is to be laid with oak battens on redwood joists, resting on india-rubber cushions, and the walls are to have a dado of cement, 5ft. high, prepared for painting, but the intervening brickwork between dado and roof is to be left rough for distempering. The main front of building faces Doughty Road, and is designed in the Tudor style, faced with best stock bricks and Ancaster stone dressings, roofs to be covered with Port Dinorwic slates.

Mr. W. J. Hopkins, F.R.I.B.A., of Sansome Lodge, Worcester, died recently at the age of eighty years. He was Diocesan Architect of Worcester.

A Board School Competition.—Six sets of plans were sent in recently in competition for the new school which the Loughborough School Board propose to erect in Rendell Street. The assessor, Mr. Evans, of Nottingham, has awarded the premium to Messrs. Barrowcliff & Allcock. This firm sent in two schemes, one of which was placed first and the other second. The plans show provision for a mixed school, an infant school, a cookery centre, pupil teachers' centre, also a separate room for defective children.

A New Public Library and Council Offices at Briton Ferry is being erected in Neath Road at a cost of £3,000. The ground floor will consist of a commodious reading-room and library, whilst the first floor will contain the council chamber offices for the clerk to the urban district council, the surveyor and the rate collector. The caretaker's house will adjoin the library. The architect is Mr. H. Alexander Clarke (surveyor to the Briton Ferry Council), and Mr. T. Walters, of Swansea and Briton Ferry, is the contractor.

COMING EVENTS.

Wednesday, June 12.

INSTITUTE OF SANITARY ENGINEERS.—Meeting at New Offices, 19, Bloomsbury Square, W.C., of General Purposes and Finance Committee at 4 p.m., and Half-Yearly General Meeting at 7 p.m.

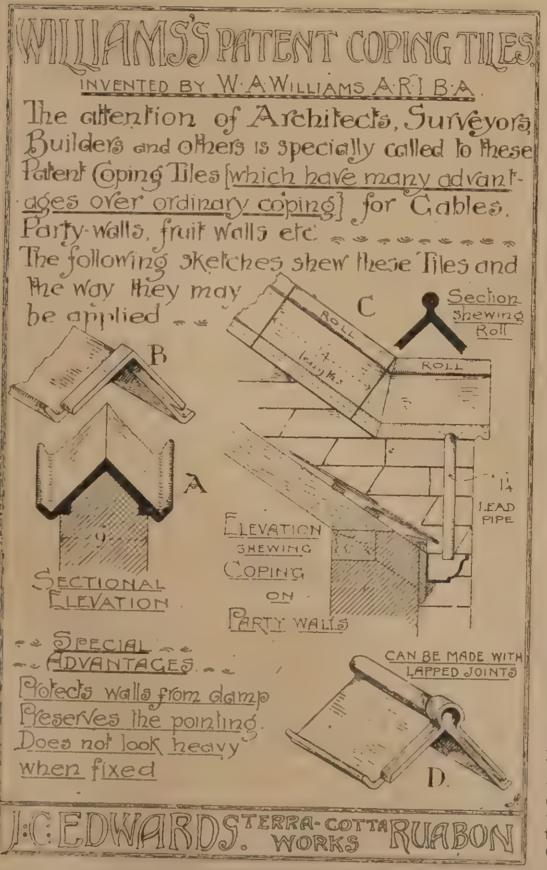
IMPROVED COPING TILE
(PATENTED)
For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES
INVENTED BY W·A·WILLIAMS A·R·I·B·A
The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc
The following sketches shew these Tiles and the way they may be applied
C
ROLL
ROLL
Section shewing Roll
B
A
1¼ LEAD PIPE
Elevation shewing Coping on Party walls
Sectional Elevation
Special Advantages.
Protects walls from damp
Preserves the pointing.
Does not look heavy when fixed
CAN BE MADE WITH LAPPED JOINTS
D.
J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

Property and Land Sales.

In Chancery.—Re Charles Jack, deceased, Jack v. Jack.

The very valuable FREEHOLD ESTATE known as Beech Hill Park, in the parish of Enfield, in the county of Middlesex, almost adjoining Hadley Wood Station, on the main line of the Great Northern Railway, and only about a mile from the Market Town of Barnet. It is specially valuable, either as an important residential property or as an unequalled estate for the erection of first-class houses, and occupies a really grand position, in the heart of a lovely country, at an elevation of some 300 feet above sea level. It has a direct south aspect, is beautifully adorned with noble old timber, has frontages of about 6,500 feet to main road, is only 10 miles from London, and has direct access in about 30 minutes to King's Cross, also to Moorgate and Broad Street Stations. The property comprises a spacious family mansion surrounded by charming old time pleasure grounds, prolific kitchen garden, with vineries, peach-house, green and hot houses, &c. In an enclosed yard is the stabling for 10 horses, large coach-house, harness room, and three rooms for coachman. There is also a spacious Farm Homestead, neat entrance lodge, and gardener's cottage; and a dwelling-house, cottage, garden, and buildings let at £60 per annum. Well-timbered and undulating Park in which are sheets of Ornamental Water of about 8 acres. The intense quietude of the spot, the entire absence of footpaths and rights of way over the park, and the purity of the water, attract numbers of wild fowl to these pools, and it is a rare sight so near London to see, as one often does here, many hundreds of birds upon and over these waters, and no doubt the formation of a decoy would be not only highly interesting but very lucrative to an owner. Other game is fairly plentiful, and the positions of the several woods and plantations would enable a resident to keep up a good stock of pheasants. The whole property covers an area of about 261 acres 1 rood 26 poles, and, with the exception of the dwelling-house, &c. above-mentioned. Possession will be given on completion of purchase. Also a valuable enclosure of Freehold Building Land, with two cottages, of about 4 acres 0 roods 18 poles, having an important frontage to the main Barnet road, adjoining Hadley Common, and near to Hadley Wood Station; now ripe for immediate building operations.—Mr. EDWARD TEWSON of the firm of Messrs.

DEBENHAM, TEWSON, FARMER, and BRIDGEWATER (the Auctioneer appointed by the Judge to whose Court this cause is attached), will SELL by AUCTION at the Mart, on THURSDAY, JULY 25, at 2, the above-mentioned very important FREEHOLD PROPERTIES.

Particulars of Messrs. SAXTON and MORGAN, Solicitors, 29, Somerset Street, Portman Square; of Messrs. SURMAN and QUEKETT, Solicitors, 35, Lincoln's Inn Fields; of Mr. A. Kingwell, Estate Agent, 103 and 104, Cheapside; and of the Auctioneer, 80, Cheapside.

By Order of Mortgagees.

Birchington-on-Sea, Kent. Valuable Freehold Building Estate of 70 acres, known as The BIRCHINGTON BAY ESTATE, facing the sea, with extensive frontages to a splendid sea wall promenade, well-made roads, and public gardens. Ripe for immediate development. The Public Hall with stage and handsome billiard saloon will be included in the Sale. The Estate has been well developed, large sums have been expended in the construction of the sea wall and roads, which are well designed and give a high-class tone to the property. All the houses are of a good class. A good drainage system has been constructed, and no expense has been spared to ensure a profitable development of the scheme. The Estate is within easy reach of the station, two miles of Westgate-on-Sea, three from Margate, and 70 from London.

MESSRS. HARMAN BROS., of 25, Ironmonger Lane, Cheapside, E.C., will, in conjunction with Mr. E. HOLSWORTH, SELL the above at the Mart, Tokenhouse Yard, E.C., in one lot, on MONDAY, JULY 1st, at 2 o'clock.

Particulars, with plans and conditions of sale, may be had of Messrs. YOUNG and SONS, Solicitors, 29, Mark Lane, E.C.; of Mr. E. Holsworth, 80, High Street, Stoke Newington, N.; and of the Auctioneers, 25, Ironmonger Lane, E.C.

Edgware (7½ miles from Marble Arch), within five minutes of station on G.N.R., one mile from Stanmore Station, L. & N. W. Ry.—39 Plots of valuable Freehold Building Land, on the Mead's Estate, extensive frontages to Mead's Road. Well made and sewered and admirably adapted for the erection of small dwellings for working men. Gas and water supplies laid on. Also seven Freehold Cottages, Nos. 2, 4, 6, 8, 10, 11, and 12, Mead's Road. All let to reliable weekly tenants, and producing a gross rental of £138 10s. Free conveyances. Purchase money payable by instalments.

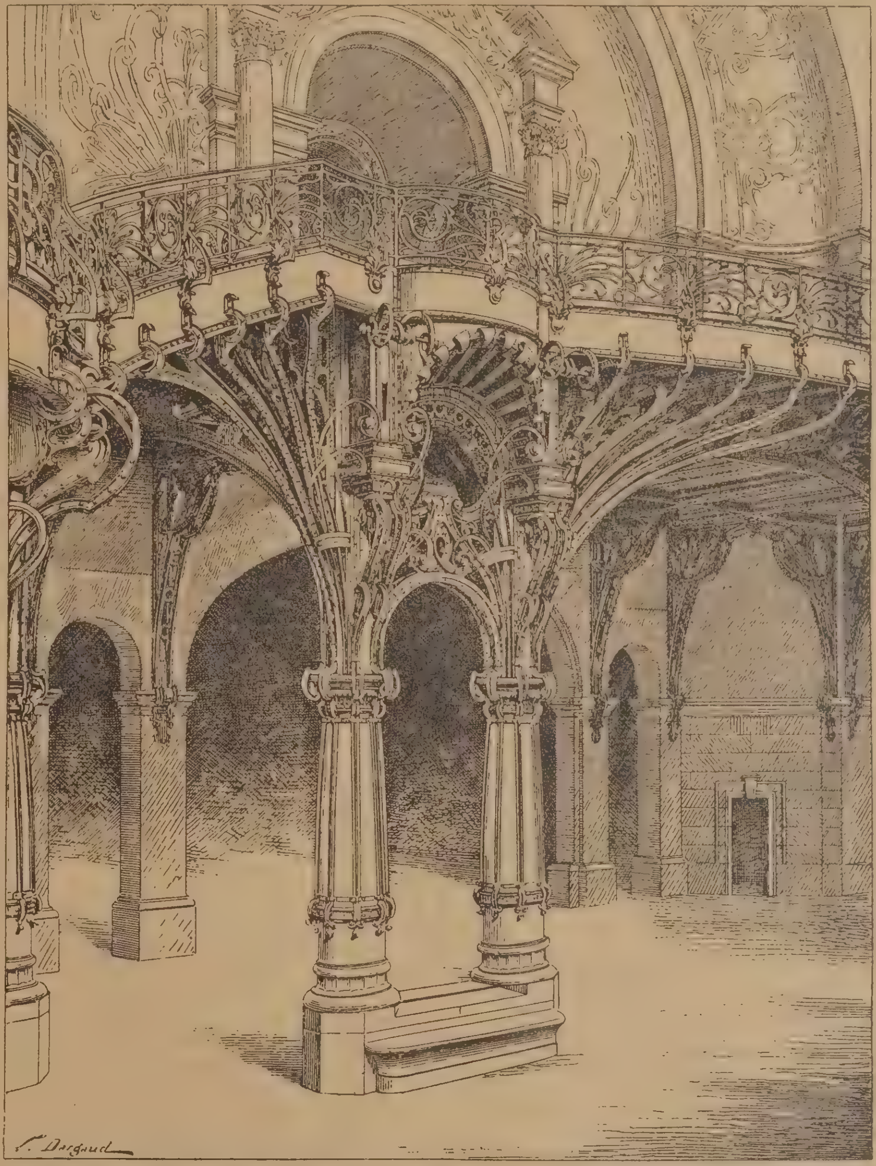
An Architectural Causerie.

"The Architectural Review." AN announcement of considerable interest is made in the current number of "The Architectural Review." It is to the effect that, in order that its contents may be as comprehensive in tone as possible, an advisory editorial committee has been formed, consisting of the following well-known architects and others: Mr. Norman Shaw, Mr. John Belcher, Mr. Frank T. Baggallay, Mr. Reginald Blomfield, Mr. Gerald C. Horsley, Mr. Mervyn Macartney, Mr. E. J. May, Mr. Walter Millard, Mr. Ernest Newton, Mr. Edward S. Prior, Mr. Halsey Ricardo, Mr. Leonard Stokes and Professor F. H. Simpson; Mr. D. S. MacColl, who acts in the capacity of literary adviser; Mr. Percy Hastings, representing the proprietors; and Mr. J. H. Elder-Duncan, as editorial secretary. In addition to securing the advice of such an eminent board, whose names are a guarantee that only the best work will appear in the pages of this high-class magazine, the proprietors have decided to reduce the price of "The Architectural Review" from one shilling to sixpence, so that it may be brought within the range of a larger number of students of architecture, professional or amateur. The committee will establish full control with the October number, though they will be partly responsible for the July, August and September issues. We wish "The Architectural Review" every success in its revised form, and feel certain that under the new régime the high reputation it holds as the only monthly magazine in this country devoted to the interests of architecture and the allied arts will be fully upheld.

A Metal Staircase. WE publish the accompanying drawing in order that our readers may see what is done by a leading French architect in the design of a metal staircase, the method adopted being intended to show how metal may be treated architecturally with happy results.



DETAIL OF STAIRCASE, GRAND PALAIS DES BEAUX-ARTS, PARIS. M. LOUVET, Architect.

The Richmond View. THOSE who have stood on the terrace at Richmond and looked down on the beautiful view of woodland, meadow and river will be in sympathy with the efforts now being made to prevent such a scene being utterly marred by rows of modern villas in red brick with stone dressings; yet there is considerable risk that the destroying hand of the builder will prevail. Most recently, through Sir Whittaker Ellis, the public has become acquainted with the fact that the stretch of land on the Middlesex side of the river between Richmond and Twickenham is likely to be laid out in plots, divided by roads, and the fine timber cut down. Already this has been done to some extent, and one sees villas of the kind mentioned protruding here and there amidst the trees. Several large houses having extensive grounds stand on the land, and when—like Lebanon House—these come into the market, the inevitable must result. At the next meeting of the Twickenham Council a member will move that a committee be appointed to enquire what steps are really needful to be taken in order that the view may be preserved, what the cost is likely to be, and what contributions might fairly be expected from the Middlesex County Council. We fear, however, that the expense will be prohibitive, though by a combined action of the Twickenham, Richmond and Middlesex Councils something might be done. For the present, the opposite side of the river is in no danger of being similarly spoiled. The Richmond Corporation have secured the preservation of the Hill, and the beautiful meadow at the foot of it; and also Petersham Eyot. But these are much less extensive than the land on the Middlesex side. If it comes into the builder's hands the view will be ruined. It is most desirable to prevent this; but we fear the worst.

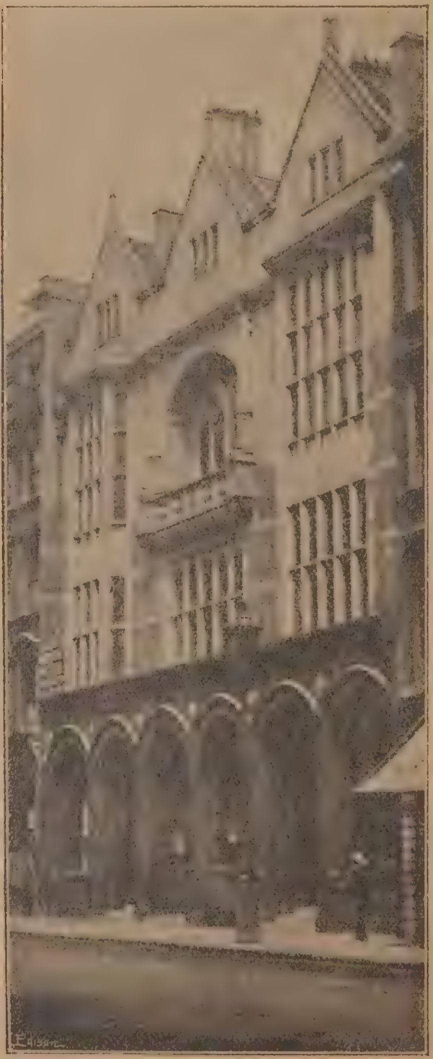
An Enigma. IT is difficult to understand what is the London County Council's notion respecting the alteration of the Strand around St. Clement Danes' Church. After considerable labour the bodies in the churchyard have been removed, a brick subway has been built, and the surface levelled and laid with wood blocks. Only a narrow strip of ground now remains around the church, and this is enclosed by a dwarf brick wall surmounted by railings. It was natural to suppose that this reduction of the churchyard was done for the purpose of giving an additional width to the roadway, which, on account of the excessive traffic in the Strand, needed widening, just as the roadway between this church and that of St. Mary-le-Strand was increased to its present splendid width by the demolition of the houses on the "island"; but instead of adopting this course, the Council have brought forward the pavement of the circus on the north side of St. Clement Danes to such an extent that it is now almost double its former width. The result is that the roadway, instead of being wider, is narrower than it was before, while the additional width given to the pavement is to little purpose, for it was quite wide enough for the comparatively few persons who pass that way. Perhaps the Council's intention is to secure a vista eastwards. If so, they could have obtained it equally well by leaving the pavement as it was, and throwing the extra width into the roadway.

NEW BUILDINGS IN THE CITY.

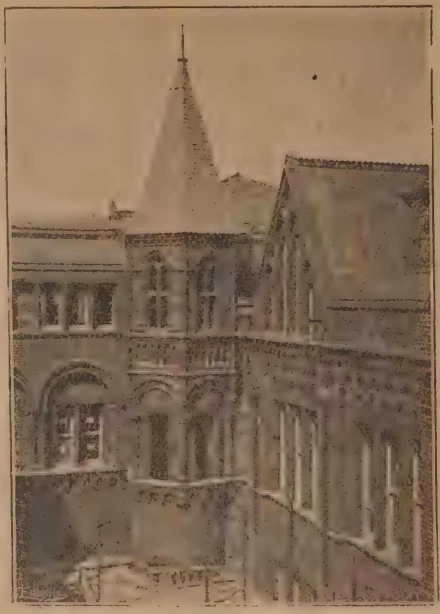
By F. HERBERT MANSFORD.

IN considering the architectural changes which are transforming the City of London it is convenient to begin at Holborn Bars, because at this point is arising what will be one of the most notable structures within the civic area. Covering slightly less ground than the Bank of England, but with a floor space vastly exceeding it, the offices of the Prudential Assurance Company will afford testimony to the magnitude of their undertaking. The chief feature of the Holborn front will be a lofty tower 40ft. square surmounting the entrance, and a modelled frieze displaying the arms of about fifty of the towns where the company have branch offices. Passing beneath the tower, the vaulted carriage-way will open into an outer court separated from the great court by a corridor with open traceried windows carried upon an arch nearly 40ft. in span. Glimpses will be obtainable here and there of a third or eastern court. The design throughout is distinctly Gothic in character, and at the present rate of progress the building bids fair to represent the last example of the Gothic revival as applied to a great secular structure. But the edifice will be emphatically modern in most respects, notably its materials—red terra-cotta, faïence and glazed bricks; these will doubtless endow the structure with that almost perennial youth so characteristic of the works of Mr. Alfred Waterhouse, R.A. (An illustration of this building was published with the issue of the BUILDERS' JOURNAL for January 3rd, 1900.)

On the opposite side of Holborn, the old-fashioned distillery, the immediate descendant of the one described in "Barnaby Rudge," has been reconstructed by Messrs. Treadwell & Martin, being faced with stone and generally modernised, displaying some of the recent tendencies of English architects in its ornamentation and the curious proportion (or lack of proportion) of its glorified gable finials. Notwithstanding, the facade is interesting because it has evidently been carefully thought out by an imaginative mind, only one regrets that the gables are shams and supported partly by tie rods from behind. (An illustration of this building appeared in the issue of the BUILDERS' JOURNAL for September 26th, 1900.)



OFFICES AND WAREHOUSE OF MR. HENRY C. STEPHENS, ALDERSGATE STREET, E.C.



ANGLE TURRET IN THE EASTERN COURT, PRUDENTIAL ASSURANCE COMPANY'S NEW PREMISES, FURNIVAL'S INN.

Between here and the Old Bailey there are no recent buildings worthy of comment; this neighbourhood was subjected to such extensive rebuilding when the viaduct was constructed that it is likely to be many years before it is much disturbed. But beyond St. Sepulchre's Church we shall shortly see great changes indeed. Even if a new street be not formed from the corner of Giltspur Street to Aldersgate Street,* as has been more than once advocated, it is probable that the site of Christ's Hospital will be largely covered with the extension of St. Bartholomew's Hospital and with commercial premises. One could wish that the great dining hall and a portion of the playground might be acquired for the Volunteers; and that the Ecclesiastical Commissioners would purchase the masters' houses abutting upon the charming garden which skirts Little Britain, to form rectories and vicarages for some of the City clergy. Wren's red-brick gateway, which formed such a pleasing bit of colour in Christchurch Passage, has already been moved to Horsham. The western end of Cheapside is being rebuilt on new frontage lines, and Newgate is soon to be demolished. Christ Church itself seems likely to be the only old landmark remaining in this quarter, for even Smirke's General Post Office is threatened with reconstruction.

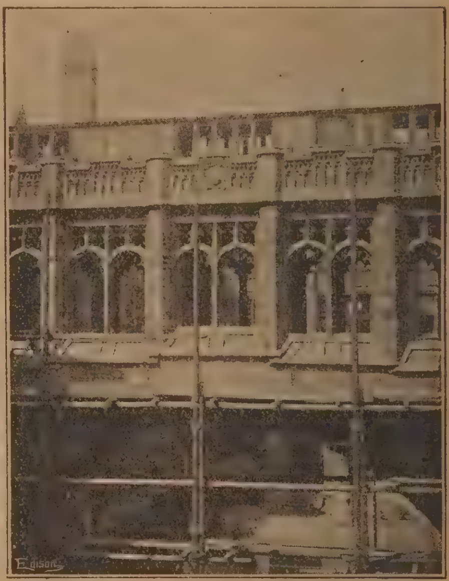
About half-way up Aldersgate Street, and occupying the site of Lauderdale House, is a striking building erected for Mr. Henry Stephens of ink fame. Some would have preferred that the elevation had been treated entirely in granite and stone without the intervening floor of red brickwork, but the generous way in which effect has been considered at the sacrifice of space should be appreciated. The three stone gables afford a roof-line particularly happy in a gently sinuous thoroughfare like Aldersgate Street.

Returning to St. Paul's Churchyard, and realising that half of the frontages have been rebuilt within the last twelve years, it might be wished that some harmonious Renaissance treatment had been initiated so that our great cathedral had been more worthily environed. To a certain extent such an idea was started with the warehouses erected upon the site of St. Paul's School, but, although the new buildings on the south side are upon ground leased from the Ecclesiastical Commissioners, the idea was not developed. Some shops that have been recently completed at the north-east entrance to the churchyard are artistically unworthy of their important situation.

Fleet Street is being subjected to a much-needed widening, and thus affords several examples of present-day architecture. As the buildings demolished were as commonplace as any in the City, the gain is indubitable. Barclay's Bank (formerly Gosling's) affords one of the most pleasing elevations, dignified and appropriate, yet its details not lacking in novel treatment. The mullioned windows which the architects, Sir Arthur Blomfield & Sons, have introduced between the Ionic columns emphasise the English character of the design; while the graceful festoons of flowers in no way counteract the soberness suitable to a bank. (An illustrated article on this bank appeared in the BUILDERS' JOURNAL for July 11th, 1900.)

On the opposite side of the street, the Law Life Assurance Society have carried out the extension of their old premises, marring St. Dunstan's tower. It is unfortunate that those in authority did not recognise how much of the beauty of the elaborate lantern was due to the contrast afforded by the plainness of the tower below. (St. Dunstan's tower, as it appeared before the insurance offices were extended, is illustrated on page 162 of the BUILDERS' JOURNAL for October 3rd, 1900.)

On the Victoria Embankment three substantial buildings, standing side by side, have been recently completed. The Metropolitan Asylums Board Offices (Edwin T. Hall, architect) are doubtless admirably planned and constructed, but their external appearance will probably be regarded as lacking the dignity of effect which is the prime æsthetic quality of a public building. The council chamber in the rear is clearly expressed externally by a separate roof treatment and its octagonal form. Adjacent are the offices of the National Telephone Company (A. T. Bromley, architect), an imposing block with an extensive frontage to Temple Avenue and a lofty gabled end towards the river. One may regret the monotony of the figure sculpture, and yet feel that the architect has achieved a work which is an ornament to the Embankment. Opposite are the offices of the Employers' Liability Corporation (William Emerson, architect). Although of Renaissance design as a whole, the sculptured ornament recalls Byzantine and even Indian art, but there is no loss of unity of effect. The purple marble columns flanking the south entrance are unpolished, and perhaps for that reason do not appear to introduce a disturbing element among the materials.



BRIDGE BETWEEN INNER AND OUTER COURTS, PRUDENTIAL ASSURANCE COMPANY'S NEW PREMISES, FURNIVAL'S INN.

There is now but one plot remaining unoccupied of the old site of the City Gas Works, which were cleared away at the time of the formation of the Embankment.

In Cannon Street the buildings which were formerly pre-eminent for businesslike solidity of effect are being replaced here and there by others which are chiefly noticeable for mere prettiness—a prettiness which will be even less effective after a few years' exposure to the London atmosphere.

---

* The object of this thoroughfare is to form part of a direct route to Liverpool Street, and so relieve Newgate Street and Cheapside of much of the omnibus traffic.

Passing east of the Bank we find that the long low facade of the Drapers' Hall has recently given place to the Throgmorton Restaurant, remarkable for its showy mixture of materials—brick, stone, granite and marble used in a restless profusion that makes us sigh for the comparative dignity of its predecessor. The new entrance doors to the Drapers' Hall itself are entirely covered with metal and beautifully enriched. In Threadneedle Street a clearance has been made of the "Baltic" and other premises mainly to afford a site for the British Linen Company's Bank, but incidentally the fine gateway erected for the old Oriental Bank is thrown into prominence. Even the Wesleyan Centenary Hall is gutted previous to reconstruction, and there are few buildings in sight from this corner but have been erected within the last twenty-five years.

Bishopsgate has acquired an entirely new character owing to railways. First they rendered unnecessary the coaching inns and yards for which it was famous, then they afforded facilities for people to daily visit offices and banks, and finally they absorbed a whole quarter for their termini. The extension of the Great Eastern Company's hotel is approaching completion, and rumour now has it that the company are considering how they can best increase the capacity of the station itself. The enormous demand for offices in this neighbourhood has caused the demolition of the greater portion of Finsbury Circus. St. Mary Moorfields and the Ophthalmic Hospital have also gone down before the enhanced values of their sites.

On Finsbury Pavement are rising (from the designs of Mr. Belcher, A.R.A.) the new offices of the Eastern Telegraph Company, destined to be one of the finest blocks in this part of the City, although shorn of part of its destined sculpture.

Passing to the neighbourhood of Fenchurch Street, we come to the new street which has been formed on the site of the Dock Company's bonded warehouses. "Lloyds Avenue" promises to present two unbroken series of stone facades; certainly, at present no terra-cotta or brick elevation has intruded itself. At the corner of Fenchurch Street are the new premises for "Lloyds," who will shortly migrate from the Royal Exchange. The architect (Mr. Collcutt) has provided a noble hall on the first floor surmounted by a much lower series of rooms with windows recessed from the front by intervening rusticated columns. At the angle is a turret, with sculpture in low relief, the whole surmounted by a vane in the form of a full-rigged ship. On the side elevation is a richly-carved frieze whereon dolphins disport and ogle one another somewhat fiercely. The broken outline of the site has suggested a circular treatment to part of the building, and this portion is carried up above the roof as an open belvedere with a stone-domed top. The stone employed throughout is of a particularly pleasing colour and texture. (A corner of this building was illustrated in the BUILDERS' JOURNAL for May 16th, 1900.)

Near by, in Jewry Street, is the Sir John Cass Foundation Institute, designed by Mr. Arthur Cooksey. Dignified in aspect and somewhat original in detail, the building would have looked better perhaps if the tower had been employed to mark the main entrance and carried up rather higher. The whole structure is about the size and character of the municipal buildings of an average provincial town, and yet, probably, not one person in London out of 100 remembers having seen or heard of it. Such a reflection causes one to realise the vastness of the Metropolis, and to wonder whether its citizens will ever take the pride in its thoroughfares and buildings which is characteristic of those of some other great towns.

There is a dignity about many of the City streets, when seen fairly clear of traffic—say, on a Sunday morning—not to be found in many cities ancient or modern. The Court of Common Council are proposing to regulate the size of shop signs and projecting boards; if similar measures could prevent the wholesale obliterations caused by advertisements and scale-destroying letters, we should be spared such mortifications as Ludgate Circus. The telephone wires will shortly disappear from above our heads, but no legislation or invention will preserve the dignity of our streets if the temperament of its citizens becomes less appreciative of restraint and solidity.

PRINCIPAL ENTRANCE, CASS FOUNDATION INSTITUTE, JEWRY STREET, ALDGATE, E.C.

VANISHING VENICE.

BY ALFREDO MELANI.

THE subject of this article is one of the saddest, and it will make a profound impression on my readers. Ought I therefore to refrain from writing it? Not a bit of it. It is not the duty of the skilful surgeon to cause his patient to laugh, and it is not worthy of a respectable writer to conceal the truth. Yesterday, it was the Ducal Palace whose static conditions, although exaggerated by an official report, stirred the public. To-day, *apropos* of a new bridge over the Lagoon, it is the very integrity of Venice which has been brought into discussion, and the diabolical cry, "Venice is vanishing," is heard on every side with an insistence which would be culpable if it did not correspond with the realities, to the general condition of things that are in open contradiction with the rights of art, of history and of the beauty of the most original city of Italy.

Venice is vanishing—that is, the Venice of the Doges, with its *calli*, with its *campi*, with its little palaces, which have the delicacy of lacework—it is this Venice which, from day to day, is being wiped out as if it were merely a question of a city whose importance was a negligible quantity.

Unfortunately, even Venice, like Florence, Rome and Naples, has need of a good general plan of sanitation. If there is in the world a difficult city to be sanitated, Venice is that city. In fact, from the time that the study of the plan of sanitation was proposed, protests were raised on every side. These were the voices of artists, scholars, and the admirers of the beautiful who were united by a sentiment of fear and disapprobation; so the Italian Government, in order to soften an agitation which tended ever to expand, instead of leaving to the municipality of Venice the exclusive responsibility of the sanitation of the city, arranged that a mixed commission should be chosen in the interest of art, of history and of the public health in order that it might study the questions which were concerned in the sanitation of the city, and at the same time ordered that this Commission should present its conclusions within a reasonable length of time.

This was done, and the official report was the object of discussion, for it showed to the public a series of truths, which, alas, were found to be in perfect disaccord with the feelings of the artists.

It goes without saying that modern life has new demands, new needs, which cannot be neglected, and the Commissioners affirmed that the bad dwellings and the great agglomerations of individuals are the most pitiless enemies of the healthfulness of life in Venice.

Therefore, these habitations must be made more humane, and opposition must be made to all over-crowding, if it is really hoped to solve the matter of the regeneration of Venice; and since light and air are the essential elements of health, the suppression of several alleys is imposed on those who study the problem. To enlarge most of the streets of Venice would be to destroy the city, but some enlargement may be carried out with prudence and discretion without doing violence to the picturesque character of the city, while at the same time respecting the tortuous movement of the streets; for right lines are not for Venice, a city without horses—without carriages.

Already, sketches after this programme have been prepared, and the result has been disastrous from the æsthetic point of view. And this is why commissioners, historians and artists find themselves in opposition to the sanitarians, and these last proclaim, supporting themselves by figures, that the healthfulness of Venice is higher in those places where the typical Venetian aspect is most sensibly represented in its lines and its deplorable habits.

It goes without saying that all the Commissioners were possessed with a desire of reaching a common conclusion, at least on the essential point of the investigation, but in practice each one of them drew conclusions for his own side, and in place of having a report on the sanitation of Venice, we have different reports. the tone of each of which was that of the specialty of the several reporters; thus, the sanitarians complained of the artists, the artists of the sanitarians, who, in a letter addressed to the President of the Commission, declared that

CASS FOUNDATION INSTITUTE, JEWRY STREET, E.C.

NATIONAL TELEPHONE COMPANY'S OFFICES.

hygiene had been sacrificed to art; that this sacrifice is neither useful nor worthy of praise; that, finally, the sanitarians are convinced of having the support of the laws of logic, and not so much because of public health as because of the improved viability of the city.

It appears, then, that the artists should have triumphed, and the report of which I have spoken should have been accepted as it stood by the Italian Government and the municipality of Venice; but, on the contrary, the report has been forgotten, and an architect member of the Commission, who is always in relation with the Government, particularly in these later days, declared, in a letter to a daily journal, that the Ministry, as well as different members of the Commission, desired that the report should be allowed to sleep; and, in fact, it does sleep, and no one as it appears will waken it. In the meantime Venice continues to find herself in danger, and her artistic integrity appears to be dissolving like a snow statue in the sun. The ruins cannot be counted, whether in the centre of the city or in those quarters of the city far from the centre; it is true that the matter relates to picturesque ruins—ruins which are the especial loves of the impressionist painter and the dreamy poet—but the condition in which some amongst them are found is not reassuring to those who, apart from all considerations of beauty, are interested in stability. It suffices to make a trip along the Grand Canal to gather enough facts bearing on the subject which interests us. The colour of Venice no longer exists except in the soul of the poet; the passage of the years as they flow by is going to finish the work of destruction, and the moderns show themselves insensible to this destruction, which, moreover, is often fortified, so to speak, by the "*soins*" of these same Venetians, who have forgotten their race and the might of their ancestors. On the Grand Canal we meet several of those pretty facades with those unforgettable "*finestrati*," little buildings with from four to six windows partly barred by walls which rise between the slight columns of these "*finestrati*"; Gothic palaces with Venetian blinds, Gothic palaces with modern additions and little isolated windows, of an elegance at once an æsthetic pleasure and a model of good taste, alternating with balconies of iron, balconies even of a commercial type which are a real offence to the most elementary laws of propriety. And halt before one of the palaces of the municipality itself still on this Grand Canal, once called the finest street in the whole world; a clock is here so placed that its effect is so disastrous that the municipality should not allow it in the case even of a private house. Next, direct your glances to the Museo Correr, quite near; beside it rises a terrible roof, the Pescheria, or fish-market, a construction with columns of a kind which would do well enough in a village, but on the bank of the Grand Canal shock the view even of those who are most insensible to æsthetic pleasures. For a long time people have been thinking of replacing this structure with a building which might be in proper relation with the beauty of the place, but long discussions have not yet resulted in anything real. There exists, however, a project for a fish-market prepared by M. Rupolo, an architect to whom has been confided the restoration of the Ducal Palace, and M. Laurenti, a Venetian painter full of suggestiveness and sincerely in love with his art; and we can only hope for the realisation of their scheme, which will destroy for ever the ugliest building on the Grand Canal. And think for merely a moment that this old Pescheria, besides not being far from the Museo Correr, is almost facing the celebrated Ca' d'Oro, the most charming of the Venetian edifices which formerly gave life to the Canal and afforded to the eye the joy of the most exquisite forms which can be imagined. Thank God, the Ca' d'Oro is going to be restored at the expense of Franchetti, its present proprietor; and in the midst of the ruins, the dangers, the disgraceful additions on the Grand Canal, here the eye rests with satisfaction.

Now listen to what the Venetian Section of the Italian Society for Public Art has to say, for on the matter of Venice it uses words of an exemplary frankness and directness. Artistic Venice has no more time to lose, it says. Destroyed are its private galleries; migrated are its paintings, its bronzes, its well-heads, its most beautiful friezes; exported are its mantelpieces, its doors, its mural decorations and the ceilings of its ancient richness. Except for a few palaces, still preserved, there remains to-day only the curtain of the facades, and it is precisely to save this glorious remnant that provision must be made. To succeed in this it is not necessary to demand new laws, it is enough to revise those which exist and make them respected without exception. Respect for the law is really one of the most important points in the question. In fact, Venice, like all the cities of Italy, has its Regulation of Public Edility, respect for which might be enforced in favour of the integrity of the city, much more than would appear at first sight. Do you know how many pieces of carved marble, whether they came from the facades or the interior of the palaces, have been taken away and sold, to the great damage of the artistic patrimony and exterior beauty of Venice? An incredible quantity. I was in London last month, and, in visiting anew South Kensington Museum, I was thunderstruck at the number of Venetian marbles and sculptured stones. It was the love of Ruskin and all that was Ruskinian which urged the English to bring to London everything Venetian that they could get hold of whenever such things were put up to auction by the Venetians; and the English, thanks to the condescension of the Venetians and the indifference of the authorities, little by little have drawn to the Museum on Cromwell Road, and even to the Museum in Trafalgar Square, not only marbles and carved stones, but also the paintings from the Pinakotheks of Venice. This affects the honour of those who believe in the existence of an intellectual life which is in need of fertilising itself amidst the pleasures of art, and I speak of it only to point out a real fact, which could not exist if the Regulatoin of Public Edility at Venice was not almost always a dead letter. In fact, this Regulation forbids anyone whomsoever to place, to change from its place, or to remove from the outer walls of any buildings, monuments, objects of art or anything having an historical or archæological interest, any decorations, whether in stone or terra-cotta, or any paintings, cartouches, armorial bearings, &c. Well, if this article of the Regulation were enforced as it ought to be would it be possible to see Venetian antiquaries becoming agents for the transfer of sculptured stone from Venetian proprietors to foreigners? Surely not. Nor am I speaking only of the past—I address myself to the present time, for the difference is less apparent than it might be, as one can easily see: the shops of Venetian antiquaries are full of objects of art, of fixed decorations and architectural ornaments, which have been removed capriciously, or for the sake of being turned into money by their owners, to the great disfigurement of the Venice of the artist, the Venice of the intellectual, the only Venice possible in the eyes of persons who think.

I do not change the subject from the Regulation in exposing a new truth which will not fail to give my readers surprise. The city of Venice, beside the Regulation of Public Edility, has also a Municipal Bureau of Engineers, a technical bureau. One would believe that a technical bureau should be composed of architects, or even of engineers, in such a city as Venice, which is artistic beyond everything. But not a bit of it. Above the doorway of this Bureau might be put, as Balzac wrote on the title leaf of his "Physiologie du Mariage," "Art enters not here." [Balzac wrote "Women enter not here."] And when one knows that, in Italy, engineers, as a rule, have no knowledge of architecture—even those who erect palaces and churches—one easily measures the gravity of the situation which I draw attention to, which weighs terribly upon the fate of ancient and modern architecture in Venice. There is a Commission for Ornament, but the event has proved that its successes are not glorious; and, however that may be, a reform on this subject is necessary. The integrity of Venice demands the modification of the Municipal Technical Bureau and of the Commission for Ornament.

I ought not to forget that one of the enemies of Venice is quite a stranger to art, to construction, and to all speculation in objects of art, and that is the little launches which, from morning till night, tear up and down the Grand Canal. We are assured that these "*vaporetti*" are not of the most approved type, and that the wash of the waters they produce in the Canal breaks and decomposes those foundations which are not of stone (*macigno*), enlarging cracks, and hastening to a critical condition the stability of the palaces.

They say that it is because of this that they are going to project a new bridge over the Lagoon, and this bridge has been the object of feverish agitation, not so much because of its uselessness (according to the opposition) as because of the dangers in which Venice would be found later through this enlarging of its streets to answer new demands of viability because of this new passage-way opened over the Lagoon. This would be a new and formidable buffet in the faces of those who love Venice, who love its beauty, although they are not of the country. The chief fact is this: the artists are the principal enemies of this new bridge over the Lagoon, which is to connect Venice with the mainland. —(From "The American Architect.")

NEW CHURCH AT NEWCASTLE.

A NEW Wyclif Baptist Church at Newcastle-on-Tyne is now being erected in Elswick Road. The style is Perpendicular Gothic, freely treated. The accommodation in the church is for 300 adults, or for a mixed congregation of about 360. A future end gallery is provided for, to seat 160 adults or 120 mixed, or an eventual total of 470 mixed. The choir is on the platform, in front of the pulpit; and the baptistery is also on the platform, covered when not in use; the organ is in an apse behind the pulpit. The building consists of a wide nave with hammer beam, open-timbered roof and plastered ceiling, with double transept on each side, with timber arches supported on iron columns, each transept being lighted by a three-light traceried window. There are two two-light traceried windows in each side wall of the nave. A spacious portico projects in front, with vestibule and inner lobbies with swing doors, and a vestry on one side and a staircase on the other side in the tower will lead down to the school and up to the gallery in the future. There is a staircase on each side of the pulpit leading down to the school below the church and to ministers' and deacons' vestries. A ladies' vestry is situated behind the pulpit. The seating is arranged semicircularly on plan, so that every hearer directly faces the minister. The heating will be by hot-water pipes and radiators. There is an exit door from the tower, and another from the back into Northbourne Street, the two front entrances being from Elswick Road. All doors open outwards. There is a spacious school under the church and a church parlour 19ft. by 13ft., and also heating chambers, lavatories, &c. The school will be well lighted by large windows into areas and streets. A ventilating flèche on the roof will withdraw the heated air, with gas accelerator to assist upcast, and fresh air inlet shafts to admit fresh air. The seating is of panelled sloping backs, with book racks, &c., varnished. The windows will be glazed with lead-lights. The external walls will be faced with red pressed facing bricks, with tawny terra-cotta dressings and tracery, &c. The contract for the building is £4,383, including boundary walls, gates, railings, &c., but exclusive of upper portion of tower. The builder is Mr. Alexander Bruce, of Newcastle. The architects are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clement's Inn, Strand, London, W.C.

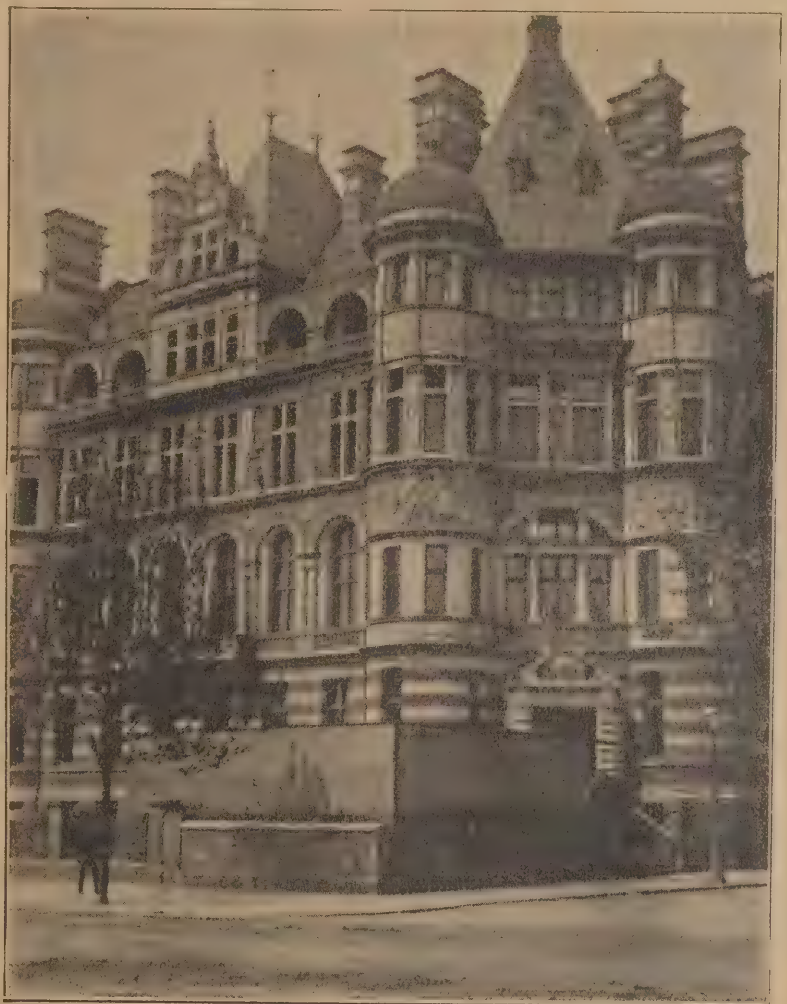
Mr. R. C. Leslie, eldest son of the late Mr. C. R. Leslie, R.A., and brother of the present Royal Academician, Mr. G. D. Leslie, died on June 11th. Mr. R. C. Leslie was a marine painter of considerable ability. He was an intimate friend of John Ruskin.

TRADE TRAINING.*

BY W. J. COLLINS.

AT a recent meeting of the Architectural Association of Ireland, Mr. John Good (hon. secretary of the Master Builders' Association), delivered an address on "Some Aspects of the Labour Question as applied to the Building Industry" (see p. 103 of the BUILDERS' JOURNAL for March 13th last) in the course of which he speaks of the apprenticeship system as being capable of immense improvement in "instruction, inspection and examination," and he insists that both theoretical training and practical instruction are necessary. This is the subject with which I now wish to deal. How can we supply both the theoretical and practical training in the best possible manner?

In the past trade training was accomplished by a system of apprenticeship, and until the introduction of machinery it was very successful. The reputation of the English mechanics as the best and most skilful of the world's workers was gained when the apprenticeship system was in force, and every one had to serve his time, usually seven years. Of late this custom has almost entirely died out, and we have nothing as yet to take its place. Some may ask, if this system was so successful, why not try to reinstate it? I propose to deal, first, with the need for practical training; secondly, the need for theoretical training; and lastly, to suggest a remedy.



METROPOLITAN ASYLUMS BOARD'S NEW OFFICES, VICTORIA EMBANKMENT. E.C.

The Need for Practical Training.

At the commencement of the nineteenth century the craftsman stood in practically the same position, so far as progress was concerned, as his predecessors did for hundreds of years. What advantage he may have possessed was due to any improvements that may have been made in the construction of the hand tools used. How different it is now! Very few hand tools are required for ordinary work. The introduction of machinery has so revolutionised the production in all trades that the method of working has entirely altered, and what was suitable one hundred years ago is entirely out-of-date to-day. Take our own trade as an example. In a large joiner's shop to-day the joiner often does not see the work until it is ready to be put together, whereas formerly he would have had the rod and rough stuff given to him and would have created the work himself. Should there be an apprentice in a shop like this, where the elementary part of the work is never prepared, I do not see what opportunity he has of learning how to do it. In olden times he saw the work from the commencement, consequently he had every opportunity of learning the practical part of his trade in the shop. But—and this brings us to another question—if the mechanic will not be required to perform these operations, if they are always to be done by machine, is it necessary that he should learn how to do them? I think he should, most decidedly. If a man is to be master of his trade, he must know it from the beginning. The practice in the a, b, c of his work will give him that skill of hand and confidence in his own ability which is absolutely necessary to enable him to perform his task with the accuracy essential to the production of good work. If you agree with this, I think you will also agree that under these new conditions of working new methods are necessary for learning a trade.

In the "Daily News" for December 22nd last Mr. T. A. Organ, chairman of the L.C.C. Technical Board, in referring to the dearth of apprentices in London, says "it is disastrous to our London boys," and adds that "many country lads have the advantage of apprenticeship, and in the end migrate to London, and eventually occupy the highest positions in their respective trades." Mr. Organ may be right, but I think it more probable that they have learnt their trade more thoroughly, owing to there being less machinery employed. However, in spite of all I have said, I believe a shop training to be necessary; but there must be some means by which a lad can learn the rudiments of his trade, which at present cannot be done in the shop.

---

* A paper read at the Carpenters' Hall, before the British Institute of Certified Carpenters, on May 4th, 1901.

Theoretical Training.

So far I have dealt only with the practical training, but I think you will agree that a theoretical training is also necessary if a man is to be anything better than a machine. I know many of the older mechanics who learnt the trade before the days of polytechnics or evening schools will say that they never attended classes, that they can work as well as any other men, and that this extra study is unnecessary. But I am pleased to think that this opinion is dying out. The increasing number of young men who present themselves for examination by the City Guilds and the Education Department shows that they themselves recognise that something else is necessary to make a good mechanic besides the ability to use his tools. The reason that more students do not present themselves is, in my opinion, due to the want of a system of training. The City Guilds took a step in the right direction when they refused to issue a full certificate to those who passed their examinations unless they had previously passed in at least two qualifying subjects (such as Mechanics and Geometry) which had a bearing on the theory of their trade.

The following remarks on plumbers' apprenticeship may be interesting, as showing that other trades are meeting with a difficulty in this subject: "In London, and indeed in the Southern Counties generally," says the "Lancet," "the system of apprenticeship in the plumbing trade has been gradually dying out, while the plumbers' ranks, as a rule, have to be recruited from a class of men known as plumbers' mates; now the master-plumbers, together with the operatives, have at length recognised the importance of this fact. They are of opinion that it is a system alike injurious to the best interests of the London plumbing trade and to the public health. A joint board has therefore been formed under the influence of the Worshipful Company of Plumbers, consisting of certain elected members of the London Society of Associated Master Plumbers, together with representatives from the London lodges of the United Operative Plumbers. The aims of the board are to encourage the taking of apprentices under an agreed form of indenture; to exercise a certain control over the apprentice, so as to insure his attendance at a duly approved technical school; to examine him occasionally as to the progress made in practical and theoretical knowledge; and, finally, to register him in order that information as to his training and abilities may be accessible at any future time." I think something similar to this might be done under the auspices of the Worshipful Company of Carpenters.

An American Professor's Opinion.

Among the diplomatic and consular reports in South Kensington Museum library I found one entitled, "Education in Chicago," received at the Government offices in this country on November 5th, 1900; so that it is quite recent. After speaking of the technical schools in Chicago, and of the interest which is taken in technical training in that city, the consul gives extracts from an address by Mr. Victor Aldersen, Dean of the Armour Technical College (who last year visited most of the European cities where technical education is provided), the subject of the address being "The Economic Aspect of Technical Education." Among other things he says: "The continued growth and prosperity of any nation depend upon the technical education of its people. The war in South Africa or the Philippines is less fatal to the working man than the ceaseless competition of similar working men in other quarters of the globe. It is this unremitting rivalry between workers of the same class all over the world that makes necessary the cultivation of the working man's powers by means of technical training." Later on he speaks of the system of evening classes in London. He does not agree with them, because "after a man has been working all day, he is not fit for study at night, and his best energies are as necessary for his studies as his manual work."

Lord Reay was speaking on the same subject in this hall on the occasion of the distribution of prizes to students of the trade classes towards the close of last year, and from his speech we learned that the French and Germans have not only recognised the need for the training and better education of artisans, but have established schools for the purpose; and I do not think I can do better than read you an extract from a book on the apprenticeship schools in France which I found in South Kensington Museum library:—

"It has been recognised in France, as elsewhere, that the ordinary system of apprenticeship has many shortcomings, and is not unfrequently productive of far-reaching evils. The apprentice is too often entrusted to the direction of an artisan or foreman little interested in his instruction, or perhaps incapable of instructing him by a graduated succession of exercises in the principles and practice of his trade. The method of instruction is thus little favourable to the development of ultimate skill and perfection.

The Apprenticeship School at Rouen.

"The apprenticeship school at Rouen, founded by the municipal council of that city, aims at training well-instructed artisans and foremen in the various trades and occupations in wood and ironwork. Pupils, on entrance, must be at least twelve years of age, and provided with a certificate of primary studies. Candidates not holding the certificates must be at least thirteen years of age, and are subjected to an equivalent examination. The course is one of three years, and young apprentices are formed into three sections corresponding to each year. The course of instruction includes a complementary course of literary instruction, a course in arts and sciences, and the technical instruction. The course is free, and tools and materials are supplied gratuitously. The school is under the control of a committee selected by municipal council, under the presidency of the Maire of Rouen. Apprentices must enter the school at 7 a.m. throughout the year, and are not permitted to leave, except by permission of the director, till 6 p.m. They take their own dinners, and dine in a refectory under the superintendence of one of the masters. Their food is heated by the servants. Those habitually absent are expelled from the institution.

Its Programme of Work.

"The programme is divided into four parts: (1) General literary education; (2) drawing; (3) technology; (4) workshop instruction.

"The general course is a continuation of the primary school course, embracing the principles of those sciences which underlie the trade in which apprentices are being trained. It is a course which imparts special information, and aims at that general mental development which is an essential element in the training of the young worker who strives at perfection in his craft." Then follows a list of subjects with which I will not weary you. The writer concludes: "We have only given a summary of the course of practical instruction in the workshops such as may give a general idea of the character of the training which apprentices undergo in the institution. Taking into consideration the standard of general education which pupils must have attained on entrance to the school, and the instruction in literature, science, &c., which goes on simultaneously during the whole course, it will readily be seen that apprentices trained in this manner must turn out more intelligent and efficient workmen than those trained by ordinary apprenticeship."

Some Particulars of the Paris School.

The following is an extract from the report of the City of Manchester Technical Instruction Committee (who have been visiting a number of cities on the Continent to gather information for the new Technical College at Manchester) relating to the apprenticeship school in Paris:—

Age of admission, 13 to 16. Candidates must pass a preliminary examination. A boy enters the school as an apprentice for three years.

The first year's course is higher elementary education in mathematics, mechanics, history, physics, geography, chemistry, &c., and the apprentice passes from one workshop to another in order to find his special aptitude.

In the second year he must have chosen his trade, and is then kept steadily working at it, both in theory and practice, as well as his ordinary studies.

In the third year the same course continues. The instruction is gratuitous, and tools and material are furnished free of cost.

Remedies.

I have endeavoured to show you in this paper (1) that practical training is necessary, (2) that theoretical training is necessary, (3) that the old method of apprenticeship does not satisfy the requirements under the new conditions, and (4) the manner in which they are striving to meet the difficulty in another country.

Although I do not agree with the French schools entirely, yet I believe that an apprenticeship school is the way by which trade training will have to be accomplished.

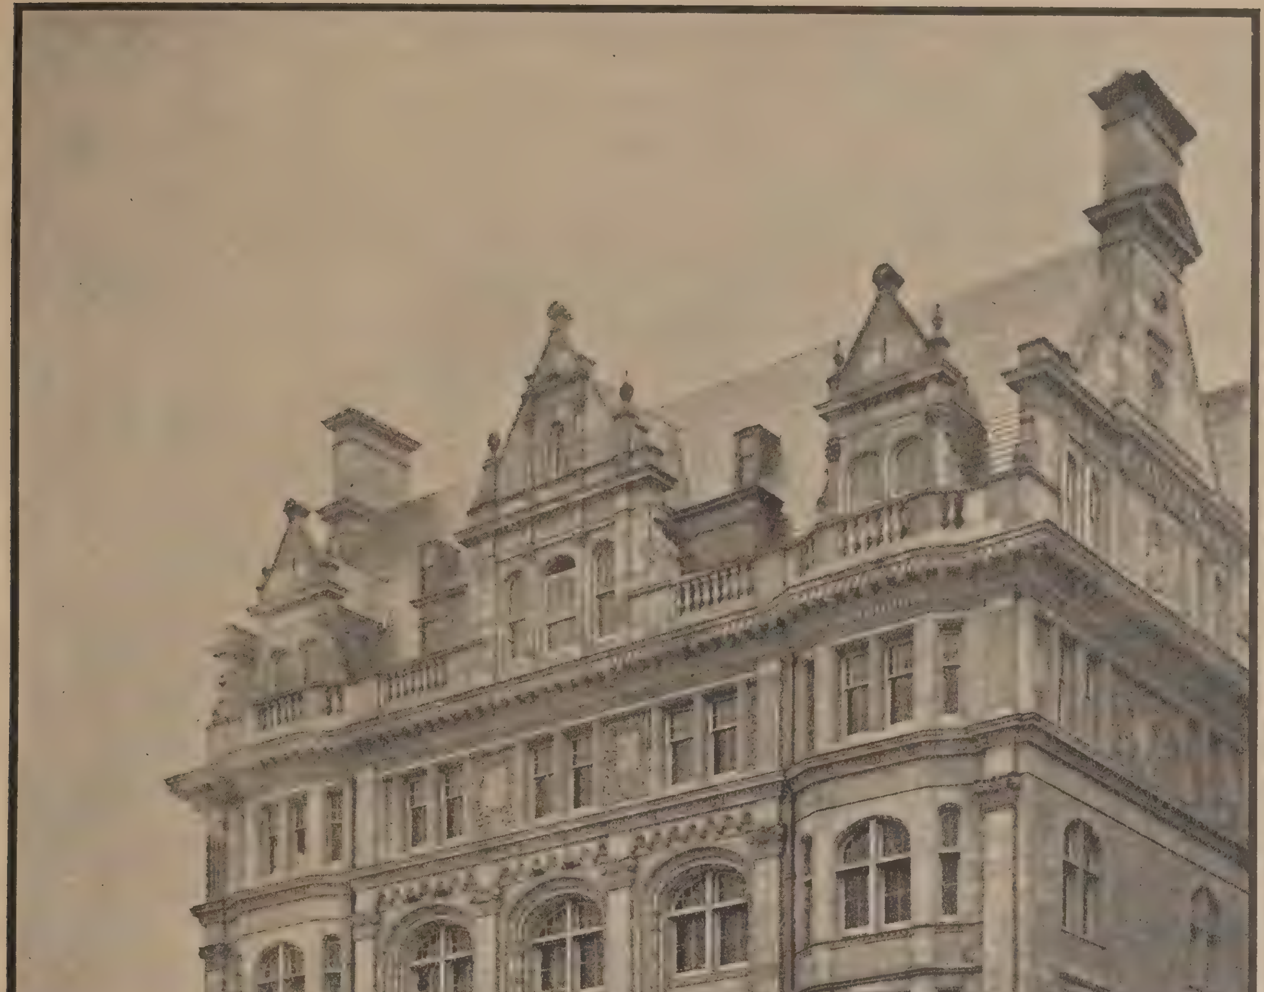
I think that twelve months wholly in the school is long enough, the rest of the time being spent partly in the shop and partly in the school. Examinations should be held at stated periods; and if the apprentice does not show sufficient progress he should be dismissed.

As to admission to the schools, I think that should be by examination, and I also think that as manual training is now so general, a report from the candidate's school-teacher and instructor as to his fitness for a mechanical pursuit might be of advantage.

The above is only my idea of the lines upon which the trade training in the future will have to proceed. I think the question is one which we, as carpenters and joiners, must seriously consider, as the woodworking trades are more affected by machinery than others in the building industry. Although I have mentioned the building trades specially, I think the system would apply to all.

SOUTH SHIELDS MUNICIPAL BUILDINGS COMPETITION.

MR. T. E. DAVIDSON, architect, of South Shields, writes to the "Shields Gazette" as follows: "Having just had the opportunity of inspecting the three selected designs for the proposed municipal buildings, I cannot refrain from expressing my disappointment at the result, and I hope that the question I am about to call attention to will be replied to upon its merits, and without in any way bringing in the personal element. I do not so far attach any blame to the committee, they having done their best to conduct the competition on fair lines, but I think the time has come when the whole matter should be reconsidered both in the public interest and in that of the seventy architects who have spent so much time and money in the preparation of their plans. What I complain about is this: the Corporation issued certain particulars or requirements and with them a printed plan of the site showing the surrounding buildings. For these each competitor had to pay £1, to be returned on receipt of a bona-fide design. This site plan showed clearly the lines of existing buildings in Ogle Terrace, St. John's Terrace and Broughton Road, but on examining the plans I was astounded to find that all three selected plans had entirely ignored these building lines and shown buildings that will completely cover up St. John's Church on the Ogle Terrace side, and Mr. R. Purvis's residence on the Broughton Road side, which would be contrary to the third section of the Public Health Act of 1875, which says that 'No building (or part thereof) shall be erected or brought forward in any street, or any addition made thereto, beyond the front main wall of the building on either side thereof in the same street. Daily penalty 40s.' . . . . . What I wish to point out also is that those competitors (including the three selected ones) who have taken this liberty of ignoring the defined building lines, and thus increased their frontage by 50ft., have taken an immense advantage over others who have kept their building to the proper lines, and I invite Mr. Belcher respectfully to give his explanation on this, what I consider, fatal objection to the three selected plans, and I also invite the committee to say whether it is their desire to allow their new municipal buildings to come out practically to the footpaths in Ogle Terrace and Broughton Road, as shown by the three selected designs."



HAMILTON HOUSE, VICTORIA EMBANKMENT. WILLIAM EMERSON, P.R.I.B.A., Architect. (*Photo by H. Irving.*)

Builders' Notes.

Mr. R. Hodgson, builder and contractor, of Hurworth-on-Tees, died recently at the age of sixty-five years. In addition to carrying on the business of a builder in all its branches, he owned and worked the brickworks at Skip Bridge, and farmed some land in the township of Hurworth. His business will be carried on by his sons.

The Slate Trade.—At a recent meeting of the Carnarvon Harbour Trust it was stated that the amount of slates shipped during the month of April was 6,359 tons, an increase of 1,419 tons on the corresponding period last year. During the preceding three months the quantity of slates shipped was 23,790 tons, an increase of 3,801 tons on the corresponding period last year.

Breach of Building By-laws.—At the Halifax Borough Court, John Taylor, Stanley Road, was recently summoned by the Corporation for a breach of the by-laws. The defendant pleaded guilty to erecting two houses in Highfield Place without giving notice of his intention to build to the Corporation, in accordance with By-law 96. He was away from home at the time and his foreman neglected to give notice. A fine of 20s. and 5s. 6d. costs was imposed.

FIRST CHURCH OF CHRIST, SCIENTIST, GRAND FORKS, N. DAKOTA, U.S.A. F. R. COMSTOCK, Architect.

Partnership Dissolved.—The partnership existing between Messrs. Thomas Crawshaw, William Crowther, George Burton Maud and Arthur Crawshaw, carrying on business at Halifax, in the county of York, as builders and contractors, under the style or firm of "T. Crawshaw & Co.," has been dissolved as from the 30th day of April last, so far as regards the said William Crowther, and the said business will hereafter be carried on by the Messrs. Thomas Crawshaw, George Burton Maud and Arthur Crawshaw alone, under the style or firm of "T. Crawshaw & Co."

A New Flooring.—A German chemist is reported to have found means, by mixing sawdust with certain chemicals, of producing a flooring which is as hard and smooth as marble or concrete, and yet elastic and warm to walk on. It is stated to be fireproof, impervious and sound deadening, and although laid down for some years to have in no instance shown signs of bulging or cracking. It is laid down in a moist state without seams, and thereby allows of the corners and sides being rounded off, an important point from a hygienic point of view. It hardens fully in forty-eight hours.

Pentelicon Marble.—The recent development of the Pentelicon marble quarries in the Piræus is described by the British Consul there in his report on the district for the past year. The quarries are now under a British company which has spent a very large sum in laying down railways and machinery; and it is hoped that everything will be in working order there by the end of the present month. There is a considerable demand for this marble in the Greek market, and a contract for a large quantity for the Stadion at Athens has been made. It appears, also, to be likely that the marble will find a ready sale abroad. Inquiries are made from all parts of the world, and trial shipments have been despatched to the United States. Hitherto Pentelicon marble has been shipped mainly to Germany and in German ships, because the latter have specially strengthened their gear for the purpose of loading and unloading marble. Cippolino marble from the south of Eubœa is being produced in larger quantities also.

LIVERPOOL SCHOOL OF ARCHITECTURE AND ALLIED ARTS.

BADLY IN NEED OF FUNDS.

WRITING to the "Liverpool Post," Mr. Walter Raleigh says:

With a cathedral and a university in prospect, the future of Liverpool promises well. These schemes will take long to complete. In the meantime a more pressing necessity claims the attention of those citizens who desire to see their city great and famous. The School of Architecture and the Allied Arts, which was founded in connection with University College some six or seven years ago, is an experiment that has perhaps attracted less attention than it deserves. The nucleus of the school was found in the Chair of Fine Art in University College, a Chair which had been devoted, during the tenure of Professors Conway and Stevenson, solely to verbal exposition, criticism, history and archæology. By degrees, chiefly under the inspiration of Professor R. A. M. Stevenson, the opinion gained ground that a Chair of the Fine Arts could not do its right work in a great city while it was totally dissevered from the practice of the arts. By the generosity of the city it was made possible to give effect to these views; and there was established a school of the most comprehensive and ambitious character, in which all the most important of the arts and crafts that are, in any of their applications, subservient to architecture were grouped together in the closest relationship to each other. The school has thrived; it is working a revolution in the education of architects, and in the other arts has attracted to itself artists and students of distinction and promise. But the school, by the very rapidity of its growth, lacks money. And the temptation to sin often comes to an institution, as to an individual, under the stress of poverty. It appears that money is to be had by those who will accept the terms on which it is offered. By accepting some measure of control from the central national organisation that is still popularly known as the Science and Art Department, South Kensington, the Liverpool school can eke out its finances and continue its activities. The question is whether this School of Architecture and the Allied Arts, the child of this college and this city, which has hitherto admitted no external control, but has grown up freely under local conditions, shall throw itself into the South Kensington organisation, and submit to the Central London Authority. I trust that the board will refuse this solution of their difficulty.

A Criticism of the South Kensington System.

Of all kinds of education, art education has least to gain and most to lose by centralisation. For art, if it has life in it, is a growth, and a growth of infinitely diverse forms, eternally experimental, original at the peril of its life, adapting itself to the shifting conditions that environ it. It is far from my purpose or wish to abuse or decry the men in whose hands, as teachers or directors, the South Kensington system rests. Doubtless they do their best under the system that they inherit. If it were really necessary that teachers of no originality should continue to produce pupils of no distinction at the cost of enormous mechanical labour, the system, with its monster national competitions and its sedulous cultivation of niggling, is well adapted to achieve that end. A "national competition," to anyone who has thought about art and cares for what is vital in it, is in itself an absurdity. Success in such a competition must always be achieved in well-worn grooves. The judges are little likely to recognise rare, shy, or curious merit; the business is too risky; they will generally return verdicts that are readily understood, and give prizes to trained skill in the service of an average purpose. The works to be judged are disparate and incommensurable in style and in aim. The real encouragement of art for the possibilities and the promise that it shows belongs to local authorities and teachers, above all to a school which is free to develop its own style and to work out its own destiny. The support of such a school where it already exists is surely a privilege and a duty in a city like this, which dreams of high destinies. With an art and a style of her own, the city might be confident of her future.

But all, I shall be told, is changed. The Department of Science and Art is now reconstituted and renamed the Board of Education. It is controlled by good artists and wise men. If so, then King Log has become King Stork. Men who undertake to control the artistic activities of a whole nation are dangerous and harmful exactly in proportion to their abilities. The only hope for a system of "grants by results" and "national competitions" is that it shall fall into incompetent hands. A strong man, or a body of strong men, will make it seem plausible, and will impose on the intelligence of the man in the street, or in the council. What they cannot do is to awaken the impulses that create original art in a community, or to give the sympathies that encourage it. It is a part of the ill-fortune of generous and wealthy men that they are often unable to tell how their money will be used, or whether it will be of real service to the end they have in view. But here the thing exists, and asks only to be saved and developed. If it falls into the great national drag-net there will go with it all the high hopes of a revival of art in Liverpool which originally actuated its founders, and which at this moment actuate the little company of artists that are its staff.

THE BRITISH FIRE PREVENTION COMMITTEE'S VISIT TO BERLIN.

AS already reported in our columns, the British Fire Prevention Committee, at the special invitation of the German Government, arranged to send a deputation to Berlin, firstly, with the object of attending the International Fire Congress; secondly, to see the great Fire Exhibition which had been organised in that city; and, thirdly, to make itself acquainted with the effect of the new building and factory regulations upon structural work in the capital. The deputation (which included Mr. Edwin O. Sachs, the chairman, and the Committee's resident engineer) met with a very cordial reception.

On the second day the Congress was opened in the central council chamber of the Imperial Houses of Parliament, when no fewer than 2,000 members were present, half of whom were district surveyors, engineers, architects and insurance experts from all parts of the world, whilst the other half included chief officers of the leading professional and volunteer fire brigades. The Congress was presided over by the German Minister of Finance, with four vice-chairmen, namely, the Minister of Interior, the chairman of the Central Council (Count Kamerovsky), Chief-Officer Westphalen of Hamburg, and Mr. Edwin O. Sachs; whilst among the official guests on the special visitors' tribune were representatives from nearly every public department in Germany.

Among others, the two following resolutions were passed:—

(1) "That the careful investigation of fire-resistance of building materials and systems of construction was a subject that should have the support both of the Government and local authorities as well as of the technical societies, to the members of which the results of such investigations are of importance in the practice of their profession."

(2) "Owing to the fact that identical materials and systems of construction are frequently employed in different countries, an effort should be made to standardize the results obtained from fire tests in such a manner that the investigations made in different countries could be compared in a practical manner, with due regard to units of measurement and temperature.'

In the evening a big banquet was given at the Exhibition, at which the Minister of Finance again presided, supported by the vice-chairmen named above. The next day was again devoted to a considerable amount of Congress work in the Houses of Parliament. In the evening the British Fire Prevention Committee gave their banquet, when a message was received from the Emperor William, and two speeches were made by Sir Frank Lascelles (the British Ambassador). Mr. Sachs presided. Altogether the Committee's banquet was a very great success. The next day was entirely devoted to the inspection of buildings in the capital.

After staying another day at Berlin, the party moved on to Hamburg, where arrangement were made for another official reception.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Architecture (as all the other Arts) being grounded upon rules taken from the imitation of Nature, admits of nothing that is contrary or foreign to that Order which Nature has prescribed to all things. . . . Although variety and novelty should please all, yet we are not to go against the precepts of Art and that which reason demonstrates.—PALLADIO.

Our Plates. THE entrance doorway to 74, Cheyne Walk, Chelsea, designed by Mr. C. R. Ashbee, M.A., and executed by the Guild of Handicraft, Essex House, Bow, is of deal with flush panels, the lower portion being covered with copper sheeting with a floral design in repoussé of a white pink, which, by the way, is the emblem of the Guild. The front elevation of this house, which has been carried out in stock bricks and rough-cast, appeared as a plate in our issue for June 13th, 1900. Our illustration is from a pen drawing by Mr. Sydney Newcombe.—The house for Mr. S. R. Timson is situated at the top of a steep ascent near the village of Berkhampstead known as White Hill, and embraces fine views of the surrounding well-timbered district. Both house and garden are designed in companionship and as neighbours to the Hertfordshire house and garden shown by Mr. Mallow's illustration in "The Art and Craft of Garden Making." Our illustration also forms part of the second edition of this work, which has been enlarged and revised and is now being re-issued by the publishers, Mr. Batsford and Messrs. Newnes & Co. The house is from designs by Mr. Dan Gibson, of Windermere, the materials employed being those which are those traditionally employed in the district, brown tile roof and rough-cast, rendered and carried out by Messrs. H. & J. Matthews, contractors, of Berkhampstead. The plan of house and grounds was given on p. 92 of our issue for March 13th last. In the disposal of the ground Mr. Thomas H. Mawson's object was to secure as much as possible for garden and pleasure ground, the main building, supplementary buildings and offices being arranged to partially enclose a square carriage court, entered from the road immediately through gates without any intervening drive. Bordering on, but screened from the carriage court by a high climber-covered trellis, is a separate path for tradesmen, entered by a separate gate. A full-sized tennis lawn claims the major portion of the remaining ground, the strip of ground between it and the impenetrable boundary hedge of holly being utilized for flower beds to brighten the prospect, box edged—accompanied by a reposeful sun dial. A square (not octagon) summer house, rough-cast, is set angle on to the tennis lawn. Select clipped trees of simple form and a quiet, restful green colour, a sparing but select assortment of shrubs for flower in summer and evergreen to furnish in winter, and roses and climbers wherever a suitable footing can be found to embower the house, aided by the kindly rough-cast trellis, pergolas, arches and hedges well-nigh complete the remainder.

An Early Building Indenture. THE following is reckoned to be the earliest known document relating to the erection of a house in this country, dating as it does from 1472: "This indenture made between Alice Chester, of Bristol, widow, some time the wife of Harry Chester, of Bristol, draper, on the one party, and Stephen Morgan, of Bristol, carpenter, on the other party, witnesseth that the said Stephen hath covenanted with the same Alice and him bindeth by these presents to make well, workmanly, and surely of good timber and boards a new house, in the High Street of Bristol, with floors, windows, doors, and partitions and all other things of timber work belonging to the same house, except laths and lattices, which said new house shall be set between the tenement called the Bull on the one party, and the tenement in which one Jone a Cork, Corviser (cordwainder or shoemaker), now dwelleth in, on the other party, containing in length 19 feet and 5 inches of size, and in wideness 10 feet and 4 inches; and the said Stephen shall make in the said a shop, a hall above the same, with an oriel (bay window), a chamber above the hall with an oriel, and another chamber above that by the feast of the Annunciation of our Lady next coming, for which house so to be made by the same Stephen the said Alice granteth, and her bindeth by this present (writing) to pay unto the said Stephen £6 18s. 4d. sterling; that is to say, at the feast of the Nativity of our Lord next coming £3, at flooring of the said house 33s. 4d., and at the end of the same work 40s. Also, it is accorded, that it shall be lawful to the same Stephen to have and take as his own all the old timber of the said old house without any gain-saying of the same Alice, or any other for her, or in her name. In witness, thereof, the parties aforesaid to these indentures interchangeably have set their seals. Given the 17th day of the month of November, in the 12th year of the reign of King Edward IV.—Hardyng."

The Cretan Excavations. MR. ARTHUR EVANS announces that the concluding excavations of this season in the prehistoric palace of Knossos have produced discoveries which throw an entirely new light on the architecture of Homeric Greece. East of the great central court he has now brought to light a suite of princely chambers with walls descending in places 20ft. and including the remains of upper storeys. A portico to the east opens on a fore-hall with eleven doorways and giving access to the principal hall. A side passage leads from this to a second hall, which shows on two sides the remains of a double tier of colonnades, within which a triple staircase leads to the upper galleries. In this hall was a large deposit of tablets with prehistoric inscriptions, one larger than any yet discovered, and apparently containing lists of officials. In the neighbouring chamber were fallen fragments of human figures of coloured plaster in high relief and of most magnificent execution, the rendering of veins and muscles showing a naturalistic skill never again rivalled till the Italian Renaissance. In the adjoining gallery were remains of bull-hunting scenes, in which girls, attired like Mycenæan cowboys, also take part.

Kirkham Priory. THE members of the York Architectural Society recently visited Kirkham Priory. A paper on the history and architectural features of the Priory was read by the president, Mr. C. H. Channon, F.R.I.B.A. A paper on the heraldry on the gateway prepared by Lord Hawkesbury was read by the secretary, Mr. George Benson, A.R.I.B.A. The Priory was founded in 1121 by Sir Walter Espec and his wife Adeline for canons regular of the Order of St. Augustine and in honour of the Holy Trinity. The Priory church was cruciform, having an aisleless nave, transepts with chapels, central tower and square-ended choir with aisles. South of the nave was the cloister, round which the Priory buildings were grouped. The south wall of the cloister contains a beautiful late Norman enriched doorway, leading to the refectory. Of the choir, a single lancet remains at the east end, with side shafts and capitals of foliage. The designer has impressed his individuality on the lancet window; it differs from other work, but has a quiet dignity of its own. About 1290 the Norman gatehouse had a decorated design grafted on it; the tracery in the two windows is fine. Heraldry plays an important part in the decoration of the gatehouse front; the shields are those of Clare, Plantagenet, Ros, Vaux, Fitzwilliam, Scrope and Vesci. About this period the lavatory in the cloister was inserted; it is a beautiful composition of geometrical decorated work. A visit was afterwards paid to Crambe Church, an edifice with a Pre-Norman chancel arch, Norman windows in nave and chancel, and an interesting Norman font, and to the modern church of Whitwell.

Excavations at Silchester. THE exhibition of antiquities found at Silchester during the course of last year was open to the public last week at the rooms of the Society of Antiquaries, Burlington House. The collection was certainly one of the most interesting which has been acquired since the present committee took over the work in 1890. Last year's excavations were confined to four of the insulæ into which the area has been divided, numbered 23 to 26. Insula 23 formed the northernmost of the unusually large squares in the central portion of the town. Here the late Rev. J. G. Joyce unearthed a house of considerable size so long ago as 1865. Later research has revealed an additional series of chambers to the north-east, which evidently formed part of the same dwelling. Another house of large size with several mosaic pavements was also uncovered on the east side of the insula, and in the mouth of its courtyard was a small square building which was probably devoted to sacred purposes. This had been raised round a small and earlier structure of the same character. The pits and wells in the immediate locality were unusually productive in pottery, and included a hoard of smiths' and other iron tools numerically larger than the famous find of 1890. In insula 24 were found two houses, one of which was not only large but of exceptional interest owing to the peculiarity of its plan and its numerous mosaic floors. Other buildings encountered by the excavators near the north gate were apparently connected with dye-works; while in insula 26 the late Mr. Joyce's work was again supplemented by the discovery of the complete plan of a house partially revealed by his industry. The same area contained three other structures, of which one was represented by a solid circular platform with a cement floor 27ft. in diameter. This seems to have been enclosed by woodwork or half-timbering. The whole collection will eventually be placed for arrangement in the architectural room in the Reading Museum.

Houses Built of Glass. THE following are extracts from an article on glass houses which recently appeared in the "Spectator": We suppose there is something of the advertisement in the descriptions we see of the new "stone glass," which, according to M. Henrivaux, the great French glass-maker, is to supersede brick for building, but the idea has a certain charm in it nevertheless. It fascinated Mr. Percy Greg thirty years ago; and in that remarkable effort of imagination, "Across the Zodiac," the grandees of Mars all live in indestructible houses of glass, translucent from within, yet impervious to the eye which gazes from the outside. There are objections to the material, as we shall presently show, but that it can be made exceedingly durable, harder than stone, and of every variety of colour, we are willing to believe. . . . If there is a Beckford among the millionaires now so numerous among us, we recommend the idea to him, with the proviso that his architecture must not be Gothic, and Arab rather than Italian. The material is for the Alhambra, not for a Christian minster. He would have a house unlike any other in the world, that would continue to exist, unless artillery were used against it, as long as the Egyptian vitrified ornaments, or say four thousand years as a minimum, and which in all that while would be, or at all events might be, a miracle of cleanliness, the only detergent needed being soap and water rather lavishly expended. Its rooms might be of marvellous variety, and in one way of beauty, the material admitting of every perfection of Arabesque design, and even of reliefs to which skilfully localised opacity would yield the necessary shading. . . . Open windows being needless and ventilation secured from above, the house could be embosomed in a grove of trees far closer to it than our customary architecture will allow. . . . It would be an experiment worth making if one had, say, £20,000 to throw away; and who nowadays of the new palace-builders would miss so insignificant an amount? A fifth-rate New Yorker would waste it on his staircase. . . . Except for an experiment, however, we distrust glass as a building material for the general housing of a community. We doubt the growth of a desire for an unvarying pressure of light or of a wish for the feeling that we are always out of doors. Nor do we fancy that glass can ever be very cheap. Its substance may no doubt be—for instance, glass could be made from sea-sand—but vitrifaction requires intense heat, and intense heat is costly to produce, while if the material is no cheaper we do not see its superiority either to stone or good brick.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Opaque Blinds.

Manchester.—Old Subscriber writes: "Kindly name the makers of opaque material for window blinds. It is used for putting rooms in total darkness."

Messrs. Guynan & Son, of 11, Carburton Street, Great Portland Street, London, W., make a speciality of opaque spring-roller blinds in various styles for lecture-rooms, studios, laboratories, &c. They will, doubtless, be willing to supply the material alone if required.

Books on Chimney Construction.

Beeston, Notts.—T. C. C. writes: "Is there any book dealing with tall chimney construction, giving more particularly the size of the flue required for, say, from one to six boilers, and also the height necessary?"

"Boiler and Factory Chimneys: Their Draught Power and Stability," by R. Wilson (3s.), and "Chimney Design and Theory," by W. W. Christie (12s. 6d. nett), will be found useful. They can be obtained from Mr. B. T. Bastford, of 94, High Holborn, W.C. We have an article in hand on "The Practice of Stalk Building and Boiler Setting," which will be published shortly.

Floor for Small Fever Hospital.

Bath.—V. S. writes: "Can you suggest an inexpensive and efficient floor for a small fever hospital, terrazzo, oak and teak being too expensive?"

It is difficult to suggest a cheap and effective substitute, but trowelled cement might be used for the corridors, and concrete made of Portland cement and cork dust used for the floors, being sanitary, cheap, warm and soft to the feet.

Papering Walls.

Southsea.—W. A. C. writes: "Which is the most satisfactory and economical means to prevent the first papers fixed to walls (new) from being affected by the lime?"

Plaster should, whenever possible, be allowed to dry thoroughly, and in good work is generally distempered and left in that state for about six or twelve months before papering. If, however, this cannot he done, for cheap work a coat of spirit varnish, paper coated with pitch, or lining paper may be first put on; one ply Willesden paper is more satisfactory, and for first-class work tin foil should be used. Sulphuric acid has been recommended for drying plaster, but it renders the surface liable to considerable decay.

Nailing Floor to Concrete.

York.—Floor writes: "I am thinking of nailing down a wood floor to concrete direct. It is more solid and sanitary than nailing to fillets. Does experience show that there is danger of dry rot? Wood block flooring seems to stand so far as this danger is concerned."

Wood flooring should not be nailed down direct to the concrete, as there is a danger of rot setting in. This is more especially the case in cellars, and where the floors are often damp. The case of wood-block flooring is entirely different, being in small pieces, mostly laid on end, and tarred on the underside. We would suggest that the concrete be trowelled off with neat cement and tarred, and the underside of the boards tarred also. The floor should not be covered with linoleum or a similar non-porous substance.

Hollow Walls for House in South of England.

London, W.—R. G. B. writes: "I am building a house a few miles from Bournemouth, and the prevailing custom appears to be to build 11in. hollow walls. Would a 9in. solid wall with 1in. cement rendering and rough-cast or pebble dash keep the walls dry, and, if so, which of these is the best? The house is detached, but not exceptionally exposed."

In the South of England, where the usual stock bricks are so porous, the custom of building hollow external walls is very general. I have built a great many cottages with 11in. cavity walls with either iron ties or with Jennings' patent binding bricks, and consider the latter the better of the two. It is very necessary that the two 4½in. thicknesses should be carried on the same foundation, and they should he finished at the extreme top with a little solid brickwork in order that the roof may be carried equally on both. An article on this method of walling, detailing the necessary precautions which should be taken, is to be found in the Builders' Journal for January 16th, 1901, and reference may profitably be made to it. There is no doubt that an 11in. cavity wall with ties is of less strength than one of 9in. solid work, and a greatly better construction consists of a 4½in. outer skin, 2in. cavity and a 9in. interior wall carrying the floors and roof timbers. If, however, this method of building be considered too expensive there is no doubt that a 9in. solid wall covered with cement rendering or with rough-cast can be made absolutely waterproof, but to some minds its appearance is rather a drawback. If this plan be adopted small staples should be inserted for the attachment of wires if creepers or roses are to be trained upon the walls. The pebbles referred to are merely a matter of taste, and form no part of the waterproofing construction. G. S. M.

Books on Workmen's Houses.

Liverpool.—H. W. writes: "Kindly name some books (with plans, &c.) on the building of small houses for workmen with six to ten rooms."

The following will be useful: "Houses for the Working Classes in Urban Districts," by S. W. Cranfield and H. I. Potter (15s. nett); "The Principles and Practice of Modern House Construction," edited by G. Lister Sutcliffe (published by the Gresham Publishing Company, 25, Farringdon Avenue, E.C.); "Examples of Labourers' Cottages, &c.," by J. Birch (7s.); "Dwellings for the Poor," by T. L. Worthington (2s. 6d.); "Cottages," by A. W. Brunner (4s. 6d. nett). Any of these can be obtained from Mr. B. T. Batsford, 24, High Holborn, W.C.

Civil Service Examinations.

Cockney writes: "Kindly answer the following questions: (1) If I write for particulars and application forms for Civil Service Examinations when they are announced, can the Commissioners compel me to go in for that examination and pay the fee? (2) Can an assistant surveyor R.E. enter for the examinations for assistant surveyor in the Office of Works, which seems a better post, and if he passes be transferred? (3) Do assistant surveyors in the Royal Engineers wear uniform, and are they considered officers? (4) What are the best ways for learning architectural design?"

(1) No. (2) Yes. (3) No. (4) See answer to enquiry on architectural training on p. 346 of our issue for June 5th last.

Waltham Abbey.

London, N.—Waltham Cross writes: "Kindly give the titles of any books relating to Waltham Abbey, particularly relating to the Lady Chapel."

A paper on the "Architecture and Early History of Waltham Abbey Church," by E. A. Freeman, appeared in Vol. ii. of the Transactions of the Essex Archæological Society. Then there are Fuller's "History of Waltham Abbey" and Stubb's "Foundation of Waltham Abbey."

Experience in a Country Architect's Office.

Pro Bono Publico writes: "What is your opinion of a county architect and surveyor's office for a young man wishing to gain an architectural and surveying experience—London not included, of course?"

As a general rule a student can gain more experience in a country than in a London office, but very much depends upon the principal, the district, and the class of his practice. This is usually more varied than in town, and there are greater opportunities of inspecting works in progress, but, on the other hand, the designing is often of a low order, and the opportunities of private study are few. This last drawback however, can be remedied by becoming a "student" of the Society of Architects and entering for the students' competitions, or by working for the R.I.B.A. examinations, taking correspondence tuition from someone who undertakes this work.

Brick Clays.

Queenstown, South Africa.—Builder writes: "Kindly recommend some books dealing with the treatment of clay for brickmaking, also for brickmaking machinery."

"Bricks, Tiles and Terra-Cotta," by C. T. Davis (21s.), to be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C. Particulars of the various kinds of brickmaking machines will be found in "Architectural Pottery," a very comprehensive work recently published by Messrs. Scott, Greenwood & Co., 19, Ludgate Hill, E.C., price 15s. nett.

Books on Colonial Architecture.

Lux writes: "What is the best book on Colonial architecture or building construction?"

We are not quite clear as to what querist wants—whether a book giving illustrations of current architecture in the Colonies, or a book dealing only with their construction. As regards the former, we know of no book on the subject; but an illustrated article on "Architectural Art in New Zealand," by Mr. S. Hurst Seager, A.R.I.B.A., which appeared in the R.I.B.A. Journal for September 29th, 1900, may be useful; and, perhaps, "Old Colonial Houses at the Cape" (Batsford) may also be of use. The ordinary books on building construction will be suitable for Colonial work. Rivington's "Building Construction" (4 vols.) should be obtained; and other useful books are Clarke's "Farm Buildings" (6s. nett) and Giraud's "Stable Building and Stable Fitting" (6s). These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Renaissance Buildings in Worcestershire.

London, N.W.—P. T. H. writes: "Kindly name two or three Renaissance buildings in Worcestershire, or adjoining counties, suitable to measure for the R.I.B.A. Final Examination."

The Guildhall at Worcester would seem to answer the description best. It was built in 1723. Westwood House, Worcestershire, also might serve the purpose. The main block is Elizabethan, and it has a splendid porch, but the wings are commonplace and the interior has to a great extent been modernised. G. A. T. M.

Assistant Surveyors, Civil Service.

London, S.W.—M. A. J. C. writes: "I am in a surveyor and estate agent's office and hope in a few years to either start for myself or enter the Civil Service as an assistant surveyor. What course should I take in order to obtain such a position?"

Particulars of the Civil Service examinations can be obtained by applying to the Secretary, Civil Service Commission, London, S.W. Some useful and interesting correspondence and an article on the Civil Service examinations appeared in our issues for November 22nd, 1899, May 16th and 30th 1900.

Payments to Adjoining Owners.

London, E.C.—J. W. R. writes: "I am obliged for the reply to my query on page 345 of your issue for June 5th relative to the rebuilding of a party wall. Could you name the case in question?"

The case is *Irving* v. *Turnbull* 2, Q. B. (1900) 129. The decision was made by reason of the terms of the conveyances under which the respective parties derive their title. A. O. H.

Preventing Paint Blistering.

Boiled Oil writes: "Could you recommend a dark-green paint for woodwork much exposed to the sun? I have tried several, but find all of them blister."

Dark-green paint, in order that it may not blister, must be composed of hard drying varnish and turpentine, and afterwards varnished with a carriage varnish. Ordinary oil paint will probably blister if the work on which it is used has blistered before. The fault has been in the original painting. For full particulars as to the prevention of blisters, see "Painting and Decorating" (Griffin & Co.). W. J. P.

R. I. B. A.

EDUCATION IN BUILDING.

By Professor W. R. LETHABY.

A MEETING of the Royal Institute of British Architects was held last Monday evening at No. 9, Conduit Street, W., Mr. William Emerson, president, being in the chair. The minutes of the previous meeting having been confirmed, Mr. Alexander Graham, hon. secretary, announced the death of Mr. J. A. Inglis, which is referred to in another column. Mr. Charles J. Sculthorpe Hall, Professor of Architecture to the State College, Puebla, Mexico, was then elected a fellow of the Institute. Mr. Emerson announced that the appeal for funds at the annual meeting of the Architects' Benevolent Fund, when Mr. Macvicar Anderson had offered £100, if £1,000 would be made up, had been successful in obtaining that sum.

Professor W. R. Lethaby then read his paper on "Education in Building." He began by referring to what is usually meant by the word "architecture." He said it was very ambiguous, meaning anything and nothing, according to the varying conditions of the moment. It meant either actual building, drawing, &c. "Architect" was also another ambiguous word; it was almost one of the words which philologists might call a myth-making word. It was also the same with "science," "civilization," "progress" and "liberty." The word "architect" was very unfrequently found used in the Middle Ages, meaning a master in craft. The early craftsmen were associated in guilds, and the words used instead of architect were usually mason or carpenter, but above all it always referred to the doing of work. We found such expressions used as "the *work* at St. Paul's," or "at London Bridge." Considerable study had been made in France of contemporary documents dealing with the builders of the great churches and cathedrals there, but in this country very little was known, yet one could say with certainty who was the master of works in their erection. The facts laid ready at hand for those who were willing to investigate with regard to our cathedrals. We went on reading and hearing it stated that it was not known who built this old building and that, but the facts were at hand. When the old documents were studied, first carpenters and masons were referred to as the master craftsmen, and then later masons and carpenters. In the guilds a craftsman first entered as an apprentice and after seven years, supposing he were qualified, he was entered as a master. The freedom of the City of London was originally merely the natural right of every craftsman. Masterhood was a definite degree in craftsmanship, just as a master, such as of arts or letters, in a university, and ranked equal. The fact of the guild organisation was the great fact of the Middle Ages. The country was subject to the barons and nobles, but the towns were on the craft guild basis. In the twelfth century there was a great struggle between these two sides. Industry was early organised into groups. Mr. Lethaby thought that the modern use of the word "master" was a mere derivation of the early use, in that only a master in a guild could be the employer of labour. The guilds claimed a notable place in civic life. We could now hardly realize, any of us, the airs a craftsman gave himself. If we wanted to build a shop we called in a carpenter, or for church a mason; so, then, the carpenters attended to houses and masons occupied chief place in churches. Probably abbots and lords often laid down very carefully the requirements of their buildings. The design was merely the professing and doing of the work in the ordinary way.

It was probable that there had been a succession of masons in charge of Westminster Abbey right down to the present day, since Henry III. began to build it. As there were special officers of the King, so in the guild days there were a King's mason, a King's baker, &c. He spoke merely of normal conditions; there were of course exceptions. The guild was a co-ordinating authority, and there was no art nonsense. The building of old work was a natural evolutionary product. He had been investigating the documents dealing with the builders of Westminster Abbey, and he gave some of the results of his researches. He found the term master mason in use in the twelfth century, implying the existence of a guild. In 1244 he found that preparations were being made for the rebuilding of Westminster Abbey by Henry III., and a Henry as master mason was mentioned. This Henry almost certainly became the first master of Westminster. He next found that the materials were consigned to Edward the clerk, who doubtless had to deal with the finance, and a master of the works. In 1246, Master Henry Seminarius took a house at Westminster, and he and Edward, the clerk were mentioned as keepers of the work. Their wages are stated later, and 600 or 800 men were ordered by the King to be put on to urge on the work. Later, a mandate was issued to Henry, the master mason, to expedite the work. John of Gloucester was appointed his successor, and as King's mason in another mandate. Mention is also made of a master carpenter. In 1260 this great mason died and was succeeded by Master Robert of Beverley. Robert was employed in erecting a stage for Edward I., and completed the Tower of London and the King's Mews at Charing. We learn that 1,000 to 2,000 marks—an enormous sum in those days—was being spent annually upon the work at Westminster. In 1279 Robert was still keeper of the works. Robert was succeeded by Richard Crundall, as chief mason. Then we read of Walter of Canterbury, Richard Witham, Thomas of Canterbury, William de Ramsay, &c., up to the time of the Black Death.

Everywhere the art of building was developed by men engaged in actual building. It might not be possible to bring back this sort of thing—perhaps it was not desirable. The modern system was marked everywhere in building, and we had a garbage of diseased ornamentation of fatty luxury, which he might call the "Syndicate" style. It was, perhaps, necessary that in the study of past art the different forms should have been labelled styles, but it was truer to say that there was only one style—the art of experiment, of expressing on work thought. That was the measure and value of our work to-day. Then let us consider the future in the light of the past. Were we to aim again at reproduction of some forms of a past architecture, such as those of Mexico, which had not yet been imitated or, something more easy, as the methods and mannerisms of Wren? They could do no such things. The attempt could only be made by an architectural ostrich with his head in the sand. What was there else but the art of building in the practical work of to-day and in the scientific study of to-day?

Archæology was only a branch of history. Proportion was the outcome of a right use of material, as a North Western Railway engine was proportioned to its driver, and no one knew anything else. Taste and principles in design no one had. Beauty, that subtle and illusive science which spoke to our spirits, they could not formulate; in art it was the evidence of a balance of quantities and method. Work was certainly a serious part of life, and we might say beauty was the smile of energy. It was work the effort they had to teach, and not the smile—that would come of itself. Nothing wise or beautiful could but spring from this. Want of knowledge had been prescribed as a remedy, but he thought against the blankness of ignorance it would be better to have knowledge. To give up all and carry the hod would be the part of a saint in architecture.

There were many ways to help to better the state of things—such as in the sacrifice of ornament, by spending more time at the work and less at the office, &c. They might learn much about building by questioning the workmen, who knew many things, of methods they had seen. We were living through a period of quick change in these things, and probably the most valuable work that could be done would be gathering these old receipts in building. Those rough, tired men the British workmen were, after all, the true architects. It was they who knew how much water should be in a mortar when worked up with the trowel, how many nails went to each slate. It was they, and they only, who knew what was proper; and he always felt ashamed when he called a building his.

The trade unions in a much narrowed form represented the old guilds, and no real improvement would be made until they took them over and placed the teaching in the hands of the men themselves. Even at this moment the plasterers of London were endeavouring to make every learner go through the technical schools already established. The quality of work done rested in the long run on the economic basis. The art of bygone days was the work of great artists in feudalism; the art of the monasteries was the flowing out of illuminated books, glass, &c.—but generally there was peace in work.

It was often stated that the breeze of art blew where it listed, that there was no governing principle, and that it grew up both in oppression and in freedom, but that was not so. Wherever labour was honoured, there art would be found, for honourable labour was art. That proposition stood. Labour was really employed by the work and not by the agent. They must learn by practical work, and he would have schools established where all the building crafts could be practised side by side. In that school the science of mechanics should be taught, with practical methods and materials tested. Planning he would have taught, and normal types of plan; and also negative taste should be formed, that was the critical taste, but not the art of design or talk of styles allowed. The question of education in building must meet all classes of men engaged in building. Some day pleasant, natural work would be founded on common building; it could stand on nothing else.

Mr. Paul Waterhouse, in proposing a vote of thanks to Prof. Lethaby, said the paper had been a lesson for all of them. Whenever he saw a man approaching the Middle Ages he had fears that the veil was about to be lifted. But Mr. Lethaby had still left some mystery. He had shown how successful that system was. The architect had been knocked out as he had been before, but there still seemed a doubt as to who designed those things. To superintend was one thing, and to design was another thing. They were face to face with the conclusion that the buildings of the Middle Ages conducted themselves. It brought out the great contrast of our architecture of to-day and of that. They felt that it was impossible to revive those successful conditions of the Middle Ages with the trade unions. In Gardiner's "Dunwich" there was a form of contract quoted for the building of a church which showed that it was to be copied in general from the buildings in the neighbourhood, showing that the striving for originality was not their aim.

Mr. Beresford Pite, in seconding the motion, thought that mediæval architecture evolved itself step by step was a fairly self-evident proposition, and in its ordinary or ordinated course room was not found for the architect as we conceived him. To examine in the art of architecture was scarcely possible. The Institute examined Associates in design, but in the class of Fellows they did not. He thought the time had come for the sound sanity of the policy to be applied to the Associate examination as well as to the Fellowship, and he would suggest a modification.

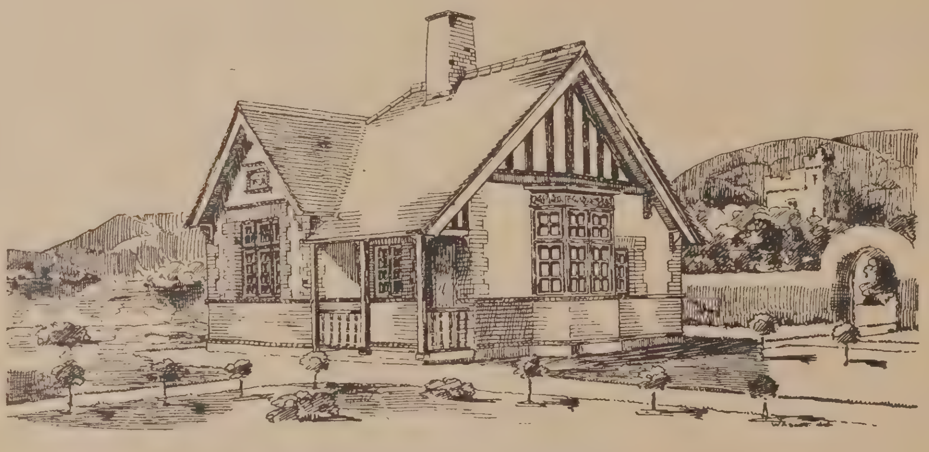
Messrs. Leonard Stokes, Thomas Blashill and F. Batchelor also spoke. Mr. Emerson, in putting the vote of thanks, said the same system Mr. Lethaby had referred to as in the Middle Ages appertained in India to-day, the master mason preparing no design for even very large buildings. The vote having been accorded, Professor Lethaby, in acknowledging, said some of the speakers had spoken of the master mason as a common man, but the whole meaning of mediæval art was that a man could rise to be the equal of any in the realm.

The New Wesleyan Church at St. Leonards has been erected in Norman Road. The old chapel it will be remembered, was destroyed by fire. The new building is of white stone, with intermediate local blue stone, and is of handsome appearance, the spire being 90ft. in height. The interior arches are also of white stone, the columns of red Peterhead granite, and the walls of Suffolk white bricks, relieved with red local bricks. Four steps lead up the rostrum, which is of pitch-pine ornamented with roses of sycamore. Electric light and gas illuminate the chapel. The building will probably cost £5,500. Mr. Clayton was architect, and Mr. W. J. Morgan builder.

Law Cases.

Mortar made with Mud.—At the South-Western Police Court recently Elijah Hedges, builder, Manor Road, South Norwood, was fined £5 and ordered to pay one guinea costs for constructing walls of houses in New Clive Road with mortar composed of 44 per cent. of sand, 26 per cent. of lime and 30 per cent. of mud. There were road sweepings, dustbin refuse, and dirty ashes in it.

Fined for Building Walls too Thin.—At the Colwyn Bay Petty Sessions, Owen Lloyd, builder, was summoned for offences against the building by-laws. Mr. William Jones, C.E., surveyor to the Colwyn Bay Urban District Council, said the defendant submitted plans for six houses three storeys high. He built four of them in accordance with the plans, but in the last two, instead of making a 13½in. wall to the level of the third floor, it was only 9½in., which would save him using 5,000 or 6,000 bricks. The foundations, therefore, were not sufficient for the superstructure, and the stability of the building was imperilled. In the other case defendant added an additional storey not shown on the plans. The bench imposed the maximum penalty in each case, £5 and costs, amounting altogether to £11 16s.



GATE LODGE AT BEAUPARC, CO. MEATH. ANTHONY SCOTT AND SON, Architects.

Reasonable Wear and Tear": A Dilapidation Case.—The case of *Terrell* v. *Murray* was recently heard in the King's Bench Division of the High Court of Justice. This was a motion to set aside the judgment of Mr. Hemming, K.C., the official referee, in an action brought by Mr. A'Beckett Terrell, the plaintiff, against Lady Murray, the defendant, to recover a sum of money alleged to be due in respect of dilapidations under a seven years' lease of 20, Harcourt Terrace, South Kensington. There was no covenant to repair during the term, but the tenant covenanted as follows: "To deliver up at the expiration or sooner determination of the said term the messuage with all fixtures attached thereto in as good repair and condition as it now is in, reasonable wear and tear and damage by fire excepted." At the expiration of the term the plaintiff made a claim for £112 under the above covenant. He brought the present action to recover this amount, and the action was subsequently referred to the official referee. The official referee found that the sum of £39 was due from the defendant. In this sum was included £12 for painting the outside of the building, £2 for repointing certain brickwork, and £5 for repairing parts of the kitchen floor which had become affected by dry rot. The official referee held that the fact that the mischief which necessitated the above items of repair had arisen through lapse of time did not excuse the defendant from executing the repairs. After hearing the arguments of counsel, the Court gave judgment for the defendant. Mr. Justice Bruce said that it was a little curious that there was no very satisfactory authority as to the meaning of the words "fair or reasonable wear and tear." He could not agree that no meaning ought to be given to the words at all, nor could he agree that they had no operation in regard to the outside of the premises. The meaning of the covenant in his opinion was that the tenant was bound at the end of the tenancy to deliver up the premises in as good condition as they were in at the beginning; subject to the following exceptions, that was to say, dilapidations caused by the friction of the air, dilapidations caused by exposure, and dilapidations caused by ordinary use. As he was of opinion that outside painting was not a thing the tenant was bound to do under that covenant, and as the amount due to the plaintiff would thus be reduced to the amount paid into Court, he gave judgment for the defendant. Mr. Justice Phillimore felt some difficulty, but on the whole concurred.

Building Contracts: Extension of Time.—In the King's Bench Divisional Court Mr. Justice Bruce and Mr. Justice Phillimore recently gave judgment in the case of *Sattin and another* v. *Poole*, in which the plaintiffs sought to set aside a report and a judgment founded upon it of Mr. Verey, the official referee, in an arbitration between the parties. The plaintiffs were Mr. Joseph Sattin and Mr. Herbert Evershed, co-partners, who carry on business in Brighton as builders and contractors. The defendant was Mr. G. T. Poole, the owner of the St. James's Restaurant, Brighton. Plaintiffs had contracted to re-build the defendant's house, the contract between the parties being governed by the usual conditions as to a time-limit with regard to the completion of the works; a right given to the owner's architect (Mr. Clayton Botham) to grant "reasonable" extensions of time in the event of the work not being completed within the time specified; and a power of imposing a penalty of £12 per week for the period during which the work should remain incomplete after the time specified in the contract, or after any extension that should be certified by the architect. This penalty the owner had a right to deduct from any balance remaining due to the builder for work and labour done. The defendant paid in respect to the work done, the architect having given progressive certificates, leaving a balance of £681 due. In respect to that amount he claimed £231 by way of penalties on the certificate of the architect that the work could have been reasonably completed in the extended time, which expired on September 20th, 1899. The defendant paid £450 into Court in satisfaction of the balance, and the case went before the official referee upon the point as to whether the penalties could be deducted under Clause 24 of the contract. The official referee, according to the plaintiff's case, refused to hear the evidence offered on the part of the plaintiffs to show that the delay was caused by the owner or by his architect in ordering extras, in supplying material after the specified date, in delay in the selection of the stone to be used, and in the alteration of plans, and he found for the defendants on the architect's certificate. Two of the chief points raised by the plaintiffs in their appeal were that the architect could not properly be judge in his own cause, as it was contended he was, and the allegation that he was himself responsible for the delay, and yet had certified as to the work not having been completed within "reasonable time." Mr. Justice Phillimore, in giving judgment, said that certificates were given according to a common practice, and were not conclusive as to the scheme in respect of which they were granted. They were only conclusive in so far as saying that at some time or other the builder might be entitled to his claim under his contract. The other matters raised by the case turned upon the agreement under the contract. The works were to be completed by May 20th, but, by one of the clauses, the architect had power to extend the time, and the architect had certified that the work was not done within a reasonable time. His lordship thought that the judgment of the official referee was right, and therefore the sum of £450 paid into Court was the proper sum due. Mr. Justice Bruce agreed, and judgment was given accordingly.

County Antrim Asylum: The Contractors' Claim.—On June 11th, before the Lord Chief Justice and a common jury, the case of *H. & J. Martin, Ltd.* v. *County Antrim County Council* was heard. This was an action for £4,167 2s. 1d. for balance of work done by the plaintiffs as contractors in building a new asylum for County Antrim. The contract was made with the Commissioners for Asylums in 1895, and since then the works have been proceeding, and possession was taken by the county council (the successors in title of the Commissioners) in April, 1900. The total amount of the contract exceeded £60,000. By two certificates granted in November, 1900, the plaintiffs were entitled to two several sums of £2,000 and £165, those being the two last certificates of the architects. In November, 1900, submission to arbitration was made between the parties, and an award was made by which the plaintiffs were declared entitled to £1,900. The present claim was made in respect of the three sums named. The Lord Chief Justice entered judgment for the plaintiffs for the sum of £4,175, the plaintiffs agreeing to give a stay to the defendants till August 1st.

DESIGN FOR GATE LODGE.

THE illustration on this page is an alternative design for a gate lodge for Mr. Peter Austin, J.P., C.C., of Beechville, Beauparc, co. Meath, erected at his Slanduff residence in the same county. Slanduff (Dark Valley) is situated in one of the most beautifully wooded and picturesque valleys in the heart of the rich and fertile county of Meath, under the shadow of the ruins of that once formidable keep, Walterstown Castle, now fast crumbling into ruins, and in view of the world-famed Hill of Tara, once the seat of the high kings of Ireland—where all Ireland's provincial kings were crowned—the original sanctuary of the "Lea Fail," or Stone of Destiny, now to be seen under the Coronation Chair in Westminster Abbey. Messrs. Anthony Scott & Son, A.R.I.B.A., M.R.I.A.I., of Drogheda and Navan, were the architects.

NEW CHURCH AT ULVERSTON.

A NEW Wesleyan Church at Ulverston has been opened recently. It occupies a site at the junction of five roads—Neville Street both ways, Hartley Street, and Chapel Street both ways, and is a conspicuous landmark from each. It is built of limestone, with Yorkshire stone dressings. The design is the Early Gothic style, with Transitional front windows of geometrical tracery. The tower is 11ft. 4in. square, and terminates with a spire at a total height of 85ft. The plan is cruciform, with nave, transepts, and chancel, the latter occupied by the choir. The organ chamber is fixed at the side of the chancel, and arched off from the chancel and nave. There is a gallery at one end. The windows throughout are glazed with leaded cathedral glass. In the chancel is a memorial window. The roof is partially open, with arched timbers and a pitch-pine ceiling, and is of good acoustic properties, being constructed after precedents which the architect has found excellent in this respect. The pews also are of pitch-pine, and the church will seat 512 adults, or a mixed congregation of 675; and the cost is £4,150, exclusive of architect's fees and site, which, with the organ, brings the total cost to about £5,300. Mr. John Wills, F.S.Sc., of Derby and London, was the architect, and Mr. W. Waite, of Ulverston, the contractor.

Correspondence.

Examinations in Building Construction.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I have read with pleasure the number of protests against the manner in which the questions were set at the building construction examination held on May 11th. In question 69, Division III., we are asked to design double labourers' dwellings for a rural district, showing all necessary conveniences and the enclosure; also to take out accurate quantities and price them—and this as one question of five in four hours! Would any quantity surveyor take out the quantities and price them for less than £5? We are asked to do it in twenty-four minutes. There were five questions on design in Division III. What I ask is that these, and quantities, should be left for other examinations.—Yours truly, A STUDENT SALFORD TECHNICAL INSTITUTE.

New Patents.

These patents are open to opposition until July 22nd.

1900.—Transporting Timber.—12,663. G. BRISTOW, Bentinck Saw Mills, Lynn Docks, King's Lynn, Norfolk. The planks, deals, &c., are transported by a conveyor consisting of two driving chains having transverse bearers at intervals. The device is intended to supplant hand labour.

Concrete Walls.—13,278. E. L. RANSOME, 532, Ninth Street, New York City, U.S.A. The object of this invention is to accelerate the drying of concrete when used in the construction of walls. The successive portions are moulded into continuous chambers with inlets for heat, which is afterwards applied from a gas jet or other source. The heat is in some cases associated with carbonic or other gases that will aid the hardening of the concrete.

Combined Snow-Sweeper and Water-Cart.—14,385. W. WOOD, Victoria Street, St. George, Bristol. This invention relates to a combined snow-sweeper and water-cart for use on tramways; the vehicle also carries cleaners for the grooves in the rails. The driving power may be through the axle or furnished by an electro-motor supplied with current from the main leads.

1901.—Hardening Plaster.—4,316. J. L. KESSLER, Clermont-Ferrand (Puy de Dome), France. To render the plaster impervious to a slight depth, so that it may be washed, it is coated with a solution of alkaline silicate well saturated with silica. If the plaster is to be made very hard it must be impregnated with the solution.

The following specifications were published on Saturday last, and are open to opposition until July 30th. A summary of the more important of them will be given next week.

1900.—3,471, NOBLE & LUND, band-sawing machines. 7,579, SMITH & CRUICKSHANK, calculating scales or slide rules. 9,420, CHUBB, doors of safes and strong rooms. 9,850, PURNELL, open firegrates. 10,025, HALL, crushing and pulverising machines. 11,856, CRANE, fastenings for doors. 13,282, BRUNCKHORST, building blocks. 13,467, THOM & OAKES, manufacture of artificial stone. 17,725, BOARDALL, window sashes. 23,779, SHOTWELL, saw clamps or vices.

1901.—862, ROBERTSON, building blocks. 1,750, DOVE, keyless locks or fasteners. 6,344, BOND-BUELL & WASHBURN, acetylene-gas generators. 8,238, DE MARE, ventilators. 8,325, BASSICK, water-closets. 8,361, WORSSAM, pipes for heating or cooling purposes.

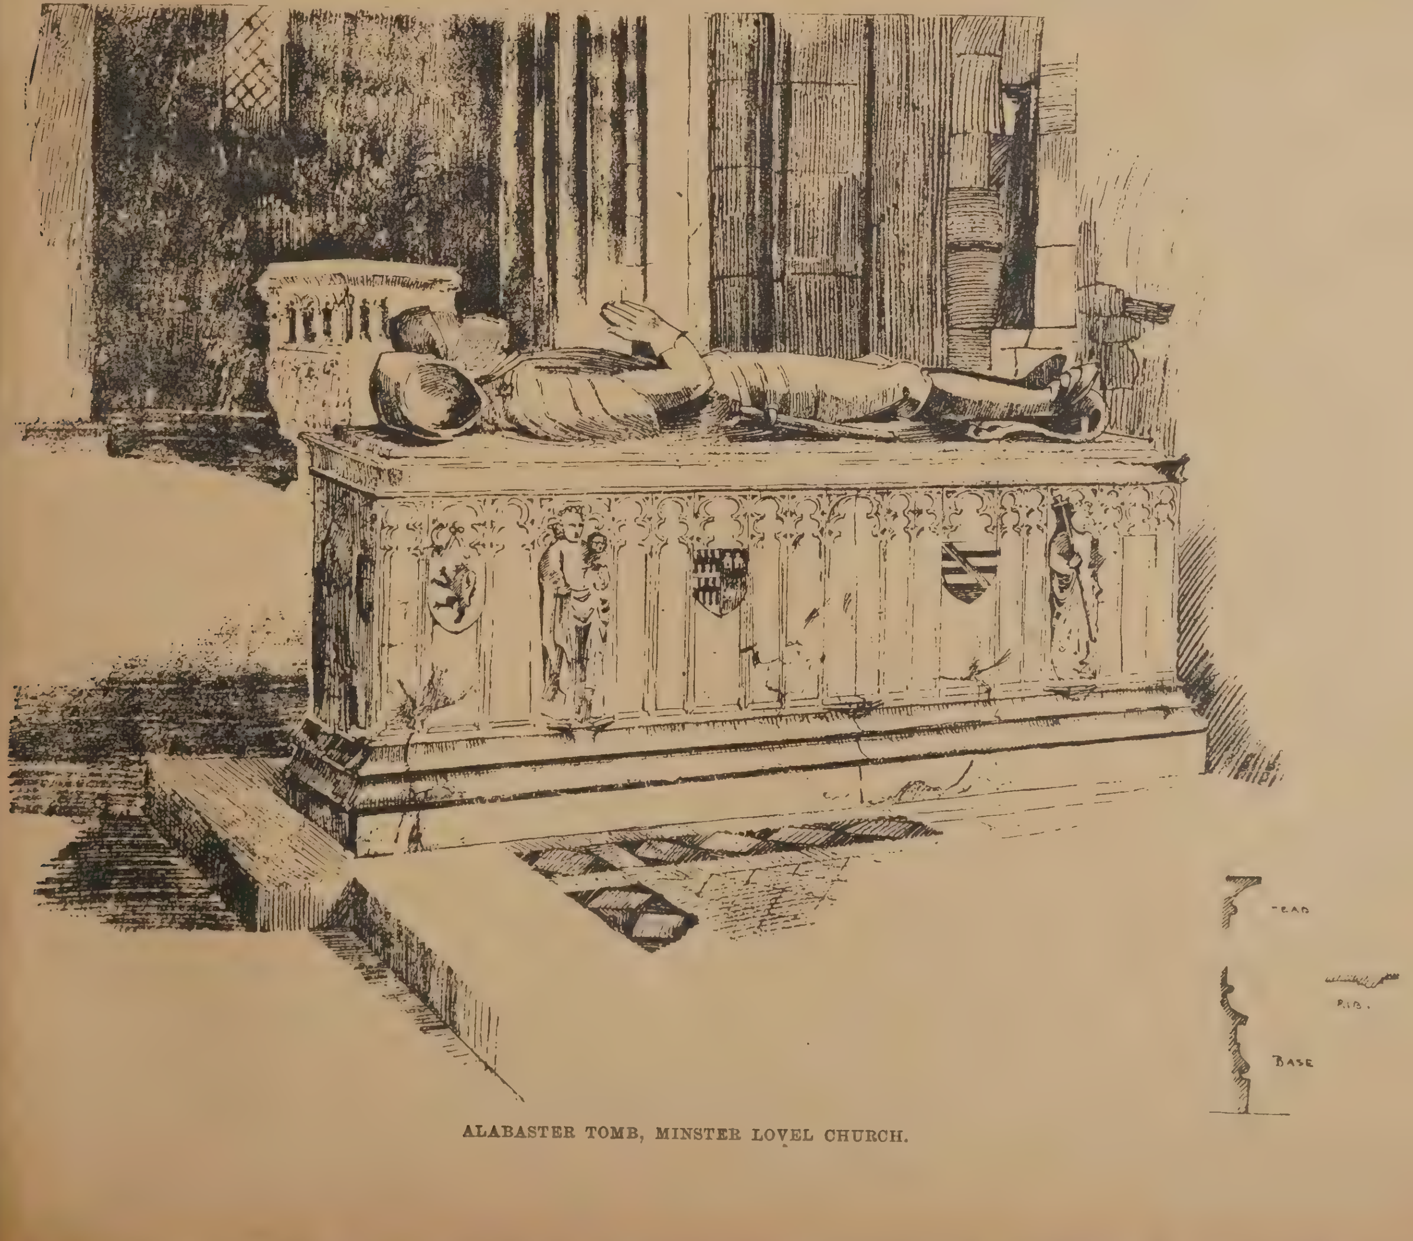
Masters and Men.

Tredegar Dispute.—Nearly the whole of the building trade of Tredegar is dislocated by the strike of plasterers, who are demanding an advance in wages from 8d. to 9d. per hour. All the men, with two exceptions, are connected with the Association of Co-operative Plasterers, and the association has sanctioned the strike.

Holidays for Working Boys.—We have received an appeal from the Bishop of London for funds for the Seaside Camp for London Working Boys, which enables London working boys to have at least seven days' holiday at Bexhill. Contributions will be gratefully acknowledged by Mr. F. Abel Bloxam, the secretary, at Northumberland Chambers, Charing Cross, or may be paid direct to the bankers, Messrs. Cocks, Biddulph & Co., 43, Charing Cross, W.C.

Masons' Strike at Corsham. — The banker masons, to the number of between seventy and eighty, working under the contractors connected with the Corsham and Box stone firms, have struck for an advance in wages of a halfpenny per hour, and the compliance with certain new regulations. The contractors have conceded the advance in wages, but they object to one of the proposed new rules which would impose a considerable restriction on the number of apprentices employed in the yards.

The Stonemasons' Strike at Leicester has been settled after six weeks. At the end of April the operatives demanded an advance of 1d. per hour (from 9d. to 10d.) in their wages, and alterations in working conditions. The employers refused to concede this demand, and the men accordingly came out on strike on May 1st. Eventually both parties agreed to refer the dispute to Sir William Markby, who, after careful consideration, stated that in his opinion 9½d. per hour would be a fair wage for the operatives. This suggestion the masters have agreed to adopt, and the men have now returned to work.



ALABASTER TOMB, MINSTER LOVEL CHURCH.

SOUTH KENSINGTON EXAMINATIONS.

QUESTIONS AND ANSWERS IN BUILDING CONSTRUCTION.—Advanced Stage.

[Note.—The questions and answers in the elementary stage were published in our last issue.]

21. *If we take 8 tons per sq. ft. as the safe load on a course of brickwork, and 120lb. as the weight of a cub. ft. of brickwork, neglecting any question of wind pressure, to what height may a pyramid of brickwork be safely built? What is the duty supposed to be performed by bonding in this structure?*

a. Weight of a pyramid =

$$\frac{\text{area of base} \times \text{height} \times 120\text{lb.}}{3}$$

$$\text{Safe weight} = \text{area} \times 8 \times 2240, \text{ in lbs.}$$

$$\therefore 8 \times 2240 = \frac{120}{3} \times \text{safe height.}$$

$$\therefore \text{height} = 448\text{ft.}$$

It is to be noted that the height to which a pyramid or cone of any material may be built is independent of the base area where an overturning force is not to be provided for.

b. The bonding is supposed to distribute the weight uniformly over each course. It is to be observed that while in actual structures a sufficient base area must be provided for overturning forces, an exaggerated base for which the bonding is insufficient may result in a weak structure.

22. *Why is it advisable to carry the masonry or brickwork of a building well below the surface of the ground (independently of sufficiency of bearing)? Name what you think should be a minimum depth; give the circumstances under which you would not insist upon it.*

A job of pebble dashing, which looked fair when just finished, is found in some months to be scaling off and blotched; give probable cause.

1.—*a.* To be beyond the action of frost.

b. Two feet, in this country; but this depends on the nature of the ground as well as the climate. It should not be insisted upon in the case of a rock foundation.

2. In this country we insist (properly) on sand being sharp, free from loam or clayey matter; in countries where there is *no frost.* or very slight frost, masons do not understand this provision, and they by choice use mud mixed with lime for mortar. If the job of pebble dashing looked well when finished, it was probably done in suitable weather. If the "stuff" contained loam or clay to any serious amount, the first frost (or rather after frost) would make it scale and blotch.

23. *What are: stock bricks, malms, purpose mades, place bricks?*

In selecting the best bricks from a heap, they are taken up in pairs and thrown to a second man; the work is done rapidly; what instructions would you give to the man picking up the bricks to ensure that the second man receives picked bricks?

Bricks from the same kiln differ by greater amounts in one dimension than in either of the other dimensions; which dimension is this, and why?

1. Stock bricks are good common bricks, mostly clamp burnt. Malms are made from clay mixed with chalk and cinders. Purpose mades are bricks made to special shapes. Place bricks are under-burnt stocks.

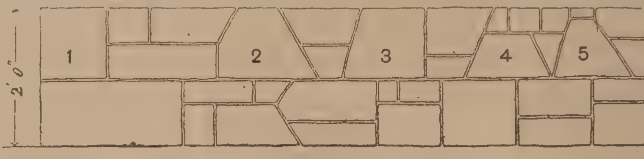
2. Properly-burnt bricks are recognisable by their colour and misshapen bricks by their form. The workman is to be instructed on these points. As he picks up the bricks he knocks them together, and the sound tells him whether the bricks are sound and well burnt. He is not to pass unsound bricks to the second man.

3. It is difficult to have exactly equal firing; and as unequal firing, or burning, causes unequal shrinking, the longest dimensions (the length of the brick) will vary most in absolute amount.

24. *What are: Portland cement, Roman cement, Keene's cement, Medina cement?*

State what you know of the manufacture and properties of good Portland cement. What would you specify as the conditions to be fulfilled by good Portland cement? How would you perform the test?

1. Portland cement consists of 75 per cent. of chalk mixed with 25 per cent. of clay, dried, burnt in a kiln, and ground fine. Roman cement, consists of nodules found in London clay, driedf burnt, ground. Keene's cement consists of plaster-of-Paris soaked in a saturated solution of alum, and then recalcined. Medina cement is obtained from nodules dredged from the bed of the Solent—similar to Roman.



SOLUTION TO QUESTION 26.

2. Portland cement. The materials are, roughly, limestone and clay. In localities where the limestone is found soft, in the state of chalk or whiting and fairly free from flints or pebbles, and the clay also in a state to easily work into mud with water, the chalk and clay (in the proportion of three parts to one part) are pugged together with water and run into tanks or backs as slurry. The slurry is dried, broken into suitable fragments, and burnt in a kiln. The resulting clinker is ground very finely and spread to "cool" and "air slake." Where the limestone is hard it is ground fine before being mixed with the clay. The latter may be burnt and ground before mixing with the ground limestone, and the mixture is pressed together (with a small allowance of water) into suitable small blocks for burning. Cement should be finely ground, and when made into a briquette it should bear a good tensional stress. The test for fineness which is most commonly spoken of—namely, passing the cement through a sieve of so many meshes to the square inch made of a wire of a certain gauge—is, owing to the difficulty of keeping such fine sieves in good order, an impracticable test. A better test for fineness is the behaviour of the cement when gauged with a suitable sand. Briquettes are made by mixing with a moderate amount of water, filling into brass moulds carefully, and, when "set," placing under water for some time. The briquettes are tested in a machine which gives a steady gradually-increasing pull. A seven days' neat cement briquette should bear 350lb. per sq. in. The expectation of a gauged briquette of good cement depends upon the character of the sand, and the tester should see that he has got a standard figure with a definite sand, so that when he uses this figure the sand is always of the same uniform character. There are many other tests proposed A rough-and-ready test which can be applied by a workman is most valuable. A workman can judge by the feel of his arm whether cement is too "hot" or "right" or "dead." He might occasionally be mistaken in "dead" cement. The cold feel of dead cement is not altogether a question of temperature; a thermometer will not answer for the workman's arm. The weight per bushel must be taken with the question of fineness (about 112lb.).

25. *A short deep Warren girder is shown loaded at its two bottom joints; the two loads being equal, state which members of those marked a to i are in tension and which in compression.*

What change will be made if the left-hand load is made double of the other? What will be the nature of the stresses if the girder is loaded equally at the three top joints, but no load on the bottom joints?

(See accompanying illustration.)

1. *a, d, d, i,* are in compression; *e, b, f, h, e,* are in tension; *c* and *g* have no load.

2. *a, d, d, i,* and *g* are in compression; *e, b, f, h, e,* and *c* are in tension.

3. *a, d, d, i, c, g* are in compression; *e, b, f, h, e* are in tension.

26. *A wall is being built in coursed rubble; the stone is irregular fragments of granite, or trap, or any stone which fractures without much regard to "natural bed." Sketch two 12in. courses in elevation of such a wall for, say, 4ft. long, scale $\frac{1}{8}$; put numbers 1, 2, 3, &c., on the stones of the top course, showing the order in which a mason working from the left towards the right would set them.*

The mason speaks of the bed and the face of such stones; what does he mean? What is "rock-faced" work? What is a "shiner"?

(See accompanying illustration.)

The mason would place his good bedded stones to cover the joints in the course below; he would make up between with closers, and level up his course for the succeeding course. The mason sees, easily, two rough faces which he can dress with his hammer so that they will meet at a right angle. He has to choose between these two which he will show in the face of the wall, the other being the "bed" of the stone: if he is building for *strength*, he will put the largest face for the bed; if for *show*, he will put the smallest. A "shiner" is a thin stone set upon a small bed, and showing a large face in the wall. The rule of setting stones on their "natural" beds does not apply to these stones. Rock-faced work consists of stones dressed (punched) to show regular joints (including bed joints), the faces being "pitched" off from the edges of the joints, leaving portions of the stone projecting.

27. *A usual form of bond in brick walls shows three courses of stretchers, followed by one course of headers in face; the drawing shows the end elevation of a two-brick wall in this bond. Repeat drawing, and show both sides extending, say, three bricks along from the quoin. Sketch separately the three bottom courses in plan.*

What can you say in favour of thick joints in modern brickwork in regard to special strength of work? What precaution should be particularly well observed in building bricks with cement mortar?

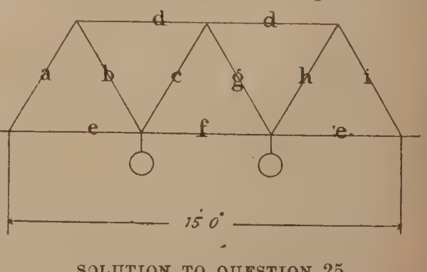
a. See accompanying illustrations.

b. Any rigid body placed on a surface more or less rough rests on three points only. If the main use of mortar is to distribute the pressure between the courses of bricks, and if the mortar is of less value in its resistance to crushing than the bricks, the joints should be no thicker than will suffice to distribute the pressure; but the increasing use of Portland cement in mortar has altered the conditions very much, and if the joints are not thick the advantage of using cement in the mortar is lost. With many kinds of bricks, Portland cement does not hold well to the surface; good thick beds and joints form a continuous matrix enveloping the bricks. If the work is to be stuccoed, the joints (especially if left rough) give hold to the stucco.

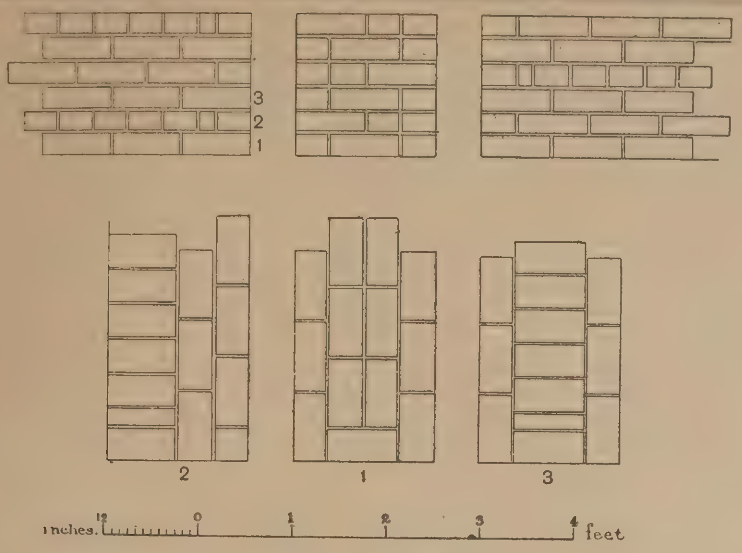
c. The bricks should not be too dry; they should be *sufficiently* wetted; if too wet (which is not usual) they may make the mortar too soft.

28. *Show by a sketch, to the scale of $\frac{1}{16}$, a cross-section of a slated roof extending 5ft. up from the eave; slates 26in. long. The wall is 1ft. 6in. thick; it has a projecting eave-course (of cut stone); rafters 5in. deep. What is rendering, and what purpose does it serve? How would you specially secure the tails of slates in a very exposed situation, as near the sea?*

Empresses, 26in. by 16in., cost £14 per M. Countesses, 20in. by 10in., cost £6 5s. 0d. per M. What points would you take into account in comparing the cost of a square of Empresses and a



SOLUTION TO QUESTION 25.



SOLUTION TO QUESTION 27.

square of Countesses? and give a rough comparison.

a. The sketch needed for this question may be the same as that given in answer to question No. 10 in the elementary stage (see p. 366 of last week's issue), except that the slates are longer.

b. Rendering is plastering the slates on the inside of the roof between the battens (or "laths") with rich well-haired plaster (coarse stuff). It is important that the stuff shall be well pushed in at the top edges of the battens. It prevents the heads of the slates from rattling with the wind. It stops the wind and prevents the slates from moving against their nails (thus making the nail-holes large, or cutting the nails). It is, of course, not done where a roof is close sheeted.

c. In very exposed situations moderately small-sized slates should be used. This gives more nails in a given area. As a matter of course, they should be nailed at the middle of the slate (in nailing slates in the middle, great care should be taken by the slater to drive the nails properly—if they are not driven home, the top slate bears on the head of the nail; and if they are too far driven, the nails draw the slate down, bending it). To fasten the tails of slates, each tail should be bedded on a small quantity of mastic in oil cement, laid in such a way as not to show on the roof. Portland cement is sometimes used, but mastic and oil is better.

d. An Empress slate will cover 180 sq. in. (with a 3½in. lap): $\left(\frac{26 - 3\frac{1}{2}}{2}\right.\ 16 = 180.$

A Countess with the same lap covers 82½ sq. in.:

$$\therefore \frac{\text{Cost of Empresses}}{\text{Cost of Countesses}} = \frac{360}{165} = \frac{\pounds 14}{\pounds 6\ \ 5\ \ 0.}$$

With less lap the price will be in favour of Countesses, which, however, need a few more battens, as they take more nails, &c. We have seen above that small-sized slates are more desirable in certain circumstances than those of large size.

29. *Show clearly by a perspective or isometric freehand sketch three or four bays of a secure bricklayers' scaffolding at the corner of a building; the wall has reached about the middle of the second storey. Supply reference letters, and name and describe the various pieces.*

(See accompanying illustration.)

S, poles or standards; L, ledgers; P, putlogs about 6ft. long and 7in. or 9in. by 3in.; B, scaffold-boards, 1½in. to 2in. thick; C, braces; H, putlog hole.

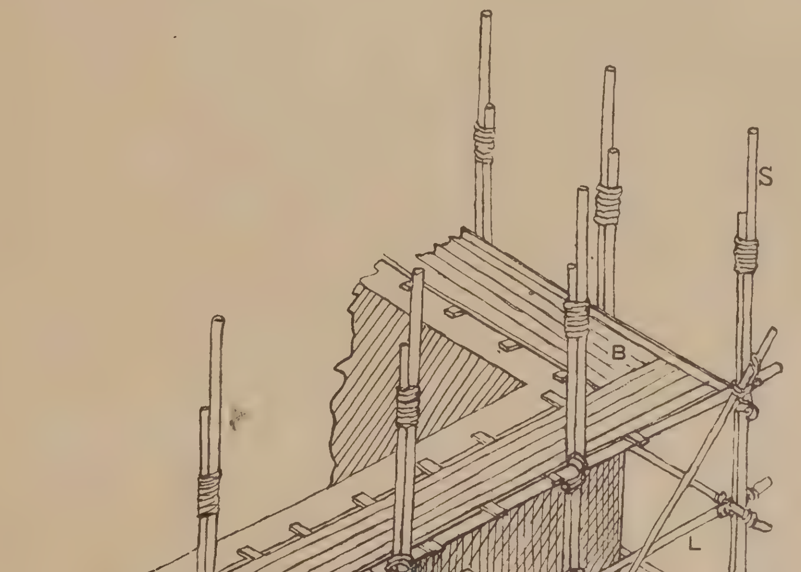
30. *Diagram of roof truss: rafters and struts of pitch-pine, king bolt and ties iron; to carry an ordinary slate roof; spaced 10ft. apart. Draw, to the scale of $\frac{1}{24}$, a little more than half from one end. Show all details to the scale of ¼. No holes are to be bored in struts or rafters; all the ironwork is to be such as can be forged from the bar and fitted by a country blacksmith. Show foot resting on stone template. Has such a truss advantages as compared with an all-wood truss? Explain.*

(See accompanying illustrations.)

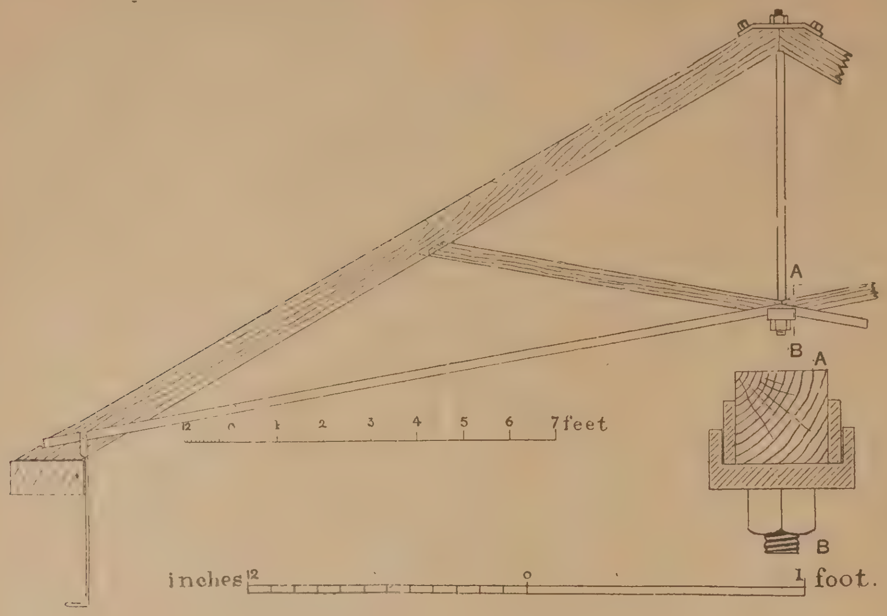
The ties are of strap-iron on edge in order that they may be able to bear their own weight without sagging. The method shown gives better head-room than an all-wood truss; moreover, it is probably cheaper.

31. *Compare sliding window sashes, as common in this country, with casement or French windows. In what circumstances would you use one kind rather than the other? What precautions should be observed to prevent guillotine sashes from rattling with the wind? Draw, to the scale of ¼, cross sections of bottom rail and frame sill of both kinds of windows. Explain the points of good fasteners for both kinds; illustrate with sketches.*

If French windows are made to open inwards, the sash or sashes (considered as a valve) are blown by the wind off the valve seat, and the wind enters. It is better as regards weather-tightness if the window is made to open outwards. Casement windows, which hang on hinges, are considerably stressed by their own weight; they should have numerous hinges to hold them to the work at the heel, and they should have strong and good fastenings, binding them at as many points as possible. Casement windows are used to give passage to balconies



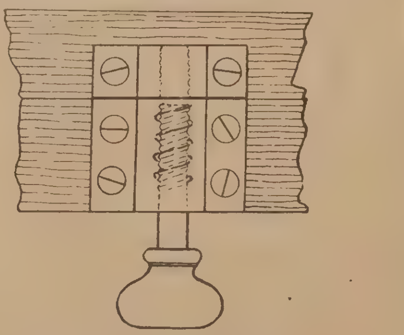
SOLUTION TO QUESTION 29.



SOLUTION TO QUESTION 30.

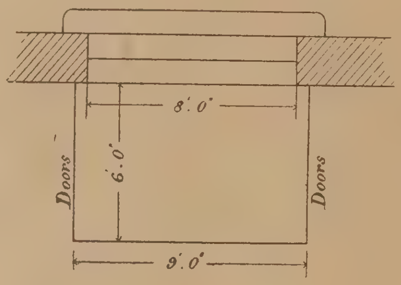
and to lawns direct from a room. In this country they are not snug enough, and it would be advisable, especially in country houses, to have the opening fitted with guillotine sashes as well as casements, so arranged that the sliding sashes could be put up or down out of the way in fine weather. Guillotine sashes are not stressed much with their own weight. They are easy to maintain in good order; wind-pressure from the outside presses them against the parting slip, they are cheaper than casements, but they can only be opened to give one-half of the window area. To keep sashes from rattling at the meeting rail, the sash fastener should draw the sashes together, and there should be "room" for the sashes to nip the parting slip when they are drawn together. In fitting, care should be taken that when the window is closed the bottom sash will absolutely rest on the wood sill; if it does, and if the sashes are fast at the meeting rail, the bottom sash will not rattle. The point now to be attended to is the upper part of the top sash. Many persons put in a small wooden wedge called a window wedge, and this is efficacious, but it will probably be found that window wedges can be dispensed with if, in hanging the top sash, the window cords are fastened to it as high up as possible, and if the pulley boxes for this sash are kept as high in the frame as possible. It appears absurd to keep the pulley boxes at the same height, as is commonly done. This weakens the frame very much, and there is no doubt if the upper sash hangs from the lines by its top there will be no rattling: the pull of the weight on the cord would oppose rattling.

There are very many sash-fasteners, which circumstance shows that there is still something to be desired which none of them gives. The old screw fastener with a helical spring to keep it back is quite as good as any of the others (see accompanying illustration). It seems absurd to make these fasteners with round knobs. It would be a little more difficult to make them elliptical in outline, but this should be the shape. The spring of this fastener is well protected, and it does not readily get out of order. A fairly good fastener without any spring is the Anglo-American (it has another name when made by a different maker). A sash-fastener ought to hold the sashes well together; it ought not to be openable from the outside; it ought to have no spring liable to rust and soon break. (In further answer to this question, see the drawings accompanying questions 9 and 13 on pp. 366 and 367 of last issue.)



SOLUTION TO QUESTION 31.

32. *Plan of lobby to a balcony of a small public hall; height of ceiling of hall, 11ft.; cornice, 8in. deep from ceiling, is carried round the partition; partition framed and openings filled with panels of framing, 2in. thick, having panels 1in. thick. Doors to be double-leaved spring swing doors, hinged to posts; doors 7ft. 6in. high. Draw, to the scale of $\frac{1}{16}$, elevations showing a pair of doors; one-half of the partition. Give full details and sketches for a neat piece of work in pitch-pine.*



(See accompanying illustrations, which are fairly full and need very little explanation.) Pitch-pines require very thorough and careful seasoning. The bolection moulding shown should be fastened to the framing, and not to the panels: the panels (which are wide) should be free to contract a little.

A Granite Cross in Memory of Prince Christian Victor, the eldest son of Prince and Princess Christian of Schleswig-Holstein, is about to be forwarded to South Africa to be placed over the Prince's grave in Pretoria Cathedral burial-ground. The cross (of the early Irish type in treatment) and the kerb are of Balmoral granite from the royal estate, while around the cross is a railing made from the metal of old guns that once did good service in our wars. The cross and railing were designed and carried out—from suggestions made by the Princess Christian—by Mr. A. Y. Nutt, architect at Windsor Castle, the work having been executed by Messrs. Macdonald, of Aberdeen, and Goslin, of London.

THE TRUE EDUCATION OF AN ARCHITECT.

AN AMERICAN VIEW.

By RUSSELL STURGIS.

FIRST of all, he should be taught how to build. It is hardly supposable that this proposition will be seriously disputed, although in practice its truth is disregarded so generally that it becomes necessary to assert it once in a while. There is a growing tendency to treat the art of architecture as the art of making drawings, "rendered" in accordance with certain hard and fast rules; and it is as well to repeat that the business of an architect is to build. What is meant when it is asserted that the young architect must be taught how to build?

When any man calling himself "architect" or "builder," or merely acting as the amateur creator of his own home, prepares to put up a building of any sort, the primary necessity for him is to have a thorough understanding of the means at his disposal and the object which he proposes to attain. The material which he can control he should understand exceedingly well, and its possibilities. The building which he intends to erect he should see clearly in his mind's eye, and its construction. This requires that he shall know how stones and bricks are laid or set; how mortar is mixed and applied; how walls are bonded together; when anchors are needed which shall tie those walls to the floors, and whether it be ever possible to avoid the use of anchors; under what circumstances lintels may be safely used; how far corbels may be used to advantage; the conditions of an arch, its line of thrust (in a general way, for it is not always feasible to calculate the exact line of its sideway pressure); how gutters may best be carried at the head of the wall; what are the approved methods of attaching to the main structure such lighter and smaller pieces as bay window, carriage porch or kitchen wing.

He must know, in a familiar way, what a brick wall is, and what are the conditions of its being—solid or hollow or built with hollow bricks. In some of our States the masons have a theory that brickwork ought not to be laid up too solidly, nor so filled with mortar as to be one homogeneous mass, because such a mass transmits the moisture from the outer to the interior face. These masons prefer slightly and loosely built walls, with plenty of cavities within to act as air spaces.

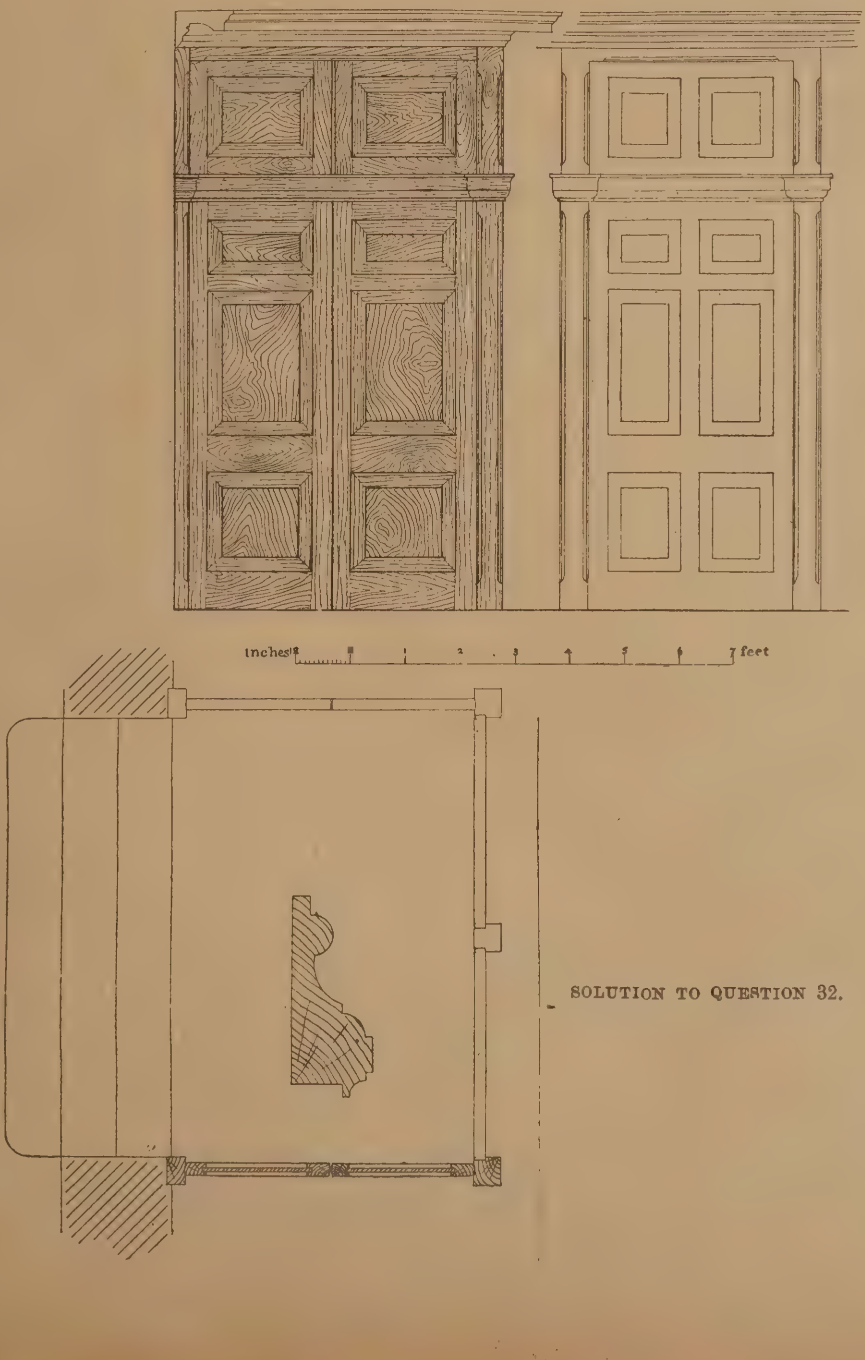
Our builder should know whether that astonishing theory is warranted or not, and also whether a more deliberately planned air space is better or not so good as furring, and whether either advice be necessary in a given case. He should have even some notions of double air spaces, for he may be called on to build in Minnesota or Manitoba. Again, he should be aware how commonly the skilled French builders disregard such devices altogether, and trust to the repellant power of good stone walls. The building of chimneys should be a special fad of his; for although it may be admitted that no man can guarantee his flue and his fireplace as affording together a chimney which will not smoke, yet there are conditions precedent, and one of these is that the flue in an outer wall should be protected on its weather side from stress of weather. Many are the chimneys that will not draw because the outer air keeps them too cold, and because the wind drives through the porous bricks of the outer wall. Such chimneys there are, even in solidly-built houses, which seem to transmit rain and cold from without more readily than smoke and hot air upward from within. The professional architect, then, must know, in the intimate sense indicated in the above paragraphs, the whole art of building. He must also love building; he must love heavy stones, and good bricks, and stout solid walls, and handsome timbers, handsomely cut and framed. He must even love the new material, wrought and rolled iron and steel, for its great and as yet only partly known capabilities. When one is asked by a would-be student about the chances of succeeding as an architect, it is expedient to find out what his proclivities are, and whether he is merely interested in fine art, and seized with the idea that architecture is an easy fine art to study and to practice.

Advice to the effect that really he ought not to become an architect unless he truly loves building and the materials of building is apt to be in place, and instances could be given where such advice has been well applied and well taken. One of the very best and worthiest of our mural painters had that advice given him twenty-five years ago, when he proposed himself as a student of architecture. He was told plainly that it seemed to his adviser that he was rather a lover of drawing and a dreamer of fine art dreams than a possible builder. The young man took the advice that was given him, and the noble results of his career prove the soundness of the counsel.

The architect should love the quarries, and should visit them with eager curiosity. The cleavage of stone and its appearance in its natural bed should be not only a delight to him, but an object of close study. He should love the lumber yard, not to say the forest. To him, the timber in itself should be a thing delightful to study, and its possible uses delightful to contemplate. He should love the brickyard, and experiments in cements and in mortars should be his holiday amusement. Finally, the architect must have such an eye and such a soundness of judgment that bad work cannot escape him. A familiarity with details not unlike that of a good master-builder he must combine with a knowledge of principles and possibilities far beyond that of the master-builder, so that good work will come to his buildings as of inevitable sequence, and bad or even slighted work will be impossible in them.

The matter of modern scientific construction in iron and steel can only be touched upon here, and there is really but one thing that need be said about it. Such construction is the affair of the engineer. Let it be admitted that the architect should understand its general principles. These are not so remote or so mysterious as they may seem to the beginner. When it comes to the actual building, to be run up in ten months, the metal uprights and ties composing the structure and the exterior of masonry being a mere concealing and protecting shell, that metal structure is the work of the engineer, and must be. It is, indeed, probable that in this case the engineer should be the first man employed, and that the architect should act as his subordinate; for the plans of the storeys are rarely complex or difficult, and all the uses of the building are simple and obvious, while what need special ability are the calculations of the engineer. It is useless for the scheme of education laid out for any pupil in architecture to include steel construction in its higher development.

What, then, becomes of our student of architecture? Is he to be expert in one thing only? He is to be expert in all the branches of ordinary building, ready, dextrous, handy and full of resources; and he is to know so much of the general principles of building, and also of the putting together of metal and the conditions of stability of the metal structure, that he can foresee the need of engineering skill in a given case, and can forestall the probable decisions of the engineer. What should be taught to the young man meaning to be an architect is, primarily, the how and why of simple everyday building, such as has been practised for centuries, is adapted to all those materials which his own country furnishes, and is according to all those processes which his countrymen recognise: Thus, if he should wish to study Byzantine vaulting without centres, or Gothic vaulting with ribs, or vaulting in cut granite, such as is used in our seacoast fortifications, it would be, in a sense, an additional and most interesting study for him; but his instructors should see to it that, first of all, he thoroughly learns the building of common life. After ten years of practice he may well enjoy the attempt to introduce into his work some of those beautiful, simple, inexpensive methods of building which the past offers for his consideration, while the present ignores them; but he will not begin with this. Building of an everyday sort—that is what he needs to know; but he needs to know it thoroughly well, to know it as a child feels the conditions of stability of his house built with wooden blocks. And he must grow to be ambitious to excel in the perfectness of his work. The writer remembers the shock which he felt when, as a student of architecture, he heard one architect in large practice say of the newly fallen wall of the unfinished church of a brother architect, that no one could find any fault, because the accident was due to frosty weather. Was that the standard which one architect set, up for another? Was it really held by prominent architects that a wall might fall down, and the blame of it be laid on cold weather? His wonder has not diminished since that time, nor does it seem easy to understand how anything can excuse the falling of a wall, unless it be an earthquake or a bombshell. A mason of repute would never have forgiven himself, or have been forgiven, for such a collapse. The builders in our cities are not too conscientious, nor are the builders in our small towns too skilful or troubled with too high a standard of excellence; but the architect, as we find him, may generally lean upon the builder, as we find him, with great advantage, and get sound and good example from the practice of the builder when left to himself.—From "The Architect and Builder" (Philadelphia and New York).



SOLUTION TO QUESTION 32.

A NEW CHURCH AT WEST BRIDGFORD.

A NEW Wesleyan Church at West Bridgford is being erected on Trent Boulevard. The building will be 58ft. long by 31ft. wide, and is to accommodate 300 worshippers. The style is Perpendicular Gothic. At the rear a church parlour is being erected the measurement of which will be 31ft. by 17ft., with two large vestries, over which there are to be two class-rooms. Every provision has been made for a heating chamber, kitchen accommodation and other offices. Access to these at the back of the structure will be obtained from the church by means of a specially-arranged hall at the side. The roof of the church will be partially open, and the whole of the internal finishings, including the pews, are to be of Canadian pine. At the main entrance to the church will be a porch 21ft. by 9ft. The main front will be faced with Coxbench stone and dressings of white Hollington stone, while a special feature will be made of a large tracery window. At the angles of the building it has been arranged to have stone ornamental buttresses, terminating with stone pinnacles. The church, it is expected, will cost £2,000. Mr. A. E. Lambert is the architect, and Mr. T. Barlow the builder.

The New St. Margaret's Established Church, Tollcross, has just been completed. It is built on a site south of the railway at Tollcross Station, fronting Braidfauld Road. The style is late Gothic. It will afford accommodation for 322 persons. Ground is also reserved on the north side for nearly doubling this accommodation, and on the east for building a small hall and session-house. The plan consists of a nave with aisle and a chancel or choir raised one step above the floor of the nave. The main entrance is by a roomy porch at the south-west corner, which communicates with nave and aisle. The pulpit is on the north side of the nave and is of stone. The architect was Mr. W. G. Rowan, 234, West George Street, Glasgow. The church is intended to cost about £2,300.

DRAINAGE SYSTEMS FOR DWELLING-HOUSES.

By JOHN W. HARRISON.

THE following notes and illustrations are intended to show the different methods of drainage for dwelling-houses, from the common back-to-back type to the detached house. The plans and description of the drainage for the back-to-back houses are introduced to show the defective method of laying, &c., which is a cause of serious nuisance.

In the accompanying sketches combined drains and sewers are shown by double lines and single drains by one line, and the following abbreviations are thus explained: I.C, inspection chamber; S, intercepting trap or siphon; F.A.I, fresh-air inlet; V, ventilating pipe; V and S.P, vent and soil pipe; G, gulley; W.C, water-closet; D.B, dustbin; C.C, concrete; D.S, down spout.

Fig. 1 shows the plan of a block of four houses built back-to-back, a type very common in some of our northern manufacturing towns. It will be seen that all the four houses are drained by a 6in. combined drain or sewer, which is laid through a covered passage or cart-way. All these houses have cellars, and the passage sewer is not often laid as deep as the cellar floors, while the joints of the pipes are often made with clay, so that the slightest obstruction or settlement of the ground causes the joints to open, and then leakage occurs into the cellars, immediately adjoining the passages. The house sinks are grouped together in the centre of the passage at the head or top of the cellar stairs in each house. The sink waste pipes all empty into one gulley, which is fixed in the centre of the passage over the passage sewer. Waste pipes empty over the gulley, but under the passage flagging. The gulley is covered with a grating; and as all the coals of the four houses are tipped on to the top of this grating the gulley is often full and overflowing into the cellars, which the writer has seen 4in. and 6in. deep in sewage.

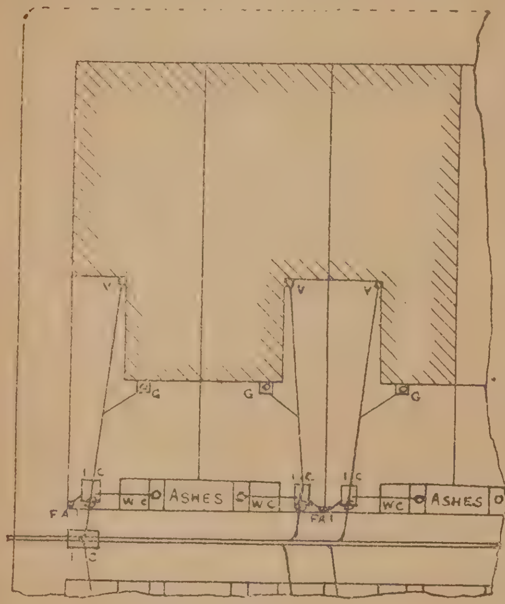


FIG. 2.

One front and one back house each have bedrooms over this passage. The sewer is not laid in concrete, and the ceiling of the passage is only lath and plaster on wooden joists. No intercepting trap is fixed on the drains, nor on the passage sewer, nor is the same ventilated. Only too frequently the down spouts do not discharge over gulleys so that they ventilate the sewer into the upper rooms of the house through the open joints and top. The sewer after reaching the yard branches off by 4in. drains to each w.c., and a gulley for the yard drainage.

Fig. 2 is a plan and Fig. 3 a section showing the method of laying the drains for ordinary small through houses of four or six rooms, generally built in terraces and with the sewer in the back street or passage, which should be at least 9ft. wide, to allow carts to pass along for the purpose of emptying the ashpits, &c. The inspection chamber in the yard is not a necessity, but is a great improvement, as, if an interceptor with a raking or inspection arm is fixed, the drain can be cleared of obstruction in either direction by means of drain rods without disturbing the surface of either yard or passage.

Fig. 4 is a plan and Fig. 5 a section showing how the drains should be laid when there is no sewer in the rear of the houses, and all drains need to pass under the house from back to front. The drain between the inspection chambers should be completely surrounded by 6in. of good Portland cement-concrete if of stoneware pipes, but it is preferable to lay the portion of this drain with strong cast-iron pipes with caulked lead joints, and they should be coated with Dr. Angus Smith's solution to prevent corrosion; or they should be glass-lined pipes.

Fig. 6 is a plan showing how semi-detached houses divided only by a narrow passage can be drained by a combined drain or sewer laid through the passage, and terminating in an inspection chamber, into which the two yard drains empty. The interceptors in this system are fixed just inside the yard gates, with the fresh-air inlets brought up the adjoining yard wall.

Fig. 7 is a plan showing how semi-detached houses are drained when they each stand in their own grounds. It will be seen that this is a more expensive method than the last, as two inspection chambers are required to each drain.

Fig. 8 is a plan showing the drainage system for a detached house, with stable if required.

The following remarks apply to all the above systems:—

Fresh-air inlets should be brought up to 2ft. or 3ft. above the ground, and be fitted with a mica flap-valve, to prevent back-draught, or they should be carried about 6ft. high. They are generally sunk into a chase in the wall to prevent them being damaged. All the vent shafts and soil pipes should be carried up full diameter, without bends if possible, to a height of 2ft. above the eaves if there is no attic, and above all windows which open and clear of all chimneys if there are attics; and the top end should be fitted with a wire balloon.

The special points requiring attention are: The drains should be deep enough under the ground to prevent breakage or disturbance by carting, &c., on the surface. The fall or gradient should be uniform and sufficient to make the drains self-cleansing, and not less than 1 in 40 for 4in. pipes and 1 in 60 for 6in. pipes, as they will seldom be flowing full. If sufficient fall cannot be obtained a flushing apparatus should be fixed at the upper end of the drain to discharge automatically and at regular intervals.

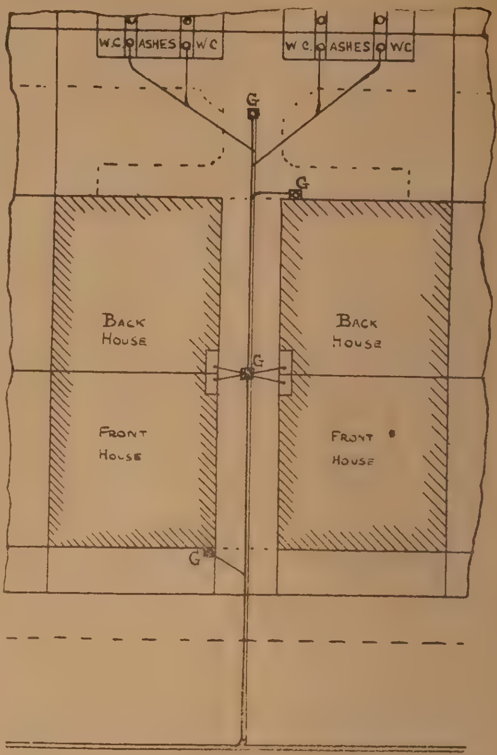

FIG. 1.

The pipes should be glazed socketted stoneware, with the glaze omitted from the inside of the socket and the outside of the spigot end of pipe to afford a good key for the Portland cement, which should be used for the joints.

The foundation or ground should be solid. If it is not so, the drains should be laid on a good thick bed of concrete. The drains should be laid in straight lines from point to point, and, unless prohibited by expense, inspection chambers should be built at all angles and important junctions. The main drain should be disconnected from the sewer and ventilated. All w.c.'s should be trapped and ventilated. Slop sinks are treated in the same way as a w.c.

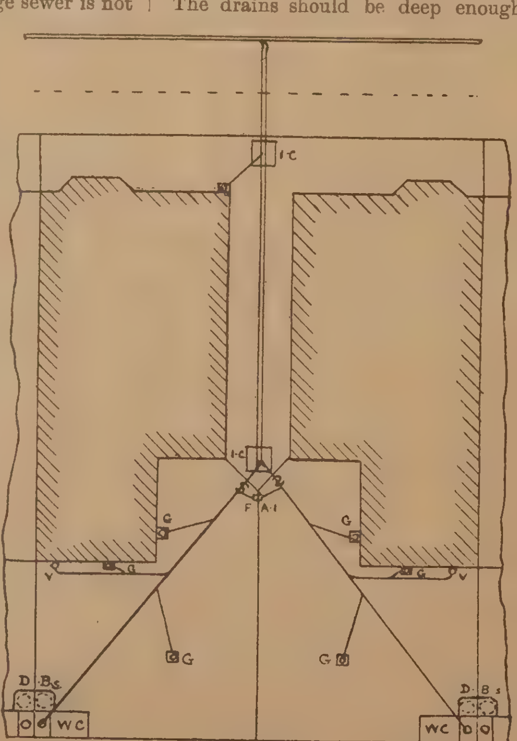

FIG. 6

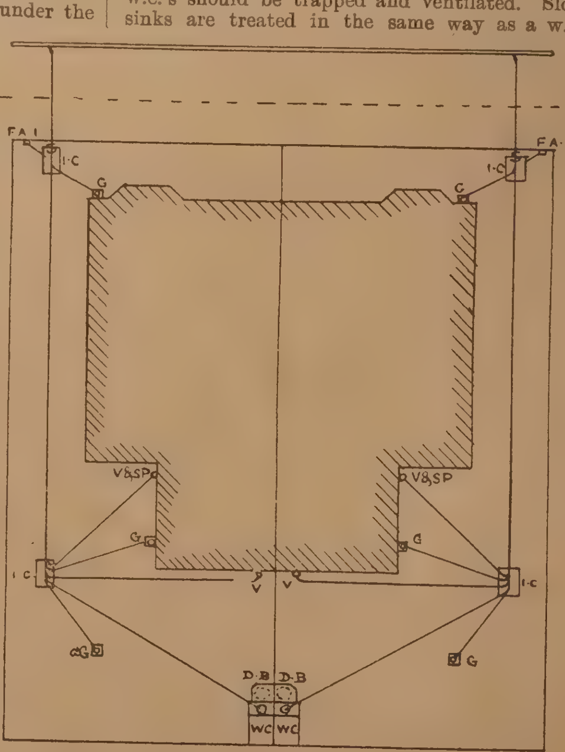

FIG. 7.

All sink, bath and wash-basin waste-pipes should be trapped and disconnected over an open channel 18in. distant from a trapped gulley. Plans should be prepared of all drains, showing their depth and direction, and kept for reference, as time may be often saved by being able to at once locate any drain or branch.

Engineering Notes.

The "E.L.B." System in America.—In the course of a recent meeting of the shareholders of the Electric Lighting Boards, Ltd., it was announced that the American rights of the system have been disposed of for a very considerable sum, the first cash payment, which was recently cabled, alone amounting to £15,000. The negotiations for the sale were conducted entirely by Miss Amy Ashton Bence, the secretary of the company, who visited New York, and as a token of their esteem the shareholders handed her a substantial cheque, while a set of plate was presented to her by the directors in their personal capacity. Miss Bence was formerly the right hand of the late Sir Augustus Harris. Among the shareholders is Mr. J. H. Colls, of Messrs. Colls & Sons, builders. A demonstration of recent improvements and developments of the system will shortly take place.

New Welsbach Burner.—The Welsbach Incandescent Gas Light Co., Ltd., of York Street, Westminster, S.W., are introducing a patent self-intensifying Kern burner for all kinds of public lighting. Its great feature is that a considerably intensified light is obtained without the use of any compressing plant or high-pressure mains. The burner itself does not materially differ from the ordinary Kern burner, the extra light being secured by the employment of a long, specially-designed, chimney. With a single self-intensifying burner using 10 cub. ft. of gas per hour at ordinary pressure a light of 300 candle-power is obtained. The Welsbach-Kern high-pressure burner, for use with compressing plant, works at 8in. to 10in. water-pressure, and gives 30 to 35 candles per cub. ft. of gas, so that with a consumption of about 10 cub. ft. per hour 350 candle-power is obtained. Five-light candelabras of these burners are in use for lighting up the grounds of the Glasgow Exhibition, the total illuminating power of each such standard being, approximately, 5,000 candles.

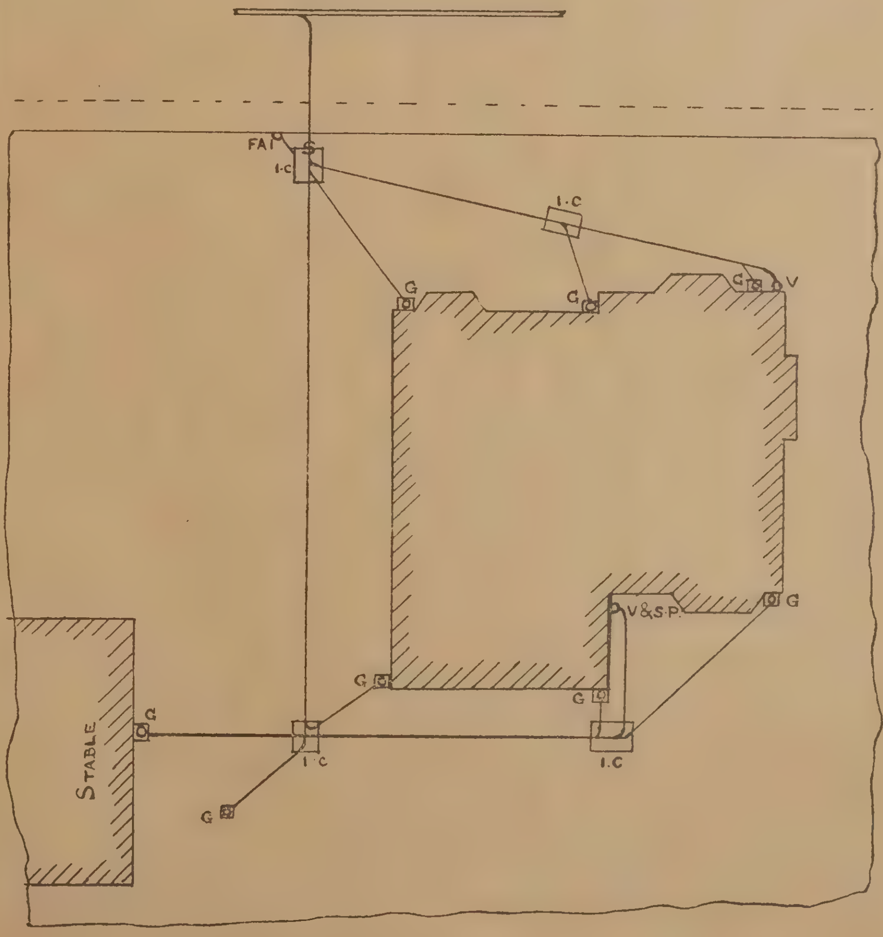

FIG. 8.

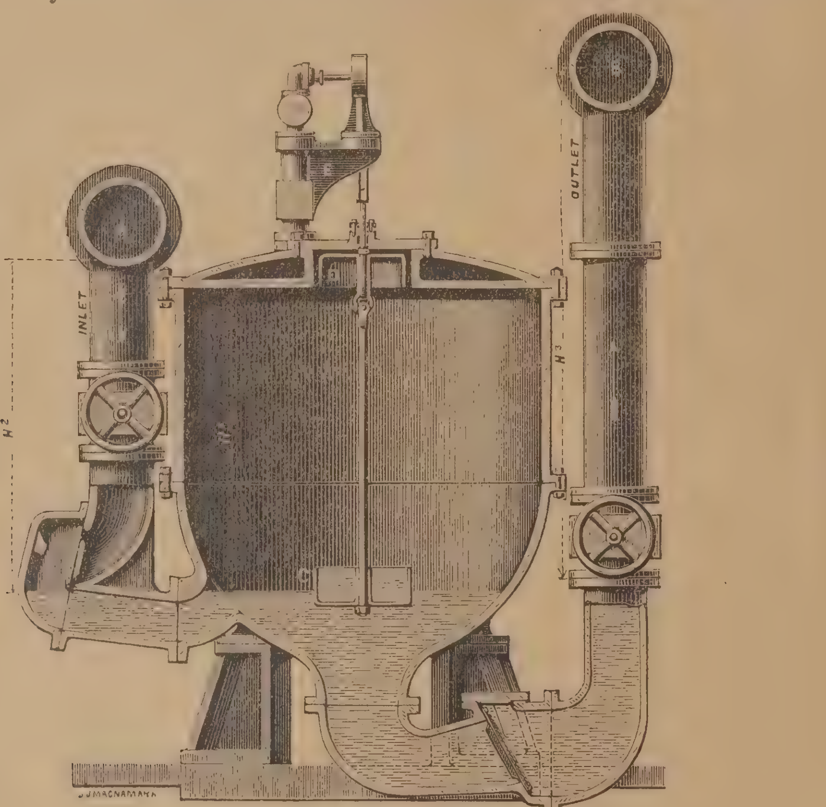
SEWAGE DISPOSAL.

A Description of the Shone Ejector.

A VERY interesting visit was made by the members and associates of the Society of Engineers on June 12th to the air-compressing station for the Shone system of sewage ejection at the sewage disposal works, Erith, Kent, and the engineering works of Messrs. Fraser & Chalmers, which are also situate at Erith.

The Erith Sewage Disposal Works in which the air-compressor plant is working occupy about two acres of land. The gas-engine air-compressors are four in number, being two sets in duplicate. The first pair produce the compressed air for working the Shone ejectors for pumping the low-level sewage. These engines were made by Messrs. Crossley Brothers, and comprise two Otto gas-engines and air cylinders, each to compress 158 cub. ft. of free air per minute to 11lb. per sq. in. The second pair produce the compressed air for the sludge pressing and for driving the mixing machinery. The gas cylinders indicate 25 h.p. each engine, and the air cylinders are capable of delivering 250 cub. ft. of air per hour at 100lb. per sq. in. All four engines have automatic arrangements for throwing the air cylinders out of work when the working pressure in the receiver is reached. The second pair have this apparatus so arranged that the air cylinders can be entirely thrown out of work for any desired period. In addition to the foregoing, small air-pumps are fixed in each ejector chamber in order to pump out the condense water from time to time as it accumulates in the chambers. Dowson gas is used for the gas engines, and is produced by the plant erected at the works by Messrs. Paisley, Welsh & Co.



THE SHONE PNEUMATIC EJECTOR.

The air main is laid at a depth of about 4ft. along the Manor Road, High Street, West Street, Lower Road, and Lower Abbey Road, to the several automatic ejectors situate in those roads, the last station being about three miles from the works. Following are particulars of station plant :—

Station No.	Name of Station.	No. of Ejectors.	Discharging capacity of each Ejector in gallons per minute.	Size of Air Supply: inches.	Size of Air Exhaust Pipe: inches.
1	Appold St.	2	300	2½	2½
2	High St. -	2	200	2	2
3	Lower Rd.	2	150	2	2
4	Station Rd Belvedere.	2	150	2	2
5	Lower Abbey Road.	2	50	2	2

The compressed air is delivered to the ejector stations through 4,600ft. run of 4in. cast-iron socket pipe, jointed with yarn and lead, and 10,900ft. run of 3in. similar pipe. All the pipes were tested to a pressure of 40lb. per sq. in. The fall in pressure in one hour does not exceed 5lb. The compressed-air pipe is provided with stop valves close to each of the automatic valves, so that each of the ejectors can be repaired independently of the working of the others. Siphons for drawing off water are constructed at several points in the air main.

The Shone system of sewerage may be briefly described as a system of distributed stations for the lifting of sewage, worked from one central station by means of compressed air, whereby the whole drainage area is divided into a number of compact districts, each with its separate outfall and discharging station, the discharge from all the stations converging into one common main leading to the ultimate common outfall. The system is applicable wherever the sewage of a town or district requires to be lifted.

The motive power employed is compressed air, and the action of the apparatus is as follows :— The sewage gravitates from the sewers through the inlet pipe A into the ejector, and gradually rises therein until it reaches the underside of the bell D. The air at atmospheric pressure inside this bell is then enclosed, and the sewage, continuing to rise outside and above the rim of the bell, compresses the enclosed air sufficiently to lift the bell, spindle, &c., which opens the compressed air admission valve E. The compressed air thus automatically admitted into the ejector presses on the surface of the sewage, driving the whole of the contents before it through the bell-mouthed opening at the bottom, and through the outlet pipe B into the sewage rising main or high-level gravitating sewer, as the case may be. The sewage can only escape from the ejector by the outlet pipe, as the instant the air pressure is admitted on to the surface of the fluid the valve on the inlet pipe A falls on its seat and prevents the fluid escaping in that direction. The fluid passes out of the ejector until its level therein reaches the cup C, and, still continuing to lower, leaves the cup full until the weight of the liquid in the portion of cup thus exposed and unsupported by the surrounding water is sufficient to pull down the bell and spindle, thereby reversing the compressed air admission valve, which first cuts off the supply of compressed air to the ejector and then allows the air within the ejector to exhaust down to atmospheric pressure. The outlet valve then falls on its seat, retaining the liquid in the sewage rising main, and the sewage flows into the ejector through the inlet once more, driving the free air before it through the air valve as the sewage rises; and so the action goes on as long as there is sewage to flow. The positions of the cup-and-bell floats are so adjusted that the compressed air is not admitted to the ejector until it is full of sewage, and the air is not allowed to exhaust until the ejector is emptied down to the discharge level. The compressed air for actuating the ejector is produced at a central station, and is conveyed in iron pipes laid under the streets to the several ejector stations, as already explained. The Shone ejectors at Erith were supplied, and the air mains laid, by Messrs. Hughes and Lancaster. We are able to give the accompanying illustration through the courtesy of the Secretary of the Society of Engineers.

Keystones.

Labourers' Cottages at Sidcup.—In illustrating these cottages last week Mr. E. Harding Payne, A.R.I.B.A., was mentioned as the sole architect. We have since learnt that the name of Mr. John Owen should be associated with them, as he was joint architect with Mr. Payne.

New Business Premises at Lancaster are being erected for the Lancaster and Skerton Co-Operative Society, Ltd. The front line is set back in New Street, so as to widen the street. The buildings are of local stone, with bases of Shap granite, the roofs covered with Westmorland green slates. The work is being carried out by Messrs. J. Hatch & Sons, of Lancaster. Messrs. Austen & Paley are the architects.

Another Lady Architect.—Miss Josephine W. Chapman, of Boston, is a successful woman architect. She will be the only representative of her sex at the Pan-American Exposition to be held next summer in Buffalo, N.Y. Miss Chapman has erected a number of churches, business buildings and residences. She employs none but men in her office, as she declares that women fail to give their undivided attention to the work, and at the most critical moment want to go home to make their clothes.

The New Star and Garter Buildings at Aberdeen which have been erected at the corner of Langstane Place, looking into Union Street, are nearly completed. The block is six storeys, and has cost £20,000. The contractors for the works are: Mason, Mr. Edgar Gauld; carpenter, Mr. William Dawson; plumber and electric lighting, Mr. J. F. Anderson; plasterer, Messrs. Rodger & Baxter; slater, Messrs. George Currie & Co.; painter, Messrs. John Masson & Sons; heating, Messrs. Shirras Laing & Co. The stone used is white Kemnay granite. Mr. George Curtis, of John Street, Aberdeen, is the architect.

A New Wesleyan Church at Cowes has been ereced in Birmingham Road. The style is Gothic, freely treated, and the building is of red brick with Bath-stone dressings. The builder is Mr. H. H. Sherrin, of London. On the north side is a tower finishing with a slated spire. The church will seat about 750 persons. The pews, which in the centre of the church are open from end to end, are of pitch-pine. The windows are of cathedral glass. The choir gallery, where the organ is also situated, is behind the rostrum. In addition to the minister's vestry there is a vestry for the choir. The roof is covered with permanent green slates. In addition to the church building efficient schoolroom accommodation has been provided.

The New Government Buildings at Preston now being erected in Market Square, opposite the Town Hall, are intended to provide accommodation for the Post Office and Inland Revenue Departments, including both excise and tax branches. They will be Renaissance in style, and constructed externally of Storeton stone, the roofs being covered with green slates. The public office for post office business and the posting boxes will be placed in the front, while the entrance to the Inland Revenue Office will be in Market Square. The architect is Mr. Henry Tanner, F.R.I.B.A.; the contractors are Messrs. Thornton, Liverpool; and the work is under the supervision of Mr. George H. Woolven,

A New Isolation Hospital at Tiverton has been erected at a cost of over £6,000.

A New Bathing Pavilion at Arbroath has been erected for ladies by the town council at the West Sands. The new pavilion was designed by Mr. William Stewart, burgh surveyor.

The New Church of St. Aidan's, Carlisle, which has been erected on the east side of the town at a cost of about £8,000, was opened last week. A parish hall is being erected in connection with the church, to cost about £1,200, from plans by Mr. C. J. Ferguson, architect.

Christ's Hospital Bill: Discussion Adjourned.—In the House of Commons on Friday last there was a brief discussion on the second reading of the Christ's Hospital Bill. Lord Balcarres, Mr. H. C. Richards, and many other members on both sides of the House, are anxious to prevent the passing of this Bill in a form which might involve the destruction of the old school and the loss of one of the few remaining open spaces in the heart of the City. It was agreed, however, that it would be better not to oppose the second reading, but to reserve the discussion for a motion which will be moved next Friday with a view of so modifying the Bill as to secure these objects.

Site for Liverpool Cathedral.—The Liverpool Architectural Society at a special meeting held on Thursday last, Professor Simpson presiding, passed a report on what they consider the best site for the proposed Liverpool Cathedral. They agree with the Cathedral committee that the St. Peter's Church and the St. Luke's Church sites are unsuitable, but they disagree with the committee in preferring Monument Place to St. James's Mount. They admit that the latter site is the less expensive, that it is quiet and its surroundings are picturesque, while any buildings erected on it would stand out well. But they think that the disadvantages outweigh the advantages. It is inaccessible, and, in an architectural sense, the approach is very bad. The foundations will cause great expense, and the orientation of the building cannot be arranged according to the custom of the English Church. The Monument Place site, which the architects favour, is stated by them to have a position and an approach unrivalled in Liverpool. It is near the great public buildings, and near to or in communication with the principal railway stations. The foundation is rock, and it would be of advantage to the city to remove many of the buildings now occupying the site. The surroundings are not of the best, and the architects admit that the Monument Place site would be very costly. But they think it would be better to acquire a part of it and build a portion of the Cathedral, leaving the rest for another generation to finish.

The New U.M.F. Church, Walthamstow, has been fitted with the latest improved low-pressure hot-water heating apparatus by Messrs. John King, Ltd., of Liverpool.

Chester Cathedral.—A recumbent effigy of the late Duke of Westminster is to be placed in the south transept of Chester Cathedral, which is undergoing restoration, as a county memorial to the late duke.

A New Roman Catholic Church at Huntingdon has been opened in New Town. It will seat about 200 persons, and is built of brick with stone dressings to the windows. The roof is of red tiles. The architect was Mr. Simeon Croot, of Frampton, and the builder was Mr. M. J. Allen, of the same place.

The late Mr. Arthur Cates, who died on May 15th last, aged seventy-two years, has left personal estate of the net value of £174,064 18s. 11d., and has bequeathed £1,500 to the Royal Institute of British Architects for an "Arthur Cates Prize," £1,500 to the Architects' Benevolent Society, £500 to the Benovolent Fund of the Surveyors' Institution, and £500 to the Charitable Fund of the Surveyors' Club.

Mr. E. Stanley Mitton, architect, of Oxford Road, Moseley, Birmingham, has been awarded a diploma and a bronze medal for a design for a bandstand to be erected at the Birmingham Industrial Polytechnic Exhibition to be held in Bingley Hall, August 26th tc November 2nd, 1901, the object of the exhibition being to raise funds for the establishment of bursary scholarships for the sons of artizans in connection with the University of Birmingham.

Watford School Competition: Result.—Mr. Thomas J. Bailey, F.R.I.B.A., architect to the London School Board, has awarded the first premium to Mr. John Hunt in the competition for the new Victoria Boys' School at Watford, and Mr. Hunt has been appointed to carry out the work. Three other competitors submitted designs, namely, Mr. C. P. Ayres, Messrs. Pridmore & Anderson, and Mr. W. H. Syme.

The Gloucester Hotel, Weymouth, was a favourite summer residence of King George III., and, although altered somewhat, the original bathroom used by the king, and the old kitchens in the "Gloucester," have been retained. The hotel has just been redecorated and refurnished throughout by Messrs. Oetzmann & Co., the well-known art furnishers, of 62–79, Hampstead Road, W. The drawing-room on the ground floor now has gilt furniture in Louis XV. style, while the coffee-room is in fumigated oak and apple-green morocco. The bedrooms, private sitting-rooms, and reading- and writing-rooms have Sheraton and Chippendale furniture, and the smoking-rooms are now treated in saddle-bags and red morocco. The hall is fitted with lounges.

Change of Address.—Mr. Walter Fullerton, architect and surveyor, has removed to 10, Leabourne Road, Clapton Common, N.

The Old Parish Church of St. Andrew, at Clewer, near Windsor, is to have its roof restored at a cost of about £400.

The Ancient Church of Marlston, in South Berkshire, has been restored and enlarged. An old Norman doorway which had been walled up has been opened out and a fine oaken door fixed.

Queen Elizabeth's School, Cranbrook, Kent, has been enlarged by the addition of new science buildings, containing laboratories and lecture theatres, at a cost of £1,000. Mr. Williams was the architect, and Messrs. Marshall & Son were the builders.

A New Parish Church at Llangeitho has been erected at a cost of £1,300, as the old building has become dilapidated, and did not boast of a chancel. The church was designed by Messrs. Williams, of Brecon, and built by Messrs. Evans & Co., of Llanddewibrefi. The main portion is of native stone, with Bath-stone dressings. It consists of a chancel, nave and aisles, and will seat about 200.

A New Congregational Church at Whetstone, near Barnet, has been opened at a corner of the New Southgate Road, Oakleigh Park. It is of red brick, with numbers of large round-topped windows, the entrance doors being flanked by two low, square towers, between which stands a large window. The interior is also of red brick, with a high wooden panelling stained in two colours of green. The seats and the open woodwork roofing are also stained light green. At the eastern end is an apse. The architect was Mr. E. F. Knight. The cost has been £6,000.

A New Police Station at Berwick has been erected on a site having a frontage to Church Street of nearly 70ft. The principal elevation is of polished sandstone, the roof being covered with red Staffordshire tiles. The design is Renaissance in character. The ground floor is occupied for the most part by the police station, and consists of charge-room, chief constable's office, parade-room and seven cells. Special attention has been given to the ventilation. The extraction of vitiated air in the court-room and cells is by means of a fan driven by a hot-air gas-engine. The design was selected in open competition in May, 1898, from thirty-seven competitive schemes. The work was started in June, 1899. Mr. Hugh Steel acted as clerk of works, the architects being Messrs. Cackett & Burns Dick, of Newcastle-on-Tyne. The cost of the new building was estimated at £4,945, exclusive of the site.

Trade and Craft.

Anaglypta at the Glasgow Exhibition.

The Anaglypta Branch of the Wall-Paper Manufacturers, Ltd., have an interesting exhibit (No. 314) at the Glasgow Exhibition, in the right and left corners of the Bridge (Machinery Hall end) leading from the long gallery to the Machinery Hall, the space on each side giving two walls and a 15ft. square ceiling. The examples shown on one side are as follows: Two different forms of wainscot panelling, treated in black oak colour. Above one is a filling, in modern style, designed by Mr. George C. Haité, and finished by paint and glazes in a quiet leather treatment. Above the other wainscot is a design by Mr. O. P. Moller, finished in a contrasting metal treatment, having the general effect of an old leather decoration. Upon the ceiling is fixed a bold ceiling, designed by Mr. O. P. Moller, and finished with framing mould in Anaglypta following the cornice line. The ceiling is painted and flatted in plaster white. In the other corner of the bridge the examples shown are: A design composed of a peacock and some decorative forms in modern style, finished in a rich decoration upon metal leaf. Above this filling is an original frieze, decorated on metal leaf in contrast to the filling. Below the filling is a simple wainscot panel dado, treated in dark oak colour. Next to these decorations is a filling by Mr. A. Jonquet. A Louis XVI. frieze and a Louis XV. frieze, a filling in Louis XV. and XVI., by Mr. Owen W. Davis, architect, are shown, and a filling, in modern style, by Mr. George C. Haité, above which is a frieze decoration in modern style, decorated in metal effect, with suitable lacquer, glaze and paint colours. Below the filling is another example and form of wainscot dado finished in dark oak. The ceiling is a pure Louis XV. decoration of corners and intermediate connecting pieces, finished with paint and flat in plaster colour. This ceiling may be used on any sized ceiling with flanks of not less than 13ft., and not necessarily a square ceiling. Outside (right and left hand) of the two corner spaces above described are two walls upon which are temporarily fixed various examples of frieze decorations, some finished in colours, and some left in plaster white. Below these are two dado decorations—one by Mr. O. P. Moller, in modern style, finished in copper metal effects; and the other, by Mr. A. Jonquet, in Francois I., finished in wood effect, and two dados—one, an Arabian panel design by Dr. C. Dresser, finished in reddish wood colour; and the other, by S. Moutrie, a wood panel effect, finished in wood colour. Besides the foregoing fixed decorations, there are pattern stands of other samples of work, photo-litho books illustrating different productions, and photos of the ceiling produced in Anaglypta and fixed in the Royal Pavilion at the Paris Exhibition last year; also photos of the Anaglypta Exhibit at the Paris Exhibition, for which work two gold medals were awarded.

A New Parish Hall at Waterloo attached to St. Mary's Church has been erected. The building is of red sandstone, dressed with Cefn stone, and the interior of buff and red bricks, and will provide seating accommodation for about 250 people. The fittings are of pitch-pine. The old choir vestry has been converted into a clergy vestry. During the past twelve months the church grounds have been laid out with flowers and enclosed. The cost of carrying out these improvements has amounted to about £1,700.

Drury Lane Theatre is to be altered so as to give additional seating accommodation. Various other improvements in the auditorium are also to be carried out. As at present arranged, the four pit tier boxes will be removed and their places taken by stalls on a greatly improved plan, the seats being ranged in the segment of a circle, there being four gangways instead of two as previously. The grand circle and first circle are also to be enlarged, and the two inconvenient little boxes at the side of the proscenium will be made into large stage boxes.

Mr. John A. Russell Inglis, of the firm of Messrs. Williamson & Inglis, architects, Edinburgh and Kirkcaldy, died in Edinburgh last week from an overdose of a sleeping draught, it is supposed. Mr. Inglis was a young man, and commenced his professional career with Mr. James B. Dunn, architect, Edinburgh, afterwards going to London to continue his studies. While in London he was successful in gaining the Soane medallion, which entitled him to a travelling studentship for six months in Italy and Sicily. After three years' study in Oxford he returned to Scotland and assumed partnership with Mr. William Williamson, architect.

Property and Land Sales.

By Order of Mortgagees.

Birchington-on-Sea, Kent. Valuable Freehold Building Estate of 70 acres, known as The BIRCHINGTON BAY ESTATE, facing the sea, with extensive frontages to a splendid sea wall promenade, well-made roads, and public gardens. Ripe for immediate development. The Public Hall with stage and handsome billiard saloon will be included in the Sale. The Estate has been well developed, large sums have been expended in the construction of the sea wall and roads, which are well designed and give a high-class tone to the property. All the houses are of a good class. A good drainage system has been constructed, and no expense has been spared to ensure a profitable development of the scheme. The Estate is within easy reach of the station, two miles of Westgate-on-Sea, three from Margate, and 70 from London.

MESSRS. HARMAN BROS., of 25, Ironmonger Lane, Cheapside, E.C., will, in conjunction with Mr. E. HOLSWORTH, SELL the above at the Mart, Tokenhouse Yard, E.C., in one lot, on MONDAY, JULY 1st, at 2 o'clock.

Particulars, with plans and conditions of sale, may be had of Messrs. YOUNG and SONS, Solicitors, 29, Mark Lane, E.C.; of Mr. E. Holsworth, 80, High Street, Stoke Newington, N.; and of the Auctioneers, 25, Ironmonger Lane, E.C.

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

Hazardous Risks, Premium, £3/10/-

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

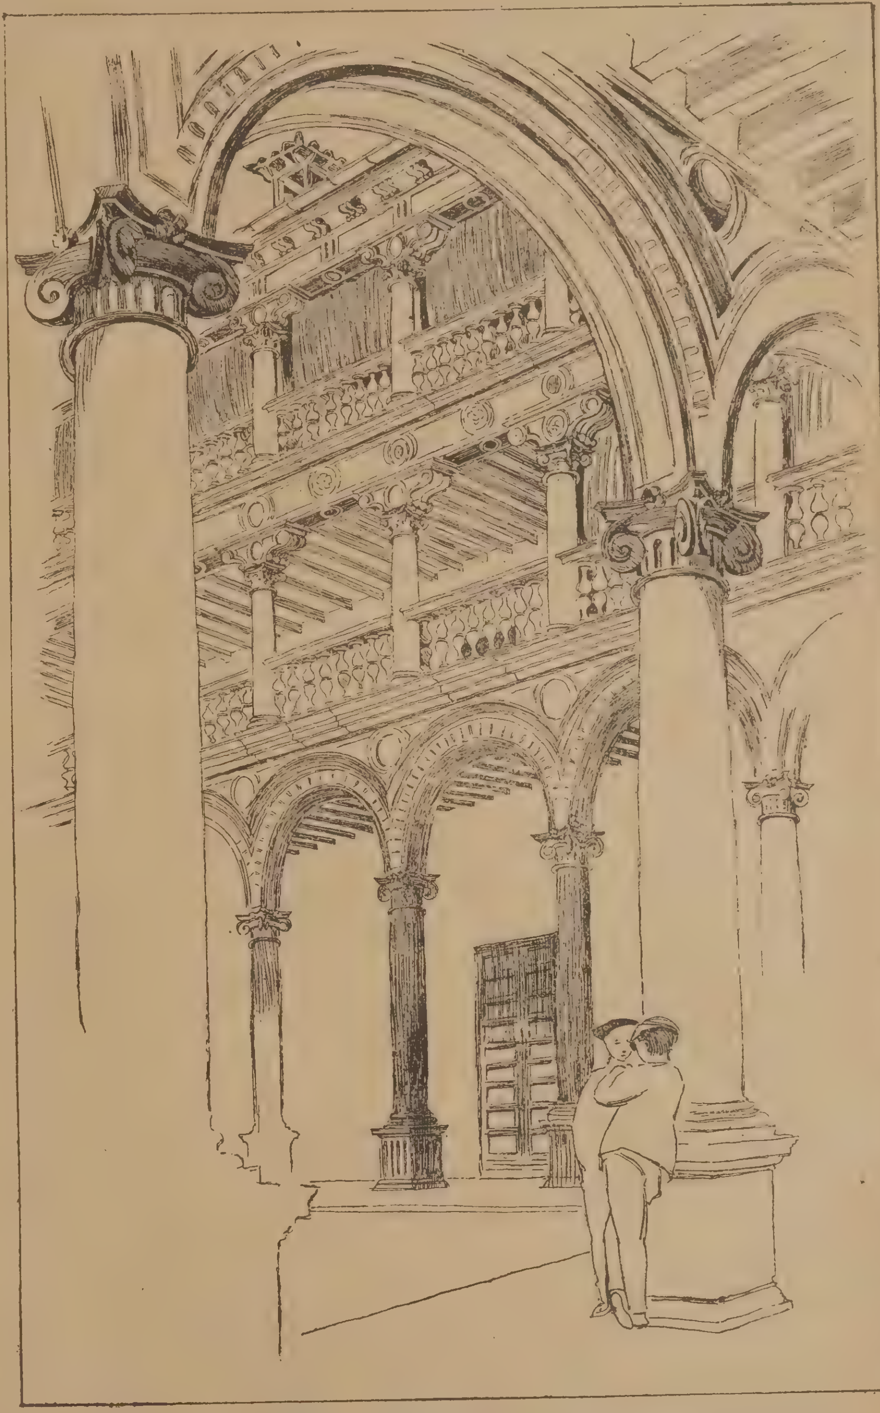
An Architectural Causerie.

Waterloo Bridge. THOSE who have occasion to frequently cross a bridge spanning the river that runs through the heart of a city will have taken special pleasure in watching the varying aspects of the surrounding buildings under changes of light and air, in fog and sunshine, rain, frost and snow. The main bridges of London are specially capable of affording this pleasure, and Waterloo Bridge, perhaps, the most of all, because it commands a more extensive view of the great buildings of the city than any other. Crossing from the Surrey side one notices to the right, first, Somerset House, its stonework now weathered white with more than a century's exposure (for it is so long ago as 1776 since Sir William Chambers commenced it, the wings being added by Smirke & Pennethorne); then the group of dark-red brick buildings built by John Dunn, with their flowing Gothic ornament, Tudor windows, and gargoyles, in strange contrast to the classical Government building; still further east, the London School Board offices, a medley of glass and pediments, very displeasing at close quarters, but not without enchantment at this distance; next to it the late J. L. Pearson's office of the Astor estate, with its neat Perpendicular windows and handsome railings, the roof crowned by a weather-vane of a ship under sail, and the small side garden exhibiting the hand of a master in its wonderfully skilful treatment; next to this, and standing a little forward, in the region

> "Where now the studious lawyers have their bowers,
> There whilom wont the Templar Knights to bide,
> Till they decayed through pride,"

Savage's stone library, with its grotesque angry animals always about to spring on the passer-by from their places on the walls; eastwards again, the New Paper Buildings in the Temple grounds (built by Sydney Smirke), now white like Somerset House and recalling the "bricky towers" of Spenser's Prothalamion; then the three great office buildings just completed from the designs of Mr. William Emerson, Mr. A. T. Bromley and Mr. E. T. Hall (all three were illustrated in our last issue); then a fine building by the late Sir Arthur Blomfield—Sion College; then, its long spirelet standing up against the sky, the City of London School, followed by a miscellaneous collection of buildings; and then the great dome of St. Paul's dominating the whole, just as Brunelleschi's dome draws the eye from all Florence. Further to the right one may perceive the ugly roof of Cannon Street Station, then London's ancient fortress, and, perhaps, the Tower Bridge itself. Thus the view extends along the Thames front, with the Embankment wall as a factor of strength in the foreground; while behind and above the roofs one catches glimpses of other buildings farther away—the white spires of city churches, the towers of the Record Office and of Street's Law Courts, and a sea of chimneys. This, one sees to the right of the bridge. To the left lie the Savoy and Cecil Hotels, the former a hopeless mixture of columns and balconies; then the stately terrace of the Brothers Adam adjacent to no less inappropriate a thing than the curved roof of Charing Cross Station; next Whitehall Court, a familiar and pleasing skyline; then two great Government buildings—New Scotland Yard and the Houses of Parliament, both in marked contrast; and, lastly, the towers of Westminster. One sees four bridges—the two at Blackfriars, so muddled that they appear as one ungainly structure; Charing Cross Bridge, with its ugly piers and decorations like gas jets; and Westminster Bridge. This view from Waterloo Bridge (which, by the way, is the most handsome of the city's bridges) always fascinates and is always fresh, for the buildings and the water are never seen under exactly similar conditions, and this variety is a constant charm to the eye.



PATIO OF THE HOSPITAL, TOLEDO, SPAIN. DRAWN BY A. N. PRENTICE.

The Fate of Christ's Hospital. LAST Friday in the House of Commons the postponed discussion on the Christ's Hospital Bill took place, but, despite the strenuous efforts of Mr. Richards and Lord Balcarres, there was a majority of 108 against an instruction to the Committee to consider how the site could be dealt with in order to prevent its being covered with business premises. The standpoint of the Governors seems to be that of the fatalist. The total amount needed by them is £940,000, and against this they have stock worth £177,000 and a firm offer of £720,000 for the site. These are plain facts, but we think that if the Governors had taken a less fatalistic view of things some arrangement could have been arrived at. There now appears to be little hope for the celebrated old buildings.

MEN WHO BUILD.

No. 64.—Mr. A. N. PRENTICE.

OF recent years it may safely be said that considerable progress has been made respecting the general education of architects in matters of taste; and among the younger men there is a large number of talented artists who, however much it may be objected that they do not produce living architecture nor that they possibly could under the present conditions, do produce work which has a value—negative though it may be thought—as regards simplicity and general refinement. For this there are several reasons, among which are the attention directed to drawing, painting and modelling, and other branches in what are called the "Fine Arts"; architectural examinations; and the study of old work from its sketchable side. The "styles" have been abandoned, and we have now in its place a striving after originality, fostered doubtless partially by this study of outward appearances. Though this originality has led to many atrocities, it has created independence and thought, and our younger men are not afraid of venturing away from the leading-strings of the "styles"; and this very independence has made them more careful of their effects and forced them to rely upon their artistic judgment more than upon their archæology. Of course, this is productive of all that self-consciousness so criticised in artists, and it merely argues for graphic design in contradistinction to the traditionary and condition-produced character of ancient architecture; yet, in the present state of affairs, nothing else can be done. If the conditions are altered in the future, and it is most probable they will be, then we should be right in expecting something else, but to-day we can but ask that the architect should be an artist as well as a practical man.

Among the foremost and best of the younger men is Mr. A. N. Prentice, whose work has been so much admired for several years past. Although Mr. Prentice is such a fine artist, he has this distinguishing quality above the majority of his fellows, that he uses his materials in a workmanlike and scientific manner. It is well enough to ask for artistic neat designs, but unless these also exhibit good construction, logical expression, and a clear understanding of the principles of architectural design, there will surely be failure and dissatisfaction with the work. We cannot pardon ignorance, and although by accident much is often done that is fairly pleasing, yet on the sum total we clearly perceive the true value. If the materials to be worked with and the requirements are not studied, no matter what the art is, the result cannot but be bad. Though the principle of "functional expression," as it has been called, is of course well known to all with any pretensions to architectural knowledge, one may say that comparatively few recognise the full significance of it, and this want of knowledge among the great mass of the profession is one of the most deplorable facts of the moment; the admirable suggestive essays of Viollet-le-Duc, in particular, being seldom read.

Mr. Prentice is one of those who have read Viollet-le-Duc's writings, and not only has he found them useful in the study of old work, but they have plainly helped him in his perceptive and logical work, which is so free from the offence (even in small things) to be found in the work of other architects who bulk largely in the public view just at present.

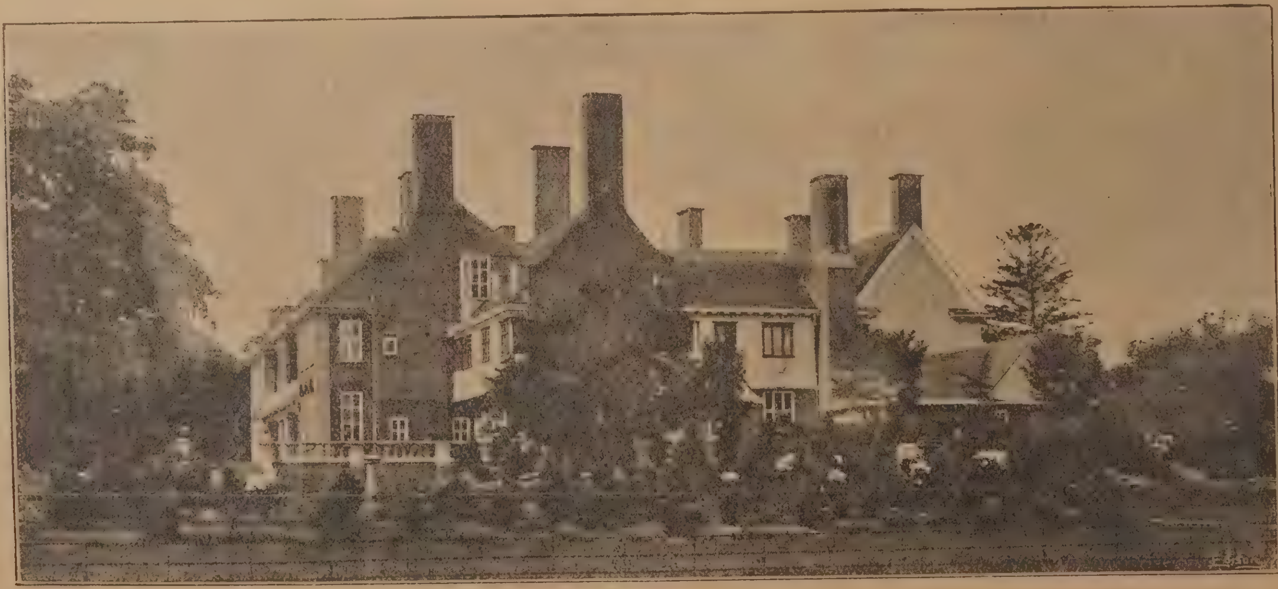
Mr. A. N. Prentice was born on April 20th, 1866, at Greenock, N.B., and studied at Glasgow University with the intention of going to the Ecole des Beaux-Arts at Paris, but ultimately he entered the office of Mr. William Leiper, R.S.A., as a pupil, and remained there till 1888, when he gained the Soane Medallion for a design for a gentleman's country house, which showed very considerable merit and was highly spoken of at the time. On this, he travelled for six months in Sicily and Italy as Soane Medallist, and afterwards in France, returning home in the summer of 1889. In the autumn of the same year he set out for a trip to Athens and the East, but on the advice of Mr. R. Phené Spiers changed his plans and set out for Spain to study Spanish architecture. He returned from Spain in June, 1890, after an eight months' tour, and then entered the office of Mr. T. E. Collcutt, F.R.I.B.A., being with him till May, 1892, when he returned to Spain for four months. As a result of these Spanish travels, Mr. B. T. Batsford published in 1893 Mr. Prentice's book on "Renaissance Architecture and Ornament in Spain," which met with such an appreciation that it was quickly sold out, and its influence is to be considerably noticed in the detail of many architects' designs of the last few years. One of the drawings intended for this work, but not used, is published for the first time in connection with this article, and shows the accuracy and grasp of essentials Mr. Prentice has and his command of drawing detail. Previous to going to Spain for the second time, he qualified as an Associate of the Royal Institute of British Architects in 1891. He started practice as an architect in 1893 at Hastings House, Norfolk Street, Strand, W.C., and has since been actively engaged with works chiefly of a domestic character.

MR. A. N. PRENTICE.

The largest and most important work Mr. Prentice has carried out is Cavenham Hall, Suffolk, for the late Mr. H. E. M. Davies, which, with the stables, &c., cost more than £30,000. We now give several views of this delightful example of domestic work, with its stables and the interesting fountain in the garden, which has lead ornaments on it modelled by Mr. A. Broadbent, a rising young sculptor. We may specially refer to the remarkably successful treatment of the large conservatory to this house—most difficult to treat successfully.

Another large house executed from Mr. Prentice's designs is that at Lakenheath, Suffolk, for Sir William Dunn, Bart., M.P., of which we give two views from water-colour drawings by the architect. Mr. Prentice has also erected Fryerne House, Caterham; houses at Pinner, Bedford, Reigate and Broadway; and has carried out alterations to numerous houses in London, among which may be mentioned 33, Bruton Street, for Mr. H. J. Tennant, M.P. He also altered Bolney House for Mr. Henry Tate; Bohun Lodge, Barnet; and 37, First Avenue, Brighton, for Mr. W. B. Chamberlain; and in Scotland carried out alterations to Park Circus, Glasgow, for Mr. P. M. Inglis, where there is an interesting room carried out in Dutch style (included among the accompanying illustrations), containing bookcases covered—in a somewhat novel manner—all over with red morocco leather, with the windows backed by iron grilles specially designed by Mr. Prentice. A new drawing-room, &c., for Mr. W. H. Curtis at Greenock has also been built from Mr. Prentice's designs. Among his most recent works are a new house for Dr. Mathieson at Donne, and a kiosk for Messrs. Van Houten & Sons in the grounds of the Glasgow Exhibition. This latter is not quite so happy in effect as the other work, the plasterwork especially being somewhat too rococo. The walls are constructed entirely of plaster, the interior not being wood-panelled as might be supposed from the photograph. This architect has also laid out a large estate at Reigate.

Mr. Prentice is a strong believer in competitions, but, owing to pressure of work, has not engaged in any for the last few years. He



CAVENHAM HALL, SUFFOLK: NORTH-EAST VIEW. A. N. PRENTICE, ARCHITECT.

CAVENHAM HALL, SUFFOLK: GARDEN FRONT.

submitted designs for the Cardiff Town Hall and Law Courts; and a Spanish design of his for the Glasgow Art Galleries was highly spoken of. He also submitted designs for the Sunderland Schools and Durham County Buildings, in conjunction with Mr. A. T. Bolton, and for the Liverpool Technical Institute and Royal Insurance Offices in collaboration with Mr. T. E. Collcutt. None of these, however, was awarded first premium.

Mr. Prentice has also given much time to the study of metal work (especially in Spain), and has made numerous designs for the leading metal workers of the day. He holds the opinion that much more could be done in the construction and decoration of London Street fronts in this material, if the Building Act would allow it.

As a draughtsman it is unnecessary to speak of Mr. Prentice's ability; we give several examples in this issue illustrative of his style in line, pencil, wash and water-colours. He makes all his own perspective drawings, which are frequently exhibited at the Royal Academy, besides making his own half-inch and full-size working drawings. And this, no doubt, has led to the success of his designs; for, having made such study of perspective representation and measured drawing of old work, he would be better qualified to judge the actual look of a feature when erected than draughtsmen possessing less knowledge.

Mr. Prentice has his ideals, as everyone should have, if he is to do anything of value in art. One of these is, that he does not feel inclined to enter into the controversies waged so vigorously among architects, but thinks that it would be better if there were less talk, and more done—a sensible proposal that might advantageously be followed by others. There is far too much talk from those who by example are the least likely to be followed.

CAVENHAM HALL: FOUNTAIN IN GARDEN.

WHY SOME HOUSES ARE GOOD.

THE most important qualities that enter into the design of a house are care and fitness. Care means thorough attention to everything; fitness signifies suitability and adaptability. The building of a house is a complicated process, requiring the services of many men, and utilising the products of many industries. It is a work that no one goes about thoughtlessly; and yet all the world knows many houses are designed and built in a careless manner, and without that thorough attention to every detail that the importance of the undertaking should command as a matter of course. For carelessness in building is very far from meaning indifference in construction; that, indeed, is a special carelessness that is punishable by law; but there is a vast quantity of carelessness in house-building which the law does not reach, which builders and owners are indifferent to, and which is illustrated on almost every street and road.

This carelessness is due to a failure to realise the real importance of the art of building. It is a serious thing to build a house. It means the expenditure of a sum of money, often large in amount, in a permanent work that is so seldom altered as to be practically unchangeable. The house builder, therefore, assumes, whether he fully realises or not, a responsibility to the public that may view his structure, willingly or unwillingly, as well as to himself. And this responsibility extends not only to his own occupancy or ownership of the building, but so long as it may last. One may not build for all time, but one at least builds for some time.

No method has yet been devised for punishing those who build ugly buildings, and probably there never will be. The Philistine who builds an ugly house can, perhaps, content himself with it or find someone else who will be equally happy in an indifference to appearances. And yet the whole tendency of American practice in house-building is toward betterment in appearances. Our houses are not better built than they were twenty-five or fifty years ago, and yet the average house is better to look upon. This betterment, however, still leaves so much to be desired that it may be profitable to consider some of the reasons why some houses are good and others bad.

There is, unquestionably, an advance and an improvement in design compared with the results achieved twenty years since. People are waking up, more and more, to the value of houses that not only are good, but which look to be good. Good-looking houses are quite as much in demand as good-looking carriages or handsome horses, and the market for them is much greater than for fine paintings or other high-grade works of art. Here is an economic fact that apart from any question of art, is helping in the bettering of the appearance of our cities and towns; and this, possibly more than the spread of a real architectural taste, will hasten and develop good building and good design.

The speculative builder, the man who builds houses to sell, is the most powerful as well as the most dangerous factor in the development of house architecture. He is the most powerful because the larger number of houses are built to sell; the individual builder, owner and occupier is as yet in the majority. Miles and miles of streets in New York are lined by the creations of the speculative builder; and the most gratifying evidence of his progress in the last ten or twenty years is shown by the continued betterment in the appearance of the buildings he erects.

It is quite the same in country and suburban districts, many lesser towns and new settlements without end having been opened up and developed by the real estate agent who looks upon houses as articles of merchandise rather than as things of beauty. He has been forced to recognise the fact that beauty in a house will help him to sell his wares; but it is obvious a vast difference exists between him and the man who seeks to make his home beautiful for the love of the beautiful. And it is because of this that the speculative builder is a dangerous factor in artistic development. True beauty, true art in building, can only come with a real and personal appreciation of what this quality is. It is hard to believe that real progress will be accomplished when those chiefly responsible for what progress may be made do not thoroughly realise their responsibilities.

The case of the man who builds his own house and intends to live in it is very different. He, at least, may be expected to exercise care in the design of his dwelling, and see that it is fit and appropriate to its use and its surroundings. His house should, in the first place, be individual. Not necessarily representing the foibles and hobbies of its builder, but showing that he thought enough of his dwelling to make it a good house to live in and a good house to look at. And it is well to remember that more people will look at his house than will live in it. He cannot ignore his responsibility to the public at large any more than he would neglect the convenience of his family, who must content themselves with what he provides them with.

And so the careful man will see that his design is a pleasing one to begin with. If he has no taste of his own, he should consult those who have; and the trained worker in building—the architect—is the one best fitted to advise and direct the whole undertaking. He will make his design as beautiful as he can, and if he seeks the proper advice he will speedily discover that great beauty does not mean, necessarily, great cost. A simple little house, well designed, carefully treated, detailed in a refined manner, built without ostentation and designed for a specific end, will give greater joy to its creator, to its owner, to the people who will live in it, and to those who can't help seeing it, than the most lavish display. No part of a house is too small or too unimportant to receive attention, and every part, if carefully treated, will amply repay the care lavished upon it.

CAVENHAM HALL: ENTRANCE FRONT.

It is most important to remember, however, that the mere bringing together of good things in a design will not, of itself, produce a good result. Every part must bear a relationship to every other part. The windows, the doors, the cornices, the porch, the chimneys, must not only each be good in itself, but they must form part of a harmonious design, united and complete. The most beautiful window will appear out of place if it adjoins a doorway that is not harmonious with it. A misshapen chimney may spoil a design otherwise of the utmost merit.

It is care in such matters that makes one house better than another, and which is the distinguishing mark between houses that are good and those that are bad. A house is an expression of an idea. If it is well expressed, it will be good; if it is badly expressed, it will be a failure. Behind the idea is the man who is responsible for it. If he fails to realise his responsibility, if he is careless and indifferent, if, above all, he does not know, and, more than that, does not wish to know, the result is certain to have every quality of badness and failure.

Houses are good in proportion to the care taken in their design. Nothing pays better in the long run. Nothing of any value has yet been produced in the world that has not entailed thought to bring it to realisation. A house is no exception to this rule. A house cannot be successful from an artistic standpoint that is not the result of much thought, carefully pondered, and expressed in the most intelligible fashion.

The question of fitness covers certain other qualities in building that are indispensable to success. Just as an evening coat is unsuited to a morning devoted to business, so every design, every combination, is not adaptable to every condition.

A house must be fitted to its use, its surroundings, its cost. It is a mistake to model a parish church after a great cathedral, or a modest dwelling after a sumptuous palace. These are extreme illustrations, but they point the lesson. It is difficult, at times, to admit the influence of the adjoining dwelling—and if it is bad, that should, of course, never be done—but it is not always possible to get away from it.

A very grave error is often made in borrowing some one feature from another house because it has proved attractive under the conditions that may have brought it into use. Yet its very attractiveness may have been occasioned by the combination and the circumstances that are wanting in its new application. Good features need not be avoided because they have already had use; but their proper use is not to transplant them bodily as one would a plant, but to recombine them, develop them, adapt them; not put them into a design, but make them part of it. In a word, study their fitness.

The most successful buildings, on the whole, ever built in this country were those erected in the last century and the early part of the present, and which are called "Old Colonial." They were carefully designed and magnificently built. With all our more abundant resources and greater knowledge, our builders of to-day do not equal the construction of that earlier period. They were carefully built, because the erection of a house was a serious undertaking, more serious than it is to-day, when expensive city buildings are pulled down to make way for more modern edifices. And not only were they carefully built, but they were thoroughly fit for their purposes. The great house was a splendid mansion; the simple house was an unpretentious affair, with slight ornament, and simple treatment that even to-day wins our admiration amid more gorgeous neighbours.

The chief lesson to be derived from these buildings by the modern builder is not that that particular style is the one to be followed, but that its methods contain all the secrets of why some houses are good. Unfortunately, the modern method is to borrow styles rather than methods; to copy forms rather than ideas. But we cannot hope for a genuine architecture, even in a problem so simple as an ordinary house, until the thought that underlies the form has been discovered and understood. The first step in building a successful house is to think. Too often the house is built, and then thought taken in making it inhabitable and good to look at.—(From the "Scientific American.")

BRICKWORK IN PARIS.

By WILLIAM T. PARTRIDGE.

THE predominant characteristic of nearly all the brickbuilding in Paris is picturesqueness. Whether that quality be altogether a desirable element in city building is at least open to question. Brick, of course, lends itself readily to the picturesque; and the small size of the buildings in which brick is employed in this city offers further temptation for the use, perhaps the exaggeration, of that quality. It is certainly much easier to make a picturesque design when the problem is a small one, or the site irregular.

To this picturesqueness of outline colour is the natural accompaniment; and the domestic structures in Paris being, as we have said, small, are freed from the strict regulations governing larger buildings and open a limitless field for the use of brick in obtaining the desired colour.

In the smaller domestic work, then, and wherever individuality and colour are sought for, brick is much employed, although stone is a cheaper material and is more easily obtained. Therefore, in looking for examples of brickwork we naturally turn to those residence centres where small private houses mark individual ownership.

Many of the buildings might fittingly be called architectural misfortunes. They are almost grotesque. In many cases, to be sure, there occur happy combinations of colour, but they are usually wasted upon buildings unspeakably poor in architectural form. Examples of the reverse instance—good outline and atrocious colour—are no less common. In most of this smaller work, indeed, the so-called "emancipation" of the French architect from the influences of the past is a matter for sincere regret. Many an attempt to reproduce a Louis XII. motive is marred by moulding, or rather expanding, its graceful detail into conformity with the school traditions. The consequent changes in scale are ruinous.

It is in the new quarter of Paris that the most interesting examples of brickwork are to be found. Brick is employed there occasionally in apartment houses as well as in private dwellings; but the larger structures are so hampered by building laws that there is little or no attempt at actual recognition of that material. Several schools and colleges, by the way, are built entirely of brick; and some attempts at a commercial or factory type, employing a com-

HOUSE IN YORKE ROAD, REIGATE. DRAWN BY THE ARCHITECT, A. N. PRENTICE.

bination of brick and iron, have been made from time to time.

The quarter of Hausmannised Paris that we mean to designate lies around the Place des États-Unis, the Parc Nouveau, and the little street of Eugène Flachat.

On the south side of the Place des États-Unis stands the house of Julian Story, the American artist. It is of a light-coloured brick, originally yellow, with red-brick quoins. The entrance, bay, an addition, and windows above are of stone, following an Italian rather than a French Renaissance precedent. A further touch of Italy is given by the wide projecting eaves. The studio is recessed and breaks the roof-line pleasantly. But the large window lighting the studio proper is bare and meagre in comparison with the charming stone motive directly above it. The brick decoration contributes an air of gaiety that is not displeasing; but greater refinement and dignity might have been obtained by using, below the attic at least, brick of only one colour with no attempt to enliven the surface by the weak cornice decoration of imitation quoins. Another innovation that is, on the whole, rather unfortunate is the addition of the entrance, which, although it makes an interesting composition, mars the mass of the main building.

Another dwelling which by its overhanging roof and arcaded upper storey is stamped with Italian influence is found in the street of Eugène Flachat. It is a logical expression of the plan, and satisfactory in spite of what may seem to be a lack of symmetry. A few simple broad lines of stone frame the lower three storeys, while the arcade and overhanging roof lend dignity to an irregular though frank fenestration. Coloured mosaic decoration is used in the cornice and under the arch of the principal window. A unique iron balcony binds the double window, and all of the stone carving is refined in detail.

Further along the same street is another and simpler Italian motive—a house of glazed brick, with no attempt at architectural treatment except in the strong basement and crowning eaves. Much of the decoration in brickwork is coarse, and much is meagre, as, for example, where the voussoirs of the arches are ornamented.

On each side of this building is a smaller house, one Gothic, the other in a late Renaissance style. The former is built entirely of brick except the base and entrances. Considerable effect is obtained by brick corbels. Coloured tile-work appears in what serves as a frieze, and a diaper pattern of dark brick covers the body of the building.

The more formal specimens surrounding those we have selected follow two conventional styles—the French Gothic and the style of Henry IV. or Louis XIII. The Gothic examples in brick are for the most part modelled after the Louis XII. wing at Blois.

A small, though none the less interesting mass, is near the Place des États-Unis. In contrast to the freedom of its large rival, its sky-line is marred on account of a bald utilitarian background—the walls of a neighbouring apartment house. The reinforcement of the soft stone party-walls of the latter by brick ties is interesting.

The florid house on the street of Leo Délibes, with its great studio window, suffers in comparison with the charming little composition near the Sorbonne, which has an individuality as distinct as the work of Burges or Wilson Eyre.

There are several attempts at the use of brick and iron in domestic work in the Style Nouveau, but the result is one to avoid. In the suburban streets are many especially attractive brick compositions. Here the background of foliage gives contrast and makes welcome that picturesqueness of which one is timid in the city.

Thus far, it will be observed, the notes of this architectural pilgrimage have omitted accrediting work to the several designers. But in the domestic architecture of Paris there is an utter lack of that individuality of conception that stamps the London dwellings, for example.

An architect visiting in Paris finds himself compelled to refer to the architectural periodicals for the identification of the smaller buildings. In England, on the other hand, the first glance at a building enables him to name the designer, Shaw, Belcher or Ernest George, as the case may be. Does the École training destroy individuality?—(From "The Brickbuilder," Boston, Mass, U.S.A.)

HOUSE AT PINNER FOR MR. J. H. SHANKLAND. DRAWN BY THE ARCHITECT, A. N. PRENTICE.

HOLBORN'S PUBLIC BATHS.

THE foundation stone of a new swimming bath in Broad Street, an extension of the Public Baths and Wash-houses in Endell Street, Holborn, W.C., was laid last week. Messrs. John & S. Flint Clarkson, of Ormond Chambers, Great Ormond Street, are the architects, their design having been accepted from several others submitted; Messrs. F. Gough & Co., of Hendon, are the contractors; and it is anticipated that the total cost of the land and baths will amount to the sum of £25,000. The extension, which will have a frontage in Broad Street of 55ft., and a depth from north to south of 130ft., will provide a swimming bath 90ft. in length, with closed dressing-boxes entered from the platforms. The bath will be paved with mosaic, the walls faced with glazed bricks, and domed ceilings of fibrous plaster will be formed above the lantern lights; a gallery will run round all four sides of the bath hall. There will also be subways all round the bath hall, entered through a vestibule, &c., from Broad Street. The height of the bath hall will be about 40ft. from the bottom of the bath to the domes. The elevation towards Broad Street will be four storeys high, of Portland stone, red Bracknell bricks being used for the upper floors. The elevation will resemble the existing front in Endell Street, the resemblance being intentionally made so strong that it will be clear that the two frontages are parts of one building. There will also be provided rooms for clubs, and a general supplementing of the existing accommodation. All the floors will be constructed of fire-resisting material. The water in the swimming bath will be heated by steam. Arrangements will also be made for the steam-heating of the atmosphere, so as to counteract condensation, and to enable the bath to be kept in use in chilly weather.

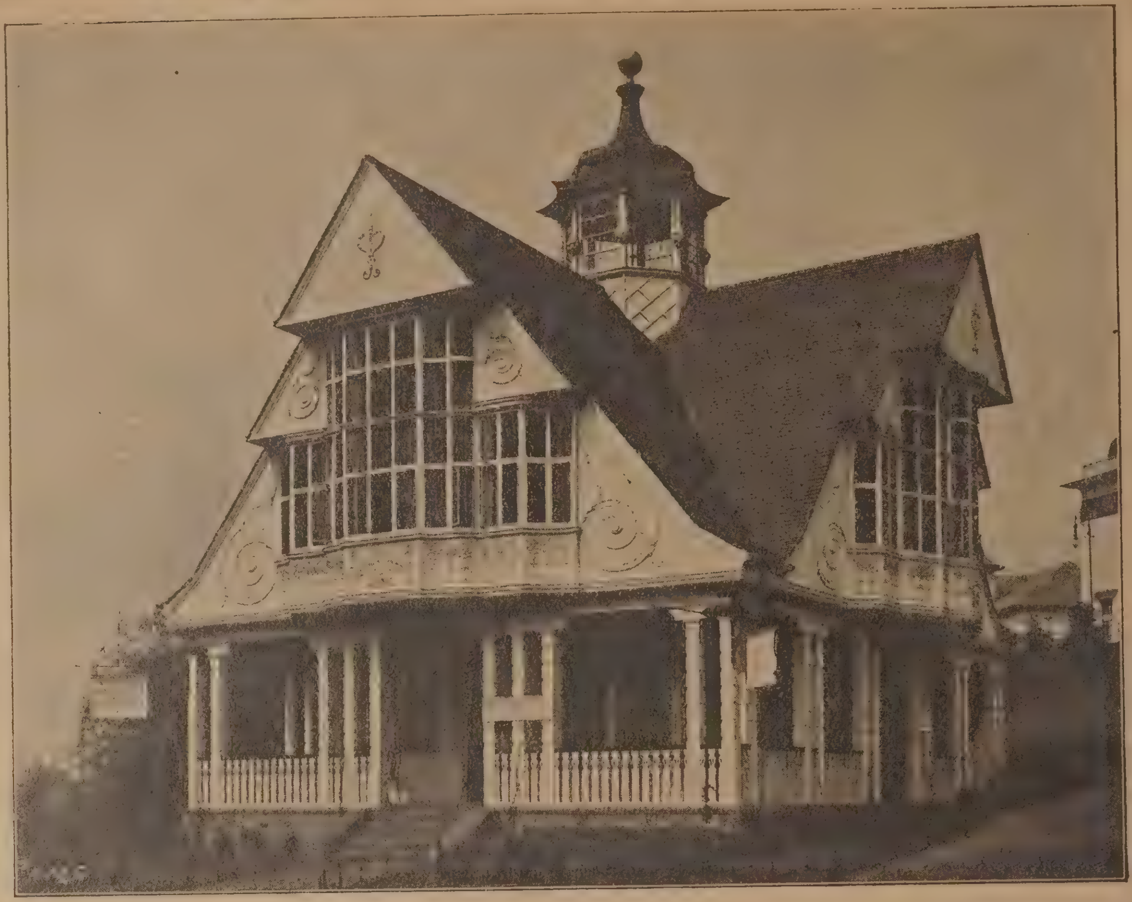
Mr. James Jemson, an architect carrying on a large business in the Fylde district, and surveyor to Preesall Urban Council, died recently from an overdose of a sleeping draught.

Engineering Notes.

Electrical Development at Tyneside.—The power station of a new electric power supply company has been opened at Wallsend-on-Tyne. The scheme has been promoted by the Newcastle Electric Supply Company and the Walker and Wallsend Union Gas Company.

A New Pier at Cromer was opened recently. The deck is 500ft. long and 40ft. broad, with bays extending to 60ft. The head expands to a width of 112ft., and here are shelters and a bandstand. The engineers were Messrs. Douglass, and the contractors Messrs. A. Thorne, B. Cooke & Co., and A. Fasey & Son.

The Gigantic Reservoirs at Staines will shortly be completed. Parliament has authorised the Staines Reservoirs' Joint Committee to take 100,000,000 gallons a day from just above Bell Weir lock, making the total daily intake of the water companies upwards of 300,000,000 gallons, and storage is now being provided at Staines for a total of 3,300 million gallons. The reservoir—for it is one for all practical purposes, although bisected for the sake of convenience—is reputed to be the largest artificial construction of the kind in the world. Its extent may be judged from the fact that it is a stroll of four miles and a quarter round its bank, and that a football and cricket ground, presently to be submerged, is a mere patch upon its surface. The water from the Thames, siphoned under several of its tributaries, is to be pumped up into the reservoir, and it will then flow in an open conduit some eight miles in length to Hampton, where it will reach the filter beds of the New River, Grand Junction, and West Middlesex companies, the joint promoters of the scheme. In event of emergency the water can be sent direct to Hampton without being stored at Staines, but the merit of the undertaking is that it will enable a large reserve to be kept at the latter place. The reservoir, in one way and another, will cost upwards of £1,000,000.



KIOSK FOR MESSRS. VAN HOUTEN AND SONS, GLASGOW INTERNATIONAL EXHIBITION, 1901. A. N. PRENTICE, ARCHITECT.

RESTORATION OF ABBEYDORE CHURCH.

ABBEYDORE CHURCH, in Herefordshire, is badly in need of repair, and funds are now being collected for the work, which will be done under the guidance of Mr. Roland W. Paul. The Abbey of Dore owes its existence to Robert, Lord of Ewiss Harold, who founded it for Cistercian monks in 1147. Its situation in the beautiful Golden Valley—secluded, like other Cistercian houses, well within the chain of border castles that stretched from Grosmont and Longtown to Clifford and the Wye, and within a couple of miles of the castle of its founder—doubtless saved it from the inroads of turbulent bands, which made its neighbour, Llanthony, in the Black Mountains, well-nigh untenable. From its foundation until the latter years of the thirteenth century there seems to have been but little to check its growth. A consecration took place at the time of Bishop Cantilupe of Hereford (1275-82), and this probably marks the completion of the church. The excavations on the site of the nave that have been carried on since 1893 by Mr. Paul have strengthened the theory that no structural alteration beyond, perhaps, revaulting took place in the building between that date and the Dissolution.

The Plan.

The church of Dore followed the usual Cistercian plan. It had a long nave with narrow aisles, aisleless transepts with two eastern chapels, and an aisleless presbytery projecting beyond them. The cloister court was on the south side, and the buildings surrounding it included, on the east, a vestry, chapter-house and cellarage, with dormitory over; on the north, the frater, warming-house, kitchen, &c.; and on the west, the range of cellarers' buildings, and rooms for the conversi or lay brethren, which was divided from the cloister by a "lane" or court, as at Byland, in Yorkshire. A short time only could have elapsed between the completion of the church as originally planned and the time when it was no doubt found necessary to enlarge the presbytery. This was done by removing the eastern walls of the two inner transept chapels, piercing the presbytery with arcades, and carrying an aisle or ambulatory round it. On the east, a range of five chapels was erected, and there were two other chapels in the south aisle. This eastern extension is one of the most beautiful features of the interior, and was highly decorated with colour, much of which still remains, partially hidden by whitewash. During the thirteenth century it is evident from discoveries made that the south aisle of the nave was partially or wholly rebuilt, and both aisles and nave were revaulted.

Arrangement of the Nave.

Digging has determined the length of the nave and its arrangement. It was 137ft. long, of nine bays, with narrow aisles. At the second pair of columns west of the "crossing" was the pulpitum or great screen wall, against which the monks' stalls were returned and which formed the termination westward of the monastic ritual choir. Against its west side were two altars, both of which were discovered in a mutilated condition. Further westward, in the fifth bay of the nave, was a second screen, having a central altar against its west side, flanked by doorways. This formed the altar of the conversi, and their choir stalls stood on either side between this altar and the west end of the nave. They had access to this part of the church from their buildings on the west side of the cloister across the "lane," and through the doorway in the north aisle. It is uncertain whether or not there was a west doorway. The return wall was discovered at the north-west angle, but the rest of it appears to have been destroyed. The stone screens which were placed between the columns in Cistercian churches, dividing the nave from its aisles, were discovered remaining 2ft. or 3ft. in height, in two bays on the north side. The arcades had pointed arches, carried on large circular columns with square bases. The whole was late Transitional Norman. There was no triforium, but over the arcade, and divided from it by a string course, was a clearstory, with a single lancet in each bay. From discoveries made it was clear that the whole of the portion of the nave near the nave altar and the pulpitum was richly decorated, and the space between the two screen walls was probably largely taken up by monuments and tombs. Of the many tombs that the church must have contained only three effigies now remain.

The Chapter-House.

Of the monastic buildings which stood on the north side of the church the most remarkable was the chapter-house. It was a twelve-sided building with a central shaft, and was an enlargement eastward, in the thirteenth century, of the earlier chapter-house, which became in the transformation its vestibule. Doubtless this enlargement was a part of the scheme, which included the enlargement of the presbytery, and it is noteworthy that the Cistercian monastery at Margam, near Swansea, founded in the same year as Dore by Robert Duke of Gloucester, has a chapter-house of similar form but of earlier date. The presbytery of Margam was, like Dore, enlarged, and it is quite possible that, close as the communication was between the Cistercian houses, Dore copied its chapter-house from Margam, and Margam in its turn was induced to rival Dore in the glories of its presbytery. In 1534 the monastery was dissolved, and the dissolution left Dore much as other monasteries were left. Altars and images were broken down, the roof was removed, the paving was torn up, and the glass destroyed, and in course of years the elements completed what the desecrator had begun. It passed into the hands of the Scudamore family, and no doubt it became a quarry for the neighbourhood. It remained in its ruined state for nearly a century, when John, Viscount Scudamore, decided, amongst his other munificent acts, to restore a portion of the church for divine service. It was reopened on Palm Sunday, March 22nd, 1634, with much ceremony.

Lord Scudamore's Restoration.

The restoration by Lord Scudamore forms a very interesting period in the history of the fabric. He found the great church a ruin. The church was large; the village, possibly large during the flourishing days of the Abbey, had become reduced in size after its dissolution. He decided therefore to restore a part only of the church, and the eastern arm naturally was that which lent itself the most to the requirements. Its vaulting was gone, and the transepts and presbytery were re-rooofed with a flat plaster ceiling, divided by beams carried on brackets springing from the old vaulting shafts. The altar, found used as a salting stone, was replaced.

The fittings included an elaborate Renaissance screen, the east arch of the "crossing," pews, pulpit, and prayer desk under the "crossing" west of the screen, a western singing gallery, a south porch, and the railing in of the sacrarium. The eastern triplet over the altar was glazed with coloured glass, excellent for its date, and at the junction of the transept and choir a large tower was erected, crowned with a battlemented parapet. The western arch of the "crossing" and the arches from transepts to nave aisles were built up.

We thus have at the present-day half of a large mediæval monastic church, unique in many of its architectural features, highly interesting it its planning, and standing alone as the only Cistercian presbytery used for divine service at the present day. Scudamore's restoration, if causing some anomalies for the student of to-day, was good of its kind, and, considering the difference in style, the "scale" of the great church has been admirably kept in the fittings which were introduced. He not only preserved for us a most valuable architectural monument, but considerably added to its interest by his treatment of the interior.

NEW WORKHOUSE INFIRMARY, HALIFAX.

A NEW workhouse infirmary was recently opened at Halifax. The new institution, which is to be known as St. Luke's Hospital, is a good half-hour's walk from the workhouse—in another part of the town altogether. It is on a twelve-acre site at Salterhebble, occupying a conspicuous position on the high road from Halifax to Huddersfield. The scheme provides for a hospital to accommodate the maximum number of patients allowed by the authorities in London, namely 750. It is, however, considered that for some time to come wards for 400 patients will be sufficient. For reasons of economy and convenience the administration block has been completed, so that it will only be necessary to add pavilion after pavilion as required. Of the ten pavilions that will ultimately constitute the the hospital proper six have been erected—three for males and three for females—besides two pavilions that will form the maternity department. The approximate cost of the whole scheme will be £130,000; the estimated cost of the portion now taken in hand was £103,000, but so well has the architect—Mr. W. Clement Williams, F.R.I.B.A., of Halifax—succeeded in avoiding that bugbear of building operations, "extras," that the expenditure has been kept well within the latter figure. This item does not include the land, which was bought for about £7,000, or the furnishing, which will involve a further outlay of £4,000.

Though little has been attempted in the way of external decoration, the grouping of the buildings produces a striking effect, with the nurses' home occupying the principal front, flanked by two large central pavilions, and having oblong pavilions branching out in other directions. The nurses' home has accommodation for about eighty beds, with sitting-rooms, lecture-room and other accessories. Immediately behind is the central administration block, and to the right and left are the pavilions for male and female patients. The two circular pavilions are each about 62ft. in diameter, and three storeys high, each of the wards providing for twenty beds. The four oblong pavilions are two storeys in height; each of the wards is over 90ft. long, and has provision for twenty-eight beds. Connected with the pavilions are isolation wards and the needful rooms for nurses. Altogether there are in the hospital proper fourteen large wards and twenty-eight small ones, the latter being for two or single beds. But in addition there is, quite apart from the main buildings, a small maternity hospital, complete in itself, and consisting of two pavilions, which it is intended to use alternately. The operating theatre, the kitchens, and the steam laundry, to name but three of the principal auxiliaries, are admirably fitted up with the latest appliances. A complete electrical plant has been put down, and from this centre the lights, the lifts, the telephones and the hot hearths for the duty rooms of the sick pavilions are worked.

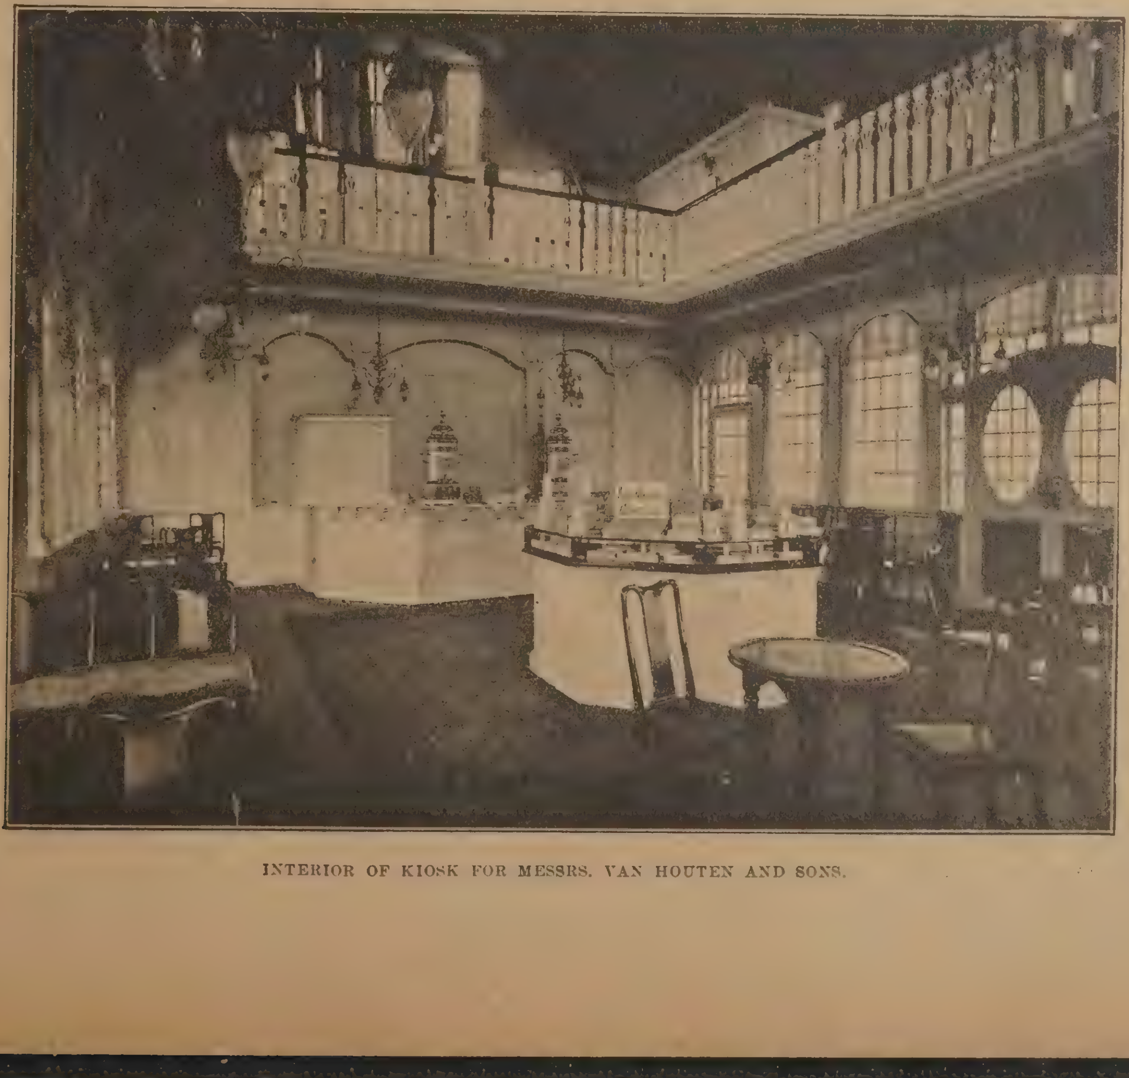
Professor Hermann Grimm, the last surviving male representative of the Grimm family, who was for many years Professor of Art History at the University of Berlin, died recently. Professor Grimm, who was a son of Wilhelm Grimm, was born at Cassel in 1828. After studying law at the Universities of Berlin and Bonn, he settled in the German capital and devoted himself to literature and to the study of art. He was the author of several essays and novels, but his best known work is his life of Michael Angelo, which was published in 1860.

Surveying and Sanitary Notes.

A New Road at Colne a mile long has been opened. The town is built upon the hillside, and the new road has been constructed with considerable skill and ingenuity at a cost of £10,000. It will form part of a new highway to Yorkshire. Previously the only through road was up a precipitous hill, and great inconvenience was felt with heavy traffic. It is expected that it will greatly develop the town and add to its ratable value.

Sale of Building Plots at Herne Bay, Kent.—On Monday in last week a number of freehold building sites on the West End Estate, No. 2, at Herne Bay, Kent, were sold for the New Century Land Co. by Messrs. Rippin & Rake, 33, Cheapside, E.C. Herne Bay is sixty-three miles from London, and reported by the Registrar-General to be the healthiest town in England. Of late years the place has been largely developed, and the value of property has increased by eaps and bounds: land near the station has been sold at the rate of £17 per ft. frontage.

The Drainage of Zermatt.—There is not in Switzerland a centre of exercise which has grown so rapidly in dimension and in popularity as Zermatt. Twenty years ago there were but two large hotels. There are now over twenty. The drainage of what may be called, in the height of the season, the town has become a serious problem to all concerned. From time to time suspicion has been aroused as to the insanitary condition of the village. The hotel proprietors have made up their minds to cope with what was becoming an increasing difficulty. They have formed themselves into a syndicate to provide the capital necessary for the introduction of drains on the most approved method. Water from the Trift-thal is kept perpetually running through the system, and from such a height the flush will be quite effective. The work will be completed in the early summer. Two other improvements have been made. A huge reservoir has been constructed up the Trift, which supplies the hotels, fountains, fire and irrigation pipes; and the vexatious cobstone in the central highway has given place to a smooth pavement.



INTERIOR OF KIOSK FOR MESSRS. VAN HOUTEN AND SONS.

CAVENHAM HALL, SUFFOLK: VIEW OF DINING-ROOM INGLENOOK.

Masters and Men.

The Leek Bricklayers are still on strike.

A Strike of Dudley Carpenters to the number of about 100 has occurred against a reduction of a halfpenny per hour in their wages.

The Strike of Norwich bricklayers, which has lasted nearly thirteen months, came to an end last week, the masters conceding an advance of a ½d. an hour from January next.

The Strike at the Penrhyn Slate Quarries seems to be practically over, as the quarries have reopened, and there is a large number of men at work, although it is in dispute exactly how many.

A Brickworkers' Dispute has arisen between the workmen employed by the London Brick Co. and their employers, a strike of 520 men having occurred for a 1d. increase per thousand output. This would mean an additional 2s. or 3s. on each man's weekly wage.

The Strike of Norwich Bricklayers, which has lasted for over twelve months, has at last been brought to a close on what is really a compromise, but which concedes the men some real and tangible advantages. The question which has given so much trouble of late, that of the "demarcation of work," has been "unreservedly left to the employers, who undertake not to infringe upon work usually done by bricklayers."

Wages in Gloucester.—The Gloucester Master-Builders' Association have had a conference with delegates of the bricklayers and carpenters with reference to the proposed alteration of wages. The men have applied for ½d. advance, whereas the masters had given notice to reduce their wages from 8d. per hour to 7½d. It was decided to let the carpenters and joiners' wages remain as at present. The bricklayers have placed the matter in the hands of their society.

Teeside Joiners and Co-operative Workshops.—As a result of a conference of the strikes committees of the Teeside and Hartlepool District operative joiners, the principle of establishing joiners' workshops on a co-operative basis has been approved, and the united trades committee has been instructed to devise a scheme on the lines of the Blackpool undertaking, and to apply to the Executive Council of the Amalgamated Society of Carpenters and Joiners for funds to finance the same. It is stated that the committees at Stockton, the Hartlepools, and Middlesbrough have already received offers of considerable quantities of work from builders and others.

THE TESTING OF BUILDING STONES.

SOME time ago M. Gautier presented to the Commission of the Methods for testing Building Materials a very interesting study relating to the system for testing quarry building stones. The responsibility which the architect and builder incur at the present day necessitate very great care as regards the stones employed for building. Formerly, as M. Gautier remarks, quarry stones were not subjected to any test. They were utilised in the vicinity of the quarries, and the quality was appreciated from the examination of previously constructed buildings. Now, however, circumstances have changed—stones are transported far from the place of extraction, new quarries are constantly being opened, and there is no time to practically estimate the qualities of the material extracted. Hence it has become necessary to subject stones to brief tests which demonstrate whether they possess the properties required for the particular purpose in view.

Until within late years stones were only tested from the point of view of their specific gravity and resistance to crushing, but it was found that other tests were needed, variable with the particular employment of the stone. Sometimes stone is utilised for balconies or lintels, where it is subjected to bending strains, so that it must be tested from the point of view of rupture by flexion. Some stones are employed for flagging, in which case one must ascertain how they wear in such circumstances; it may also be useful to estimate the difficulty of hewing. Thus we are led to hardness tests.

It is very difficult, strictly speaking, to define the word hardness, though there are several methods to estimate peculiar kinds of hardness, which are—resistance to wear by friction, resistance to splintering under impact, and resistance to drilling.

Recently-extracted stones, saturated with water, are, as a rule, less hard and easier to work than those which have lost their quarry water. Stones always contain foreign substances, which must be studied in many cases. Thus, stones which contain a large proportion of clay should not be subjected to frequent alternations from dryness to moisture, for they would then rapidly fall to pieces. Those containing magnesia are very sensitive to the action of sulphur existing in the form of sulphurous acid or hydrosulphuric in the atmosphere and soil. Therefore they should be chemically analysed.

It is well to be acquainted with the power and more or less great rapidity of absorption possessed by a stone, as this power has an influence on resistance; in this case tests of porosity must be made.

Certain stones break under the action of frost, which acts upon them in very different ways; it makes them splinter in all directions, divides them into scales, according to the beds, or, again, hollows them in the soft parts, or progressively removes the surface in the form of scales. It is then very useful to ascertain in advance the effects of frost on stone by subjecting it to frost tests.

To study the action of frost on stones artificial freezing methods are employed, but only indications can be thus obtained, for it is very difficult to realise the same conditions as those of nature. Until recent times the Brard process was employed, as defined by M. Héricart de Thury. Now apparatus are employed by aid of which the samples can be frozen at - 15° to - 20° C.; it is an artificial winter in a peculiar scientific acceptation.

Frost, however, is not the only stone destroyer, for there are many other factors which contribute to its destruction—the sun, carbonic acid of the air, moisture of atmosphere, rain, temperature, &c. Unfortunately there is no test for determining the resisting power of stone to these various agents. Experience alone can instruct.

DUTCH LIBRARY TO HOUSE IN GLASGOW. BY A. N. PRENTICE.

THE TRANSFORMATION OF BRIGGATE, LEEDS.

WHEN Leeds became a city eight years ago, a number of enterprising inhabitants set themselves the task of making it look like one. Five years ago the east of Briggate was lined by a row of variegated shops and shanties intersected by numerous dark passages that led to filthy backyards and noisome slaughter-houses. These examples of bygone local architecture have been swept away to make room for new streets and arcades, for a music-hall, and for about 250 lofty business establishments. The shopping area of Leeds has been increased by several acres and the ratable value of Briggate and its immediate vicinity has grown during the past five or six years by more than 20 per cent.

For this unique transformation the Leeds Estates Company, Ltd., the City of Leeds Central Estates Company, Ltd., the New Briggate Arcade Company, Ltd., the Buck Hotel Syndicate, and Messrs. Moss & Thornton, who built the Empire Palace, are mainly responsible.

In 1895 the Leeds Estates Company began their great scheme of evolution. Rights of way and light constituting too formidable an obstacle for dealing effectively with the property in a piecemeal fashion, they did not hesitate to try a bolder plan. Their first public transaction took place towards the end of April, 1896, when they entered into an agreement to pay £60,500 for Messrs. Willett's estate in Wood Street, and by the following August they had secured possession of this important site. Of the other eighteen plots which they bought may be mentioned Messrs. Smith's property, for which they paid £30,000; Mr. W. Kettlewell's estate, £20,000; the Shambles, £20,000; an estate belonging to Harrison's trustees, £46,500; land owned by Beuley's trustees, £34,400; and the old Grammar School site and adjoining property, including the Greyhound Inn, £37,000; plus nearly £4,000 costs of going to Parliament. The purchase price of these seven properties adds up to more than a quarter of a million sterling. Altogether the company acquired nearly 4 acres of land, on which stood about 200 old buildings—cottages, warehouses, stables, slaughter-houses, and nine public-houses. The company are providing a big and elaborately-decorated café. The County Arcade, now being completed, and extending from Briggate to Vicar Lane, is 275ft. long by 18ft. wide. It contains a number of granite pillars, the floor is covered with mosaic work, and all the shops are being fitted with mahogany fronts. Then there are two new thoroughfares running parallel to each other lower down Briggate, bearing the names of King Edward Street and Queen Victoria Street. Both are 36ft. wide and bounded by shops. Altogether the company are providing 170 tenancies, the majority of the buildings being shops. The last contracts are now in hand, and in fifteen months the transformation of this part of the city will be complete.

The City of Leeds Central Estates Company, Ltd., are building on a site of 5,015 sq. yds., lying between Kirkgate and Duncan Street. The properties annexed by them include the Bull and Mouth estate, Newsome's Yard, Old Infirmary Yard, and a small strip of land on Central Road. They have demolished 61 cottages. Some of these hovels consisted of but one room 6ft. or 7ft. square. A new street 42ft. wide, provisionally named New Central Road, crosses the site from Kirkgate to Central Road, and in due course will be handed over to the Corporation to pave and flag. The old posting-house, the Bull and Mouth Hotel, where in "the good old days" coaches used to start for London, is being superseded by a structure of brick and terra-cotta, with sleeping accommodation for 150 visitors. Among other features of the new establishment will be a billiard-room with eight tables, a buffet and luncheon bar, a big dining-room and twenty-nine stock-rooms. Adjoining, with a 320ft. window frontage to Briggate, a large six-floored general store is in course of erection. The new street from Kirkgate will be lined by twenty-two shops available for general purposes.

The New Briggate Arcade Company have completed the greater part of their task in the upper part of Briggate. The site of the Grand Arcades, covering an area of 3,535 sq. yds., was formerly occupied by an old finishing mill, the mill-dam concealed from Briggate by a tall hoarding and three or four shops facing into North Street. The company commenced operations in May, 1896, and the majority of the fifty-six shops in the two arcades were completed and tenanted by the end of 1897. What is likely to prove a profitable investment for the company is the development of the site abutting on Cross Belgrave Street and facing down New Briggate. Upon this land stood a building once a family residence 200 or 300 years ago. It ceased to be a dwelling-house about half a century ago, and up to recently was divided into four business establishments. Two or three small shops also occupied the site. These premises have now disappeared, and in their place has sprung up a row of half-timbered shops. Sixteen front to New Briggate, and four to Cross Belgrave Street.

ENTRANCE TO STABLES OF CAVENHAM HALL, SUFFOLK. DRAWN BY THE ARCHITECT, A. N. PRENTICE.

New Baths and Washhouses for Haggerston are to be erected on the Mansfield Street site by the Shoreditch Borough Council, and Mr. A. W. S. Cross is now preparing the plans. Provision is to be made for one swimming bath 100ft. by 35ft.; about twenty first-class and fifty second-class men's slipper baths; about five first-class and twenty-five second-class women's slipper baths; and about seventy washers.

BRICKMAKING IN ITALY.

IN THE BUILDERS' JOURNAL for September 19th, 1900, some particulars were given of the brickmaking industry in Russia, and in the issue for May 8th of brickmaking in Hungary. Below are some details of the industry in Italy.

The latest statistics available on the production of building material in Italy are there for the year 1890, according to which those existed in that year 5,635 clay ovens, which produced 3,606,498 tons of material, valued at 39,000,000 lire, or about £1,500,000. The number of workmen employed in these industries was 49,219. The above value represents the output of the different works in bricks, tiles, &c.

The growth of the clayworking industry has been steady and considerable. In 1899 the exports of bricks and tiles from Italy amounted in value to about £160,000. The best customers were Austria-Hungary, Switzerland, Germany, Tunis, Asia Minor, Tripolis, Egypt, Turkey-in-Europe, British India, Algeria and Brazil.

Up to the present time the great bulk of machinery used in the Italian brick industry has been imported from Germany, and, to a small extent, from Belgium, France and Great Britain. Unfortunately, detailed figures on the importation of clayworking machinery are not available, as they are included in the official statistical returns of the kingdom in the item of "general machinery," not especially enumerated. The imports of all kinds of machinery into Italy are largely and steadily increasing. In 1899 the imports of machinery amounted in value to £1,076,500, but increased to £2,253,600 in 1899. These figures speak for themselves. That the imports of machinery continue to increase is shown by the fact that during the first eight months of 1900 the value of machinery imported into Italy was 62,000,000 lire, or about £2,480,000. Not 5 per cent. of these imports were of United States origin, which must be due to lack of enterprise on the part of American manufacturers, as the reputation of American machinery in Europe and the great fear of American competition in those European markets which have been exploited by Americans are both well known.

Most prominent amongst the Italian brick and tile making establishments are firms like the stock company known as "Societa Veneta Per Imprese e Construzioni Pubbliche," of Pasiano, in the province of Udine. This establishment employs over 500 hands, and has more than twenty modern machines and presses. The company known as "Societa Ceramica Ferrari," of Cremona, employs seventy-five hands, while the company known as "Societa Anonina Fornaci Alle Sieci," of Pontassieve, employs 120 hands. An important establishment, also, is that owned by Giovani Ellena, of Bellaso, in the province of Genoa, where about 300 hands are employed. Other leading clayworking establishments are: Astengo Macchioli & Co., of Vado Ligure, where about seventy-five hands are employed; the firm of Bonazzi & Stanisci, of St. Stefano di Magra, in the province of Genoa, employs about 100 hands; Teodosio Bottacchi, of Novara, employs eighty hands; while Rossari Bottacchi, of the same place, employs forty hands. The firm of Corosio & Podesea, of Sampierdarena, near Genoa, employs about forty hands. Ponzone Longari, of Casalmaggiore, in the province of Cremona, employs about 100 hands.

There is little doubt that the output of all these works could not only be increased, but also the product improved, if modern machinery were used. The majority of the factories are of an unpretentious sort, in order not to attract the attention of the tax collector and the rivalry of the larger concerns. It may be added that the manufacture of mosaic is chiefly carried on in the district of Florence. Another very important industry, also, is that of the Italian pottery and porcelain.

THE RETREAT, LAKENHEATH, SUFFOLK. DRAWN BY THE ARCHITECT, A. N. PRENTICE.

Builders' Notes.

The Basford Workhouse, Nottingham, has just been supplied with the patent Manchester grates and special inlet panels by Messrs. E. H. Shorland & Brother, of Manchester.

The Gloucester and District Master-Builders' Association held its annual general meeting recently, when the report and balance-sheet for the year were adopted. The president (Mr. G. O. Estcourt), the vice-president (Mr. William Jones, jun.), the committee (Messrs. A. King, jun., A. Dunn, T. Gurney, W. T. Nicholls and W. J. Parker), and the secretary (Mr. F. White, Zetland Chambers) were all re-elected. References were made to the quietness of the building trade and the not very encouraging prospects of improvement. Owing to the uncertain state of the trade, notices of a reduction of a ½d. per hour in wages, to take effect June 24th, had been sent to the bricklayers and carpenters and joiners' societies. The labourers have asked for an advance of a ½d. per hour, but this the Association has been unable to grant.

Building Contracts at Aberdeen : A Protest.—A meeting of builders, house proprietors, property agents and others interested was recently held at Aberdeen for the purpose of considering what action should be taken in view of the movement set on foot some time ago by the Associated Architects' Society in Aberdeen for establishing certain working rules between themselves and the different trades. The following resolution was passed : "This meeting expresses its strong condemnation of the selfish action taken by the Aberdeen Society of Architects in endeavouring to bring the whole building trade into the hands of a few, who call themselves the Society of Architects, and as being against all sense of fairness, legitimate competition and justice, especially so in view of the fact that the amount of work which passed through their hands during the last two years only amounts to about one-third of the work done by the whole building trade of the city during that period."

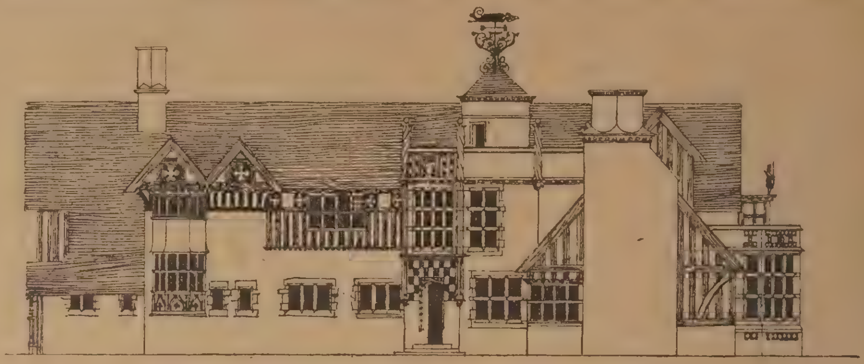
British Fire Prevention Committee's Visit to Hamburg and Antwerp.—In continuation of their participation in the Berlin Fire Congress (reported on p. 378 of our last issue) the Committee paid a special visit to the city of Hamburg, where a deputation comprising Mr. Edwin O. Sachs, Mr. Farrow, Mr. Goad, Mr. Marsland and the assistant secretary were cordially received by the head of the building police, the chief of the fire brigade, and other representatives. The visitors were first received at the headquarters of the fire brigade, after which a number of the new fire stations of the Hamburg brigade were visited. Next the various warehouses in the free port were carefully examined, and finally a large American liner was visited. In the evening the party was entertained at dinner, when Mr. Sachs had an opportunity of expressing the Committee's thanks for the reception. In conclusion of the deputation's visit to the Continent they informally visited the scene of the large fire at Antwerp where the enormous bonded warehouses covering about seven acres of ground, comprising many structures of five floors height, had been entirely gutted.

London County Council.—At last week's meeting Mr. John Burns drew attention to the threatened destruction of the magnificent view from Richmond Hill. He hoped the Council would see its way to co-operate with other bodies, including the City Corporation, with a view to preserving that splendid space. Mr. Henry Clarke remarked that Richmond Park itself was saved in the early part of last century by the Corporation. Lord Monkswell, chairman of the Parks Committee, said the Council were much interested in the statement made by Mr. Clarke. He hoped it would be an incentive to the Parks Committee to do something towards preserving the view alluded to. The Bridges Committee reported that on May 26th last the shield at Greenwich Tunnel reached the Greenwich shaft, and an opening was made to allow a passage from the tunnel to the shaft ; and by the end of the month the junction was rendered perfectly secure. The actual tunnelling work was now complete, save for the special ring at the junction with the inside plates of the Greenwich shaft. The rate of progress from the commencement of the work, including time lost for holidays, had been 5ft. 6in. per day, or 33ft. per week for a period of thirty-six weeks. It was very satisfactory to the committee to be able to report that the work had been carried on with very few accidents, and that there were only three cases of compressed-air sickness of sufficient gravity to deserve compensation from the Council.

Law Cases.

An Architect's Claim for Sketches "to Attract Tenants."—The case of *Gilford* v. *Taylor* was recently heard at the Croydon County Court. In October, 1900, the plaintiff, an architect of Purley, was requested by the defendant to prepare sketches of some houses she proposed to build, the sketches being intended for exhibition with a view to attract tenants. Plaintiff charged £12 12s. When he had done the sketches the defendant asked him to waive his claim if she employed him to prepare the plans and specifications for the houses—fifteen in number—which she proposed to build on Russell Hill. Plaintiff consented to this, and prepared the plans and specifications, which were, however, rejected by the defendant, who employed another architect. On the suggestion of the judge, when the case was first heard on April 2nd last, the case was referred to the president of the Royal Institute of British Architects to appoint an arbitrator. The president nominated Mr. Hilton Nash, of Bush Lane House, E.C., who took the arbitration on May 15th. On June 4th Mr. Nash made an award in favour of the plaintiff, and on the application of plaintiff's solicitors judgment was now signed for £37 10s. and costs.

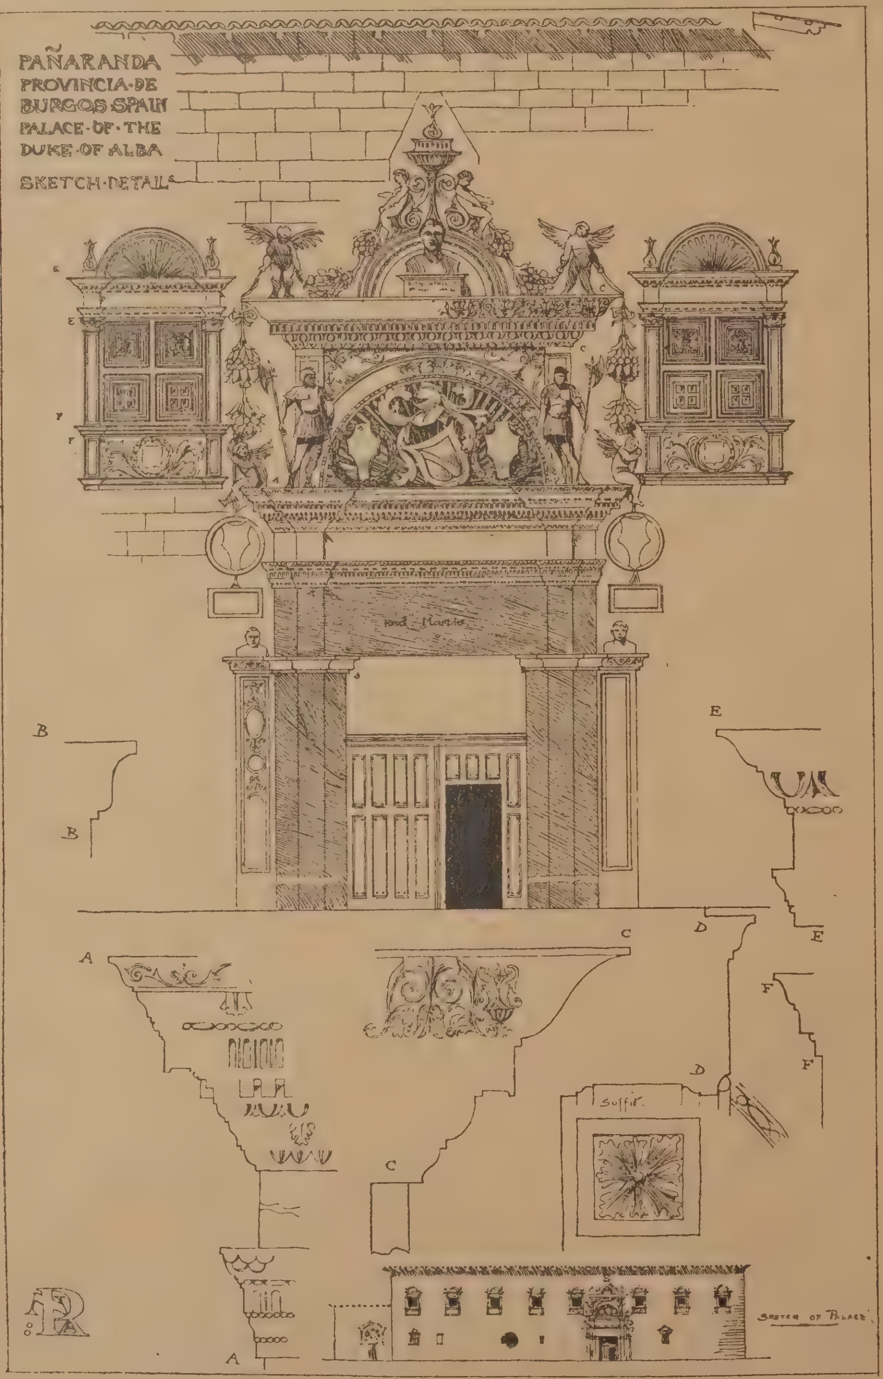
Agreements restraining Architects from Practising.—On June 14th, in the case of *Portsmouth* v. *Seward* (see p. 299 of our issue for May 22nd last), Lords Justices Rigby and Collins discharged the order of Mr. Justice Kekewich restraining the defendant till the trial from carrying on business as an architect at Swansea. in breach of the agreement under which plaintiff purchased Messrs. Seward & Thomas's business



PROPOSED COUNTRY HOUSE. A. N. PRENTICE, ARCHITECT.

there. The defendant had won the competition for new offices for the Swansea Harbour Trust, and the question was whether the agreement prevented him from carrying out the work. Their Lordships said the agreement expressly provided that if anyone wished the defendant to act for him in Swansea he was not to be restrained from so doing. There was nothing to prevent the defendant from sending in designs in the competition, and if he was successful there was nothing to prevent him from undertaking the work if requested to do so. The appeal was allowed with costs against plaintiff.

The Submission of Plans for Brick Kilns.—A case involving an interesting point in connection with the working of clay mines was dealt with at the Halifax Borough Court on June 14th. Messrs. J. Morton, Ltd., brickmakers, Cinderhills, were summoned by the Halifax Corporation for a breach of the by-laws in erecting a brick kiln at their works without having first submitted plans of the building to the Corporation. Defendants had erected a brick kiln on a site about 14yds. from the mouth of the clay mine, and their contention was that they were exempted from the requirements of the Act under sub-section E of section 2, which exempts "buildings used or intended to be used exclusively for the working of such mine." The question for the Court to determine, therefore, was—"Is a brick kiln adjacent to a clay mine, using the product of such mine, part of the working of the mine?" For the prosecution Mr. George Buckley and Mr. W. H. D. Horsfall, architects and surveyors, were called and said that the process of burning bricks had nothing to do with the working of a clay mine. The first-named witness said he knew of cases where clay was carried about a mile to the kiln, and he had known of instances where clay mined in the Halifax district was carted to Huddersfield kilns. For the defence Mr. James Mellors, of Wakefield, district inspector of mines, was called, and stated that he had supervision as inspector over the kiln as well as of the mine. It was, in his opinion, part and parcel of the working of the mine. In reply to the magistrates' clerk, the witness stated that he had no supervision over the erection of the kiln. Cross-examined, the inspector said that he had supervision over the kiln because it was adjacent to the mine. Mr. W. G. Gray and Mr. R. Edgar Horsfall, surveyors, said that they regarded the kiln as part of the mine, and Mr. George Fitton, mining engineer, Leeds, expressed similar views. The assistant town clerk pointed out that the fact of Inspector Mellors' having supervision over the kiln did not bar the operation of the Public Health Act. If the building were situated at a distance from the mine it would be under the supervision of the factory inspector, and in that case the Public Health Act would be in force. He stated, in reply to the Bench, that the by-laws adopted by the Corporation were the model by-laws of the Local Government Board. After a hearing which occupied nearly three hours, the chairman announced that a majority of the Bench were of opinion that the kiln was "used exclusively for the working of the mine," and the summons would be dismissed. It is understood that the Corporation will appeal.



DRAWN BY A. N. PRENTICE.

Effectual Drainage: An Interesting Case.—The case of *Mathews* v. *Strachan* (stated by justices) was heard last Thursday in the King's Bench Division of the High Court of Justice. An information was laid by the respondent, as clerk to the Harrow Urban District Council, against the appellant for erecting a house in Lyon Road, Harrow, without constructing such covered drains as appeared necessary by section 25 of the Public Health Act, 1875. Two sewers have been laid by the council in Lyon Road North, within 100ft. of the site of the house, one for the reception and conveyance of surface water only, the other for the reception and conveyance of sewage only. Before erecting the house the appellant deposited plans. The council's surveyor made a report that the requirements for the effectual drainage of the house were: (*a*) One main drain of not less than 4in. internal diameter, for conveying sewage only, to be . . . . connected to the council's sewage sewer; (*b*) one main drain of not less than 4in. internal diameter, for conveying surface water only, to be . . . connected to the council's surface-water sewer. The council, after considerable discussion, passed a resolution approving the appellant's plans, subject to the requirements contained in the above report being carried out. The defendant did not lay two drains as required by the notice and report, but one only in the manner shown on his deposited plans. The justices held that they had no power to question the reasonableness of the requirements for the effectual drainage of the house, and convicted the appellant. The Court held that the justices were wrong. Section 25 of the Act empowered the local authority to take into consideration certain matters, and only certain matters, for the purpose of satisfying themselves whether the drain proposed was effectual for draining the house, namely, the size, material, level and fall. If matters beyond the requirements of the section were asked for, it was in effect asking the owner of the house to subscribe to a general system of drainage. That was not the intention of the Act. The decision of the justices was therefore reversed. Appeal allowed.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Art is the child of Nature.—LONGFELLOW.

Preservation of Derwentwater. CANON RAWNSLEY, vicar of Crosthwaite, Keswick, and honorary secretary of the National Trust for the Preservation of Places of Historic Interest or Natural Beauty, has made an appeal for help in the purchase of a part of the foreshore of Derwentwater. This is the first attempt to nationalise in the only practical way—namely, by purchase—any portion of the Lake District. Public access to Derwentwater is confined to a very few places only. The plot it is proposed to purchase has been declared to be in the market, and what is desired is to rescue it from the speculative builder. It borders the lake for a mile on the western shore, is of 108 acres in extent, and gives access to the hills above. The price required is £7,000, of which £2,000 has been promised. Donations should be sent to the Secretary of the National Trust, 1, Great College Street, Westminster.

The Bismarck Monument. THE Monument to Bismarck, erected in front of the Reichstag, and unveiled recently, is the work of Herr Reinhold Begas, the well-known sculptor. The statue, which is of bronze on a marble pedestal, stands on a lofty plinth of variegated granite, to which steps lead up on all sides. The spike of the helmet is almost as high as the roof of the Reichstag. Bismarck is represented above life-size, in the well-known undress uniform of his Cuirassiers. The cloak is spread over a column. A document or map, upon which his right hand rests, lies upon it, while the left hand grasps the handle of his sword. The figure is upright; the strongly-chiselled head, gazing into the far distance, is covered by a helmet thrown a little back, thus fully exhibiting the high forehead. The central pedestal is surrounded by four fountains presided over by water-nymphs and goddesses. On the pedestal itself are bas-reliefs, one representing the apotheosis of Bismarck and the other the attacks on the great statesman by the unclean birds of Party and Press. On the plinth from which the pedestal rises are four groups symbolising Bismarck's labours for the Fatherland. The first is Siegfried forging a sword, the second is the symbolical figure of a woman resting on a Sphinx, the third is Germania with her foot on a panther's neck, the fourth is Atlas with the globe on his shoulder. The entire cost of the monument was £60,000.

"New Art" Furniture. THE Secretary of the Board of Education, secondary branch, announces that Mr. George Donaldson has presented to the Victoria and Albert Museum a collection of "new art" furniture. Mr. Donaldson, who is an accepted authority on all matters pertaining to furniture, modern and old, was in 1889 elected vice-president of the jury of awards for furniture at the Paris Exhibition, and was unanimously chosen again last year as vice-president of the recent Paris Universal Exhibition. In the process of making the awards, Mr. Donaldson noticed that in the past eleven years a remarkable and distinct art development had taken place all over Europe, causing a mercantile change of quite exceptional proportions, but one of which England was practically unconscious. On learning that the Victoria and Albert Museum had insufficient funds for allocation to this particular branch of art, and could not, therefore, place before English designers, craftsmen and manufacturers the choicest European examples of the "new art" production in furniture, Mr. Donaldson wrote to the President of the Board of Education and offered to purchase a selection of the best examples of "new art" furniture in the Paris Exhibition of 1900, and to present them to the Victoria and Albert Museum. His object was to exhibit them in the first instance at the museum and then to send them for exhibition successively to our chief manufacturing towns, in order that the manufacturers and artisans of this country might see what other nations are striving for in the direction of original design not based upon past productions. The collection is now arranged in the tapestry court of the art museum.

Ivory Carving in the Punjab. MR. ELLIS, an Assistant Commissioner in the Punjab, has lately published in India an interesting monograph on the art of ivory carving in that province, which appears to be a comparatively modern one there. In Delhi, which is the chief seat of the industry, it is almost exclusively a hereditary occupation. The whole trade of Delhi is practically in the hands of one family, the head of which pays the carvers. Some of the latter are paid very high wages, for at the last moment a slip through carelessness or want of skill might spoil the work of months. Prices are sometimes very high, as much as £500 having been given recently for a piece of carved ivory. At Amritsar, another centre of the industry, the work is less elaborate in its character, and consists chiefly of bangles, toys, combs, paper-cutters, card-cases, and the like. Hoshiarpur is the chief centre of inlaying and the manufacture of decorative furniture. Some of the inlayers prepare a stock of their goods with which they travel all over India, selling them to private purchasers. In Patiala, too, under the patronage of the late Maharaja, ivory carving has been carried on, chiefly that of bangles. At Ludhiana the turning of billiard balls has become a regular, though small industry. But, according to Mr. Ellis, the art of ivory carving as a whole does not flourish in the Punjab, although the work of Faqir Chand at Delhi and Ghulam Hussain at Hoshiarpur is famous all over the world. The raw material comes from Africa, Burma and India; but Indian ivory is of inferior quality, on account, it is said, of the food of the animals and the inferiority of breed, climate and surroundings. The industry, with few exceptions, is confined to the large towns, the purchasers of the carving being mostly Europeans. The designs, Mr. Ellis says, are Indian, the imitation of European models not having yet invaded the art.

Liverpool School of Architecture. AN exhibition of architectural and decorative designs, modellings, copper-work, examples of enamels, woodcarvings, &c., by students of the Liverpool School of Architecture and Applied Art, was opened recently by the Lord Mayor (Mr. Arthur Crosthwaite) at the Walker Art Gallery. Professor Simpson, the director of the school, in speaking of its work, said that seventy-three students had attended the day and 171 the evening classes during the past session. There was one point to which he would like to refer, and that was the fact that a special aim of the school was to pay great attention to the arts and crafts allied to architecture. In Germany the manufacturers and others were in close touch with the higher technical schools, and it was to that fact that the great progress made during the past few years was in a large measure due. He thought that those of Liverpool should take advantage of the training given, and still being given, to students in that school. The Lord Mayor, in opening the exhibition, said that the Corporation had given £1,000 to the school, and had made a further grant of £400 in consequence of the good work done. The Corporation were wishful to encourage such progressing work, and the fact that the work was progressing was emphasised by the increase in the number of those who attended the school. There were no fewer than twenty different crafts taught, and they were really trying to help that which was beneficial to the trade of the city. They wanted to encourage local talent; the school was one of the first of its kind in the country. The exhibition closed last Saturday.

Appointment of Architects by Rural Bodies. A DEPUTATION from the Council of the Royal Institute of the Architects of Ireland waited on the Local Government Board recently. The deputation consisted of Sir Thomas Drew, P.R.H.A., F.R.I.B.A.; J. Rawson Carroll, F.R.I.B.A.; R. Caulfield Orpen, F.R.I.A.I.; Charles A. Owen, F.R.I.B.A.; & W. Kaye Parry, M.A., F.R.I.B.A., hon. secretary. The object of the deputation was to bring under the notice of the Local Government Board the appointments of unqualified men as architects by the Urban and Rural District Councils in connection with the expenditure of public funds. The deputation was courteously received by the Vice-President, Sir Henry Robinson, K.C.B., and other members of the Board. Sir Thomas Drew stated shortly the position occupied by the Royal Institute in connection with the profession which it represented. Mr. W. Kaye Parry then read a statement embodying the views of the Council, and suggested that the Local Government Board should endeavour to secure increased powers to make regulations regarding the qualifications of architects employed by Urban and Rural District Councils. The chairman thanked the deputation for having brought this matter under the notice of the Board, and added that the suggestions of the Council would be very carefully considered.

Half-Timber Houses at Lincoln. MESSRS. WATKINS & SON architects, presented a report to the Lincoln City Council recently upon the old "half-timber" buildings on the High Bridge belonging to the Corporation. They said that the buildings appeared to have been originally erected as three small dwelling-houses, each with a single room on the ground floor, and in the corner of each room was a steep and narrow staircase leading to the rooms above. Each storey above the ground floor overhangs that below it by about 15in., so that the top or second storey overhangs the outside face of the ground floor about 2ft. 6in. All the constructional timbers were of English oak, and were originally exposed to view on the outside and inside faces of all the walls, and, fortunately, nearly all of them still remain. The architects considered that there would be no insurmountable difficulty in restoring the building to its original form and appearance. While retaining the shops they would endeavour to restore the building in all other respects to its original condition and appearance, except as regarded the steep and narrow staircases, for which they would substitute more suitable staircases in the annex they proposed to build at the back. It was difficult to estimate the cost of the restoration, but they were of opinion that it would be about £1,000 or £1,200. The Corporation has decided to have the buildings restored.

The Architectural Museum. THE annual general meeting of the Royal Architectural Museum and Westminster School of Art was held last week at the Museum, Tufton Street, Westminster. Mr. W. Emerson, the president, was in the chair. Mr. J. P. Seddon moved that Mr. Emerson be re-elected president for the current year. This was seconded by Mr. S. Lee, and carried unanimously. Mr. Emerson, in accepting, expressed the hope that they would soon be in a more flourishing condition. They were at present in a state of transition, and he would do his best to aid them. The adoption of the report of the council was moved by Mr. M. B. Adams, who said that through the good offices of the president a closer connection had been brought about between the museum and the Royal Institute of British Architects, which had promised an annual donation of 20 guineas to the funds. The finances of the institution were in a satisfactory state, but a heavy and immediate outlay was in contemplation, it having become necessary to renew the roofs of the older portions of the buildings. The council hoped that not only the old friends of the museum, but the profession generally, would make individual efforts to assist in meeting this exceptional expenditure. The Westminster School of Art continued to well maintain its high reputation. There were some people who thought very little of the splendid collection of casts they had there, but, as a matter of fact, those casts were of inestimable value. In keeping them together they were rendering a great service to the country. At present the old national style of architecture (Gothic) was much neglected; but a time would surely come when architects would again adopt it more largely than they now did. Mr. W. Pain seconded the adoption of the report. Speaking in support of the motion, the chairman drew attention to the very heavy outlay impending not only for repairs but also in the contemplated addition of Renaissance and other styles of casts. He promised 20 guineas towards that object. Mr. Seddon also promised 10 guineas.

SOUTH KENSINGTON EXAMINATIONS.

QUESTIONS AND ANSWERS IN BUILDING CONSTRUCTION.—Honours: Part 1.

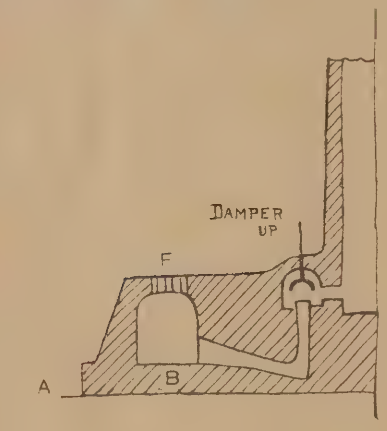
[NOTE.—The questions and answers in the Elementary stage were published in our issue for June 12th, and those in the Advanced stage in the following issue. In the Honours examination it was not allowable to answer more than six questions, of which at least one was to be selected from each of the first two divisions and two from the last.]

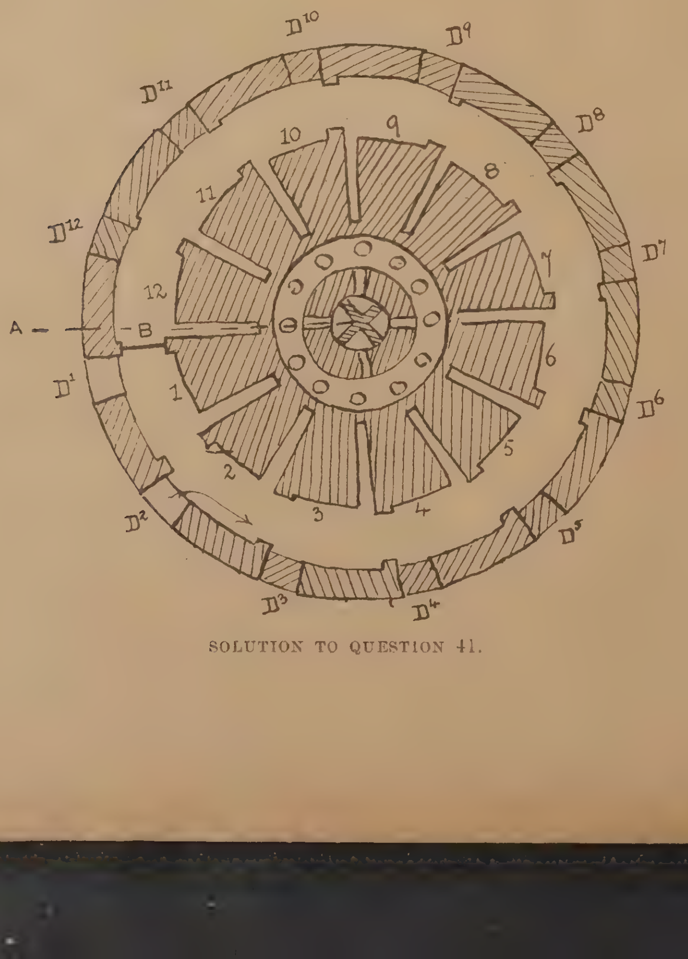
DIVISION I.

41. *Sketch a sectional plan and a sectional elevation of a Hoffmann kiln. Explain, referring to your sketches, the scientific principle of the kiln, and describe the practical working of it.*

(See accompanying illustrations.)

The kiln is designed so that the burnt bricks while cooling will heat the air going to support combustion, where bricks are being burnt, and so that the gases (the products of combustion) shall be applied to bricks about to be burnt, to heat those nearest the fires in order to make them ready for firing, and to warm and thoroughly dry those more remote. 1, 2, 3, etc., to 12 is an annular chamber properly built and lined to stand a high temperature. There are twelve flues from it to a chimney. Each flue is capable of being shut by its damper. At B is shown an iron shutter shutting off 1 from 12 (it is possible to similarly shut off 1 from 2, and so on for the twelve sections). In the roof of each section there are openings, called fire-holes, through which fuel can be applied to the sections which are burning at any time. The openings marked D^1, D^2, &c., are closed everywhere (with bricks and sand), except at D^1 and D^2, which are open as shown on the sketch. The fire-holes are kept closed, except when fuel is being sent down. We shall suppose the kiln to be in regular work. Section 1 is being filled with bricks from the hacks, while section 2 is being emptied of burnt bricks. All the remaining sections are full of bricks, spaces being left for the working of the shutters B; 3, 4, 5 and 6 are in stages of cooling, 7 and 8 are burning, 9 is very hot, getting ready for firing, 10 is less hot, 11 is warm, and 12 is drying. All the flues are shut off from the chimney, excepting flue 12. On the following day 1 may have been filled with bricks, the shutter will be down between 1 and 2, flue 1 will be open to the chimney, shutter between 12 and 1 will be up; all flues except flue 1 will be closed, door D^3 will be open, D will be built up, and the fires will be in 8 and 9. In this way there will be a regular rotation, and finished bricks will at regular intervals be taken from the doors in succession—moving, in a sense, against the hands of a watch, as shown in the sketch.





SOLUTION TO QUESTION 41.

42. *What is the difference between cast iron and steel? Describe a forge test by which you would determine whether a small sample is cast iron or steel.*

What is mild steel, and how is it made?

In comparing cast iron with steel, it is advisable to recollect the *ordinary popular distinction* between these materials. Cast iron is employed for grates and ornamental castings, and is comparatively easily broken with a blow; if a cast-iron ornament falls on a hard surface, such as earthenware or glass, it will break, though of course it is stronger than these. Steel is familiar in knives and cutting tools, and the material is associated with ideas of strength in maintaining an edge without gapping, and hardness to enable it to penetrate other hard materials. It is found that both cast iron and steel are combinations of iron (an element) and carbon (another element), and that a material is cast iron if there is more than, say, 2 per cent. of carbon, while it is steel if there is less than, say, 2 per cent. of carbon. As building students, we had better not involve ourselves in chemical language. With such a distinction, it is natural to expect that close to the line it will not be easy to say which is steel or cast iron; at some distance from this critical line the distinction is well marked and discrimination easy, and for building purposes we are not concerned in very nice distinctions—it is easy to distinguish between cast iron and steel.

The easiest forge test where rough tests are doubtful is tempering. If you heat a piece of steel to the proper temperature, and dip its point, the first hardness of the point will reduce with the heat travelling down from the part undipped. Cast iron will harden with heating and dipping, but it will not soften with a lower temperature than that at which it has been dipped. Mild steel is iron and ·16 to ·5 of carbon. It is produced in various ways. The following is a brief description of the Siemens-Martin process: A quantity of molten highly-heated cast iron is prepared in a furnace, heated scrap, wrought iron or steel is added and dissolves, and samples are taken from time to time and tested to learn the proportion of carbon in the metal. This stage is managed so that the proportion of carbon shall be ·1 per cent. To it is now added spiegeleisen, to give the desired proportion of carbon, and the metal is discharged at the proper time into ingot moulds.

43. *Describe carefully the composition of good Portland cement, and explain fully its manufacture.*

Specify good Portland cement, and explain minutely how it should be tested.

Portland cement is produced by burning, in a suitable kiln, an intimate mixture of limestone and clay, and then grinding the "clinker" (the burnt mixture) to a fine powder. The details of the manufacture differ in different localities because the ingredients are found in different physical conditions. Where limestone is found soft as chalk, and clay also soft, the practice is to pug these materials together in the proportion of 3 of chalk to 1 of clay (with a sufficient allowance of water) into slurry. This slurry is strained, settled and dried, and when fit it is fed into the kilns and burnt. After burning it is ground.

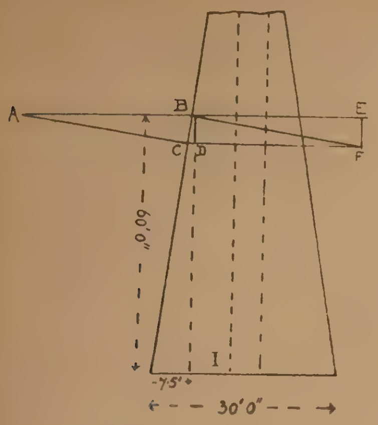
Specification.—The Portland cement shall be delivered in good, cool, working condition. The bags shall contain no lumps of damaged cement or of other foreign matters. The specific gravity shall be 3·1. It shall be finely ground equal to cement that will pass through a sieve of 32,000 meshes to the sq. in. (gauge of wire 48 B.W.G.), leaving a residue not greater than 10 per cent. Its tensile strength after seven days (from filling mould) shall be not less than 350lb. per sq. in. (neat cement). It shall be properly burnt, and its composition shall be of the best proportions.

Testing.—Thermometer test: The temperature should not greatly differ from the average shade day temperature. Test specific gravity in specific-gravity bottle. Fineness is best tested for in a continuous way by first passing a quantity of cement through a sieve of the specified fineness, then passing 10 per cent. of the residue through a sieve of 2,500 meshes, mixing these together, and gauging with standard sand. Briquettes made of this gauged stuff should be broken in the usual way and the record preserved. Any further purchases of cement should give as good a tensile strength with identical sand. Fine-meshed sieves cannot be maintained in sufficiently good condition to allow their behaviour to be sworn to. Fair samples are taken from various parts of the consignment, mixed, formed into briquettes in the usual way in brass moulds, and broken in a proper testing-machine after seven days (twenty-four hours in the moulds in a damp place, and six days out of the moulds in water). Put a pat of cement on glass and place in water. When making neat briquettes, test for setting. Fill a bottle with cement made to a proper consistency with water.

DIVISION II.

44. *A square mill chimney is 3,000 tons in weight: it is so bonded and built that it may be taken, under the conditions of the question, as one homogeneous mass. Its bottom bed is square, 30ft. by 30ft., with a 6ft. by 6ft. flue in the centre. Taking the force of the wind at 50lb. per sq. ft. on an area of 3,000 sq. ft. (centre of gravity of area 60ft. up) blowing at right angles to side of bed; batter of side of chimney 1½in. to 1ft.: find (a) maximum pressure per sq. ft. at lee edge of bottom bed, (b) minimum pressure per sq. ft. at windward edge, and (c) the total pressure on the bed.*

Referring to the accompanying illustration, A C is at right angles to the side. A B is horizontal. The batter being $\frac{1}{8}$, $\frac{BC}{AC} = \frac{1}{8}$. The sides of the triangle A, B, C are proportional thus: $AB : AC : BC = 1 : {·99} : {·124}$. The number ·99 may be determined by drawing with sufficient accuracy, but it is easy arithmetic remembering that the square on the hypothenuse is equal to the sum of the squares on the sides. A B = 50



SOLUTION TO QUESTION 44.

× 3000 = 150,000lb. Resolve this force tangentially and normally, and we get 150000 × $(1-\frac{1}{100})$ = 148500, which is the force B F—we have no use for the tangential component: resolve B F horizontally and vertically, and we find $148500(1-\frac{1}{100}) = 147015 =$ B E $\text{BD} = \frac{\text{BE}}{8} =$ 18377. This force B D may have its point of application transferred to I. Moment of B E with respect to G H = 147015 × 60. Area of base = 30 × 30 − 6 × 6 = 864 sq. ft.

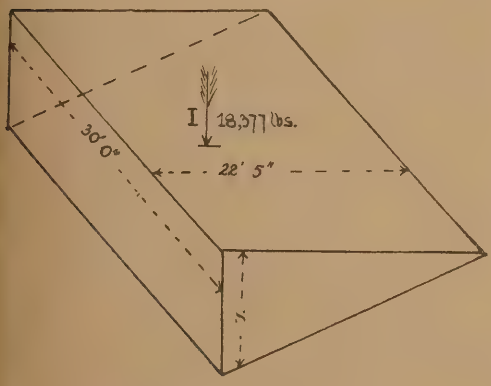
(1) Pressure per sq. ft. due to weight of chimney $= \frac{3000 \times 2240}{864} = 7777{\cdot}7\ldots$

$147015 \times 60 = p_1 \frac{2\,\text{I}}{30} = p_1 \frac{\text{I}}{15}$, where p_1 is the extra force per sq. ft. at H and I, the moment of inertia of the base $\text{I} = \frac{30^4 - 6^4}{12} = 67392$.

(2) $\therefore p_1 = \frac{147015 \times 15}{67392} = 1{,}964$lb. per sq. ft.

This force will be of the same amount at G, but of opposite sign.

As regards the pressure, 18,377 lb. at I (see accompanying illustration), if we take account of the *elasticity* of the material we shall be led into considerations which are beyond the scope of this question, and we assume that the brickwork is perfectly rigid so far as this comparatively small pressure is concerned. This force will be balanced by a system of parallel forces acting upwards, whose *centre* shall be in the line D I, and these may be represented by the volume of a wedge $\frac{30 \times 22{\cdot}5 \times s}{2}$, where s is the maximum force per unit of area.



SOLUTION TO QUESTION 44.

(3) $\therefore s = \frac{2 \times 18377}{30 \times 22{\cdot}5} = 54$lb.

a. From (1) and (2) 7777·7 .. + 1964 = 9741·7 .. lb. per sq. ft.

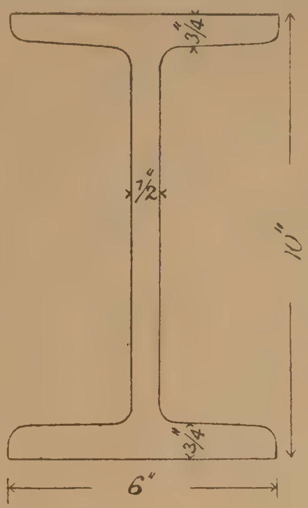
b. From (1), (2), (3) 7777·7 .. + 54 − 1964 = 5867·7 .. lb. per sq. ft.

c. 3,000 tons + 18,377lb. = 3,008 tons 4 cwt. and 91lb.

45. *Determine graphically the forces in the members of the roof truss shown. Mark the amount on each member in cwts., putting + for compression and — for tension.*

(See accompanying illustration.)

46. *Section of rolled steel joist: what is its weight per ft., approximately? Placed on bearings 12ft. apart, what distributed load will it carry approximately, the stress in it being limited to 4 tons per sq. in.?*



Area of flange = $4\frac{1}{2}$
" " = $4\frac{1}{2}$
" web = $4\frac{1}{4}$

Area of section = $13\frac{1}{4}$ sq. in.

36 cub. in. weigh 10lb.

$\therefore \frac{13{\cdot}25 \times 12 \times 10}{36} = 44{\cdot}16$ b. is *weight per ft. of joist.*

$$\frac{\text{Load in tons} \times \text{length between bearings}}{8} =$$

bending moment at middle point, where it is a maximum.

Neglecting weight of joist and also neglecting bending moment value of web,

Load in tons =

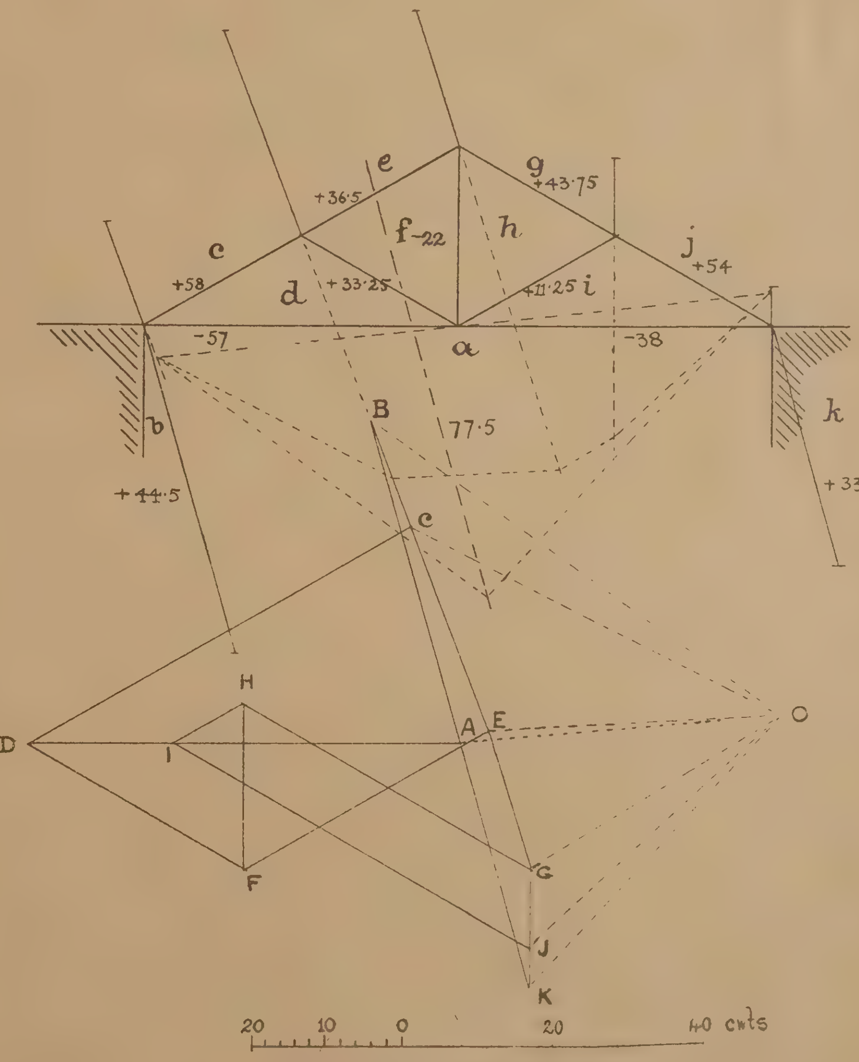
$$\frac{4{\cdot}5 \text{ sq. in.} \times 4 \text{ tons} \times \frac{9{\cdot}25}{12} \text{ dist. bet. flanges in ft.} \times 8}{12}$$

$$= \frac{4{\cdot}5 \times 4 \times 9{\cdot}25 \times 8}{12 \times 12} = 9{\cdot}25 \textit{ tons dist. load.}$$

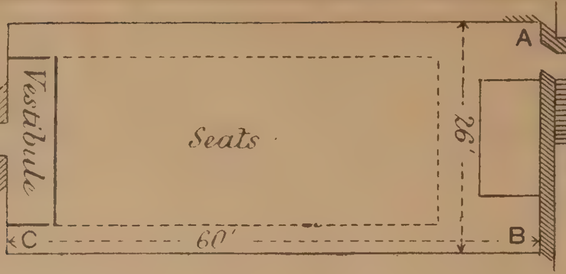
DIVISION III.

47. *You are to design and specify carefully a high-pressure small-tube hot-water heating system for the small church shown on plan. The pipes are uncovered, and they are placed in a cement recess between the wainscotting and the floor. Ceiling 18ft.*

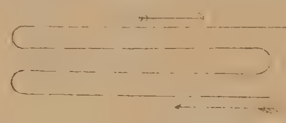
The works to be done shall include the excavation of the floor of the furnace-room to a sufficient depth, so that the coil-boiler shall be well below the floor of the church. The walls shall be carefully supported during the excavation, and all things shall be done to make them good and secure in every way. The finished surface of the floor of the pit shall be 5ft. lower than the floor of the church. There shall be a landing 3ft. 6in. by 3ft. 6in. at the door, and there shall be a secure iron railing and an iron ladder from this landing to the floor of the boiler pit. The floor shall be 9in. thick of concrete, finished smooth on surface. The sides shall be made up with concrete 18in. thick, smooth on face. A proper and sufficient chimney shall be built to a sufficient height to which the flue from the coil-boiler shall be connected. A 12in. ventilating pipe shall be brought from the outer air to the pit (such a pit should be well ventilated, as there is great danger from carbonic oxide). The boiler shall be a well-made coil of 100ft. of pipe with all



SOLUTION TO QUESTION 45.



necessary firebars, casing, &c., and proper connection shall be made to the flue of the chimney with damper, &c. The pipes shall everywhere have a fall towards the coil. The pipe from the bottom of the coil shall branch into two: these branches shall reach the points A and B at 6in. above the floor level. The pipe from the top of the coil shall also branch and reach the same points 1ft. 6in. above the floor level, and, avoiding all obstruction to doors, &c., the pipes shall be carried along the walls showing four lines of piping for the whole length of the church. The two upper lines will be carried close to the wall to the outer door of the vestibule on each side. The expansion pipe shall be at C. The whole of the material shall be of the very best description, and the installation shall be fitted with all necessary cocks for the regular testing, supplying with fresh water and every matter and thing that a good high-pressure small-tube heating installation should have. The pipes shall be of ⅞in. bore, and shall be carried on iron hook standards properly fixed. The installation shall be tested by an hydraulic testing pump by the contractor, in the presence of the architect, to a pressure of 1,000lbs. per sq. in. The contractor shall also guarantee absolute steam, &c., tightness at every part. The tubes, iron ladder, railing, &c., shall be painted with suitable enamel paint. Every matter and thing disturbed shall be made good and complete in every respect, and a complete work satisfactory in every respect shall be handed over by the contractor.



48. *Specify, exactly and fully, for the connection with main and the complete wiring and fitting of a town residence (£100 valuation) for electric lighting. Give a detailed estimate of the cost.*

Wires.—All the electric conductors shall be of high-conductivity copper, covered with best insulation. They shall be the goods of a well-known manufacturer. They shall be run in proper casing, and the work shall in every respect conform to the Fire Office rules. The casing shall not show, except where agreed upon, and conductors of sufficient sectional area shall be brought to each lamp and wall socket. A reasonable test of the sufficiency of the conductors shall be to turn on all the lights and take the pressure at each lamp. There should not be more than two volts' drop at any lamp.

Switches and Cut-outs.—The contractor shall supply a good double-pole main switch sufficient for the full current, with lights all on, and a double-pole cut-out. There shall be a good, neat enclosed distributing board controlling three circuits, namely, the basement, the reception rooms and passages (2), and the bedrooms (3). It shall be placed on the wall near the foot of the stairs (first floor), where the hall widens near the library door. It shall be fitted with proper switches and cut-outs. The lights in the dining-room and those in the drawing-room shall be in sections, so that more or fewer lights may be turned on at switches placed near the door outside the rooms.

All wall sockets for table lights shall be connected to one only of these circuits. In the basement, servants' apartments and bedrooms each light shall have a separate switch with a cut-out in its base. In other places each electrolier and bracket shall have a switch and cut-out. All these switches and cut-outs shall be properly fixed to proper bases and properly connected to the conductors. All electroliers, brackets and suspended lamps shall be properly wired with flexible wire of the best quality. They shall be properly put up and connected. All points shall be fitted with best bayonet sockets. The estimate provides for plain best fittings of every kind. The proprietor will be at liberty to substitute other fittings on giving due notice, and he shall pay the difference between the list price of plain fittings and that of the fancy fittings increased or diminished as shown in the schedule hereto.

(Here should follow a list of the rooms in the house, with a detailed instruction as to the number of lights suspended, brackets, and electroliers, shades and lamps for each room, with references to catalogues from which they have been selected. It should also give the positions of lights, wall sockets, table lamps, &c.)

The contractor shall communicate with the electric supply company to test the installation, to connect with their main, and to put in the meter. He shall also fill up the certificate for the fire insurance company, and he shall satisfy the company in every particular.

Estimate.

Basement - - - -	10 lights.
Ground floor - - -	30 „
First floor - - - -	25 „
Second floor - - -	10 „
Third floor - - - -	6 „
Total - - -	81 lights.

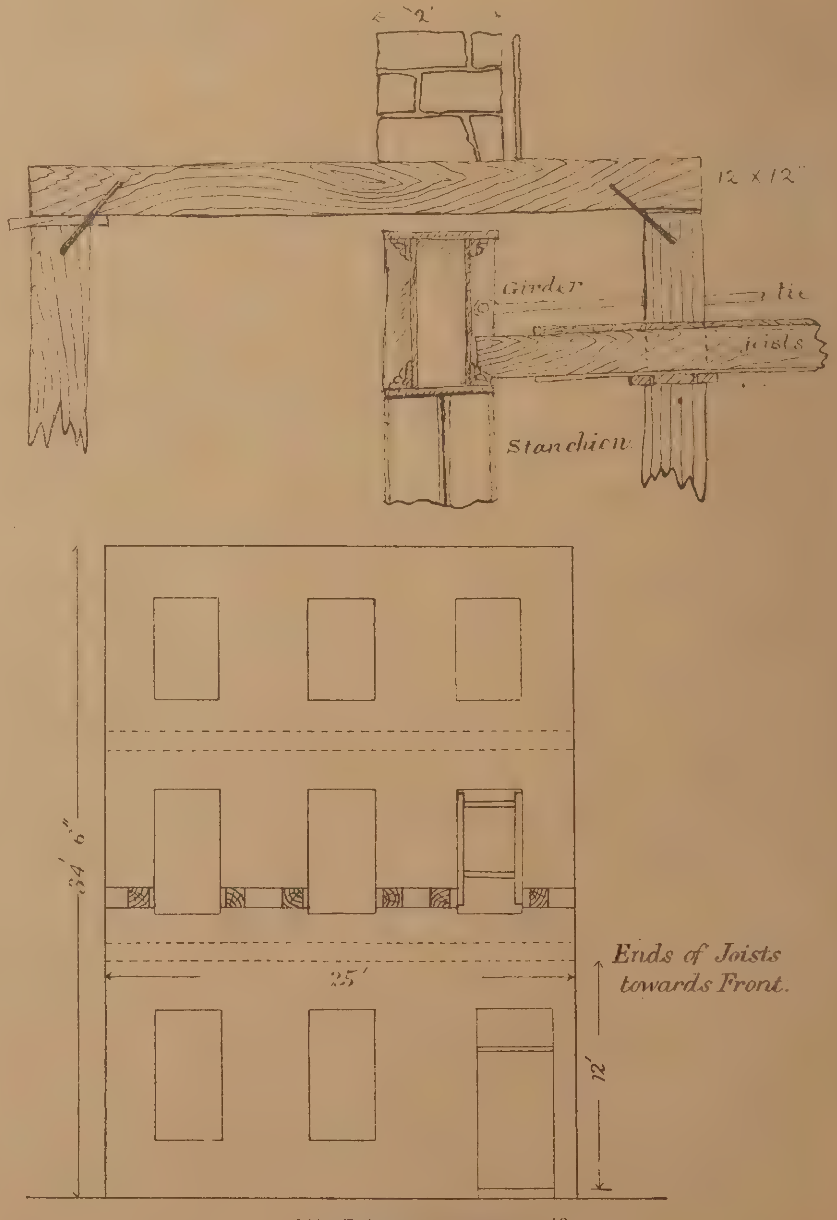
Wiring, switches, sockets, bases, roses, suspended lights, plain brackets, will average for such a house 15s. a point:—

	£	s.	d.
Eighty-one at 15*s.* - -	60	15	0
Electrolier, breakfast-room -	5	0	0
Library - - - -	5	0	0
Drawing-room - - -	20	0	0
Four brackets at £3 each -	12	0	0
Shades - - - -	5	0	0
First set of lamps - -	5	0	0
Total - - -	£112	15	0

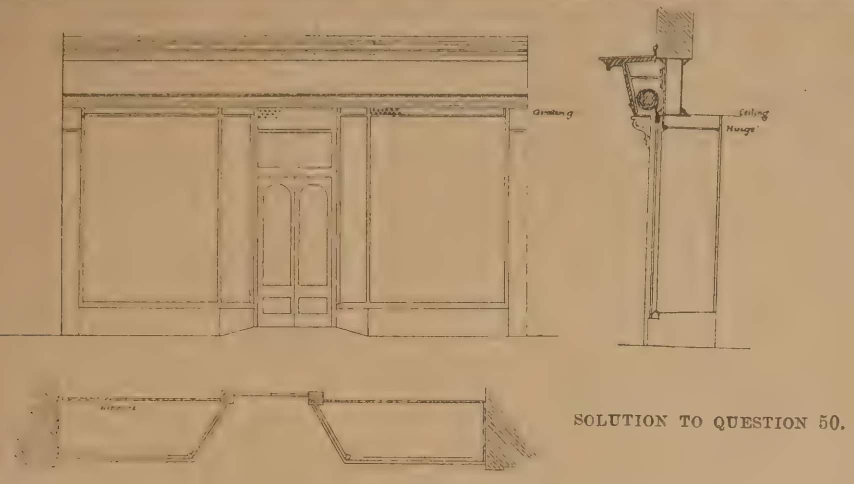
To this must be added the company's charge for putting in the service.

(Note.—A specification in answer to a question of this kind cannot be minutely detailed, but the answer should show that the student knows what he is talking about. We have given a very different answer to that which we should give if the question were set in a paper on Electrical Engineering.)

49. *Show by sketches and explain fully how you would alter the dwelling-house shown to a shop, so far as removing as much of the lower part of the wall as necessary and putting in and supporting the beam is concerned. The wall is*



SOLUTIONS TO QUESTION 49.



SOLUTION TO QUESTION 50.

rubble masonry, there are shops both sides, and the owner desires to have the opening as wide as possible, both to be in the centre.

(See accompanying illustrations.)

The first thing is to make a reasonable rough estimate of the weight, above the level of the first floor: 25ft. × 22ft. × 2ft. − (3 × 3ft. 6in. × 6ft. 6in. + 3 × 3ft. 6in. × 5ft. 6in.) × 2ft. = 848 cub. ft. of rubble masonry at, say, 15 cub. ft. to the ton; say, 60 tons; add for roof, allowing for wind, say, 5 tons: total, 66 tons. Floors are to be supported independently of walls during change, but their weight and probable loads must be provided for in designing the girder and its supports. The wall will be carried on needles resting on dead shores. If six needles are used we must provide them able to carry slightly more than 11 tons each, and we must place them where the wall may safely deliver this pressure to them. Shore all floors from the ground up, using 9in. by 3in. planks, placing these flat on floors and ceilings, with uprights to fit between, and keeping a convenient distance from the front wall. Strut all windows, putting uprights against reveals and driving horizontal struts tightly between—4½in. by 3in. pieces will probably be found heavy enough for this work.

Pieces of pitch-pine (or other fir timber) logs 12in. by 12in. will serve for needles and dead shores. If each needle is to carry 11 tons, each dead shore will have less than this. Care is to be taken that its connection with the ground shall be sufficient and safe. The place should not be encumbered with too much timber. It may be found convenient to place the inner dead shores so that their heads will reach the plank which is pressed against the ceiling at points between pairs of joists. Holes should be cut in the flooring over these, and blocks put in (if thought necessary the plaster may be also cut away), reaching, say, 2ft. above the floor level, to carry the inner ends of the needles. The outside dead shores are put up with their tops at the proper level, and stayed. Holes are now cut for the needles which are put in in succession, care being taken to see that the masonry bears properly on the needle, if necessary making it to fit with spauls and cement mortar. The full pressure is put on the needle by wedging, the wedges made fast by spiking, and dogs driven between needles and shores. There should be two needles under each pier between windows, and one under each outside pier. Everything being now thoroughly examined and found to be safe, the masonry may be cleared away from below.

By encroaching upwards a little on the first-floor windows, room could be found for a girder 3ft. deep resting on sufficient bearings at each end, so that the whole frontage will be available without any intermediate pillar. The end pillars or stanchions should each be able to carry a load of 50 tons. They should rest on good wide bed-plates to distribute the weight, and these should be bedded on blocks of concrete of sufficient bearing-area. As there are shops on both sides, care should be taken to tie the ends of the girder back to the party walls, as otherwise there may be insufficient tying; the former stability of the adjoining premises may have been owing in part to the masonry now being removed. The masonry may now be made good between the girder (which I take to have been provided of the proper section to carry, say, 100 tons on a 23ft. span, and hoisted to its place resting on the stanchions, having the bottom of its lower flange nearly in line with the ceiling, so as to give as wide an opening in every way as circumstances will allow) and the wall; the needles may be taken out in succession, and the needle-holes properly made good. The flooring joists must be properly trimmed, defective ends properly spliced, and the whole housed on to a bearer properly attached to the girder. The shoring may now be removed, and the place cleared of timbers.

50. *Draw to the scale of $\frac{1}{48}$th an elevation of a jeweller's shop front for shop as in the previous question; draw a vertical section showing roller shutter, and a horizontal section showing door, pillars, outside plate glass and the glass enclosure of the window on the inside. Explain how you would prevent internal moisture obscuring the glass.*

(See accompanying illustrations.)

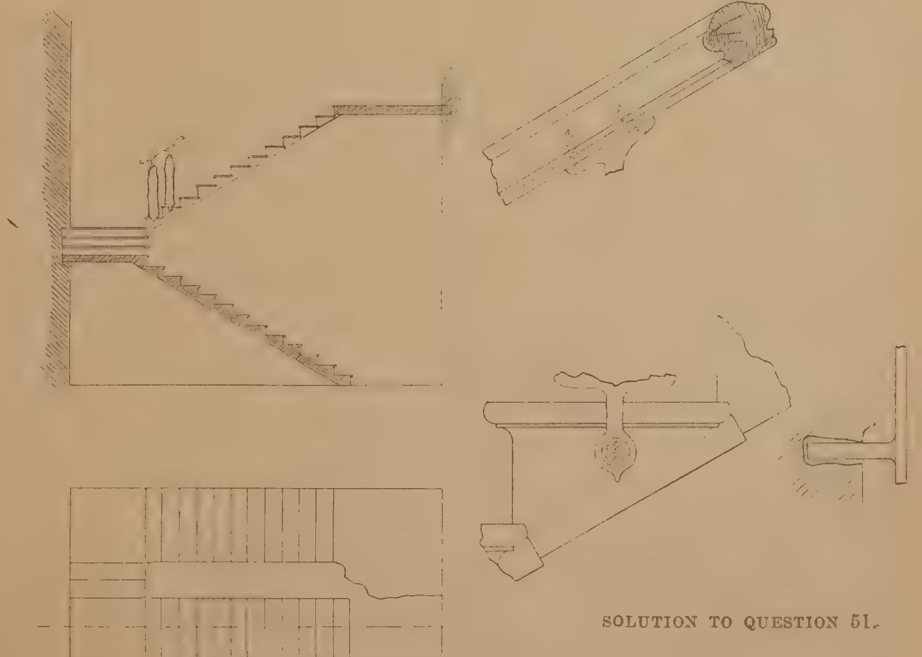
In regard to condensation trouble in enclosed windows, ventilation is a remedy. Where electric light is used, there should be little trouble of this kind. Gas in burning gives off a good deal of steam, forming a warm moist atmosphere. The inside doors are opened from time to time to take out and replace goods; the moist air of the shop enters and deposits its moisture on the cool glass, and the place tends to become a "trap" for moisture. In ventilating it is necessary to have regard to dust: owing to rapid variations of pressure during puffs of wind, much dust may enter a grating which can hardly be made fine enough to stop dust. Some loose layers of cotton wool or slag wool may be used behind the grating in a proper receptacle, and this should be so arranged that the "wool" may be taken out and renewed occasionally.

51. *In a rectangular stairway 20ft. by 10ft. place a good stone staircase, steps 4ft. long; height from floor to top of top landing 15ft. Draw plan and vertical section (scale $\frac{1}{48}$) through one flight, showing elevation of ends of steps of second flight, show at least 2 balusters. Draw, to $\frac{1}{4}$ scale, section of handrail; show details of fastening of balusters both to steps and handrail.*

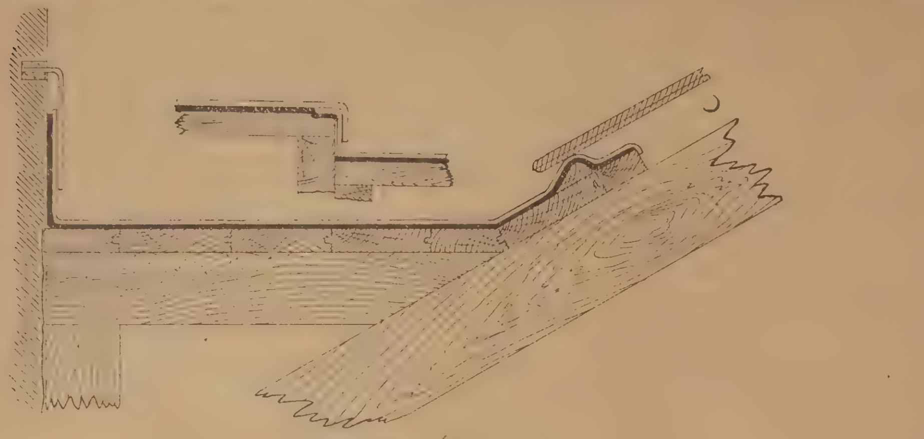
(See accompanying illustrations.)

52. *The sketches* (not reproduced) *show cross-section through a workhouse dining-hall, and broken plan. The lead gutters at* A *are defective and are to be removed; any defective rafters are to be spliced. Explain how you would direct new gutters of a proper kind to be put in. Give working drawings and sketches, and provide for a complete and workmanlike job.*

The whole of the slates from the gutter to the ridge shall be carefully taken off and put aside for the re-slating. The old battens shall be taken off (the ridge and hip tiling being, of course, removed for this side), and all defective rafters shall be made good by removing the defective parts and by side splicing at the purlin. All other defective woodwork—wall-plates, bearing pieces of every kind, hip rafters, &c.—shall be thoroughly made good. Everything being thus made good in accordance with the original design of the roof, a bearer shall be fitted to the bottom end of each rafter for a proper lead gutter. The new gutter shall fall from the centre both ways; it shall have a roll in the centre; there shall be four steps on each side of the centre roll, counting the drop over the hip as a step; the lengths of straight gutter shall be equal, and they shall have a fall to the step of about 2in. The bearers shall be sheeted with 1¼in. tongued and grooved flooring well and carefully laid, and this boarding shall be carried at least 9in. up the rafters, having its upper edge horizontal, being eased in thickness as may be necessary at the steps. The wall along the sheeting shall be well cleaned and picked out, and it shall be made smooth and good with cement plaster up to the bottom edge of the raglet, which has been cut for the cover flashing. A light tilting fillet shall be nailed on to the edge of the sheeting. If necessary, the slates from the bottom ends of the hips to the eaves shall be taken off and re-slated with proper wide soakers, properly turned up for cover flashing. The raglet mentioned above shall be cut for the whole length of the roof at the proper height, it shall be cut of sufficient depth, and the opening shall be made regular by making up with cement mortar. The whole of the sheeting shall now be covered with good heavy roofing felt, and this felt shall rise



SOLUTION TO QUESTION 51.



SOLUTION TO QUESTION 52.

also for 6in. up on the wall. The gutter shall now be laid in 8lb. lead well and accurately dressed everywhere, it shall be turned over the tilting fillet, and it shall not be nailed anywhere. The cover flashing shall be of 5lb. lead: it shall be in 3ft. lengths with 4in. laps and having the hidden edge turned up, and then laid nearly flat.

Views & Reviews.

Bricklaying.

This little book of eighty pages, by Mr. Owen B. Maginnis, of New York, is, as might be expected, decidedly American in its character, both as regards the practice, the descriptions, and also its introduction and announcement of contents, for we read "the whole making an invaluable book of reference for architects, engineers, contractors, builders and mechanics." However, we will not quarrel with the author's evident appreciation of his own work. Altogether the book is useful to those who have no (or slight) knowledge of bricklaying. We have already lost much by the decease of the old apprenticeship system, but to expect to create good bricklayers from a cursory reading of a book is absurd. There are, of course, a few useful hints to be obtained from this book; but it is a pity that these are overweighted with descriptions and illustrations of tools, and the way to lay a brick—information that can best and almost only be acquired from example and personal instruction. The book is divided into two parts, the first dealing with bricklaying, and the second with shoring, needling, underpinning and sheet piling. The illustrations are often very roughly done.

"Bricklaying." By Owen B. Maginnis. Price 2dols. Published by the Author at 810, West 128th Street, New York City, U.S.A.

Gasfitting.

For many years past we have been overwhelmed with books upon subjects one would have thought hardly needed to be taught other than by word of mouth and example, or dealing at great length with subjects that it would not have been imagined there was so much to write about. The book now under review falls into the latter category; here description follows description *ad nauseam* with regard to work that any gasfitter of any practice in his trade, and with a knowledge of its principles, would have no hesitation whatever about doing. Then there are long descriptions accompanied by illustrations of the various tools used in gasfitting, information which almost every person connected with the trade—and often not—knows. When technical processes are described, they are always involved and verbose, whereas by seeing them done they are better understood, and in a much shorter time, than by the written description. Thus the book describes the cutting and drilling of pipes, &c., with pages of letterpress, when the thing could be shown in ten minutes and remembered always afterwards. The author seems to have taken every kind and example of work he is acquainted with in gasfitting, and described its fixing and manipulation from its foundation upwards, so that the elementary processes are gone through over and over again, in regard even to alternate forms of the same thing. We have no hesitation in saying that the book could have been condensed into a quarter of its present size, and that with advantage as regards clearness and usefulness. The book, it appears, is the outcome of a series of articles contributed to a trade paper, and this may account for its verbosity. The illustrations in the book are not good, being often too small, badly drawn, and in some cases obscure. Notwithstanding the size of the book, we think a chapter on the chemistry and physics of gases, their flow, and action on pipes and the materials they are composed of, should have been given.

"A Handbook of Practical Gasfitting." By Walter Grafton, F.C.S. 5s. nett. London: B. T. Batsford, 94, High Holborn, W.C.

Roof Framing.

This book, by Mr. Owen B. Maginnis, a Yankee architect, will be found of considerable use to architects, as it gives very clearly the methods of laying out and framing roofs adapted to modern construction. The book illustrates and deals with a number of roofs of fanciful shapes, such as hexagonal, conical, octagonal, circular &c., which are often designed, but not a word of warning is uttered as to the reprehensibility of the practice, which leads to weakness, waste of material, and difficult and laborious workmanship. A chapter or more might also have with advantage been added upon graphic methods of calculating stresses in roof trusses, and the consequent method of designing the sizes of the timbers required.

"Roof Framing made Easy." By Owen B. Maginnis. Price 1dol. Published by the Author at New York.

Municipal Engineering.

We welcome this small booklet, of about twenty-five pages, describing how to become a municipal engineer. Such a work has been needed for some time, and similar ones dealing with other professions—such as architecture, civil engineering, sanitary engineering, surveying, electrical and mechanical engineering, &c.—would be extremely useful. The author has very well performed his task, and offers many useful hints to persons intending to take up municipal engineering, and his remarks are worthy of careful attention. The book, too, is published at a price which places it easily within the reach of everyone. In addition to the advice, there are also given questions set at one of the recent examinations of the Association of Municipal and County Engineers.

"How to Become a Municipal Engineer." By J. Freebairn Stow. Price 1s. nett. London: The St. Bride's Press, Ltd., 24, Bride Lane, Fleet Street, E.C.

New Offices for the Perth Parish Council have been taken in York Place, and are being renovated and reconstructed from plans by Mr. Marshall, architect, of New Scott Street. The following tradesmen have been appointed to execute the work: Mason, Mr. William Tait, Errol; joiners, Messrs. Peter Johnston & Son, Perth; plumber, Mr. Peter Duthie, Perth; slater, Messrs. James Buchan & Son, Perth; plasterer, Mr. John Sharp, Perth; glazier, Mr. Charles Alexander, Perth.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Right of User.

LLANGOLLEN.—ANCIENT writes: "On certain property of mine there was an old ashpit into which twelve cottages threw their ashes. Twenty years ago I roofed and slated this empty space, and have since kept it in repair. Can the tenants of cottages 3, 4 and 5 (plan not reproduced)—which cottages are the only ones not belonging to me—claim part use of it now? Before I cut a door-opening in it there was no means of entering at all."

The rights of the owners of 3, 4 and 5 to use the ashpit were extinguished by the pit being closed, especially as the closing has been acquiesced in for so many years. The owners of 3, 4 and 5 have, consequently, no *locus standi*, and can be prevented by injunction from cutting the door and also sued for damages.

A. O. H.

Sketching around Glasgow.

CARDIFF.—SKETCHER writes: "I propose to spend a month at Glasgow this summer, with a bicycle, for the purpose of sketching and measuring. Kindly name the chief places of architectural interest in, and within a thirty mile radius of, Glasgow."

The district around Glasgow is, architecturally speaking, somewhat barren. In the city itself the principal object of interest is the Cathedral, which is a somewhat severe example of thirteenth-century work (founded 1197), with additions of the fifteenth century. There is some elaborate stonework decoration in the crypt, and the interior is richly decorated. Though designed on a cruciform plan, the transepts were never completed. Of modern buildings the most important are the University, by Sir G. G. Scott, and the Municipal Buildings by William Young. Dumbarton Castle is within the suggested radius, and there are also at Dumbarton a tenement bearing the date of 1623 which has some good sculptured enrichment, and the fifteenth-century Collegiate Church of St. Patrick. The Abbey Church of SS. James, Milburga and Mirin at Paisley is another thirteenth-century building, and contains a series of four sedila and a piscina of fourteenth-century date. Edinburgh, with Holyrood and Rosslyn, are both beyond the radius named, but ought to be visited if possible. In the BUILDERS' JOURNAL for the following dates a series of articles appeared on "An old Glasgow Architect on Some Older Ones," which, dealing with the chief buildings in and around the city, will be of interest to querist: July 23rd and 30th, August 6th, 13th, 20th and 27th, September 3rd and 10th; all of 1895.

G. A. T. M.

Widening Masonry Road Bridge.

GLASGOW.—F. H. writes: "I am studying how to widen a bridge 8ft. on each side. The bridge is a masonry one, having one 65ft. span, 35ft. between parapets. I can only think of the scheme I enclose (not reproduced), *i.e.*, by steel cantilevers at about 35ft. centres. I do not like the cross girder, because it cuts up the roadway for pipes and conduits. Can you suggest any other method of anchoring the cantilevers? Also, how can I calculate the overturning moment?"

If the bridge has been properly designed in the first instance, there will not be sufficient margin of strength to allow it to be widened upon the same arch and foundations, apart from the unsightliness such an alteration would cause. Cantilevers have also the objection of greatly increasing the stress over the average at the face of the arch, and of concentrating the load at certain points upon an arch designed for a uniform load. It is a matter that cannot be settled by a small sketch, as the present construction of the bridge will want careful consideration. HENRY ADAMS.

Stone for Nave Pillars.

NORWICH.—FOUR YEARS A READER writes: "Several of the stones of the plain octagonal pillars of the nave of a church are cracked badly, owing to the unequal settlement caused by interments, the stone, apparently Totternhoe, being of insufficient strength. Can you recommend a fine white stone, of great strength, with which to replace the pillars? Its appearance must harmonise with the Totternhoe."

You will have to pick the quarry to match samples of the stone, which so varies that it is impossible for us to say offhand what stone would exactly suit. Totternhoe is an argillacious limestone, and another limestone should therefore be chosen. We think that you will most probably find what you want at the Wardour quarries. If you could find a bed of the right colour and texture at the Portland quarries (the white stone, not the brown Portland), it would be excellent as regards hardness.

Relative Costs of Concrete Paving.

NORWICH.—FOUR YEARS A READER writes: "What is the relative difference in cost between finishing concrete paving with granite chips and Portland cement 3 to 1, and ordinary sand and cement 3 to 1, about 1in. or 2in. thick?"

The paving we presume you mean to be laid *in situ*. One inch would not be thick enough, 1½in. being the least advisable, and that only on a very good foundation. Paving made with granite chippings in the proportion you name, 2in. thick, would run about 6d. per ft. super., and that of sand and cement about 4½d. per ft. super.

Right of Light.

BANGOR.—W. G. W. writes: "Kindly state whether the owner of the lock-up shop B at the corner of a street (sketch not reproduced) can erect a screen or otherwise obstruct the light of the side window recently erected on A.'s adjoining premises. The local authorities decline to allow B. to bring out the frontage more if he erects new premises on the site. Therefore A. claims that no one can obstruct the light now enjoyed. The old window on A.'s premises was erected about twenty-five years ago, but the new one only last year."

If the land at D belongs to B., he would be within his rights in erecting a staging upon it so as to obstruct the light to the new window, but not if this land be a part of the main road, and therefore public property. Had the new window occupied the exact position of the old window, it could not have been interfered with, but by changing its position the right of light previously enjoyed has been abandoned. That it would be ungracious for B. to obstruct the window, under the circumstances, is another matter. Probably, if the land at D be his, he would accept a small rent for the privilege of outlook. G. A. T. M.

Setting-Up Perspectives.

MARKET HARBOROUGH.—PERPLEXED writes: "I am setting up a perspective, and find that one of the V.Ps. strike the picture plane within the building (sketch not reproduced). Would this give a distorted picture? I wish to reduce from ¼in. scale plan to $\frac{3}{16}$in., and the line of height is taken where the building cuts the picture plane. Will the new line of height be found by vanishing on to the new picture plane?"

It is by no means uncommon for one of the vanishing points to occur within the limits of the picture, especially in what is known as "parallel perspective" and interior views. No distortion results. The line of height would be in the position indicated. G. A. T. M.

Government Appointments.

LONDON, N.W.—P. H. writes. "I desire to obtain the position of architect and surveyor in one of the Government offices, and should be glad if you could give me any hints. Are there any examinations held, and are berths publicly advertised?"

See reply under heading "Assistant-Surveyors, Civil Service" on p. 380 of last week's issue.

Occupying Newly-Built House.

WATFORD.—NEW SUBSCRIBER writes: "I am having a small house built, and should be glad to know how soon after completion it is safe to occupy it. It has been built—so far as the walls and roof are concerned—during the recent drought, and at present seems very dry. The plastering is not yet done."

Having been built during the dry season, it would be safe to occupy the house about a month after completion.

Formulæ for Strength of Beams.

STRESSES AND STRAINS writes: "Kindly give a set of formulæ for tranverse strength of beams, and also state whether the formulæ below are correct:—

(1) Cantilever, weight at end.

$$\text{Breaking weight} = \frac{\frac{1}{4} \times A \times D^2 \times S}{L}$$

(2) Cantilever, weight uniform.

$$\text{Breaking weight} = \frac{\frac{1}{2} \times A \times D^2 \times S}{L}$$

(3) Supported both ends, weight in middle.

$$\text{Breaking weight} = \frac{A \times D^2 \times S}{L}$$

(4) Supported both ends, weight uniform.

$$\text{Breaking weight} = \frac{2 \times A \times D^2 \times S}{L}$$

(5) Supported at both ends, weight acting at a point *not* in centre.

$$\text{Breaking weight} = \frac{M \times N}{L} \times \frac{A \times D^2 \times S}{1}$$

L = length in feet: W = breaking weight in cwts.: A = breadth in inches: D = depth in inches: S = constant: M and N distance of weight from ends of beam."

The formula usually used for the calculation of the transverse strength of beams is derived from those for the moment of resistance and the moment of the load, which are required to be equal.

The moment of resistance $M^r = \frac{FI}{\delta}$, where F = tensile or compressive stress per unit of area (lbs. or tons. per sq. in.) and δ = distance of extreme fibres from neutral axis, and I = moment of inertia.

The moment of the load M_1 = *for beams fixed at one end*, load at end, WL, and for load uniformly distributed $\frac{WL}{2}$;

or *for beams supported at both ends*, load in middle, $\frac{WL}{4}$; load uniformly distributed, $\frac{WL}{8}$; and load at any other point, $\frac{Wmn.}{L}$

Here the letters signify: L, length of beam; m and n, length of parts into which it is divided; W, load.

Putting these formulæ equal, we have the transverse strength of a beam of any section to resist fracture. Thus, suppose the load is required for a beam of rectangular section, supported at the ends and loaded in middle. Then

$$\frac{WL}{4} = \frac{FI}{\delta}$$

$$\text{or } W = \frac{4FI}{L\delta}$$

Now the moment of inertia, for a square or rectangule strained in the direction of a side is $\frac{bd^3}{12}$, where b = breadth, d = depth.

Making $d = 2\delta$ we have

$$W = \frac{4Fbd^2}{6L}$$

b, d, and L being in the same terms.

These formulæ, however, often lead to erroneous results, unless applied with care and knowledge, and querist should therefore read up the subject carefully, which can best be done from Rankine and Hurst, the latter giving a useful digest of the formulæ and methods of application, and Rankine the theory.

With regard to the formulæ given by our correspondent, 1 to 4 are correct. The fifth should be

$$\text{Breaking weight} = \frac{L \times A \times D^2 \times S}{4 \times M \times N.}$$

Books to Study for R.I.B.A. Preliminary Examination.

PORTMADOC.—T. S. R. writes: "Kindly give the names, publishers and prices of the best books to study for the preliminary examination of the R.I.B.A. in the following subjects: History, French, Elementary Mechanics, Physics and Euclid."

Ransome's "Short History of England" (Longmans, Green & Co.); Macmillan's Progressive French Course (first year 1s., and second year 2s., Macmillan & Co.); Stewart's "Lessons in Elementary Physics" (4s. 6d., Macmillan & Co.); Briggs' and Bryan's "Elementary Text-Book of Mechanics" (3s. 6d., W. B. Clive, 13, Booksellers' Row, Strand, W.C.); Hall & Stevens' "Euclid" (4s. 6d., Macmillan & Co.).

Examinations for Municipal Engineers.

SHEFFIELD.—STUDENT writes: "What are the subjects of examination for the associateship of the Municipal and County Engineers' Association, and what books would be most suitable for studying; and, also, where must I apply for forms and particulars of the examinations?"

The address of the Secretary of the Association of Municipal and County Engineers is 11, Victoria Street, Westminster, S.W. We would advise you to get a small book by Mr. J. Freebairn Stone, entitled "How to become a Municipal Engineer" (published by the St. Bride's Press, Ltd., at 24, Bride Lane, E.C., price 1s. nett), which will give you all information with regard to study and books.

Openings for Architects in Australia.

E. J. P. writes: "What is the address of the Emigration Office? I wish to know whether there are any vacancies in architects' offices in Australia."

The address of the Emigrants' Information Office is 31, Broadway, Westminster, S.W. The openings for assistants in Australia are much the same as here, that is, there is plenty of scope for good men—those who are able and willing.

Paper and Pens for Perspective.

WELLINGTON.—PERSPECTIVE writes: "What is the best paper to use for perspectives, so that when illustrated the lines come out distinct: and what pen is most suitable for this work?"

A hard smooth paper should be used. Bristol board is the best, but the drawing-papers known as Joynson's or Arnold's take line and wash well. A rough paper causes too many reflected lights from the angles of its surface. A pen should be chosen by the user to suit himself. Too fine a pen, such as a mapping pen, is apt to cramp the hand and produce a niggling style. Fine and broad pens, goose quills, and even a sharpened stick are used, according to the quality of line that may be required. It is important to remember that every line will reproduce of the same value, and the gradations will therefore come only from the varying thicknesses of the lines.

Trade and Craft.

Measures Brothers, Ltd.

As makers of British steel joists of all descriptions Messrs. Measures Brothers, Ltd., have long enjoyed a high reputation; and by reason of the enormous expansion of their business during the last few years they have found it imperative to erect new and commodious premises on their own freehold property in Southwark Street, S.E. The firm keep a stock of at least 12,000 tons of joists ready for immediate delivery, which testifies to their resources; and their large circle of customers will be glad to know that, with the increased facilities, Messrs. Measures will be able to execute orders even more expeditiously than before.

Steel girders and joists are now being so increasingly employed in the erection of buildings and other structures, and the varieties needed by architects and engineers are becoming so numerous, that it is of incalculable advantage to be able to choose from a large stock; moreover, they are sometimes needed to be delivered most speedily, and Messrs. Measures Brothers are in a position to meet these requirements with the utmost despatch. The firm is best known for its joists, but they also have a large connection for tees, angles, channels, chequered plates, castings and sheets of every description. Those in need of such goods should consult Messrs. Measures.

Keystones.

The Old Parish Church of Merthyr Tydfil has been restored at a cost of £7,000. The tower was partially pulled down and rebuilt in order to receive a peal of bells.

Bolingbroke Hospital, Wandsworth Common, S.W., is being extended by the addition of a new outpatients' wing as a memorial to the late Queen. The new department is the first part of a hospital, with 150 beds, to cost £60,000.

The New Church of St. Columb, in Lancaster Road, North Kensington, has been opened. The site of the new church cost £2,000, and the building itself cost £7,000. The church is furnished with 500 chairs.

The New Church of St. Paul's, Grangetown, Cardiff, is being completed by the addition of a chancel. The portion of the church already erected has cost £4,150, and £2,500 will be required to finish the fabric according to the original plans.

Relative to the new Royal Theatre at Stockholm.—Mr. Frederick Lilljekvist, architect to the King of Sweden and attaché to the Swedish Office of Works, who has been entrusted with the arrangement and design of the new Royal Theatre at Stockholm, visited London last week to consult with Edwin O. Sachs and inspect the new stage arrangements at the Covent Garden Opera House, Mr. Sachs having been asked to report on the proposed scheme.

A New Parish Hall at Plymouth is being erected to be used as a mission church during the building of the new church of St. Simon's, which is to seat 1,000 persons, the foundation stone of which is proposed to be laid in the autumn. The parish hall will seat about 400; the contractor is Mr. Ambrose Andrews, of Plymouth, and the architect Mr. Harbottle Reed, of Exeter, who has also prepared the plans for the church.

The New West Block of the Church House, Westminster, is rapidly approaching completion, and will be finished and ready for occupation at the end of July. The principal room in the new block is the Hoare Memorial, which will be the permanent hall for the House of Laymen. It will be capable of seating between 400 and 500 persons, and will fill a long-felt want. The new portion will also contain improved accommodation for the library and twenty-three other well-lighted rooms to be used as offices for Church societies. The total cost of the work will be £22,200.

St. Martin's new Church, Heaton Norris, was consecrated recently. The church, inclusive of £900 for site, has cost nearly £6,000. The seating accommodation at present is for 420, but when the church is extended, as it is intended it shall be at some future time, it will be able to accommodate 620 worshippers. The style is Early English. The architect is Mr. R. B. Preston, of Manchester. The church as now built consists of a chancel, chapel, organ chamber, vestries, and three bays of nave and aisles, leaving three more to be completed at some future time. The principal feature of the building is the double transepts on each side, which give an air of spaciousness to the church. Generally, the church is built of local bricks and terra-cotta dressings inside and out. The roofs are of open timber. The pulpit is carved.

The Annual Report of the Architects' Benevolent Society states that, notwithstanding the amount received in subscriptions for the year was £522 0s. 6d., as compared with £469 3s. received in 1899, there was a balance at the debit of the account on December 31st of £42 11s. 11d. It is the first time in the history of the Society that such a deficiency has occurred, and it is due to the large number of urgent applications for assistance which were considered and relieved. This bears eloquent testimony to the great need of the Society for further support. It is hoped that the deficit may be promptly covered by the acquisition of a sufficient number of new annual subscribers. The number of applications for relief has been greater than in any previous year, being fifty-five. The sum thus distributed was £677 13s., while £112 10s. was paid to pensioners, making the total sum expended in relief £790 3s. Donations may be sent to the hon. treasurer, Mr. W. Hilton Nash, Bush Lane House, Cannon Street, E.C.

The New Additions to St. Thomas's Hospital were opened last week. These consist of a new ward for children and twin operating theatres side by side, which are the first instalment of the four to be there eventually.

Lynton's New Market is now complete, having been handed over to the Council by the contractors. The building, which is of local stone, with Bath-stone dressings, is lit with the electric light, and the whole is so arranged that it can be extended at any future time.

A New Vicarage for St. James' Church, Barrow, is being erected at the top of Hartington Street, and the cost will be about £2,000. Mr. E. M. Young is the architect, and the contractors are as follows: Mr. T. Brown, brickwork; Mr. Fairbairn, stonework; Mrs. Ormandy, joinery work: Mr. Ramsay, plumbing; and Mr. Walker, slating.

The Restoration of the West Front of the Bath Abbey, which has been carried out under the advice of Mr. T. G. Jackson, R.A., at a cost of about £2,000, is now completed. The more expensive work of repairing the flying buttresses, which was not originally contemplated, is still proceeding, and will, it is expected. bring the total cost to between £5,000 and £6,000.

A New Church at Ocklynge, Eastbourne, is being erected in Willingdon Road. Mr. Granville E. S. Streatfeild is the architect. The chancel, morning chapel and vestries of the church, in which accommodation will be provided for 200 people, will be first erected; with a temporary nave to accommodate 300 to 350 persons, if sufficient money is not raised to build the permanent nave. This part of the work has been put out to tender recently, and the tender of Mr. Mark Martin for £4,184 has been accepted, this price not including the cost of the temporary nave, which would be about £350.

Isolation of the National Gallery.—In reply to questions in the House of Commons, Mr. Akers-Douglas stated that the changes which would be authorised by the passage of the National Gallery (Purchase of Adjacent Land) Bill would completely isolate the National Gallery from the buildings which are adjacent to it on the west; the nearest building will be the south-east angle of a stable, which will be 35ft. from the north-west corner of the National Gallery. With this exception, the space between the buildings will be about 40ft. The barracks adjoining the National Gallery are to be pulled down at the end of the present year.

York Minster.—The Corporation of the city of York propose to remove the quaint gateway at the College Street entrance to the minster precincts. The object is said to be to effect a street improvement and to convert the minster yard into a thoroughfare for heavy traffic to the railway station. It is contended that if the proposal be carried out it will not only disturb the peace and quiet which have so long characterised the surroundings of the venerable cathedral, but that the frequent passage of heavy traffic near the walls threatens the stability of the edifice. Important repairs have been proceeding for some years, and it is believed that other portions of the fabric are in a very insecure condition. The dean and chapter have made urgent representations on the subject.

The New Bechstein Concert Hall in Wigmore Street, adjoining the show-rooms of the well-known German pianoforte manufacturers, is oblong in form, has seats on the ground floor for 480 persons, and provision for 100 more in an end balcony facing the platform. This consists of a semicircular alcove surmounted by a cupola, which is decorated with a coloured gesso bas-relief representing Art being inspired by the Ideal, the combined work of Messrs. Moira and Lynn Jenkins. As it is not intended to give orchestral concerts the platform is only large enough for the requirements of the performers of chamber music and reciters, for whom, however, it provides ample accommodation. Mr. T. E. Collcutt, the architect, has adopted the Italian Renaissance style, and the decorations consist of Numidian and red Verona marble and alabaster, relieved by judicious gilding. The ventilation is declared to secure a supply of pure air, while obviating all draughts. The acoustical properties of the hall are most satisfactory.

Memorial to Chelsea Pensioners.—The Commissioners of the Royal Hospital at Chelse have erected a monument to the memory o the 2,625 in-pensioners who were buried i Brompton Cemetery between January, 185 and July, 1893. The monument is a granit obelisk, embellished with flags and trophies i bronze.

Mr. Kitchen has been appointed to succee Mr. P. G. Smith as architect to the Loc Government Board. Mr. Kitchen is an ab young architect. and is a son of Dean Kitche of Durham Cathedral. He married a daught of Sir Walter Foster, M.P., and was appointe assistant-architect to the Local Governme Board in 1894, when Sir Walter held the offi of Parliamentary Secretary to that Depar ment.

New Board School at Stoke Newington.—Th Princess May Road Board School, in Sto Newington Road, was formally opened last wee It has a frontage to the main road. It provid accommodation in the main building for 3 boys, 304 girls and 308 infants, and there also a separate building for deficient childre The site, with the legal expenses, has co £17,000, and the building £24,000, the tot being more than £40,000.

St. Barnabas Homes.—The west wing and t administrative block of the permanent buildin of the Homes of St. Barnabas were open recently. The part of the building now co pleted will accommodate some thirty-five clerg and it is expected that it will not be long befo all the sets of rooms are occupied. Each clerg man is provided with a bedroom and sittin room. Those who are chronic invalids a accommodated in the administrative block, whe where there are a morning-room, a smoking-roo a library, and rooms for chaplain, matron, nurs and servants. A dining-room and chapel are course of erection.

Messrs. Walter J. Pearce, Ltd., of Manchest have, for the facilitation of their London a South of England business, appointed a Lond representative in the person of Mr. Leona Laskey, who, at his office, 10, Newman Stre W., will keep a stock of sample work, glass drawings, and designs; and being persona acquainted with the technical details of t stained glass business, he will be able to d with all enquiries promptly upon the spot. M Walter J. Pearce will himself, as heretofore, in London as often as occasion requires for p sonal advice and consultation, and will at times meet architects by appointment at short notice. Messrs. Walter J. Pearce, Ltd., desire particularly emphasise the fact that the colo ing and design of every order is persona supervised by Mr. Pearce, 41, Gartside Stre Manchester.

"Law relating to Factories and Workshops New Edition.—The interest shown in the sitti of the Parliamentary Committee on the n Factories Bill, and in legislation dealing w industrial questions generally, has produc many enquiries for works relating to factor and workshops. To meet the demand authoritative literature on this subject, Mess Eyre & Spottiswoode, Government Publishe East Harding Street, E.C., announce the pu cation of a new edition of Abraham & Davi "Law relating to Factories and Workshop corrected throughout, with all the latest ru and orders, and a revised list of cases.

Nottingham Architects and Competitions.—T following memorandum has been drawn up the council of the Nottingham Architectu Society for signature by members and n members practising in the district: "We, t undersigned architects, pledge ourselves not submit plans in any competition promoted the province of the Nottingham Architectu Society, unless the conditions are those publish by the Royal Institute of British Architects. in accordance with the spirit of the same." T report states that every local member of Society except one has given this pledge, a only one outside architect has declined to si though he expresses his approval with its obj The council invite architects, on hearing o competition being mooted, to at once not the hon. secretary, so that the matter m be taken up officially by the Society or by R.I.B.A.

TO OUR READERS.

e are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

here are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

cheme No. 1 is a free Accident Insurance of **£500.**

FREE.

cheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

cheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, remium, £3/-/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

Hazardous Risks, Premium, £3/10/-

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

he Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

STRAND, W.C.

New Companies.

Wallace & Davies, Ltd.

Registered June 1st to acquire the business carried on by Wallace Brothers, Ltd., at Liverpool, Birkenhead, Seacombe, Egremont, New Brighton, West Kirby, Hoylake and Tranmere, and the premises at Seacombe recently occupied by the Dee Coal Company, together with the interest of Wallace Brothers, Ltd., in the stable, No. 18, Mildred Street, Liverpool, and in the lease of the yard and buildings, No. 46, Birkett Street, Liverpool, and to carry on the business of dealers in coal, coke, firewood, briquette, building materials, iron, timber, hardware, &c. Capital £12,000 in £1 shares. The first directors are J. W. Davies, J. E. Jones and T. Jones.

Tintagel and Delabole House-Building Company, Ltd.

Registered June 4th to acquire certain freehold land in Trewarmett, Tintagel, Cornwall, to erect any houses and buildings. Capital, £3,000 in £5 shares.

Illingworth, Ingham & Co., Ltd.

Registered June 4th to acquire the business of timber importers, timber merchants and sawyers, &c., now carried on at Leeds, Manchester and Goole, all in England, and at Cincinnati, U.S.A., under the style or firm of Illingworth, Ingham & Co. Capital £200,000 in £1 shares (75,000 first preference, 75,000 second preference and 50,000 ordinary shares). The first directors are S. Ingham (chairman), W. Illingworth, H. O. Ingham and G. N. Illingworth.

Owners of Pelton Colliery, Ltd.

Registered June 4th to acquire the business of colliery proprietors carried on by the Right Hon. H. Curzon Plunket, Rear-Admiral J. H. Bainbridge, and B. J. M. Walsh, at the Pelton Colliery, Durham, and to carry on the business of manufacturers of and dealers in coke and lime, iron, brick, tile and terra-cotta merchants, &c. Capital, £300,000 in £10 shares. The first directors are the Right Hon. H. C. Plunket, Rear-Admiral J. H. Bainbridge and B. J. M. Walsh.

J. Jameson & Son, Ltd.

Registered June 6th to acquire and carry on the business of manufacturers of and dealers in firebricks, retorts, sanitary pipes, fireclay and fireclay goods now carried on by Grace P. Jameson and W. A. Jameson, at Corbridge, Northumberland, as J. Jameson & Son. Capital £14,000 in £1 shares (4,000 preference). The first directors are James A. Jameson, William H. Allan and James Todd.

Frank Crump & Co., Ltd.

Registered June 7th to commence the business of timber merchants in London and elsewhere, and to carry on the business of timber merchants, buyers and sellers of timber and wood, and the products thereof. Capital £10,000 in £1 shares. The first directors are F. Crump (managing director), W. F. Sutton and J. T. Boyes, with powers to appoint others.

Alyn Brick, Tile and Terra-Cotta Co., Ltd.

Registered June 11th to acquire any minerals, stone, clay, brick-earth, sand, silica or other substances, with or without all or part of the surface, at or near Coed Talon, Flint, or elsewhere; to acquire the business of the Gem Brick, Tile and Terra-Cotta Co. Ltd. (in liquidation); and to carry on the business of miners, brick, tile, terra-cotta and earthenware manufacturers, &c. Capital £2,000 in £1 shares. The first directors are P. Edwards, A. T. Morris, T. Smith and S. J. R. Dickson. Registered office: St. Werburgh's Chambers, Chester.

Hawton-Lane Building Co., Ltd.

Registered June 11th to acquire any lands and buildings in Nottingham or elsewhere, to develop and turn to account any land in which the company is interested, and to carry on the business of builders, contractors, brick, lime, timber and hardware merchants, farmers, financiers, &c. Capital £5,000 in £1 shares. The first directors are T. L. Nelson, C. J. E. Parker and J. G. Slater.

Haulage and Traction Co., Ltd.

Registered June 11th to acquire the business of haulier and haulage contractor now carried on by Sarah A. The National Trust. We think that Mr. Bryce, M.P., said the right thing at last week's meeting of the National Trust for Places of Historic Interest or Natural Beauty when he remarked that "what they had got to do through the Trust was, above all, to form public opinion, and the best way in which they could form public opinion was by stimulating it locally." This is attempting to get to the root of things, and consequently it has the greatest chance of success. Public opinion is generally dominated or created by one man or a particular body of men, the great majority of people, unfortunately, possessing few opinions based on their own experience; so that the object is to try to impress upon the public at large that every old building is not to be demolished or a charming landscape marred because someone wants to make capital out of the site. Moreover, what is needed is deliberate action—public opinion, though hostile to a proposed spoliation, may be too loose and indefinite to have effect : and, therefore, when a society like this Trust attempts, as it has done, to preserve Stonehenge, or to acquire the Brandlehow Park estate on Derwentwater, its efforts deserve every support. (A sum of £7,000 is required for the purchase of the Derwentwater estate, of which £2,975 has been subscribed.) They did not make much progress last year, one reason being that the acquisition of real property is always a slow affair, but still they have done good work in influencing public opinion against the evil inroads of commercialism, of which we stand in such danger at the present day.

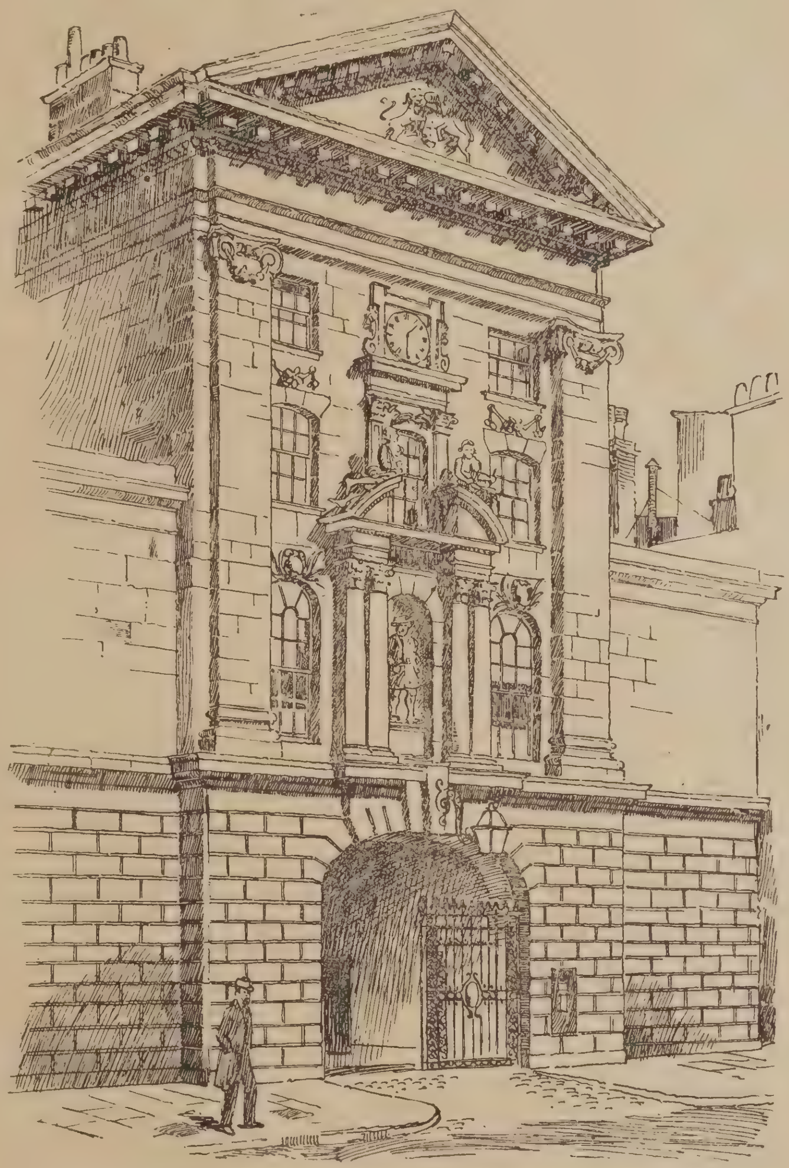
Gateway, St. Bartholomew's Hospital. This interesting portion of St. Bartholomew's Hospital forms the entrance gateway to the quad and was built by Wren, in 1702, to replace a building erected in 1546, when the hospital was refounded by Henry VIII. The original foundation was in 1102, by Rayhere, at the same time as he built St. Bartholomew's Church, on his return from a pilgrimage to Palestine.



GATEWAY OF ST. BARTHOLOMEW'S HOSPITAL. DRAWN BY H. T. REES.

The Laying-out of Estates. Much as the artistic outsider may deplore the laying-out of a familiar and secluded estate—maybe with its century-old mansion hidden among the trees—it is impossible to expect anything different as the result of city growth. But he may very justly demand that such estates should not be made into wildernesses of bricks and mortar, with villas huddled together as close as the by-laws will allow. We have a great grievance against the man who does this; the man who divides up the land into mean little plots, all—or almost all—of exactly the same size and shape. Such monotonous uniformity could only emanate from a mind of small calibre; and when on these tiny patches arise correspondingly meagre houses built (so to speak) at so much a dozen, the evil is consummated. Some abut on the pavement, while others rejoice in a strip of ground insufficient for a chicken-run. At the back is another speck of green which, because of its area, is naturally divided up by paths, with perhaps a circular flower-bed in the centre. With such methods in vogue, can one hope for anything else than what villadom now stands for? And yet there is much opportunity for improvement—which, one is glad to say, is being more extensively appreciated. It consists in varying the disposition of the plots and in allowing a reasonable air-space between each house, at the same time covering the whole available garden space with grass, perhaps with the exception of a narrow bed around the sides. An estate laid out after this manner can be made to look very pleasing. It is impossible to over-estimate the value of grass and trees as adjuncts to dwelling-houses; and though it is, of course, only possible to have comparatively little green in the area of a city, yet every effort should be made to secure that little · otherwise we shall most certainly deserve the title of a "street-born people."

Cape Town War Memorial. St. George's Cathedral, Cape Town, was the first important building erected in the Colony under the second occupation of the British, when Sir Lowry Cole was head of the Government. It is of Classic design, but is equally uninteresting as the Supreme Court Buildings or the now demolished Exchange. It is proposed to add to it transepts and an eastern end as a memorial to those who have fought and died in the South African War, a proposal which has the support of the King and Lord Roberts. Considering the animosities which have necessarily arisen over the war, one cannot but admire the reason which dictates that the memorial shall not take the form of one of victory over a conquered foe; but it is unfortunate that so inferior a building as St. George's Cathedral should be chosen as the subject of additions, which, whatever they may be, can never look harmonious, and must either form an uninteresting appendage to an uninteresting building, or be spoiled by the latter.

SOME SKETCHES OF DERBYSHIRE WORK.

By J. TARNEY.

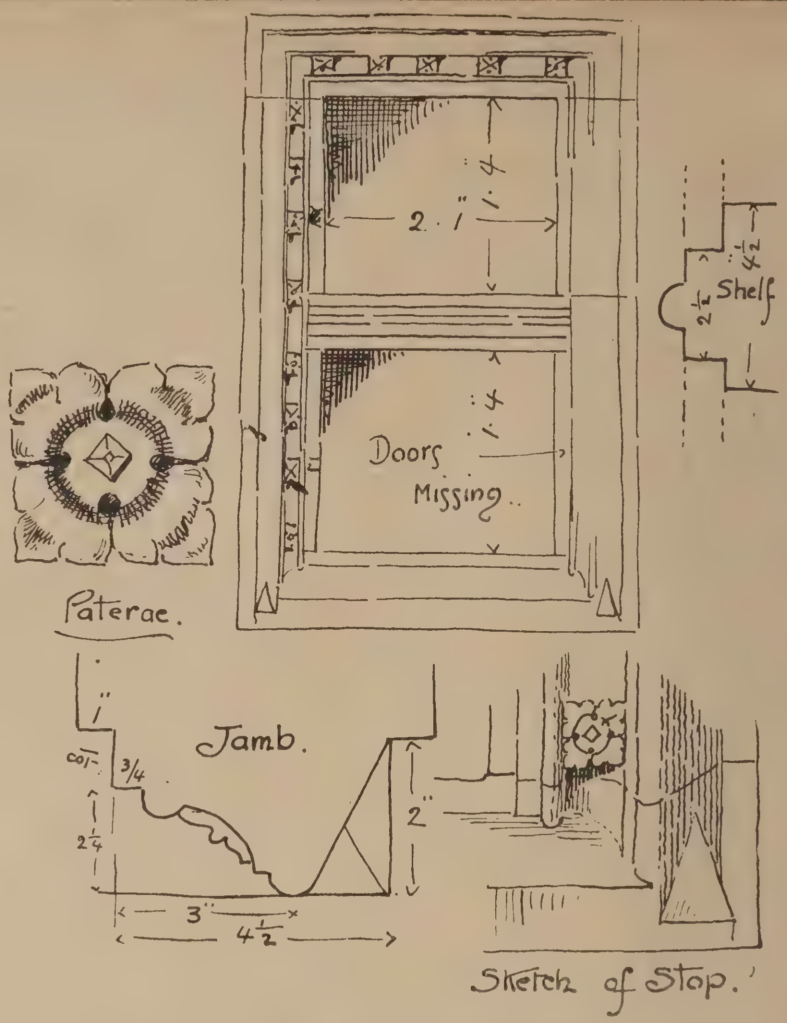
THE churches of Breadsall and Morley are both within four miles of Derby, and are exceedingly interesting. The former church is principally in the Transitional Early English to Decorated style, though it contains examples of late Norman, Early English and Decorated work, with a fine tower and spire. Near the church stands what was formerly the old Hall, of stone and half-timber, now converted to the use of the village post-office.

Morley is a small church with a Norman nave and a Decorated chancel, tower and spire, and aisles. In the latter are incorporated windows and a porch said to have been brought from Dale Abbey, which place also furnished much of the old glass and many of the floor tiles in which this church is particularly rich. There are also nine brasses to members of the Statum family, the builders of the chancel and tower, various stone effigies and monuments, four piscinæ and other details of interest. The church is very well kept.

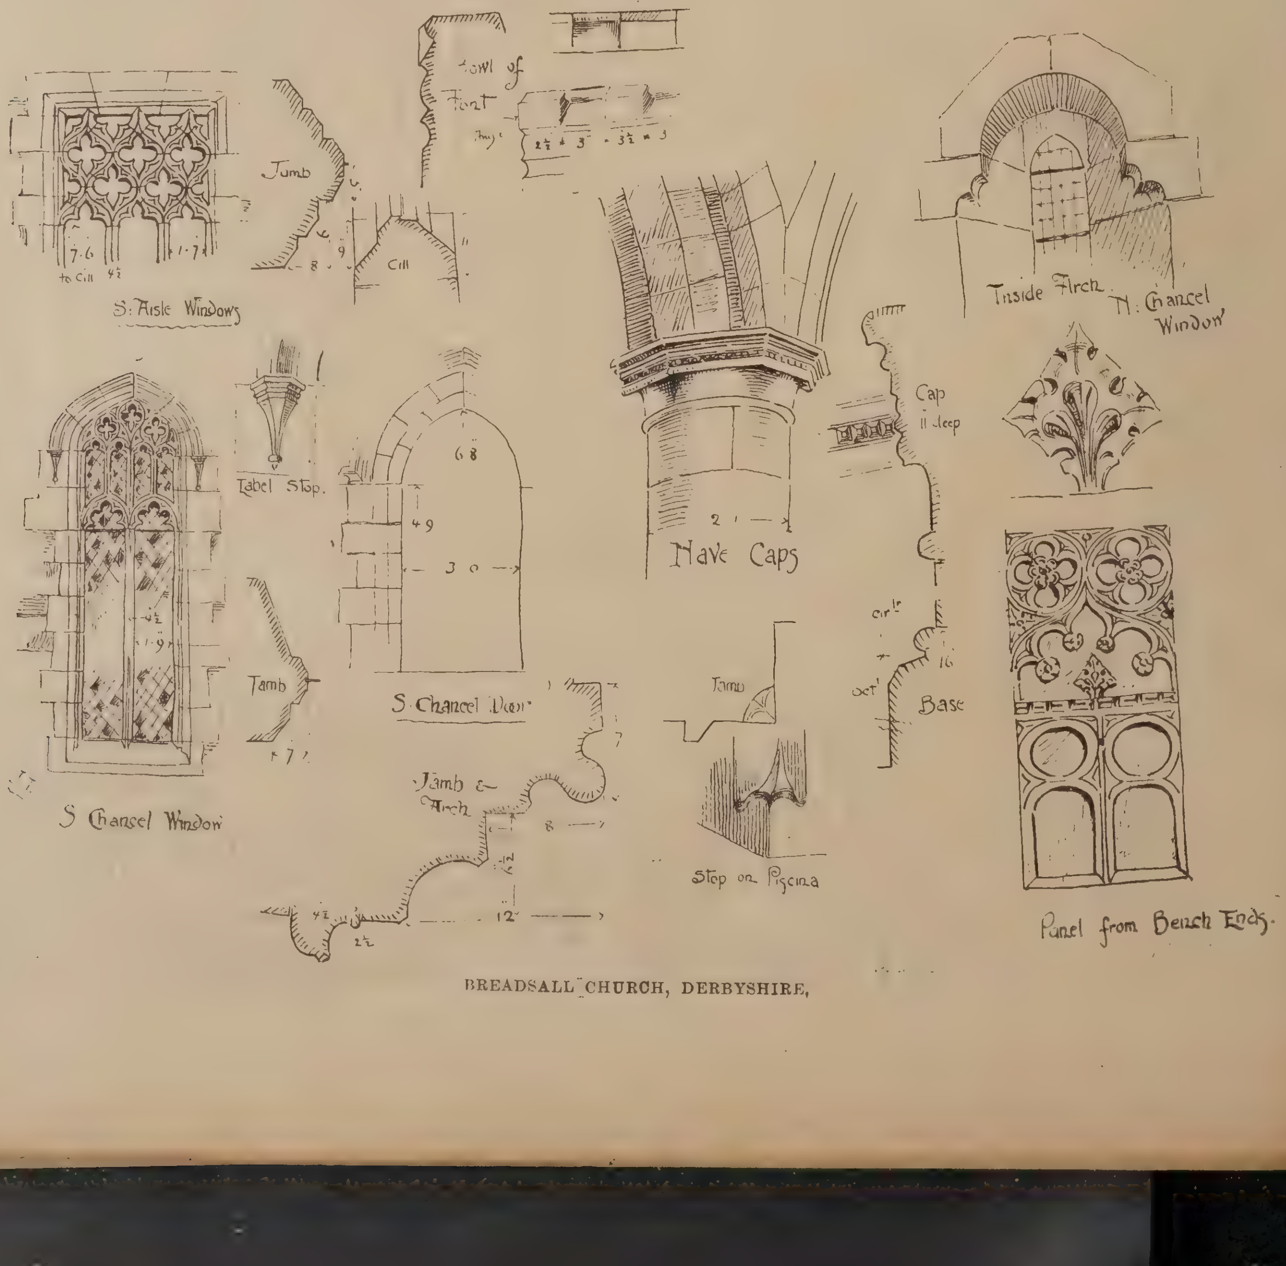
Tutbury is situated on the borders of Staffordshire and Derbyshire. The ruins of the ancient castle are very picturesquely situated on the wooded summit of the hill above the river Dove, the principal remains being a gateway and portions of the front built by John O'Gaunt, wherein Mary Queen of Scots was imprisoned.

The church, just under the castle walls, is mainly of Norman work, and rejoices in the possession of one of the finest and largest west doorways in the country, in this style; it is in a very good state of preservation. The Decorated windows illustrated are in the south aisle.

Melbourne Church, about nine miles south of Derby, is a perfect example of a cruciform church, and has the rare distinction of being almost all in the same style—the Norman. It has a central tower and two smaller west towers flanking a portico. The interior effect with the massive pillars, 4ft. in diameter, and fine stilted arches, is very impressive, especially looking



AUMBRY, BAKEWELL CHURCH.



BREADSALL CHURCH, DERBYSHIRE.

across the crossing under the tower with its triforium. Near the church is the Hall, with gardens in the Dutch style.

Rowsley, like Bakewell, is the most convenient place from which to visit Haddon Hall and Chatsworth. In the village is the many-gabled and noted "Peacock Inn"—a favourite resort of anglers—and many picturesque cottages built in the same substantial style.

SITE VALUES.

Report of the Local Taxation Commission.

THE Local Taxation Commission's report on the rating of site values marks a new stage in the long, and so far inconclusive, controversy that has centred round this question.

Who is the owner of a site value? Mr. Fletcher Moulton contends that it is the man who holds the title deeds of the land and the builder, or his representative, and he would get at them by substituting for the present system of rates a dual system with a rate or tax proportioned to the ground value only, and charged upon owners of ground value, leaving a rate on building value to be charged upon occupiers. Mr. Moulton is, in fact, the exponent of the prevailing view that the rating of site values is in the main an affair between the occupier and the landowner. Mr. Harper, an official of the London County Council, defined site value as "the annual rent which, at the time of valuation, might reasonably be obtained for the land as a cleared site, if let for building by an owner in fee, subject to equitable reduction in exceptional cases in which the full site value thus defined is not being enjoyed or obtained by any person or persons." Here, then, are two views which, while they agree as to the nature of site value, are in conflict as to the owner.

The report discusses the two doctrines in the light of a typical instance :—

		£
1830	A let land to B for - - -	15
	B built a house and let it to C for	75
1870	C sublet to D for - - -	100
1899	D sublet to E for - - -	120
	Site value - - -	60
	Structural value - -	60
	Ratable value - - -	120

Mr. Fletcher Moulton looks at the question rather from a legal point of view, and pays special regard to the security of the interest. Consequently he holds that A enjoys site value to the extent of £15 a year, and B to the extent of £45. The remaining £15 nett received by B, and the nett receipts of C (£25) and of D (£20), he attributes to the bricks and mortar, or the structural value.

Mr. Harper, from a more strictly economic point of view, attempts to eliminate from each rent the elements which represent, as a matter of fact, the return due to the builder's capital and labour, and calls the residue the site value. Thus he agrees with Mr. Moulton that A enjoys site value to the extent of £15 (the original value of the land), but he holds that B's nett receipt of £60 is simply the return due on the building, and that the remaining £45 of site value has got into the hands of C and D, because the increment of value of a property, apart from new building, must be attributed to the site.

Those who wish to familiarise themselves with the standpoint finally adopted by the Commissioners will find it useful to give this passage their attention. It sets out clearly the dividing line between the two schools of thought; and though certain practical considerations deter the Commissioners from accepting the Harper plan, yet the Harper principle that site value runs up and down from cellar to attic, and from landowner to the last lessee, clears the ground for the ultimate analysis.

A New Chapel at Papplewick is being erected by the New Methodists Connexion. The materials are red and blue bricks with stone dressings. The architects are Messrs. J. & C. Swift. Mr. Ingham, of Basford, is the builder. The fabric is estimated to cost £400, and the furniture £200.

BREADSALL CHURCH, DERBYSHIRE.

CITIES OF TO-DAY.*

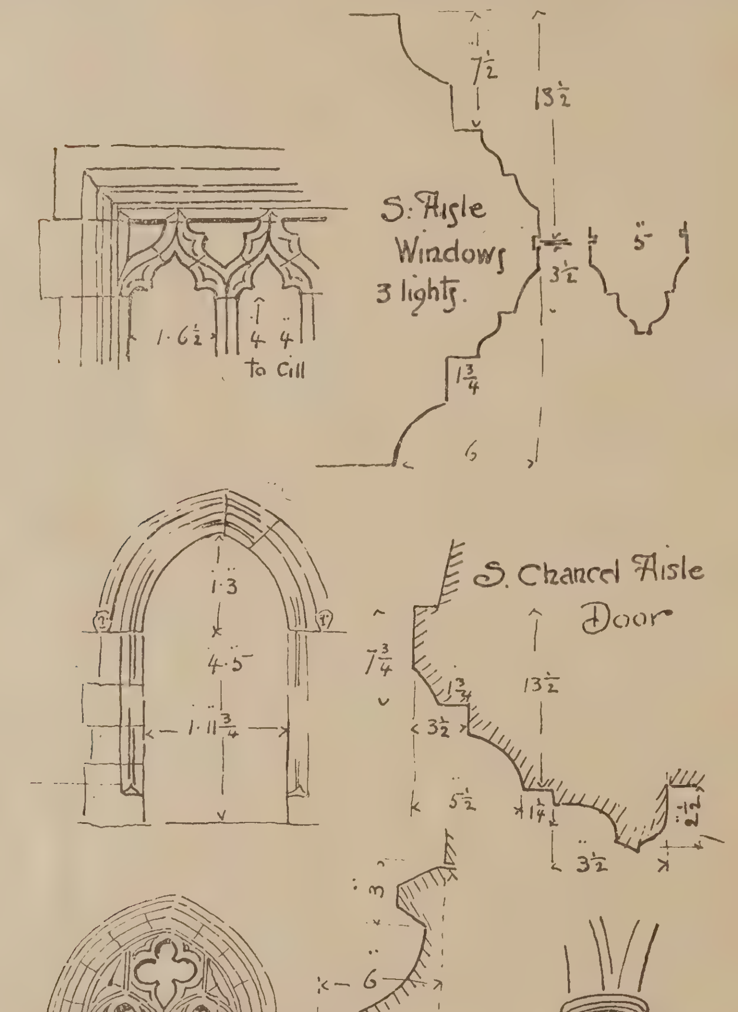
By L. A. MEAD.

THE three prerequisites to health, civic beauty and normal civic life are space, pure air and sunlight. With these insured, architectural beauty, street adornments of fountains, statues, trees and flowers may easily follow. Without these prerequisites, provided by wise legislation and maintained by constant vigilance, all minor beauties of decoration are overshadowed or imperilled or destroyed. The four worst causes of modern city disfigurement are slum areas, crowded suburbs of cheap wooden construction, abnormally high buildings, and discordant settings for buildings, fountains and statues.

The most congested tenement districts in the world are in New York City. Jacob Riis, an expert, declares, however, that the wooden rookeries of Chicago are worse than the tenements of New York, though population be less congested. Boston, San Francisco, and every large city in the country, however new, show a disgraceful section which should never be tolerated. The excessively high rents received for unhealthful tenement house property make them tolerated where money, rather than men's lives, is the chief interest of the community. The examples of an aroused public sentiment in Glasgow, Birmingham, London, and in continental cities, which is beginning to wipe out foul areas and build model houses, needs speedy imitation in American cities.

The Greatest Obstacle.

But the abnormally high building of steel construction, costing from one to three or four millions of dollars, is the greatest material obstacle to modern civic progress. It cannot be wiped out like the rotten tenement block. It has come to cast its blighting shadow for a century upon its neighbours. So long as it stands alone, the dwellers in its upper storeys have immense advantages of light and view, but as soon as every neighbour who is overshadowed builds to equal height the street becomes a noisy cañon, the lower storeys become cellars, the footways are congested with jostling crowds, and all business life becomes destructive of eyesight and nerves. Intercourse with one's fellows becomes a frantic scramble and game of push and grab.

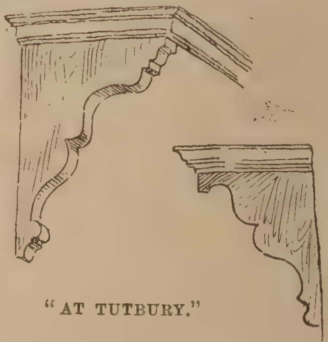


MORLEY CHURCH, DERBYSHIRE.

PORTION OF NAVE ARCADE, ASHBOURNE CHURCH.

To the average business man the view of Chicago taken from the Auditorium seems perhaps a monument of enterprise and business success. To the man who cares for length of days more than for dividends, who values health and beauty and leisure for rational enjoyment, who remembers that he has only one life to live on this planet, such a spectacle seems a hideous commentary on the ideals of modern life. A friend once remonstrated with me on my protests against Chicago's high buildings. "If the people in Chicago want them," she said, "why should you trouble yourself?"

But the people in Chicago have never been asked whether they want them or not, any more than the people in Boston have been asked whether they wanted this monstrous mass of masonry to tower above their narrow streets, or these other buildings which of course are forerunners of future buildings which will darken them. These buildings were put up by the few by taking advantage of lax building laws, in utter disregard of the needs of the many; and, so far as real estate values are concerned, by the vertical instead of the lateral development of the city they have simply robbed Peter to pay Paul, the suburban real estate man losing in proportion as those in the congested districts gain.



"AT TUTBURY."

The High Building per se is not an Evil

when it is well treated on all four sides and shaped like a tower, and when it is surrounded on all sides by ample space; however, such a building, so far as I know, does not exist in the world, and need not be discussed. The high building as it exists is an unmitigated evil to the many, while it is a convenience to the few, and to those few only so long as they can prevent their neighbours from taking advantage of the laxity of the law and following their example.

Boston now limits its buildings to a height of 125ft., or to two-and-a-half times the width of the street; this is much less than the limit in

---

* A paper read before the Second Convention of the Architectural League of America.

Chicago and New York, and yet is far higher than is permitted in any city of Europe. In Paris, and in general through Germany, Italy, and Sweden, buildings are limited in height to the width of the street. In Berlin and Vienna houses must not have more than five habitable storeys; in Brussels they must not exceed 69ft. in height, and in London the limit, with perhaps some exceptions on large open spaces, is 80ft.

Reckless Building By-laws.

No country in the world is so reckless in its building laws as America. No country permits the idiosyncrasy or greed of the individual or corporation so to infringe upon the rights of the people and sane conditions of life.

It is claimed that modern business conditions demand the high office-building, even if such a disfiguring apartment building as you see on a Boston street be unpardonable. Concentration and speed are certainly desirable, but pneumatic tubes, telephones, subways and elevators in six-storey buildings, together with a concentration of certain professions or businesses in different blocks or wards, is the only concentration needed where life is rational and well adjusted. Berlin and Paris do large business without sky-scrapers. As compared with us, their business men make less money, but more of them get more out of life, and their wealth is not counterbalanced by the fearful squalor in certain sections which disgraces the rich young cities of our prosperous land.

The modern office-building is an example of

Uneconomic Concentration.

A hundred different businesses, manicuring, insurance, law, landscape gardening, editing, engineering, and what not, are massed together. Why should not lawyers have an office block of moderate height to themselves, and insurance men, and real estate men, and hide and leather men each their own quarters? Would not business be equally well expedited and our cities freed from this pestilence which threatens at any moment to cut off the earnings of years from honest helpless citizens? A 100ft. building in Boston ruined a certain school by casting it in dense shadow. Another property belonging to a widow lost 1,000dols. rental by the perpetual twilight which its high neighbour threw over it. These are but two instances among thousands.

Delay is fatal. Every building compels others to be built in self-defence, and makes future reform intolerably expensive.

The Preservation of Natural Beauties.

The preservation and improvement of natural beauties, as at Morningside and Central Park, New York, and especially the utilisation of waterways, is a matter of prime importance. In Europe, waterways are almost always made accessible to the people and form a chief feature in the beautification of the city. With us the river-banks have usually been given over to purely commercial interests and are covered with dirty mills and warehouses, and not shaded with trees, like the Seine or the Thames Embankment.

Contrast the Merrimac at Haverhill with the Rhine at Mayence or Cologne, or with the business centre of old Nuremberg. Or contrast the Alster basin at Hamburg with the present surroundings of the Charles River basin in Boston, or the borders of the little river that flows through Berlin with the borders of any river that flows through any important city in our country, and our failure to utilise great natural opportunities is apparent.

Settings.

The question of environment, of a suitable setting to whatever has a monumental character, is the next most vital question. In spite of the fact that in many fields we are now producing much better architecture than is the continent of Europe to-day, our people and our city fathers are singularly deficient in demanding that it shall have a proper setting. Admirable buildings are placed in narrow streets or are sandwiched in between others of discordant form and colour.

At Paris one sees the monumental treatment of the Madeleine, which is balanced on the opposite side of the bridge by the Chamber of Deputies, of similar architecture. Ample space and symmetrical arrangement prodigiously enhance the effect of every building. In the dressing of shop windows, in the arrangement of flowers, and in many minor matters, we have learned to avoid the hodge-podge and heterogeneous and to strive for unity and harmony. That we have not done this in our street architecture and in the setting of public buildings is due not so much to our bad taste as to our bad politics and our inveterate prejudice in favour of unregulated individual taste. This individualism permits, as regards private buildings, any dozen men who happen to own each a 25ft. front lot in a given block to mass together a dozen buildings each of different style and colour and height and of different materials. The Paris law, which requires a certain uniformity of skyline, cornice and balconies, and harmony of colour in any given block, would be a boon to every American city. With reasonable laws, our finer building materials, more brilliant colours, and greater beauty in city domestic architecture would make our cities far excel in beauty any in the Old World. No freak or monstrosity would be permitted, and the subordination of each unit to the whole would increase rather than diminish the beauty of each, as was evident at the World's Fair. We should simply exchange unbridled licence for true freedom and have ample scope for any genuine individuality that was worth while.

MORLEY CHURCH.

The setting of all works of art is of about equal importance to the merit of the work of art itself. Of what value to Boston is the statue of Samuel Adams with its present background? Who cares for the statue of Lincoln freeing the slave amid such sordid surroundings? Would not even St. Gaudens's noble statue in Lincoln Park lose half its value were it transferred from its perfect environment and placed here? Would this Gothic fountain in Nuremberg have its full charm were it not for the ample space about it and the Gothic features of its background which accentuate its own loveliness?

Flimsy Wood Houses.

In the detatched suburban house of flimsy wood exists one of the greatest obstacles to beautiful city life. Here jig-saw trimming, grotesque gables and excrescences and patches and stripes of various colours often make as unpleasant a conglomeration of lines and proportions as the world can show. The dangerous crowding of such buildings as the city extends its limits makes the detached house (only 3ft. or 4ft. from its neighbours) worse than a brick block in respect to danger from fire. The law should prohibit any wooden building being erected within 50ft. of another building of wood. Continuous blocks of broad shallow brick houses built around large open squares give all the advantages of air and light and more privacy than the wooden house squeezed in between others. It can be made architecturally beautiful and harmonious, and, as is shown by many delightful modern English residences of brick for persons of moderate means, is far better than the fantastic possibilities of the average American wooden suburb.

Advertisements.

Among less important matters for consideration, the growing nuisance of the huge advertising bill-board deserves attention. Were it not so temporary in character, and so certain to be abolished as soon as an aroused public shall demand it, it might be considered a matter of great moment, as indeed it is for the time being. The desecration of rock and cliff and forest by the advertising fiend would seem to have reached almost the limit of endurance were it not that those who suffer consider themselves so helpless in the matter. In Massachusetts a law has been passed whose enforcement will materially modify the disfigurement of roads. It should be the duty of all citizens to make enquiry of town authorities whether permission has been given when any advertisement appears upon highways and town property. In nine cases out of ten in Massachusetts no such authority is given, and the good citizen is in duty bound to see that the offender removes the offence or is prosecuted.

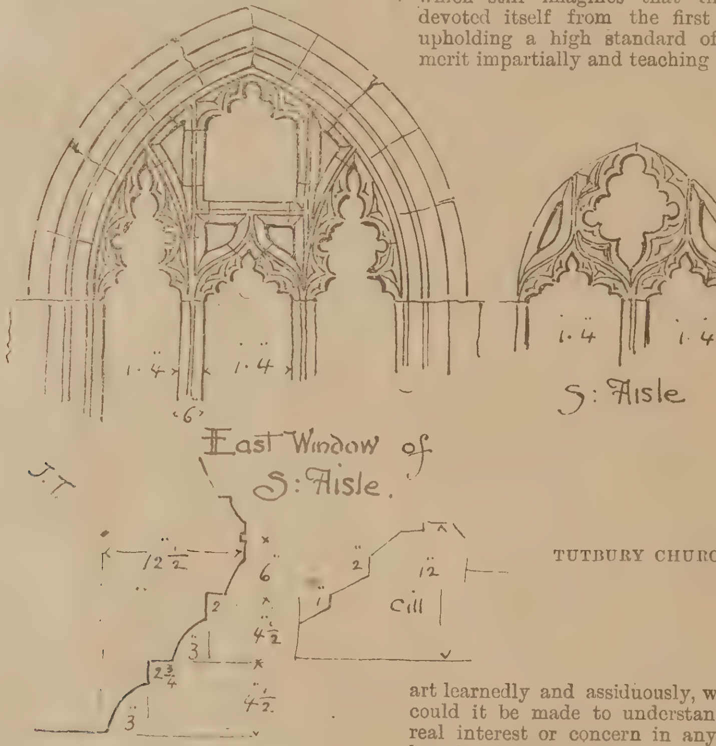
The amounts paid for disfiguring a whole landscape are ridiculously small. The chief advertising agent in Boston pays only 10dols. to 25dols. annually for the opportunity to ruin a whole landscape. The average person is as blind to these disfigurements as a newsboy is oblivious to bad grammar. Eyes he has, but the cataract of commercialism has grown over his sight so that to a great extent he sees neither beauty nor ugliness, nor knows a good thing or a bad thing when he sees it.

Who will Effect the Reform ?

To whom shall we look for the remedy from the evils which have here been thus briefly outlined? Certainly not to artists especially, for, strangely enough, a man may be an expert and enthusiast on bronzes and water-colours and book-covers and be as indifferent as a street-sweeper to the ugliness of skylines and bridges and posters. Moreover, if he does see, and suffer in the seeing, he may have no power of initiative for reform. I fear we cannot look to the daily press; for it, for the most part, must print only what stockholders and advertisers find it their advantage to have printed. Certainly not to the children, though they are learning to draw, and are studying Perry pictures; they can do nothing before much of the evil will become irreparable. We cannot wait for the next generation to do our work. And most certainly we cannot look to wealthy patrons of art to help much in beautifying our cities. In spite of many generous public gifts, the millionaires can do nothing of great importance in producing beauty until they cease promoting that very legislation which now protects their class in producing ugliness. The sky-scraper, the chimney belching forth black soft-coal smoke, the huge advertisement in the landscape—these are the things which the rich as a class will not help to remove, for they belong to them.

To whom then shall we look for a remedy? To the good citizen. It is not necessary that the good citizen should know anything about art: it is necessary that he should have common-sense. He may not know Gothic from Greek, but he must know that he does not know, and that questions of beauty must be left to experts of beauty, just as questions of public health must be left to experts in the science of health.

A board of beauty made the White City the glory and the marvel that it was. When the good citizen forces partisan politics to know its place and not intrude where it has no business to be, then such a board he must again call into requisition and let knowledge and taste give counsel and even prohibitary laws to ignorance and whim. The man, for instance, who fancies yellow brick, and wants to put a yellow brick house into the midst of a brown-stone block, like a slice of sponge cake set on edge, must be taught that no man buildeth to himself, because no man liveth or dieth to himself; that we are all members one of another, and thus no man in a civilised community may mar his neighbour's little plot by doing what he pleases with his own. The good citizen will find this no tyranny, but a welcome protection from his neighbour's follies. In proportion as he attains to beauty of holiness in his citizenship will he recognise the holiness of beauty in his city.



TUTBURY CHURCH.

The New Hop Market Hotel, Worcester, is approaching completion. Messrs. H. Rowe & Son, of Worcester, were the architects, and Messrs. Bromage & Evans the contractors. Messrs. Ward & Son have supplied the hot-water apparatus, and Messrs. Keen & Co. carried out the electric lighting of the building.

A SEVERE CRITICISM OF THE ACADEMY.

MR. J. STANLEY LITTLE has been contributing some articles on the Academy to the "Morning Post." In his second article he says:—

The question may well be asked how it has fallen out that the Academy is able to exercise so commanding an influence for evil over the minds and consciences of the ten or twelve thousand artists—to say nothing of the art craftsmen—of the kingdom. The story of the Academy's origin has been told so often that it is scarcely necessary to repeat it. The Academy was the offspring of the intrigue whereby George III. was induced to give his patronage and support to an artistic coterie, whose object in wishing to secure royal favour for the society they founded was not to elevate art in the abstract and artists generally, but to aggrandise themselves at the expense of other artists and art institutions. This was in 1768. To establish the fact that the Academy had a corrupt origin would not perhaps be damaging evidence against it. . . . None the less the larger public, which still imagines that the Academy has devoted itself from the first to the task of upholding a high standard of art, rewarding merit impartially and teaching the principles of art learnedly and assiduously, would be shocked could it be made to understand that it has no real interest or concern in any of these things, but that from its foundation to the present time it has used its privileges and advantages solely in the furtherance of one object, and one alone—the aggrandisement and prosperity of the Academy as a corporate body and of its members as individuals, and, as a corollary, the suppression of all possible rivals.

One article of its original constitution alone would be sufficient warrant for this statement. For one hundred years this article or rule rendered ineligible for election any candidate who belonged to any other art society. This rule was rescinded when the Academy found itself strong enough to despise and defy all rivals, and when certain Royal Academicians discovered that it suited their convenience to be connected with other art societies. I am reminded at this moment of a pertinent passage in a letter sent from Venice by Albert Dürer to his friend Pirkheimer. "With the exception of painters," Dürer wrote, "everyone wishes me well." And this has been the case with powerful and independent outsiders in this country. With the exception of the Academy, everyone has wished them well. Thus foreign artists of distinction, with one or two exceptions, have been excluded from the annual shows of the Academy, while the treatment meted out to such individual painters as Romney, Crome, Bonington, David Cox, Alfred Stevens, Cecil Gordon Lawes—to confine instances to the dead—is sufficient evidence of Academic intolerance and exclusiveness, and would warrant, were not additional and overwhelming support of the indictment forthcoming, the assertion that the Academy does and has done its utmost to stifle and suppress all talent which has grown up independent of and irrespective of its system and influence.

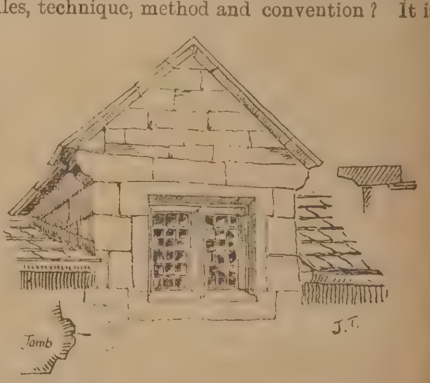
Efforts for Reform.

. . . During the past century strenuous and repeated efforts were made to bring the Academy to account. But the Academy, having assumed a national rôle, has never, from the practical point of view, been ousted from it. . . . Of the attempts to bring the Academy to some kind of recognition of its duties to the public, the most important have been the appointment by Parliament of a Select Committee in 1836, and of a Royal Commission in 1863; the Chelsea movement led by Mr. Holman Hunt, Mr. Walter Crane and Mr. George Clausen in 1886; and the movement which Mr. W. J. Laidlay initiated two years ago, leading to the public ventilation of the question during the summer of 1899 in the columns of the "Morning Post," and to the gallant attempt of Lord Stanley of Alderley in the House of Lords to induce the Government to take action on the recommendations of the Parliamentary Commissioners of 1836 and 1863.

The Select Committee's Indictment.

The Select Committee of 1836 opens its report with an indictment which, if it went no further, would in itself be simply damning. It runs thus: "The Committee advert with regret to the inference they are obliged to draw from the testimony they have received, that from the highest branches of poetical design down to the lowest connection between design and manufacturers the arts have received little encouragement in this country." Now this stricture is as true to-day as it was then. Not long since we heard a good deal about the sins of commission and omission of the Science and Art Department at South Kensington. But it must never be forgotten that South Kensington, be its faults and lapses what they may, and later the various arts and crafts societies and guilds, have established and developed the teaching and practice of the applied arts, which ought to have been one of the first functions and cares of any Academy claiming to represent the nation and to be its trustee. The Academy has never lifted its little finger to encourage tendencies making for the application of the fine arts and the arts of design to manufactures. It has given no place to any arts save those of picture-painting in oils and sculpture, for water-colour and architecture cannot be said to have any real place at the Academy. The minor arts, ceramics, glass, metal and woodwork have been absolutely ignored. As a matter of fact, the decadence of Great Britain in the so-called minor arts, in architecture and furniture, in jewellery, stone carving, silver and gold smithery and ironwork, if it cannot be said to date from the foundation of the Academy, may fairly be said to synchronise with the day which saw the Academy firmly established as the acknowledged head and centre of national art.

The foolishness of the present system of teaching, so called, at the Academy schools is now generally understood and acknowledged. It is a case of the blind leading the blind. . . . Moreover, each painter develops his own methods and his own art principles. Now, how is a young man or woman desirous of learning the rudiments of art to acquire knowledge from half a score of teachers who all have their individual rules, technique, method and convention? It is



DORMER TO COTTAGE AT ROWSLEY.

very well for a painter or sculptor who is beginning to find himself to come under the influence of various masters, but not for one who is yet to feel his feet. . . . The art education of the Beaux-Arts is decidedly the best in the world, and the schools attract young painters from every part of the civilised globe. There are in France ten or more other schools of the fine or decorative arts, and the Ecole Nationale des Arts Décoratifs de Paris is only second in importance, if second at all, to the Beaux-Arts. In brief, both in France and in Italy the organisation for teaching the graphic and plastic arts is infinitely better than anything this country can boast. Throughout France, and in a less degree Italy, the system of State schools discovers any boy of talent who may appear in the remotest village, and such boy, if he should prove to have the stuff in him, is helped to the foremost place by municipal, and afterwards by State, assistance. In England in art, as in most other things, it is the practice of all teaching agencies to ignore nascent talent appearing in odd places.

NEW LABORATORIES AND A DAIRYING SCHOOL AT LEEDS.

On Friday last Earl Spencer formally opened the new educational buildings which have been erected at the Manor Farm, Garforth, Leeds, by the East and West Ridings Agricultural Council. The buildings are intended to serve a double purpose: in the first place, they contain lecture rooms and laboratories for students taking the course of instruction given in the Agricultural Department of the Yorkshire College; and, secondly, they provide a practical dairying school, equipped on the most modern principles. The buildings face the road leading from Garforth Station. Planned by Messrs. Smith & Tweedale, architects, of Leeds, they form a conspicuous object seen from the railway. The design is carried out in red-pressed brick, with stone dressings, the roofs being covered with red tiles. The portion next to the railway line is of two storeys, and contains the rooms intended for lecturing and research purposes. Passing into the entrance-hall, one finds on the left hand a large well-lighted lecture-room, fitted with single desks for the students, and having on a platform at the upper end a desk about the width of the room, so furnished as readily to be converted into a chemical lecture table. On the opposite side of the hall from the lecture-room is a professor's room. The rest of the ground floor is occupied with a male students' sitting-room and study, to which lavatory accommodation is attached.

On the first floor, reached by a massive stone staircase, which is lighted by a large tinted-glass window, there are five rooms. One of the largest of these is devoted to general bacteriological work. The chemical laboratory is also a spacious room, equipped with all the apparatus necessary to enable students to specialise in some branch of research. The building is furnished with the electric light, the source of supply being a dynamo driven by a steam engine at the farmsteading. For heating purposes there is a hot-water circulation from a boiler in the basement, where there is also a boiler providing the steam required in the working dairy.

The dairying school occupies a side wing, one storey in height, adjoining the main building. The separating-room is 24ft. by 12ft., and the churning and making-up room 32½ft. by 24ft. The separating and churning rooms, both lighted with windows at each end, are divided by a glass and wooden partition, so that the demonstrator has all the students under observation. Every arrangement is made with the view of securing absolute cleanliness. The walls are covered with white glazed tiles; the woodwork is painted white and enamelled; the shelving is of polished slate; and the ventilation is on the most approved principles: the premises are heated by steam and lit by electricity. Off the separating-room is a milk-setting room. A weighing and packing room, divided by a movable glass screen from the room where butter-making is carried on, and a cold-storage room, complete the equipment of one of the most extensive and up-to-date dairying schools in the United Kingdom.

COMPETITIONS.

AN INSTRUCTIVE CODE.

The following competition code is the result of the joint efforts of the Architectural League of America and the American Institute of Architects:—

A competition as a means for the selection of an architect may properly assume one of the following forms:—

A. *Limited* to a certain number of architects, each of whom is invited to take part.

B. *Open* to all who desire to enter or to all of a certain class.

C. *Mixed*, certain architects being invited, but others being at liberty to take part.

Payment of Competitors.

In all competitions the first prize should be the award of the commission to design the building and superintend its construction, and the programme should definitely state that the successful competitor will be so retained, and that he will be paid for his services at the rates established by the American Institute of Architects. In certain cases, however, this procedure may not be legal, and the course to be pursued as to the successful competitor should be clearly stated. To provide for the contingency of delay or of the discontinuance of the work, the programme should provide for a substantial payment to the successful competitor on the award of the competition, such payment to be regarded as on account of the final commissions.

Payments to unsuccessful competitors should be as follows:—

In limited competitions each should be paid a fixed amount. In open competitions prizes fixed in number and amount should be provided.

In mixed competitions the two classes of competitions should be paid in the manner above described.

The Professional Adviser and the Jury.

It is highly desirable, in the interests of both owner and competitors, that a professional adviser should assist in the preparation of the programme, and that the professional adviser, or a competent jury consisting at least in part of experts, should assist in making the awards.

The professional adviser or jury may have full power to make the award, or they may select a number of designs and, placing them in the order of merit, leave the final choice to the owner or his representatives. Where possible, the adviser or the jury should make a positive report in favour of one design, and recommend the employment of its author as architect for the building.

The Programme.

The programme should be so drawn as to form a contract. It should—

a. Name the owner of the structure forming the subject of the competition, and state whether the owner institutes the competition personally or through representatives. If the latter, name the representatives, state how their authority is derived, and define its scope.

b. State the kind of competition to be instituted, and, in limited competitions, name the competitors; or, in open competitions, if the competition is limited geographically or otherwise, state the limits.

c. Fix a definite time and place for the receipt of the designs. The time should not be altered except with the unanimous consent of the competitors.

d. State the limit of cost, if fixed; the desired accommodation, and the condition of the site.

e. Fix uniform requirements for the drawings, giving the number, the scale or scales, and the method of rendering. As the presentation of a general scheme (rather than a design perfectly studied in all its parts) is the object of the drawings, they should be of the simplest kind capable of explaining such a scheme.

f. State whether the submission of more than one design by a competitor is forbidden or permitted.

WINDOW JAMBS IN QUEEN MARY'S APARTMENTS, TUTBURY CASTLE.

g. State whether the competition is to be anonymously conducted or not, and if anonymously, provide the method.

h. Name the judge or jury, or provide a method for their selection. Define his or their power.

i. Provide for the placing out of competition of any drawing which violates the terms, or of any set of drawings whose authors have so disregarded the terms as to deserve the extreme penalty.

j. Provide that during the competition there shall be no communication upon anything relating to the competition, except in writing, between any competitor on the one hand and the owner, or any representative of the owner, the professional adviser or any juror on the other, and that any information, whether in answer to such communication or not, shall be given in writing simultaneously to all competitors. Set a date after which no question will be answered.

k. Fix the nature or amount of the awards or prizes.

l. State, in case the professional adviser or jury is not empowered to make the award, in whom such power is vested.

m. Fix the period of time within which the final decision will be rendered.

n. Provide for sending the decision and a copy of the report of the professional adviser or of the jury to each competitor.

o. Provide that no drawing shall be exhibited or made public until after the award, and not then without the consent of the author.

p. Provide for the return of unsuccessful drawings to their respective authors within a reasonable time.

q. Provide that nothing original as to this competition in unsuccessful designs shall be used without compensation to the author of the design in which it appears.

KILSYTH'S NEW ACADEMY.

ALTHOUGH some little touches have yet to be given to part of the buildings and grounds, nearly the whole new Burgh Academy at Kilsyth, Glasgow, is now in full use. It has been built of freestone from designs by Mr. Robert Hay, 147, West Regent Street, Glasgow. Facing Shuttle Street, on the ground floor, are six large windows resting on a moulded sill-course, and the architraves are moulded in blocks alternately, while the moulded lintel has keystone and moulded cap. Light is provided to the upper floor front by another half-dozen windows, situated exactly above the ground floor series. and starting from a moulded sill-course. The whole is surmounted by a cornice and blocking course. Two entrances to the Academy are provided, the one on the north for the girls, and the other, on the south, for the boys, access being gained to each of them either by gateways from Shuttle Street or from the Craigends side by the respective playgrounds. Entering by the girls' porch, there is found on the right hand a room for the female staff, and adjoining a cloakroom for the girls, while on the left is a stair leading to the upper floor. The school is arranged in classrooms, facing east and west, these classrooms being separated by a central hall about 15ft. wide. The ground floor is divided into five classrooms, three to the east and two to the west, each room providing accommodation for seventy pupils. Access is given to the rooms on the second storey from a balcony running round the central hall. The classrooms on this storey consist of four at the back, each capable of seating fifty-four scholars; and four at the front. Of the latter, the two central ones will accommodate seventy pupils each, while in the one room at the extreme corner is space for thirty pupils, and in that at the opposite corner forty pupils can be placed. The building can thus accommodate 776 scholars. Ventilation is provided by Messrs. Donald & Donald's air-pump system. All the classrooms are lined with pitch-pine to a height of 4½ft. from the floor, and finished with "Jewel" desks corresponding in colour. Heating is on the low-pressure hot-water system.

The contractors were: Mason, Messrs. George Sharp & Son, Glasgow; joiners, Messrs. Withers & M'Nab, Kirkintilloch; steel and ironwork, Messrs. Blaydon & Co., Glasgow; slater, Mr. David Logan, Kilsyth; plumber, Mr. James Raeside, Glasgow; gas fittings, Mr. Robert Mason, Glasgow; plasterer, Mr. Williamson, Kirkintilloch; glazier, Mr. John C. Hall, Glasgow; painter, Mr. John Morton, Kilsyth; heating, Messrs. Hunter, M'William & Co., Glasgow; furniture, Bennet Furnishing Company, Glasgow. The cost of the new Academy and of the alterations upon the old one, including furnishings, has been about £10,000.

A New Church at Stonebroom has been erected from the designs of Mr. P. H. Currey, of Derby, to seat 260 persons. The portion of the church at present erected will cost, with fittings, a sum of nearly £2,000, of which £300 has still to be raised.

New Patents.

These patents are open to opposition until July 30th.

1900. — Band-Sawing Machines. — 3,471. H. NOBLE & P. LUND, Felling-on-Tyne, Durham. With ordinary band-sawing machines it is impossible to cut lengths greater than the diameter of the saw pulleys or the space between the saw and the main frame. To get over this disadvantage, according to this invention the machine table is arranged slantwise to the axes of the saw pulleys.

Firegrates.—9,850. E. J. PURNELL, 66, Hatton Garden, London. In order to improve combustion, the grate is made with a false back, through which partially-heated air passes to the fuel.

Artificial Stone.—13,467. T. M. THOM, 59, Lordship Lane, Wood Green, N., and A. C. OAKES, 7, Martin's Lane Cannon Street, London, E.C. A mixture of pure lime and unburnt limestone, in the proportion of a third of one to two-thirds of the other, both reduced to fine powder, is slaked with water and moulded. The blocks are then dried and placed inside a closed vessel capable of resisting an internal pressure of 300lb. or 400lb. to the square inch, into which carbonic acid gas is introduced for the purpose of hardening the blocks.

Windows.—17,725. J. BOARDALL, Clare Road, Wyke, near Bradford. The lower part has French windows with a vertically sliding sash above.

The following specifications were published on June 22nd, and are open to opposition until August 5th.

1900.—9,626, EDWARDS, window fasteners. 10,977, SINCLAIR, decorating brass, copper and other metallic objects, tiles or ware. 11,014, SYMONS, materials for floors. 11,061, ASKHAM & KEEVIL, apparatus for crushing or grinding. 11,852, MELDRUM BROTHERS, LTD. & ORTON, kilns. 12,133, PECKOVER, stone saws. 12,297, RUSSELL, pump. 12,475, MITCHELL, chimney cowls and ventilators. 13,591, EASTMEAD & MOFFATT, hoisting apparatus. 15,571, WILSON, draught-preventing means for doors.

1901.—4,222, CHOPARD & CHOPARD, method of capturing pure air and means for warming and distributing same in insalubrious centres. 6,054, CALDWELL, manufacture of expanded metal. 6,177, CURTIS, manufacture of expanded metal. 7,466, ARMITAGE, ARMITAGE, ARMITAGE & KEIGHLEY, stone-cutting machines. 7,742, ADAMS, fire-screens. 8,887, MAYER, gasholders.

These patents are open to opposition until August 5th.

1900.—Kilns.—11,852. MELDRUM BROTHERS, LTD., Atlantic Works, City Road, Manchester, and J. S. ORTON, 35, West Avenue, Derby. The type of kiln to which this invention more particularly relates is one used for cement in which the materials are heated on floors having furnaces and flues beneath. An external furnace is employed, so that the flues may be arranged to underlie the whole of the floor. By these means the cost of maintenance is reduced and a greater uniformity in the clinker is secured.

Chimney Cowls.—12,475. W. MITCHELL, Albert Works, Waterfoot, near Manchester. In order to prevent the cowl being turned completely round by the wind, thus causing downdraught, a hanging brake, lined with felt or other suitable material, is fixed to the outside of the annular cover. When the side pressure of the wind becomes excessive the brake swings inwards and so checks the movement of the cowl, returning to its normal position as the wind abates.

1901.— Expanded Metal. — 6,054. W. L. R. CALDWELL, 10, Murray Street, New York, U.S.A. The object of this invention is to provide a simple, effective and comparatively-economical machine for producing expanded sheet metal. The slitting is done by a pair of rolls having a series of fingers and another pair provided with cutters. The slitting device does nothing but slit the metal ready for the stretching or expanding device, which is independent, and is adapted to take hold of the sheet and stretch it uniformly throughout its width. Finally, there is a pair of rolls for setting the walls of the expanded meshes at the desired angle.

The following specifications were published on Saturday last, and are open to opposition until August 12th. A summary of the more important of them will be given next week.

1900.—10,162, FRENCH, taps or valves. 12,038, HANSEN, cocks and valves. 12,070, GAUNTLETT & LLOYD, production of designs upon glass and other surfaces. 12,132, LOWOOD, GARDNER & ARMSTRONG, machinery for making bricks. 12,654, MURDOCH & MURDOCH, saw guards. 12,970, HUGHES, machinery for pressing bricks. 13,371, SPENCER, securing glass in window frames. 13,699, KLABER, stencil sheets. 13,919, T. C. FAWCETT, LTD., & BOTTOMLEY, machines for making and pressing bricks and tiles. 14,138, HENNINGS, apparatus for the production of acetylene gas. 14,542, HOWORTH & ROBINSON, apparatus for setting or marking out carpentry or joinery work. 15,042, BOUSFIELD, compound rollers for sliding doors. 16,643, KEEL, firegrates. 17,029, VACHELL, sash frames of windows. 17,285, SEWELL, sliding sash-windows. 17,995, COPPARD, swing stages or cradles. 20,652, RÖDER, scaffolding.

1901. — 1,549, WATSON, centre-bit drills. 2,948, GARDINER & ABBOTT, floor sawing and rabetting machines. 6,016, ONGLEY, workmen's time recorders. 7,610, BROMHEAD, taps, valves and faucets. 8,068, PARSONS, manufacture of slag blocks. 8,282, BOAS, manufacture of building materials. 8,536, WUHRMANN, pumps. 8,881, JOHNSON, apparatus for manufacturing gas. 9,525, GOOD, glass pressing or moulding apparatus.

POPLAR HOSPITAL.

A NEW wing has been added to the Poplar Accident Hospital by the munificence of the Drapers' Company. It consists of a lofty block of buildings erected at a cost of about £14,000, and is situated on the eastern side of the surgical ward block of the old building, being an extension of the out-patients' department and an addition of three medical wards and quarters for the staff. The basement is devoted to the out-patients' department, in which surgical and medical cases are separated, with waiting, examining and dressing-rooms for each department, the former out-patients' department being converted into a spacious general waiting-room. Upon the ground, first and second floors are the three wards (41ft. long by 28ft. 6in. wide) for ten medical cases each. The wards are approached through the old surgical wards, but have, in addition, their own staircase and outside escape stairs, with ward scullery, bathroom, sink-room and other sanitary accommodation in spurs at the east end, the sisters' room at the west end, and day-rooms upon the ground and first floors. Each ward has a wide balcony upon the south front, overlooking the docks and river. The floors are laid in ornamental terrazzo mosaic in panels and borders, the walls and ceilings being plastered. The lofty windows are provided with extract ventilation flues. The third floor provides accommodation for the nursing staff, and includes a nurses' sitting-room (32ft. by 12ft. 6in.) with large square bay, and seven nurses' bedrooms, besides linen storage and the necessary sanitary accommodation. The sitting-room, which has been pleasantly and almost luxuriously decorated and furnished, faces the south and south-east, and possesses extensive views over the Thames valley and Kentish hills. The fourth and fifth floors are occupied by servants' bedrooms and a broad flat for recreation, a portion of which is covered with a shelter roof. The new buildings, like the old, are constructed throughout with fireproof floors and stairways, and close attention has been paid to the perfection of the sanitary work. The builders were Messrs. Harris & Wardrop, of Limehouse, who have executed this and the whole of the other additions in connection with the main hospital building. The architect was Mr. Rowland Plumbe, F.R.I.B.A., the architect of the hospital.

NEW BATHS AT PORTOBELLO, EDINBURGH.

THE new baths at Portobello, Edinburgh, opened last week, are built of Dumfriesshire red stone, and were designed by Mr. Robert Morham, the city architect. There are swimming baths, and to them are added Turkish, spray, and douche baths. Facing the sea, on the first floor are retiring and reading rooms. The front of the baths skirts the Promenade, and admission is gained there. The entrance is divided in duplicate, ladies entering by the right and gentlemen by the left. Beyond these doorways there is a spacious vestibule, which is divided into two parts by massive columns and entablature of Doric order. To the left and right of the entrances are the passages to the plunge baths. In the portion allotted to gentlemen there are six first-class baths, with twelve dressing boxes; while in the parts used by ladies there are four baths, with eight dressing boxes. One of the prominent features of the baths is the arrangement whereby a ready supply of salt water can be had. This, it is reasonably believed, will prove one of the strongest attractions of the baths.

The hall in which the large pond is laid out measures 95ft. by 55ft. The swimming pond is 75ft. by 35ft., the depth of the water being 7ft. at one end and 3ft. 6in. at the other. Along the sides of the hall are fixed 56 dressing boxes. Cast-iron columns, with moulded capitals, divide the hall longitudinally and support the gallery and the roof. The south end of the hall is portioned out as a gymnasium, which in turn provides all the athletic requisites commonly used at galas and different aquatic exhibitions. The gymnasium measures 32ft. by 30ft. At the north end of the baths is an alcove measuring 33ft. by 14ft. At the private entrance to the baths from Melville Street, and adjoining the gymnasium, is a resuscitation room, in which will always be ready the necessary medical appliances, and which is also fitted up with heated baths. There is a similarity between the baths for women and those for men. Situated between the respective ponds are the second-class baths. They differ from the first-class baths in being under the control of the attendant and not of the bather. Adjacent to these baths is a sitz bath, and near it are the offices for the superintendent and female attendants.

The Turkish bath occupies the centre of the southern portion of the building. It consists of two hot rooms, the laconicum and calidarium, where the temperature will range from 200 to 210 degs.; a sudatorium at a temperature of about 190 degs., and the tepidarium or cooling room. The shampooing room, which is fitted up with the usual spray, douche and other apparatus, adjoins the sudatorium, but is entered by a disconnecting porch. There is a Russian vapour bath in the same part, while here there is also a cold plunge bath 16ft. long by 5ft. wide. The fittings of the tepidarium are of the most complete kind.

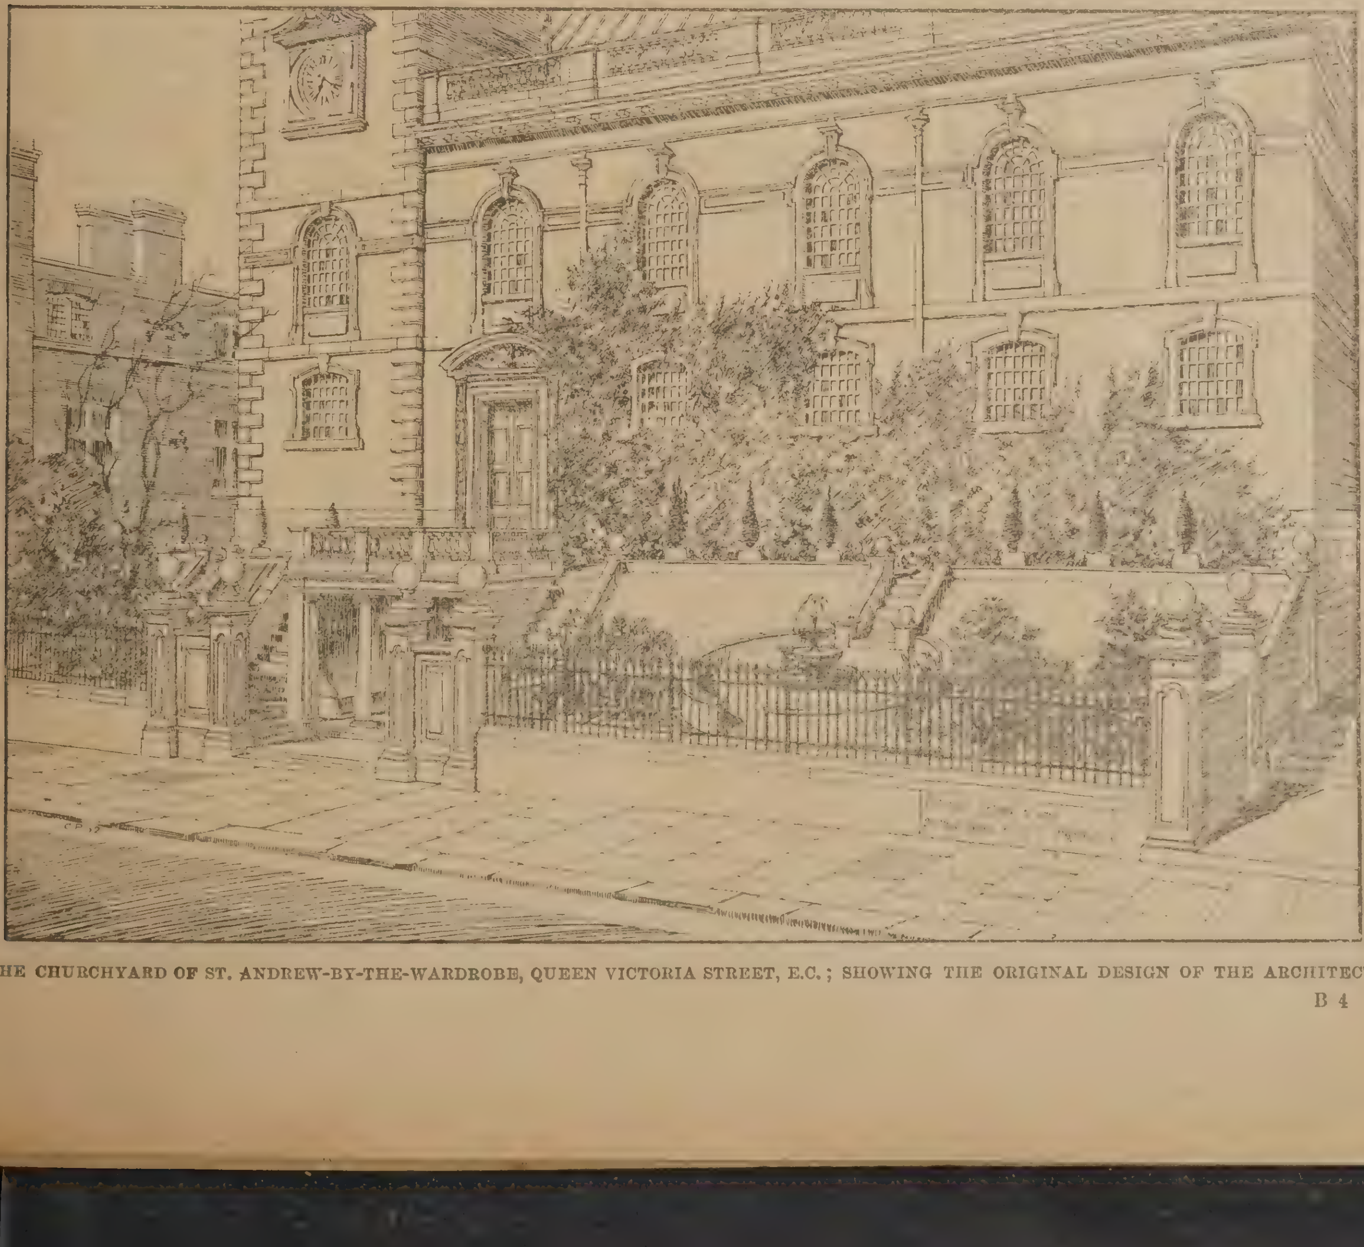
A very prominent arrangement exists on the first floor of the building towards the Promenade. This consists of a series of rooms for the use of visitors. The centre room has been fitted up as a refreshment buffet, and is connected with the kitchen in the flat above by means of lifts. Adjoining the refreshment room there is also a smoking-room.

The Corporation had the benefit of expert advice in connection with the purity of the sea water, and as a result have adopted a system whereby the water is pumped from a point 400 yds. distant from the Promenade. The boiler, which is one of the principal portions of the plant at the baths, is a 22ft. by 7ft. Sinclair's Patent No. 1, and generates steam for the whole building. This steam is used for heating the water of both ponds, driving the pump, heating the building, heating the salt and fresh water, and the Russian and Turkish baths. The salt water is pumped up from beyond low-water mark by means of a Worthington steam piston pump, capable of delivering 15,000 galls. per hour, and the water is drawn from the sea by means of a 10in. pipe. The water is then put through a Reeves filter, and thence sent to the pond, and to a tank for sea water, which holds 3,600 galls. and supplies the plunge and other baths. The plunge baths, which are sixteen in number, have both a salt and a fresh water supply.

The drainage of the building was throughout executed under the supervision of the [illegible] engineer, and is of iron piping. [illegible] was experienced with this work owing to the sea water coming beyond the level of the sewers. The pumping and filtering machinery has been erected by Mr. J. Reid Ellis, Portobello, local agent of the sole licensees, Messrs. Mather & Platt, of Salford. The other contractors were: mason work, Messrs. Kinnear, Moodie & Co.: plaster work, P. F. Cavanagh; engineering work, Messrs. Mather & Sons; and plumber work, Messrs. Morrison & Son, a great part of whose work was of a special nature, and from special designs prepared by the firm. The cost of the baths has exceeded £30,000.

A CITY CHURCH GARDEN.

AT the present time the churchyard of St. Andrew-by-the-Wardrobe in Queen Victoria Street is unseen from the street, its growth of pretty shrubs being obscured by a high brick wall. This obstruction is to be removed, and the space thrown open to the street. The accompanying illustration shows the alterations that are projected in connection with the churchyard. Messrs. Banister Fletcher & Sons are the architects. The illustration shows the *original* design for the rearrangement of the existing steps by the formation of two flights of side steps and the construction of a balcony, the lower portion of which would form an alcove, while the upper part would provide an open space available for seating accommodation. The present arrangement is, however, confined to the removal of the existing ugly brick wall, and the erection of stone gate piers and wrought-iron railings in keeping with the general design of the church. The ground behind the railings is to be sloped up to the terrace in front of the building. This ground will be turfed and laid out as a garden. The fountain shown in the sketch also forms part of the original design.



THE CHURCHYARD OF ST. ANDREW-BY-THE-WARDROBE, QUEEN VICTORIA STREET, E.C.; SHOWING THE ORIGINAL DESIGN OF THE ARCHITECTS.

PURE DESIGN.

HOW IT SHOULD BE STUDIED.

THE following are extracts from a report recently made by the Committee on Education of the Architectural League of America:—

QUESTION: A. "Should architectural design and the study of historic styles follow and be based upon a knowledge of pure design?" B. "How can design in the abstract be best studied?"

ANSWER: "The 'historic styles' should be studied as solutions of the problems which were presented by them in their time. It is a fact that too much stress is laid upon this matter. It is of very secondary importance. It is the most serious blunder of the schools that the 'historic styles' are impressed as of primary importance. The schools are the only influence in the architectural life to-day which seeks to keep these ghosts imbued with artificial life. Were America free of influence from foreign schools, the conviction is forced home to us that by this time its people would have made more progress in substantial architecture. All in all, the results might not have been better, but, upon the other hand, they could not have been worse, or more enslaving and retarding in effect. This is proven by the universal progress which is recorded in all departments in which 'schools' have not existed, and consequently have not interfered The shortcomings, however, are not those of architecture nor of archæology, nor is this an argument against schools, but the art of education itself is only in a formative state and only but recently has itself become progressive and self-reformatory. We would much prefer to go to

The Root of the Whole Matter

and discuss the queries: 'Of what does architectural education consist? How can it best be imparted to the student?' The root answer to both would be: Hereditary disposition on the part of the student; his physical and mental fitness; sympathetic environment. Here we have the school, the system of imparting knowledge, the methods of acquisition, the subject, the materials, and the object all combined. The school, the student and the course are but details growing out of this general proposition. The profession of education reaching out to inform itself as to its own functions, looking for light that it may behold the fruition of its own ends, asks itself, first of all: 'Of what does any kind of education consist? How can the various kinds be imparted to the various individualities of students?'

"The problem of architectural school education applies equally, although with less force, perhaps, to other educational departments. In the sciences and in law, for instance, definite and absolute quantities and propositions are dealt with, whereas in architectural art we may only say of what it has consisted in the past and admit with more or less reluctance that the materials, the methods, and the forms and organisation of modern life make the imitation of the real art of the past but mockery of the present. We testify to lack of knowledge and inspiration, to wrong analysis, to an education which is worse than none at all, by dogmatic insistence that the art-triumphs of the past must contain the solution of the new problems of to-day. But it is all very well to make demands upon the schools. The school itself must have its own disposition, its own character, its own environment. The hereditary disposition of the American school must be the spirit of American institutions and American inventiveness and progressiveness. Its environment must be one free from influences beyond its own, of spectres and shadows. Its equipment must consist of an understanding that there are real modern problems of architectural necessity to be met with, real modern materials as evolved by modern knowledge.

One National School.

"Finally. In order that an art school may create its own atmosphere and fulfil its purpose, contain in itself an inspiration and an incentive to work and study, all the various art branches of the colleges and universities of the country should be detached from other branches of study and be amalgamated in one American Art School, thus gaining in scale, volume, influence and effect through concentration and through singleness of purpose.

"Answering the final question then, under these conditions only, 'Can pure design be best studied?' Given now a bouyant and vigorous American student-boy under the tutelage of independent and progressive men, and who shall say what are the restrictions set upon the American architectural art of the future!"

Builders' Notes.

Building at Elland.—The builder seems to be busy in Elland, and is likely to be for some time to come. Not only are the public baths growing out of the ground, but several other buildings are in course of erection. The erection of the new Conservative Club in Victoria Road is proceeding apace, and the roof may be on by about September. The new church is being erected in Savile Road. Not many men are engaged on the job, and thus the erection is proceeding but slowly. As to other buildings, roofs are being put on five new houses in Savile Road and four new dwellings in Garden Street. There is still a dearth of houses.

The Granite Quarries in County Donegal, Ireland, comprising 70 sq. miles of granite, are being offered for sale. The varieties include grey of different shades, red, awarded the gold medal at the Minerals Exhibition in London, 1889, and also pink and salmon coloured. Owing to the company's willingness to sell in parts on account of its immense extent, and to the variety of colours to be had all alongside the sea, the granite offers facilities to small capitalists. The stone is of the best quality, and owing to its situation near to a good shipping port, and having a railway which is being constructed from Letterkenny to Burtonport running through the finest bed, the quarries form a very desirable investment.

Building By-laws at Bridlington.—The surveyor to the Bridlington Town Council, in his report to the committee respecting the new building by-laws, points out that "there have been several cases within the month of deviations from the plans deposited, and in one case I had to insist on a portion of a building being pulled down, as it did not correspond with the plan which was approved by the Council. In two or three other instances during the month I have had to entirely disapprove of the timbers used in some of the buildings. I have found floor joists altogether inadequate in strength put in which have had to be taken out; and I found in one building old timber put in which had been recently pulled down; in addition to the timber being unfit for use, it was inadequate in size." These delinquencies, however, do not include all. Six sheds have been erected without plans having been previously submitted; in another case a building has been occupied without a certificate of completion, and in another a builder has apparently set the Council at defiance by building two washhouses, plans for which were rejected by the Council.

Building at Leeds.—Many dwellings, including a large number of the cottage class, in Leeds are at present without tenants, and fear is being expressed that the city is overbuilt. At Armley an agent in that suburb states that he has on his books no fewer than fifty empty houses, whereas the number in normal times has not been more than twelve. Inquiries of other agents show that there are now four times the number of "to lets" that there were a year or so ago. And it is said that cottages in Armley township are from 6d. to 9d. per week cheaper than similar accommodation in the Roundhay Road and Kirkstall Road districts. In Bramley township the proportion of empties is rather larger than in Armley. A year ago new property in Bramley was let before its completion. Messrs. Yates, Ltd., of the Wellington Mills, in Broad Lane, have erected seventy-eight first-class cottages opposite their works, and these have been readily let to their own and other workers. This, it is said, has caused numerous empties amongst the poorer-class property. There are at present in Town Street and Back Lane cottages to let which have not remained empty for any length of time during the past fifteen years. At Swinnow empty houses can be seen in many streets. It is expected, however, that the extension of the tramways will have a beneficial effect in the district. In Holbeck new cottage property lets well, but regarding some parts of Hunslet and on the Bank, complaints about empty houses are to be heard.

A Year's Building at Birmingham.—The Birmingham city surveyor's annual report contains a section dealing with the building surveyor's branch department, in which it is stated that during the last twelve months there has been a considerable falling off in the number of buildings erected, as well as the number of plans deposited. This appears to be more pronounced from the fact that during the last four years, owing to the business prosperity of the city, the erection of buildings has been phenomenal. The falling off may be attributed in a great measure to the uncertainty of trade prospects, and to the increased cost of building materials (which reached its highest point about September). Consequently many building schemes have been held back upon receipt of tenders, owing to the immense cost of the undertakings. At the same time building operations have not been at a standstill, but the progress has been normal. In the year ending December 31st, 1896, plans were submitted for 1,852 houses; 1897, 1,836; 1898, 2,308; 1899, 2,145; 1900, 1,175. Although plans have only been submitted for 1,475 houses, the number does not represent the number of buildings erected, as a great many buildings for which plans were approved during the years 1896 and 1898 were not completed until this year. As a matter of fact, 1,956 buildings were erected, of which 1,630 were houses and shops. The total number of plans deposited during the year was 1,849.

London County Council.—At last week's meeting, upon a recommendation of the Housing Committee that the work of erecting some dwellings in St. Pancras should be given to the Works Department, Sir John Dickson-Poynder, M.P., moved an amendment that tenders should be invited. He said that twenty-one buildings erected by the Works Department had cost £388,863, as against a final estimate from the architect of £363,216. On the other hand, sixteen buildings had been put in the hands of contractors for £256,165, whereas the original estimate of the architect amounted to £273,680. Mr. Waterlow, chairman of the Housing Committee, said he could not dispute the figures. Contractors were now struggling to do the Council's work as cheaply as possible, so that they might wipe out the department. Under the old management there was an excess of 7 per cent., and under the new management there was an excess of 6½ per cent. That was far from satisfactory, and he could not help thinking that the department ought to be able to do the work as cheaply as the contractor. At all events, they ought to be able to do it as efficiently as the contractor. The department were now showing small savings on some of their buildings. If that were not so he should not have been disposed to hand over the new buildings in St. Pancras to the department. After discussion, the amendment was rejected, and the recommendation of the committee adopted. The Council decided to lend the Camberwell Borough Council £8,000 and the Lambeth Borough Council £20,000 to pay their shares of the cost of the extension of Brockwell Park. They also decided to ask Parliament for powers to purchase The Rookery, Clapham Common, for addition to the common. The estimated cost of purchase is £6,000. The Highways Committee submitted a lengthy report, which included proposals for the construction of new tramways of a total length of about twelve miles on the north side of the Thames, at an estimated cost of about £430,700, and for street widenings of about £185,400, a sum, however, which did not include any provision for the cost of the street widenings that would be required in connection with one of the proposed tramways. As regards the south side of the Thames, the total length of tramways was about 16½ miles. The cost of construction of the tramways, the paving of the tramway tracks, and the provision of cars, car-sheds and other works in connection with the tramways was estimated at about £591,200, and of the street widenings at about £722,100, in which sum was included the estimated cost (£29,500) of the widening of Queen's Road, Peckham. These proposals were adopted.

DUKINFIELD TOWN HALL.

THE town hall which has been built by the recently incorporated borough of Dukinfield was opened a short time ago. The cost of the new town hall is between £14.000 and £15,000. The building, which faces King Street, stands upon rising ground, and advantage has been taken of the quantity of land in that street belonging to the Corporation to set back the building line some twenty-five yards. Upon this ground flower-beds are to be laid out and a carriage drive made. The "domestic Gothic" is the style which the architects have adopted. At the entrance hall a massive porch gives access to the ground floor from a flight of steps. Above this rises a three-light window, with the arms of Dukinfield sculptured in the tympanum of the arch. Higher up is the clock chamber, and yet higher the clock and bells, and the building is surmounted with a spire. At each end of the front there is a great gable with an oriel window, and the space between these gables on either side and the central doorway is varied with buttresses and grotesque figures. The whole of the exterior is in Accrington bricks, with Yorkshire stone dressings. The upper parts of all the windows are in stained glass. In the basement, which is nearly level with the ground, there are rooms which are to be used as lamp stores, repairing-rooms, an office for the inspector of weights and measures, rooms (including bathroom) for workmen, heating chamber, fire brigade station, ambulance station and fireman's stores. The rooms on the ground floor are entered from a corridor which extends from Chapel Street end to Hope Street end. On this floor there are the gas office, meter inspector's room, the rates and water accounts office, the cashier's office, rooms for the sanitary inspector and the medical officer of health, the surveyor's offices, waiting-rooms, and School Board offices, together with a separate staircase leading to the public gallery and the Council Chamber. From this floor to the floor above there is a spacious staircase with two return flights. The arcading at the bottom of this staircase springs from red polished granite shafts and carved stone caps. On the first floor are the Council Chamber, with a panelled ceiling, the mayor's parlour, offices for the law clerks and the committee clerks, the overseers' office, cloak-rooms and two committee-rooms. All the rooms and corridors are well lighted, and the staircase is lighted by a painted glass dome in addition to the side windows. The sanitary arrangements are complete, and there are lavatories on every floor. Messrs. John Eaton, Sons & Cantrell, of Ashton-under-Lyne, were the architects, and the borough surveyor (Mr. Hague) has acted as clerk of the works.

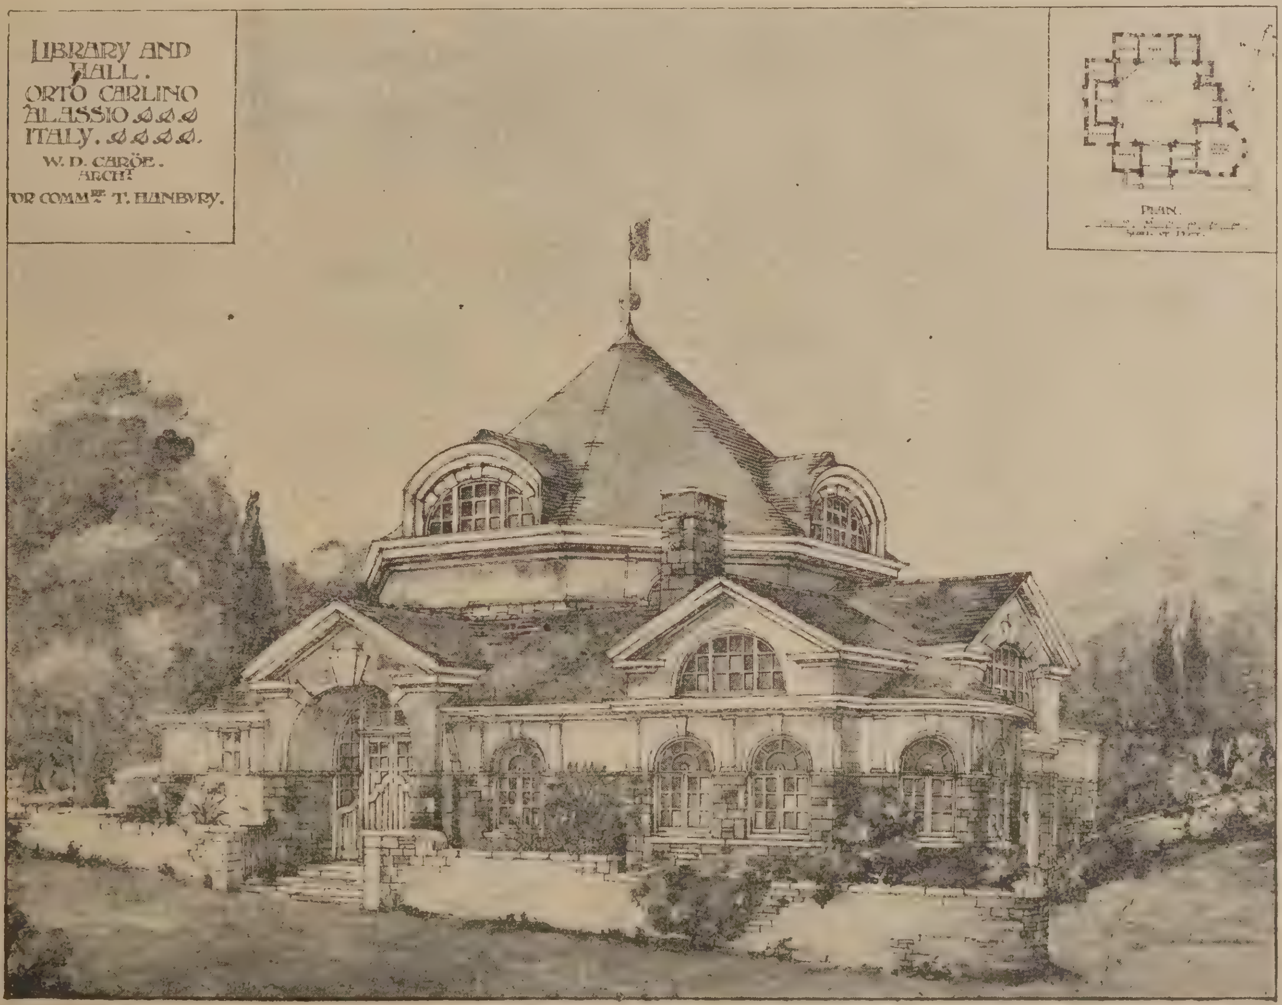
THE NEW BALTIC.

ON Tuesday in last week the Lord Mayor laid the foundation stone of a building which will, when completed, house the members of the Baltic and the Shipping Exchange. The site of the new premises is between St. Mary Axe and Bury Street, the frontage to the former place being 86ft. and the latter 72ft. The whole of the ground floor will be used for the purposes of the Exchange. Above there will be about 200 offices. The main entrance will be in St. Mary Axe, and in the basement twenty telephone boxes will be available for the use of members, and there will also be an access to Bury Street and entrance to postal and telegraph offices. Externally the front of the building facing St. Mary Axe will be in polished granite to the first-floor level, and above in Portland stone, with polished granite columns. The stone is placed on the north side of the main entrance, and is suitably inscribed. The building will contain, in addition to a large exchange, which will have a superficial area of 15,000ft., a reading room, club-rooms and arbitration-rooms, a luncheon-room, and all the accommodation necessary for the purposes of an exchange. It is anticipated there will be accommodation for at least 3,000 men.

NEW PUBLIC HALLS AND BATHS AT GLASGOW.

NEW public halls and public baths are being erected in Kinning Park, Glasgow, on sites in West Scotland Street, that of the halls at the corner of Smith Street and that of the baths almost opposite. The plans show buildings involving an expenditure of from £20,000 to £25,000. The halls have a frontage to Smith Street, showing three-light Romanesque windows over the main entrance, with minarets on each side, and truncated gable with a niche in which a representation of the Goddess of Harmony is to be placed. The principal entrance is by a flight of steps to a large vestibule, which leads through glass doors to a crush hall 65ft. by 12ft. Off the crush hall there are retiring-rooms and the stair leading to the gallery of the large hall. The hall will accommodate 1,200 persons. There will be a separate entrance to the platform from West Scotland Street, which can also be used as an entrance to the lesser halls and library. Behind the platform of the large hall there will be a four-manual hydraulic organ with full pedal compass. The lesser hall will accommodate between 400 and 500 persons. The baths will not have so many noticeable features as the halls, only the north elevation being exposed. The swimming pond is 75ft. by 37ft., being 6ft. 9in. deep at the springboard end and 3ft. 6in. at the other. The interior will be lined with white brick, and the floor and passages with Italian mosaic, having panelled borders. Over the swimming pond there will be a large gallery for spectators. Mr. Donald Bruce, of Messrs. Bruce & Hay, Glasgow, the borough surveyor, is the architect of all the buildings.

The Library at Alassio, on the Italian Riviera, illustrated on this page, was erected at the sole expense of Commandatore Thomas Hanbury, of La Mertola, and presented by him to the community. It is erected of local stone, rough-cast, and covered with local grey slates. Mr. W. D. Caröe was the architect.



Engineering Notes.

A Bridge built in a Day.—The Great Eastern Railway Company have erected an iron bridge at Wickham Market Station in a single day. Steam cranes first of all threw two girders of 15 tons each across the metals, and the whole structure, weighing 50 tons, was finished within twenty-four hours.

Electric Tramways.—The Select Committee of the House of Commons, presided over by Sir John Kennaway, last week concluded the consideration of the London United Tramways Bill and heard the case of several water companies who sought special protection for the mains from the electrolytic action of stray currents from the electricity to be generated by the promoters. A great deal of expert evidence was given, and eventually the committee declined to grant the further protection sought by the petitioners, and passed the preamble of the Bill, and ordered it to be reported.

"Conduit Wiring Erection."—This is the title of a little book by Mr. L. M. Waterhouse, A.M.I.E.E., A.M.I.C.E., published recently by Messrs. S. Rentell & Co, Ltd., 2, Exeter Street, Strand, WC., price 2s. The author explains the "Simplex" system of steel conduits for the interior wiring of electric light and power installations. This system consists of a combination of enamelled or galvanised steel tubes and malleable cast-iron fittings and accessories. The conduits are made of selected steel strip, which is passed through a tube machine: they have a perfectly smooth interior. The book savours very much of the trade catalogue of the Simplex Steel Conduit Co., Ltd., and we do not commend the author or the publisher for producing it under a misrepresentation.

Standardising Iron and Steel Sections.—A committee has recently been appointed by the Institution of Civil Engineers, with the support of the Institutions of Mechanical Engineers and Naval Architects and of the Iron and Steel Institute, to consider the advisability of standardising the various kinds of iron and steel sections, and, if found advisable, then to consider and report as to the steps which should be taken to carry such standardisation into practice. The committee is composed as follows: Mr. James Mansergh, Pres.Inst.C.E., Sir Benjamin Baker, K.C.M.G., Sir John Wolfe-Barry, K.C.B., Sir Frederick Bramwell, Sir Douglas Fox, Mr. G. Ainsworth, Mr. William Dean, Mr. A. Denny, Mr. J. Allen McDonald, Mr. E. Windsor Richards, Mr. James Riley, Professor W. C. Unwin, F.R.S., and Dr. J. H. Tudsbery (hon. secretary). Mr. Leslie F. Robinson, M.Inst.C.E., of 28, Victoria Street, S.W., has been appointed secretary to this committee, which has already commenced its work by taking evidence tendered by engineers, manufacturers and contractors upon the subject of the inquiry.

Glasgow Water Supply.—The Corporation of Glasgow, during their annual inspection of Loch Katrine Waterworks, recently opened a new supply tunnel which practically doubles the flow of water to the city. The original undertaking was constructed under an Act of Parliament passed in 1855, and was opened by Queen Victoria in October, 1859. The first aqueduct and mains cost £1,268,663, and the extensions in the city £246,907, making in all £1,515,570. In 1885 another Act was obtained to increase the supply. The first aqueduct from Loch Katrine to the service reservoir at Milngavie is 25¾ miles in length; it is 8ft. wide by 8ft. high with arched roof, and is capable of discharging 40,000,000 gallons per day. The second aqueduct, which runs almost parallel with the first all the way from the loch to the service reservoirs, is 23½ miles in length; it is 12ft. wide by 9ft. high with arched roof where not lined with concrete, and 10ft. wide by 9ft. high with arched roof where lined with concrete; and is capable of discharging 70,000,000 gallons per day. The two aqueducts, taken together, are capable of discharging 110,000,000 gallons per day into the two service reservoirs, which are distant about seven miles from the city. This quantity of water would fill a canal 30ft. wide and 6ft. deep for 19 miles. The construction of the new aqueduct has taken from March, 1886, to June, 1901, to complete, or fifteen years. The Mugdock reservoir has a water surface of 62 acres and a capacity of 500,000,000 gallons; and the Craigmaddie reservoir has a water surface of 88 acres and a capacity of 700,000,000 gallons. Combined, these reservoirs contain twenty-four days' supply at the rate of 50,000,000 gallons per day. There are four lines of 36in. pipes from Mugdock reservoir and two lines of 36in. pipes from Craigmaddie reservoir. The cost of the new works is as follows: Reservoir, £316,600; aqueduct, £730,640; outlet works and raising loch, £40,731; lands and compensation, £93,727; engineering, £31,582—total, £1,213.280. The new mains from Craigmaddie cost £116,126.

Correspondence.

South Kensington Examinations.

To the Editor of THE BUILDERS' JOURNAL.

BIRKENHEAD.

SIR,—Referring to the solutions to this year's examination questions in the Elementary Stage of Building Construction given in your issue for June 12th, in the solution to question 6 (1) the sketch does not represent this joint rightly made, as the 4in. by 4in. piece is not shown properly housed; it is a notch cut across the timber. The recess or sinking is the housing; and the whole joint, a housed and tenoned joint. The 4in. by 3in. piece should be turned flat; it is shown correctly made on the plan and section (Fig. 1).

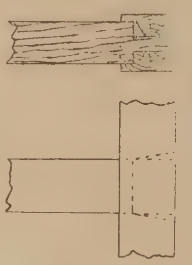


FIG. 1.

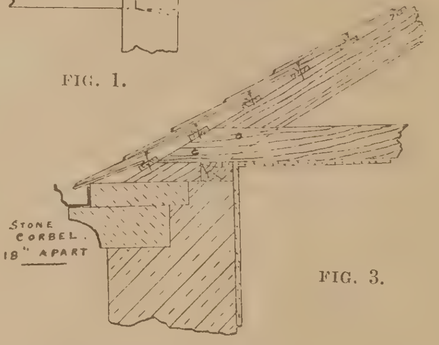

FIG. 3.

In the solution to question 8 the dotted line to represent the ends of the principal rafters is omitted from the illustration.

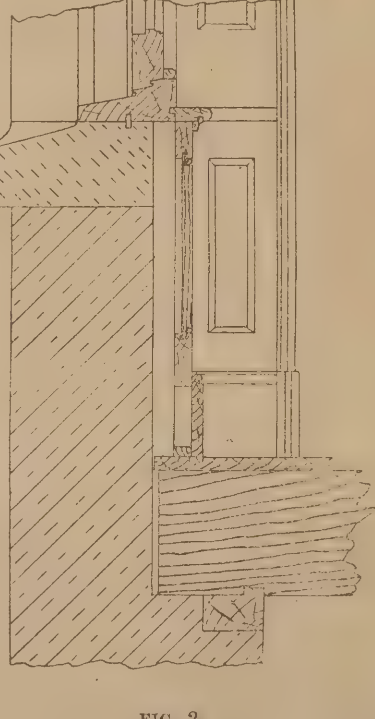

FIG. 2.

In the solution to question 9 the illustration shows the stone window sill to be about 20in. wide. This should not, nor would not, be so, as it would simply be a waste of material. There should be no 4½in. cavity between the wall of the recess and the window back, as this makes the panelled elbow and jamb-linings project into the room that distance. Also the metal tongue is omitted. The accompanying section, Fig. 2, shows these faults amended.

In the solution to question 10 some provision should be made for an eaves' spout, and, also, there is no need for the packing-piece under the ceiling joist, as they should rest upon the wall plate as shown in my section, Fig. 3.

In the solution to question 12 the walling is wrongly described as *coursed* rubble, whereas it should be described as *random* rubble built in courses, or, as generally given, built up to courses.
—Yours truly, JOHN W. HARRISON.

In regard to Mr. Harrison's intelligent criticisms, we have to say:—

Question 6 (1).—Some little latitude must be allowed in interpreting what is a "housed joint." Housing means when the whole of the end of the piece is let into the second piece: this is reasonably fulfilled in the illustration.

Question 8. The illustration would be more complete with a dotted line showing the abutment of the principal rafters.

Question 9. If this illustration is carefully examined it will be seen that the stone is dressed to have a lip inside the oak sill, and it is undoubtedly a better job than a narrow sill with a metal tongue. This small projection of the stone sill does not affect the projection of the *jamb-linings* into the room.

Questions 10. The eaves' gutter would rest upon ordinary iron brackets driven into the joint below the projecting course. As the wall plate has been laid, the ceiling joists are higher than to rest on it, and the packing-piece is consequently necessary, otherwise the weight of the ceiling would hang upon the nails. The solution shows the outside wall battened, which is not done by Mr. Harrison. It would be an improvement to show the end of the ceiling joist moderately dovetailed.

Question 12. There are certain to be some differences of definition in regard to rubble masonry, which varies in appearance with the numerous kinds of stones. The important point in the question is, of course, the order in which the stones are laid; the examiner would, no doubt, take any reasonable definition of the *class* of rubble. It must be remembered that the answer to a building question differs from an answer in arithmetic—there is more room for difference of opinion in building questions. An examiner will give more credit for an answer which is reasonably correct, and which shows direct observation and individual thought, than for a parrot-like repetition of a book answer.

Masters and Men.

The Yorkshire Master-Builders' Federation held a meeting of the executive recently, Mr. Longden (president), of Sheffield, in the chair. It was reported that the master-builders of Malton had joined the Federation, and steps were being taken to form a branch there. The meeting lasted nearly four hours, the principal subject of discussion being the Bradford dispute. The Federation unanimously decided to support Bradford and Shipley employers by every legitimate means during the dispute.

A Strike of Crieff Masons has occurred. The men desired that the agreement which had been in force with regard to the payment of 8d. an hour should be continued, but that the country allowance should be reduced from being given on three miles to being given on two miles. These terms should have come in force on the 1st June, but the masters refused to comply with them, and the operatives came out on strike. The masters offered 7½d. per hour, failing the acceptance of this, the matter to go to arbitration, and have since offered to compromise by giving 7¾d., but the men refuse to accept less than 8d. per hour. The men offer, on their part, to forego their demand as to country work.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Roof for Operating Theatre.

HOSPITAL writes: "Kindly explain the means adopted in the construction of a roof over an operating theatre, to ensure it being perfectly dust-proof and well ventilated and lighted. I enclose a sketch plan (not reproduced). What is the best kind of glass for glazing windows, lantern and underside of ceiling? Do you know of any book dealing fully with this subject?"

For reference in hospital construction, see Sir H. Burdett's "Hospitals and Asylums of the World" (B. T. Batsford, 94, High Holborn, £8 8s. nett); Sir Douglas Galton's "Healthy Hospitals" (Batsford, 8s. 6d.); Sir H. C. Burdett's "Cottage Hospitals" (Batsford, 8s. 6d.); and Sir R. Thorne-Thorne's "Hospitals for Infectious Diseases" (Batsford, 5s.) The plan given is rather an awkward shape to cover, but the best way seems to be to have an iron or steel truss (as shown at Fig. 3) across the room with half trusses (see Fig. 6) framed into it; and a slight modification of the outline as drawn will probably improve the appearance, namely, to make the ¾in. rods vertical and spread the feet of the struts to correspond. It will reduce the apparent heaviness near the junction. Fig. 1 shows frame diagram of main truss, Fig. 2 corresponding stress diagram, and Fig. 3 outlay of truss with scantlings marked. Fig. 4 shows elevation of half trusses, Fig. 5 corresponding stress diagram, and Fig. 6 elevation with scantlings marked. Fig. 7 shows the arrangement of trusses on plan. HENRY ADAMS.

New Streets.

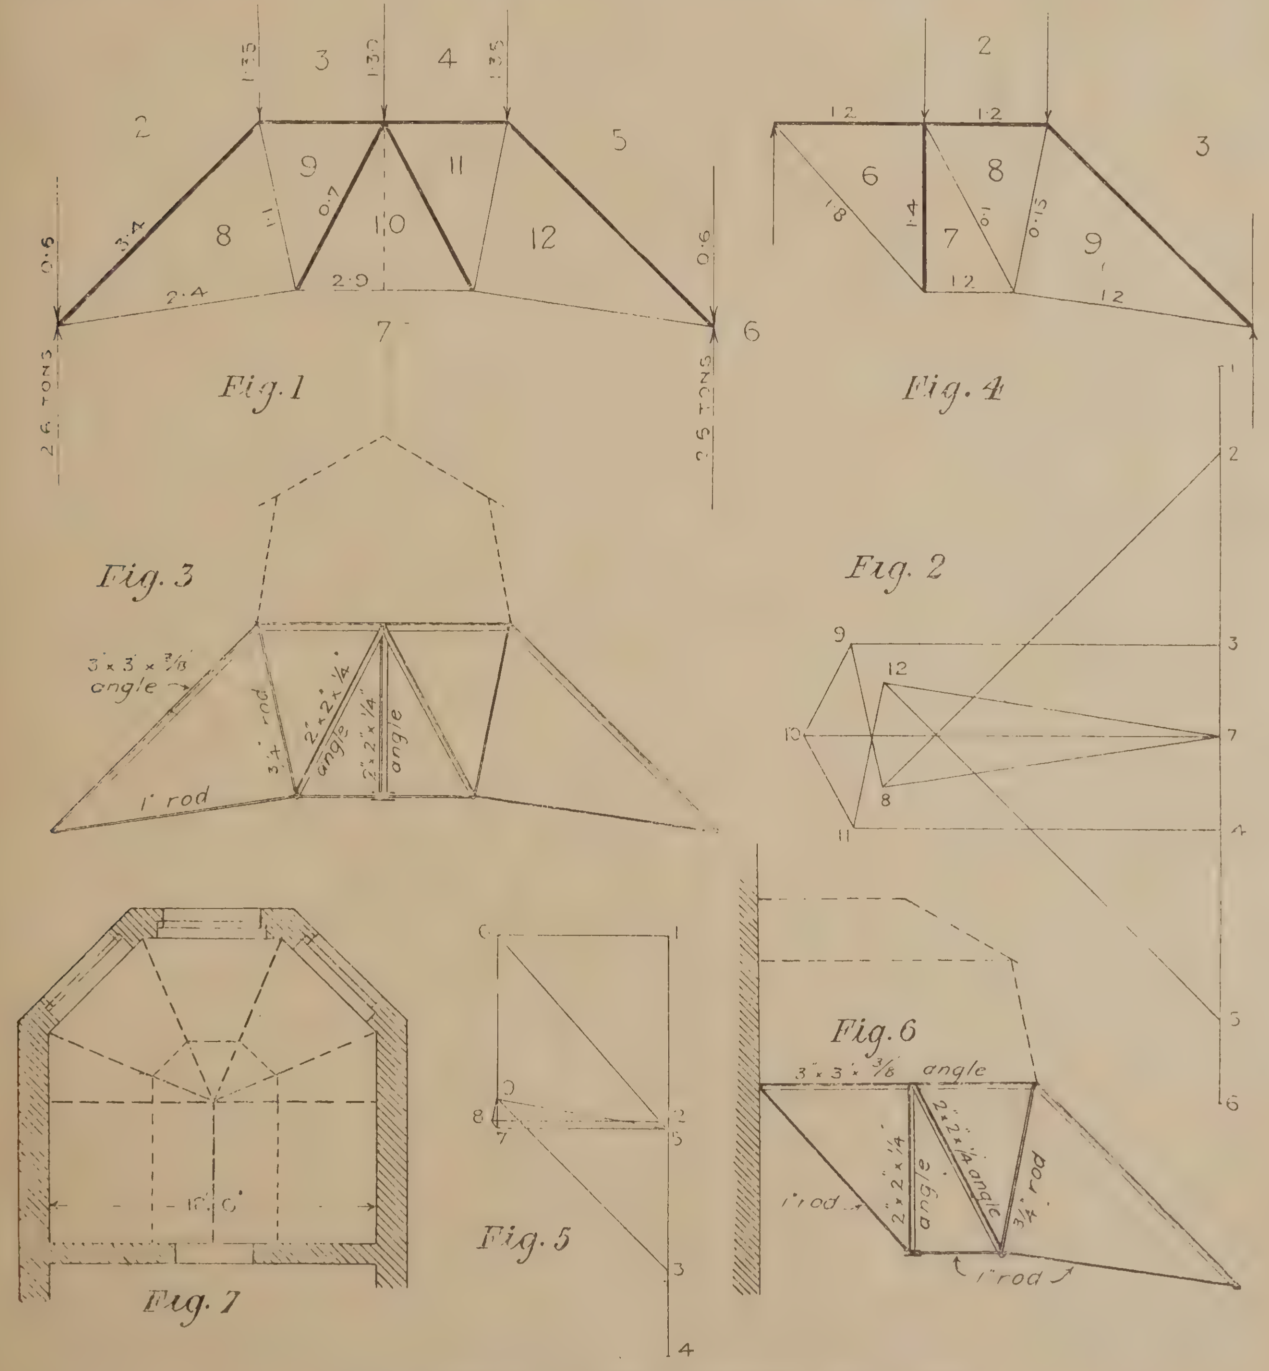
CARMARTHEN. — ONE IN DIFFICULTIES writes: "I own a field in a borough town, and in front of this field runs an old road 20ft. wide which has always been repaired by the ratepayers. I prepared plans for dwelling-houses to be built in this field, showing a 24ft. roadway in front at the required distance from the opposite side. These plans were presented to the council, but the clerk to that body ruled that they could not be built, as the building of such houses would be tantamount to the laying-out of a new street, and that the width of such new street must be 36ft., this being the specified width of all new streets according to the by-laws. What defines a new street? Was the town clerk correct in his ruling? If so, can I be compelled to give up the required 16ft. to make such new street?"

The town clerk is clearly wrong in his ruling. The best way out of the difficulty, however, seems to be to present the plans again, showing the old road 20ft. wide, but setting back the frontage line of the houses to an extent of at least 4ft., so as to leave a small forecourt. The old road cannot be converted into a new one by merely widening it. G. A. T. M.

Test for Arsenic in Wallpapers.

LONDON, S.W.—OXONIAN writes: "Is there any simple test for ascertaining whether there is arsenic in certain wallpapers?"

One of the best tests for detecting the presence of arsenic in wallpapers is as follows: Place some of the paper you wish to test in a clean flask containing some pure water, which boil; then insert some copper (which must be perfectly cleaned by dipping in strong hydrochloric acid for a second and then well washed in clean water), to which any arsenic present in the solution will at once fly, leaving a dark bluish-black iron-like stain on it. G. A. T. M.

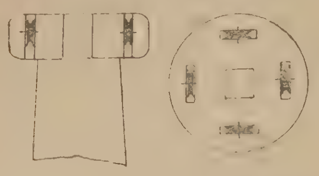


ROOF FOR OPERATING THEATRE. BY PROFESSOR HENRY ADAMS.

Flagstaffs.

NORTHAMPTON. — UNION JACK writes: "Which is the best way to fix a flagstaff; and what are the usual means for running up and lowering the flag on the gable? What wood is used for a staff from 20ft. to 30ft. in length?"

A flagstaff should consist of a carefully-selected Norway pine, free from knots and flaws, straight and well grown. It should have a diameter of from 2½in. to 3in. at the top. The method of fixing must depend largely on circumstances, but, to judge from querist's sketch, the pole may in this case be easily secured to the back of the gable by irons built into the brickwork at two or three points—the top one being as high as its proper fixing into the wall will allow. A footstep may be formed if desired by corbelling out two or three courses. Wire stays should be provided to a high pole, and in this case two such stays may be employed to anchor on to the main roof if thought necessary. The top of the pole is secured to the truck by a mortise joint, and the latter (which should be of a tough piece of flawless oak, elm or ash) is furnished with small (of 1in. or 1¼in. diameter) grooved pulleys (one for each flag it is desired to hoist) fixed vertically in slots carefully cut for their reception, and as shown on the accompanying sketch plan and section. Each slot is cut so as to just miss the staff, and the groove of the pulley is only just wide enough to take the line it is proposed to use. The halyards are not taken away when the flag is lowered, but remain on the pole, their lower ends being wound round cleats provided for the purpose. G. S. M.

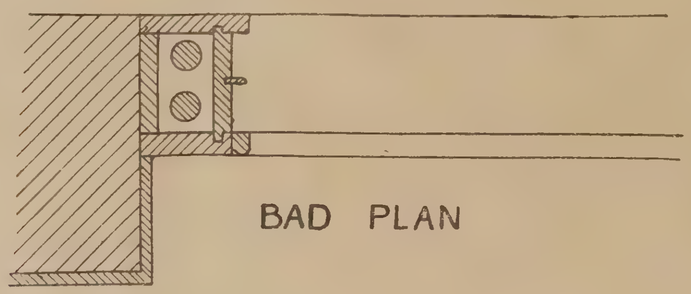


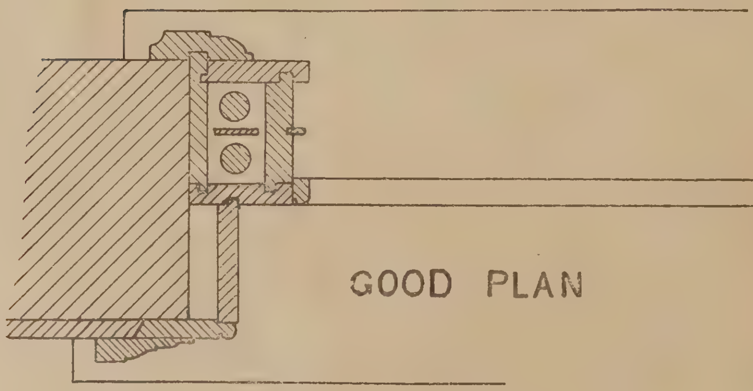
SECTION AND PLAN OF TRUCK FOR FLAGSTAFF.

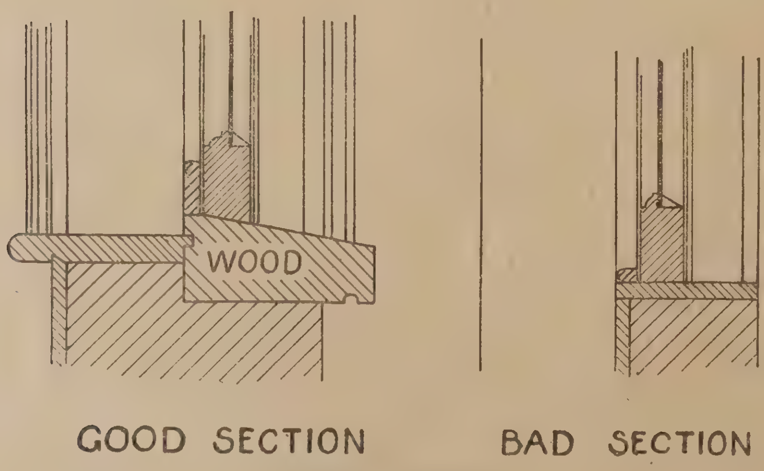
Good and Bad Frames for Windows.

LONDON, S.W.—OXONIAN writes: "Kindly show by sketches good and bad forms of window frames inserted in outside reveals flush, or nearly flush, with the brickwork. Please also state the technical name for those dark plum-coloured bricks, where they come from, and whether they are cheaper or dearer than ordinary red bricks."

The accompanying illustrations show good and bad forms of frames, both for casements and sashes. Dark plum-coloured bricks have no special technical name, beyond a description of their colour. Some of the best are made by Messrs. T. Lawrence & Co., Bracknell, Berks. G. A. T. M.







SECTIONS OF SASHES.

Measuring Lead Flashing to Chimney Stack.

BIRMINGHAM.—BRUM writes: "Kindly give the detailed dimensions which would be taken of the lead flashing to a brick chimney stack measuring, say, 5ft. up slope of roof by 2ft. 8in. It will be immaterial to me whether you assume there would be secret gutters at sides in conjunction with the stepped flashing, or whether the lead is dressed on top of the slates."

3 8
2 0 7 4 lbs. lead gutter.
Length of gutter - - 2 8
Add for ends - - 2/6in. 1 0
3 8
Width of gutter (say) - 0 6
Turn up roof („) - 1 0
Turn up wall - - 0 6
2 0

3 8
0 6 1 10 lbs. lead cover flashing.

3 8
1 0 3 8 lbs. lead apron flashing.
Length on slope - - 5 0
Add for ends - - 2/6in. 1 0
6 0

2/6 0
1 1 13 0 lbs. lead stepped flashing.

In a gutter of the length given, it is not often considered necessary to have a roll; if, however, one is shown the length of lead will be increased by 8in. for a 1½in. roll, and 10in. for a 2in. "No. 2 extra labour to bossed ends to roll" will also be required.

Granite Setts.

LONDON, E.C.—G. & G. write: "What is the usual price for granite setts for paving, kerbs and dock works, delivered either at works or f.o.b. at any British port? Also, what is the nominal measurement of setts as used in this country?"

The word "setts" has been used wrongly by our correspondents. "Setts" are squared, specially-worked, small blocks, described as 3in. by 4in. cube, or 4in. by 4in. cube, and their ordinary price is about 40s. to 45s. per ton. They are used for crossings and similar work. For roads and rougher work generally "pitchers" are used; these are not dressed so carefully as setts, and the usual sizes are about 5in. by 7in. or 3in. by 6in., by 9in. to 14in. long. The price of these is about 32s. per ton. Granite kerbs are usually 12in. by 6in. or 12in. by 8in., in pieces from 4ft. to 6ft. long, and their price is from 1s. 9d. to 2s. per ft. run. With regard to dock works, the enquiry is not clear; of course, for paving the same sizes would be used as for roads. "Spalls" are used for facing concrete blocks, being the large pieces chipped off in making the kerb. If blocks for facing dock walls are meant, the price would vary considerably with the amount of work put upon the face; the price for ordinary rough worked blocks would, however, be about 4s. per ft. cube. These prices are for Aberdeen granite on wharf in London; Norwegian, which is almost exclusively used for kerb, would be 3d. to 4d. per ft. run less. It will be understood that prices f.o.b. cannot be given in general terms, except for the ports from which the granite is shipped. As the quarries are mostly engaged in supplying all their output for shipment to the merchants, it would be somewhat futile to give the prices on ship for granite when the quotations must come through the merchants.

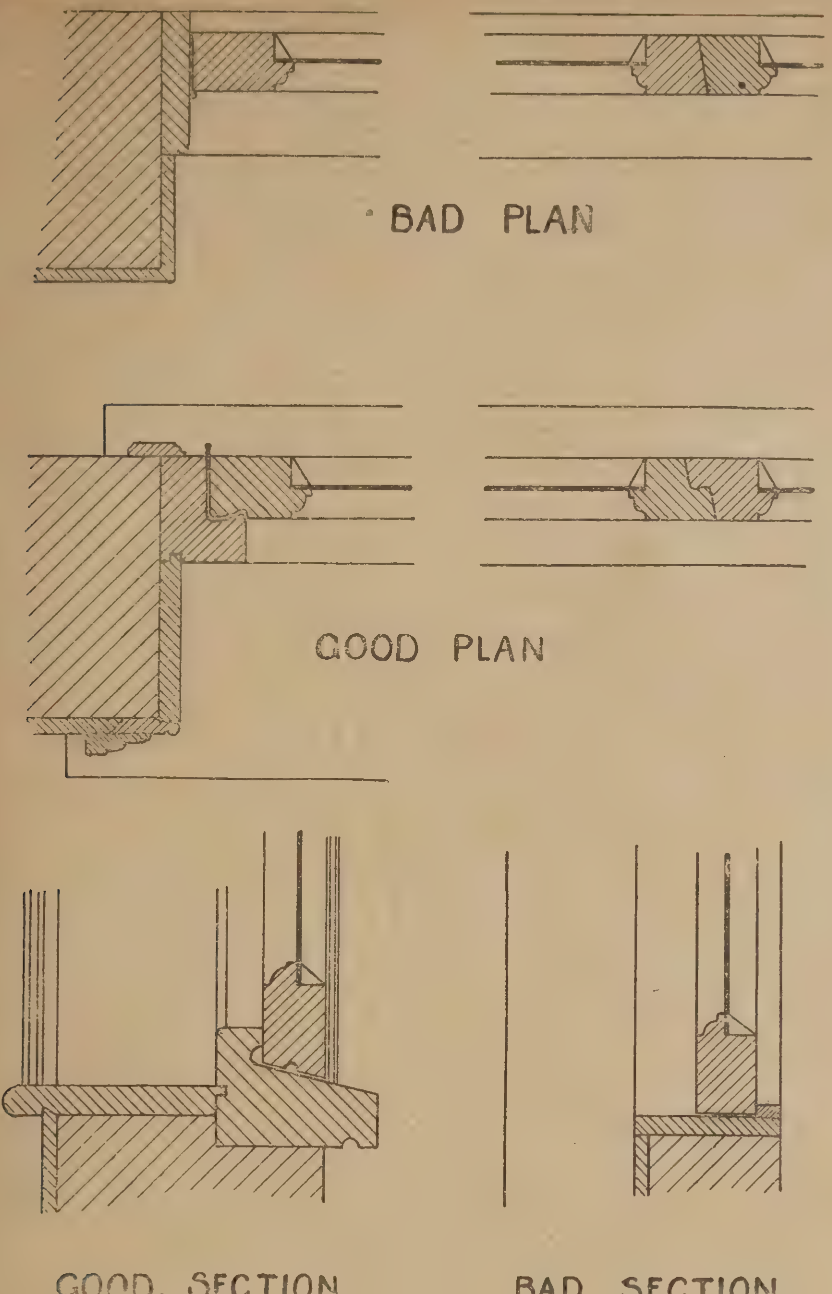
Answers to R.I.B.A. Examination Questions.

SUNDERLAND.—ENQUIRER writes: "In what numbers of the BUILDERS' JOURNAL do the answers to the R.I.B.A. examination questions for June, 1899, appear?"

The answers appeared in our issues for January 10th and 24th, 1900.

NEWCASTLE-ON-TYNE.—CLANON writes: "Kindly mention one or two books on mechanics, physics and geometrical drawing suitable to study for the R.I.B.A. examinations."

Stewart's "Lessons in Elementary Physics" (4s. 6d., Macmillan & Co.); Briggs' and Bryan's



SECTIONS OF CASEMENTS.

"Elementary Text-Book of Mechanics" (3s. 6d., W. B. Clive, 13, Booksellers' Row, Strand, W.C.); Angel's "Geometry" (Elementary Course, 1s. 6d., B. T. Batsford).

Books on Perspective, Surveying and Quantities.

EXMOUTH.—G. B. writes: "Where can I obtain books on architects' perspective, levelling and surveying, and quantities and quantity taking?"

"Architectural Perspective," by F. O. Ferguson, price 3s.; "Land Surveying and Levelling," by A. T. Walmisley, price 6s.; "Quantities and Quantity Taking," by W. E. Davis, price 3s. 6d. These can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C.

Concrete Water Tank.

BRIGHTON.—M. C. J. writes: "The concrete tank shown on the enclosed sketch (not reproduced) is intended to be built partly in the ground. It has walls 18in. thick at the top tapering to 3ft. at the base, with a bottom 2ft thick. (1) Are walls thick enough? (2) Should I have more than one cross wall? (3) Will a steel joist and concrete roof tend to throw out the walls, and if so, what method should I adopt to prevent such thrusting? (4) I purpose to use for the concrete, 3 parts of beach shingle, 2 of pit sand, and 1 of best quality cement: turned twice dry and twice wet. Can I better this? The walls and bottom will be rendered inside with 2 of sand to 1 of cement. (5) Are there any reference books for this kind of work?"

(1) Yes. (2) There is no necessity to have more than one cross wall. (3) Practically none. (4) The proportions named are good. They are often much inferior, shingle and cement alone being used in some cases. The walls and bottom, if they are to be watertight, must be left with a trowelled face and not floated, as ordinarily. There is no necessity for the iron rods at angles if the concrete is homogeneous and the bank of earth goes right round. This earth should be somewhat well tamped. (5) Rivington's "Notes on Building Construction," Vol. IV., gives the method of calculating the thickness of the walls and other particulars are given in another volume. Ransome's "Manual of Civil Engineering" and Tudsbery and Brightmore's "Waterworks Engineering" will also be found useful.

Use of Tufa in Buildings.

LONDON, S.E.—H. S. writes: "Referring to my previous query and the reply on p. 286 of your issue for May 15th, I am uncertain how to apply the information you give to the particular case. The building in question is St. Botolph's, Northfleet. I have been endeavouring to trace the earliest records of its erection, and wish to ascertain whether the use of a piece of tufa is any criterion as to the existence of an earlier building. From the information you have given me, I infer (perhaps wrongly) that a building may have been erected on the same site by the Romans, as they were accustomed to the use of the material mentioned."

We do not think you can argue much from the presence of a block of tufa in St. Botolph's, Northfleet. Our allusion to Rome in the previous answer was merely general, and it is quite wrong to infer that the Romans would take the trouble to search for tufa and bring it from a distance because it was used in the early buildings of Rome. The Romans knew how to work a finer-textured stone, and preferred it when they could get it, as is abundantly testified in their important buildings; indeed, they generally covered up the tufa, using it in foundations, &c. In civil buildings and engineering works in their provinces they mostly erected concrete structures, and it would, perhaps, argue something if this were found in an old building. The block of tufa (assuming that it is tufa) in St. Botolph's would appear to come from some distance, for we do not know of any of this stone being in the county. A geologist might be able to locate the place it came from by examination, but it might have been built in by anyone. Its weathering and working may give some evidence of its date.

Rural Building By-laws.

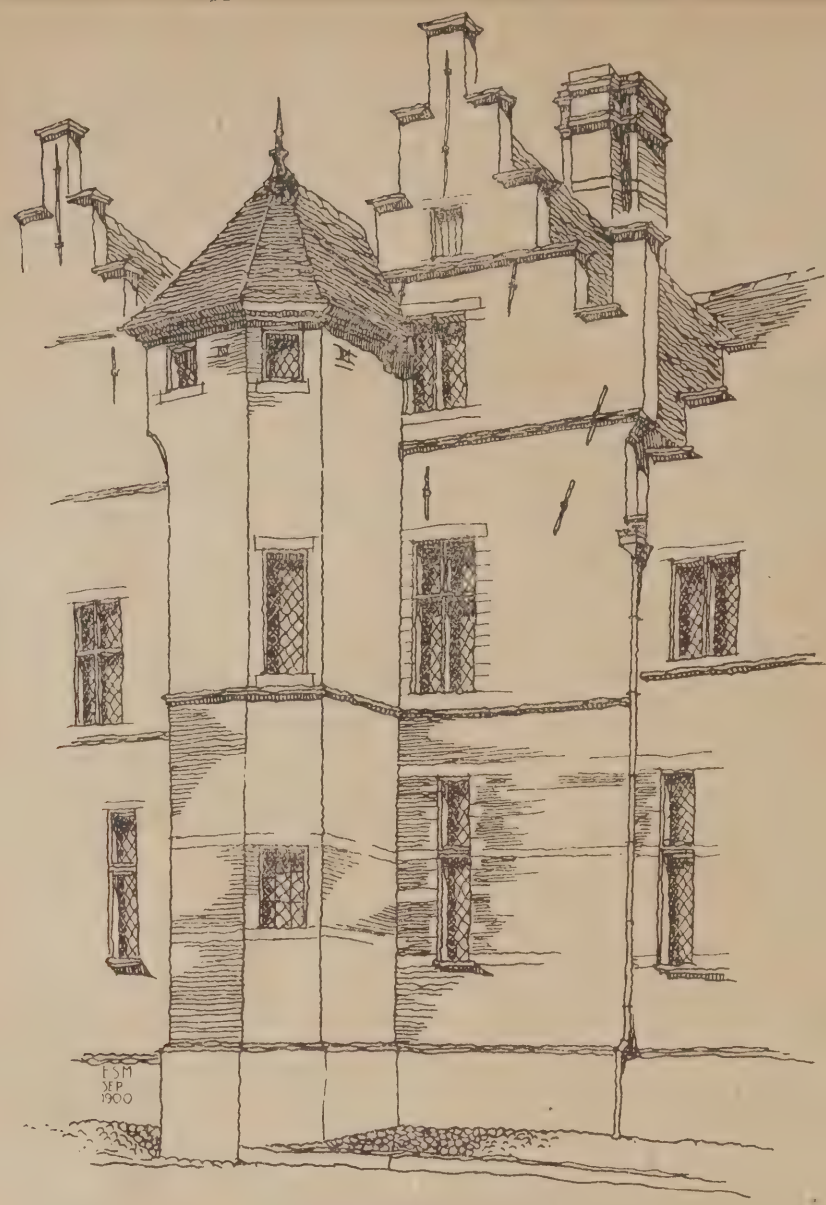
SCARBOROUGH.—H. M. C. writes: "Have any building by-laws for any rural districts been framed by any society, or have any books or articles been written on the subject?"

The matter has received the attention of the architectural societies for some time past; and, as the result of representations made to the Local Government Board, a revised series of by-laws for rural districts is at present being drawn up.

EXTENSION OF MONTROSE ASYLUM.

A NEW villa has just been completed on the Sunnyside Asylum grounds, Montrose. The building is situated at the back of the main block which originally formed the entire asylum, and is constructed so as to accommodate sixty inmate—males of the quiet, convalescent class, It is a substantial stone building of three storeys, the ground floor consisting of dayrooms, kitchen, bootroom and lavatories, while the upper floors are occupied by dormitories and bathroom. The first floor consists of three dormitories, a small one in the centre with six beds, and two larger ones on the east and west sides, each with twelve beds. On this floor over the lavatories and bootroom is a bathroom, with dressing-room and lavatory accommodation. The second floor has also three dormitories, containing in all thirty beds, and is exactly similar to the floor below minus the bathroom. The total cost of the villa with furnishings amounts to less than £115 per bed. The following had charge of the building during its construction: Architect, Mr. J. Sim, C.E., Montrose; plasterers, Mr. Archibald M. White & Son, Largo; joiners, Messrs. Fettis & Stephen, Montrose; plumbers, Messrs. C. Wood & Co., Montrose; plasterers and tilers, Messrs. Burness & Son, Montrose; slaters, Messrs. Brand & Son, Arbroath; heating and engineers, Mr. Robert Tindal, Aberdeen; electricians, Mr. James Maxwell & Son, Dundee; clerk of works, Mr. W. C. Orckney, Asylum. A lodge has been erected at the entrance from the road to Carnegie House, a building which was completed about two years ago, and erected for the purpose of accommodating private patients. The contractors for the lodge were: Builders, Messrs. Archibald M. White & Son, Largo; joiners, Messrs. John Raitt, Montrose; slaters, Messrs. John Wishart, Cauldhame, and Messrs. Lindsay & Son, Montrose; plasterer, Mr. James Bowman; plumber, Mr. J. L. Warden.

The Little Parc Monceau, on the northern heights of Paris, is becoming a rival in the way of statuary to the garden of the Luxembourg. Monuments of Maupassant and Ambroise Thomas, the composer of "Mignon," are already placed there, and before long statues of Gounod and Pailleron, author of "Le Mond où l'on s'ennuie," will be erected in the park.



PALAIS DE JUSTICE, MALINES.

Surveying and Sanitary Notes.

A New City Road.—The proposal to make a new road between West Smithfield and Cripplegate was discussed at a recent meeting of the City Corporation. An objection was raised that the cost, £872,000, was too heavy, but it was decided to print the committee's report.

New Open Space at Camberwell.—The Leyton Square public garden was opened recently. The ground is situated in a densely populated district near the Old Kent Road. The acquisition of the square as a public garden was suggested as far back as 1897, and the freehold was eventually acquired for £3,000, one-half of which was contributed by the London County Council and the remainder by the Camberwell Vestry. The grounds have been laid out by the Metropolitan Public Gardens Association at an approximate cost of £600.

Blackpool Promenade Widening.—A start on the widening of the Promenade at Blackpool is to be made as soon as the season is over. The current year's estimates allow for an expenditure of £60,000, and the surveyor, Mr. Brodie, contemplates spending £15,000 per month during the winter. South of the Victoria Pier a widened promenade has already been made, and this will be continued northward, but whether this will be 60ft. or 100ft. wide has not been settled, though the original idea when Parliamentary powers were obtained was that it should be 60ft., and the estimated cost is £300,000. It is now claimed, however, that for a little extra expenditure the 100ft. could be secured. The slope of the hulking has not yet been determined, though it will be constructed on basaltic stone, a large quantity of which has already arrived. The new promenade will have a double tramway along the whole length, but it is expected to take about four or five years to complete.

Roads Improvement Association.—At the council meeting of this association recently it was resolved to proceed with the objections to the Middlesex light railway scheme before the Board of Trade with a view to securing that the roads along which it is intended to lay the light railway should be widened to a greater extent than is proposed, and the insertion of safeguards for the efficient up-keep of the surface of the roads. It was also resolved to move certain amendments to the Light Railway Bill now before the House of Commons, with a view of more adequately protecting the interests of the general body of road-users. The report of the Royal Commission on Local Taxation was considered, and the following resolution unanimously adopted: "That the council of the Roads Improvement Association cordially approves of the recommendations of the Royal Commission on Local Taxation that one-half of the cost of main roads in England and Wales shall be borne by the State, provided that the Imperial grant shall be made dependent on compliance with conditions designed to secure efficiency, and trusts that His Majesty's Government will give effect to the recommendation at an early date."

Adams's Patent Sewage Lift.—Some sewage lifts at Broadway, Douglas, Isle of Man, were tested recently by the borough surveyor, Mr. A. E. Prescott in the presence of Mr. S. H. Adams, of New York, the inventor of the lift. These lifts are intended to raise the low level sewage into the high level sewer on the Crescent Road. The lift is worked by falling sewage from the high level district coming from Victoria Road, Upper Broadway, and Upper Derby Road districts, which discharges into an air chamber, thus displacing the air which is already encased in two large iron cylinders some 17ft. 6in. long and 2ft. 6in. in diameter. The air is forced from these cylinders, and travels through 3in. diameter air mains, which are connected with the cylinders in the chamber, the cylinders being filled with sewage from the low level sewers 12in. in diameter. The air is forced into these cylinders, thereby ejecting the sewage through 10in. diameter rising mains into the ejector chamber, and thence through the high level gravitation sewer. The capacities of the cylinders are 400 gallons each, and when the duplicate apparatus is at work it is capable of lifting 8,000 gallons per hour. The test proved very satisfactory, water being lifted to a vertical height of 6ft. into the high level sewer. Now that the test has been found satisfactory, the borough surveyor intends to complete the house connections immediately on the high level, and also turn in the sewage from the top districts, namely, Derby Road and Upper Broadway. Four lifts are proposed to be eventually constructed at a total cost of about £3,500.

SKETCHES IN BELGIUM.

By E. STANLEY MITTON.

No country of an equivalent size appeals more forcibly to the antiquary, artist or architectural student than Belgium, with its many old buildings, picturesque "bits," and useful details. Another and important consideration to the man who cannot afford much time and expense in travelling is that these fragments can be gathered frequently and easily from buildings closely grouped together. The travelling is so cheap that one can go there and back, say for thirty days, for about £12, including railway expenses, hotels, &c. English is spoken nearly everywhere.

The Béguinage—which forms the subject of one of the accompanying illustrations—was founded in the thirteenth century, and is at the south-west end of the old town of Bruges. The low whitewashed houses surround a court shaded by lofty trees. The church is of fairly plain design, and was erected in 1245 and rebuilt in 1605. Of all the cities of Belgium, Bruges has best preserved its mediæval characteristics. Except the quarter between the large market place and the railway station, the town now presents a dull and deserted appearance. Nearly one-fourth of the 48,200 inhabitants are said to be paupers. The city was long the residence of the court of Flanders. It reached the culminating point of its prosperity during the first half of the thirteenth century, when the Dukes of Burgundy held their court there. During this period a brilliant colony of artists was retained at Bruges in busy employment, and their works still shed a lustre on the name of the city.

The ancient town of Malines, notwithstanding its broad and regular streets, handsome squares and fine buildings, is a dull place, and totally destitute of the brisk traffic which enlivens most of the principal Belgian towns.

The quietness of the town forms a strong contrast to the busy scenes at the station, which is the focus of several of the important railways in Belgium. The cathedral of St. Rombold is of course the principal sight to be seen; the grand tower, with its large clock, was begun at the end of the twelfth century and completed about 1300. The face of the clock is 49ft. in diameter. The Palais de Justice, or rather Tribunal (a sketch of one of the entrances was published on page 247 of the Builders' Journal for May 1st last), consists of a picturesque assemblage of buildings built in brick and stone. The building has been skilfully restored by Blomme of Antwerp, and contains some fine chimneypieces and other interesting works of art.

Views & Reviews.

A Stupendous Muddle.

The Workmen's Compensation Act of 1897 has proved to be one of the most incongruous of our enactments, and for this reason it has justly been attacked innumerable times both by laymen and by judges of high repute. This book is an addition to the literature on the subject, but it differs from others in being an attempt to look at the matter from the business man's point of view, not pretending to deal with it from the legal standpoint. It is a plea for the revision of the Act. The author says: "Of course, it was expected that there would be a certain amount of litigation before the Act was found workable, but it was never anticipated that there would have been so many litigious points raised, and so much ambiguity as to the meaning of the various sections." As Deputy Judge Pitt-Lewis said: "The draughtsman of the Act had left the judges to guess at what was meant." Under a sketch by "F. C. G.," that clever satirist, appeared the following: Workman (minus a leg): "What happened to me? Scaffolding gave way and I fell off the top of the house. Compensation, I didn't get a ha'porth—the lawyers said as how I didn't come within the Act, because the building was only 29ft. 11in. high." Workman (with crippled arm): "That's bad luck. I only fell a matter of 15ft., but I got £100 at last, after the lawyers had tried it three times. How was that? Well, they found the buildin' was just 30ft. 6in. high, and that brought me inside the Act, so they said. It's a rum Act, ain't it? There's poor Jack Hodge being buried to-day. He was killed on Mr. Smith's farm, and his widow don't get a farthing! How's that? Well, you see, he was only a agricultural labourer, and they don't count, according to the Act." This homely illustration could not be improved upon: it typifies the Act exactly. But the chief interest of this book is the plea for revision. It is undeniably apparent that the statute needs to be revised, both in the interest of employers and employed. "Whilst it is true that a large number of legal decisions have been obtained which, on the whole, tend to limit the liability of the employer, yet the fact remains that in nine cases out of ten the master never knows whether he is liable or not to pay compensation. . . . . What is the position of the workman under the Act? Originally it was thought that his position was an assured one, and that, provided that he was not guilty of wilful misconduct, he would receive half his weekly wages after the first fortnight, so long as the disability continued. At the present time, his position is very uncertain. . . . . Viewing the subject from the standpoint of the insurance companies, there is abundant evidence to prove that a thorough revision is necessary in order that rates may be put upon a satisfactory foundation. . . . . What is required is the sweeping away of all useless restrictions, and the enforcement of a measure embodying the principle of compensation for all accidents of occupation. But, in order to be acceptable to the employer, the scheme should be clear and simple in its wording, and the compensation should be limited in extent. . . . . What is wanted is rather to set things upon a purely business basis, with less dependence upon the lawyers." This is the case for revision, and we do not think it can be confuted. The Act—an experiment—has been tried and found wanting, and the sooner it is revised the better for all whom it affects.

"The Workmen's Compensation Act, 1897." By R. T. Thomson. London: Effingham Wilson, 11, Royal Exchange. Price 2s. 6d. nett.

English Cathedrals.

This little work is an itinery of the English cathedrals for the use of travellers. As originally written by Dr. Gilchrist, of Iowa University, U.S.A., it was intended especially for visitors from the United States; but with the idea that it would be equally useful to English tourists, as a companion to their "Cathedral Series" the publishers (Messrs. George Bell & Sons) placed the manuscript in the hands of the Rev. T. Perkins, rector of Turnworth, Blandford, and he has added at the head of each chapter a brief synopsis of the ecclesiastical character and architectural features of each cathedral church, and at the end has inserted the names of other buildings in the neighbourhood worth visiting: but the criticisms in general are wrong. The order taken begins with Liverpool, where the American tourist lands, and a complete circuit is made back again there. A useful map showing the position of the cathedral churches and a table of their comparative dimensions are given at the end of the book. The introductory chapter dealing with the architecture of the cathedrals is necessarily very brief and superficial, being intended to interest the general reader; still a section or two and some details showing the wonderful and logical methods of construction employed by the builders, and the orderly development of the architecture, might have been added to enhance the educative value of the book. The remarks respecting restoration are to the point, and we are glad to see every opportunity taken to dissipate the crass ignorance and almost criminal interference displayed by many clergymen and most laymen with regard to this matter. Altogether, the book is very ably produced, and should prove most useful to those for whom it is intended. We may remark that the price of Bell's "Cathedral Series" is now 1s. 6d. nett per volume, and of the "Handbooks to Continental Churches" 2s. 6d. per volume.

"An Itinery of the English Cathedrals for the Use of Travellers," compiled by James G. Gilchrist, A.M., M.D. Revised and edited, with an introduction on Cathedral Architecture, by the Rev. T. Perkins, M.A., F.R.A.S.; price 1s. 6d. nett. London: George Bell & Sons.

Whitstable.

This is the latest addition to Mr. Millgate's series of Kentish guides. In the author's words: "The architect and antiquary, although seeing perhaps little to interest them in the town, will find it a capital centre from which to visit some of the ancient buildings and churches which are scattered over the surrounding country"—such as Canterbury; Blean Church; Graveney Church; Hern Church; the ruins of St. Mary's Reculver; 'Tankerton Tower, the manorial residence of Whitstable, which has suffered much abuse at divers hands; All Saints' Church, dating from the end of the fifteenth century, but the object of "restorations" in 1846 and 1873–5; and old Seasalter Church, which was dismantled about 1844, in order that a "jumble of nearly all the stages of Gothic architecture" might arise. The iconoclast and the restorer have done great havoc among the quaint old churches of Kent, but this guide-book will be found of much interest to those visiting them.

"Guide to Whitstable." Published by W. F. Millgate, 21, Mortimer Street, Herne Bay, Kent; price 6d. Illustrated by B. O. Dexter and Frank Hart.

Scottish Ecclesiastical Architecture.

This small book upon Scottish cathedrals and abbeys is a very welcome addition to the series of books that have been published recently on the ecclesiastical architecture of England, Scotland, Wales and Ireland. Being only a small book, it is not, of course, to be compared with Messrs. MacGibbon and Ross's "Ecclesiastical Architecture of Scotland," but it serves a useful purpose in giving in a handy form a short survey of all the important buildings. An introduction to the book has been written by the Very Rev. R. Herbert Story, Principal of the University of Glasgow; and he, like the Rev. D. Butler, is solely concerned in his review with the general impressiveness of the buildings upon their archæological, historical and spiritual side, and he merely looks at the outside skin, as it were, and less at the muscle and bones of these old buildings. To architects the latter are, of course, the most important. The author carefully takes the various cathedrals, collegiate and parish churches, and monasteries in sections, and deals with each building separately. At the end there is a very useful general survey of Scottish mediæval architecture, being a list of buildings arranged under the heads of periods, a classification of some utility.

"Scottish Cathedrals and Abbeys." By Rev. D. Butler, M.A.; with an introduction by the Very Rev. R. Herbert Story, D.D., LL.D. London: Messrs. A. & C. Black, Soho Square, W.; price 1s. 6d. nett.

A COTTAGE IN THE BÉGUINAGE, BRUGES.

Law Cases.

Damages for Breach of Contract.—The case of *Drever* v. *Martin* was heard recently at the Northampton Assizes. This was a claim for work done and for damages for breach of contract at Kettering. The case of the plaintiff (a builder and contractor) was that the defendant was anxious to erect an arcade out of Gold Street, Kettering, on the site of a furniture shop and some old buildings. He spoke to the plaintiff, who drew out a rough sketch for an arcade. Ultimately, it was settled that the arcade should be built by the plaintiff according to plans to be produced by Mr. F. A. Palmer, architect, acting for the defendant. It was further arranged that the plaintiff should be the builder, and because there was a lot of material on the site it was considered best that there should be no tendering. The defendant promised to find all the material, the plaintiff was to do the building, and he was to have from the defendant, as his commission, 5 per cent. on the total outlay. All this was embodied in an agreement executed by the parties on December 14th, 1899. Mr. Palmer produced plans which the plaintiff estimated would cost £9,000. Owing to the plans having to be sanctioned by the Local Government Board, there was some delay in starting; plaintiff employed extra men to clear up his own work in order to begin on the defendant's work at the end of January or beginning of February, 1900. The defendant, however, in the end declined to have the work done at all. Plaintiff claimed damages £600, of which £136 was in respect of profit he would have made on the wages of three apprentices, and £150 for loss on purchase of extra plant and engaging extra workmen for the purpose of building the arcade. The jury found a verdict for the plaintiff, damages £25. Judgment accordingly, with costs.

The Repair of Bridges.—The case of the *Attorney-General* v. *Berkshire County Council* was recently heard in the Chancery Division of the High Court of Justice. This was an action in which the Cookham Rural District Council, who were also plaintiffs, sought to have it declared that the defendant council were liable to repair two bridges called Sell's Bridge and Crockford Bridge, in the parish of Waltham St. Lawrence, in the county of Berks. Mr. Justice Buckley, in his judgment, said that under the Statute of Bridges, passed in the reign of Henry VIII., the county was *prima facie* bound to repair bridges. An Act passed in 1803 provided that bridges thereafter built were not to be repaired at the expense of the county unless constructed to the satisfaction of the county surveyor. No evidence of the approval of the surveyor was forthcoming, but the plaintiffs said both bridges had been built before 1803. They had evidently been built about the same time, and on one of them there was a tablet bearing a date in the eighteenth century. Both bridges also appeared in a plan dated in 1815, and it seemed plain that both of them were built before 1803. The onus, therefore, lay on the defendants to prove that repairs had been executed by immemorial custom by someone else. There was no evidence that the county had ever repaired either bridge, and there was evidence that the parish had in and since 1869 occasionally spent small sums in repairs of the bridges. But that was not enough to show an immemorial custom; and there must be a declaration that the defendant council were liable to repair the bridges, and they must pay the costs of the action.

Signboards.—Mr. C. E. Hewlitt, an auctioneer's clerk, was passing certain premises in Leicester Square when an advertising signboard fell upon his head from a height of 60ft. He sustained a fractured skull, the vision of one eye was impaired, and there was a possibility that he might lose his sight. In the King's Bench Division last Wednesday he sued for damages for negligence. Defendants pleaded that the accident was the "act of God," as it was caused by an exceptionally high wind. The jury returned a verdict in favour of Mr. Hewlitt for £650 against the landlord only, but judgment was reserved for consideration on a point of law.

London Main Drainage.—The case of the *London County Council* v. *Board of Works for Lee District* came before the House of Lords on Thursday last. This was an appeal from an order of the Court of Appeal dismissing an appeal from a judgment of the Divisional Court. On the part of the respondents an application was made for a mandamus directing the County Council to carry out certain works in connection with the drainage at Charlton, in Kent. It appeared that the area in question, which was on the bank of the Thames, was below the level of the Trinity High-water Mark. It depended for its main drainage on the County Council's main southern outfall sewer, with which the local sewers vested in the respondents were necessarily connected, and it was said that the level at which this main sewer ran and its size was such as to render the efficiency of the drainage of the low-lying land by its means impossible. When the matter came before a Divisional Court, Mr. Justice Grantham was of opinion that the mandamus should go, and Mr. Justice Kennedy, who differed, withdrew his judgment as junior judge, with the result that judgment was given for the respondents, and this decision was affirmed by the Court of Appeal. Hence the present appeal. Mr. Cripps (for the appellants) said that, having regard to the views expressed by their lordships, there had been a consultation between Sir Alexander Binnie and his clients, with the result that a statement had been prepared which he believed was acceptable to Mr. Lawson Walton (counsel for the respondents). Sir A. Binnie's report, as adopted by the Council in 1899, was in process of being carried out, the scheme being practically that designed by Sir Benjamin Baker and Sir Alexander Binnie as the best means, under all the circumstances, of dealing with the sewage of London south of the Thames and preventing local floodings. Mr. Lawson Walton assenting to this view, the Lord Chancellor said that the result would be that the appeal would be allowed.

AT BRUGES.

House Owners and Road Repair.—On Thursday last in the King's Bench Division a Mr. Constad, owner of forty-eight houses in Chester Road, Edmonton, recovered £50 damages from the Edmonton Urban District Council. The Council, it appeared, placed notices on twelve of Mr. Constad's houses to the effect that any person living in the houses would be liable to a penalty of £5 a day. This, Mr. Constad said, had hindered the letting of the houses. The Council urged that the houses could not be let owing to the state of the road. They further sought to justify their action under a private Act of 1898. Their case, as indicated above, failed.

A Claim for Seats and Pews.—At the Essex Summer Assizes recently Charles E. Orfeur, builder and joinery manufacturer, of Colchester, brought an action against Messrs. Newman, Ltd., builders, of Norwood, to recover a sum of £145 for work done. The plaintiff arranged, at a cost of £245, to make for the defendants seats and pews for a new chapel at Harringay. These the plaintiff agreed to supply ready for fixing. He completed his contract before any payment was received from the defendants, although they stipulated to pay the plaintiff as the goods were delivered. No complaint was made as to the character of the seats supplied before they were finished and delivered; it was only after the plaintiff had several times

pressed for payment of his account that any complaint was made. Plaintiff received one payment of £100 on account, and that was only after a writ had been issued, and had to be stopped. After that, further pressure was brought to bear upon the defendants for payment of the remainder. For the defence, it was stated that the defendants sub-contracted for the work, the erection of the chapel being in the hands of other builders, Messrs. Thorn. The latter communicated to the defendants that some of the seats were too short and others too long, and, that, in consequence, 185 hours were spent in fitting them properly. They therefore claimed deductions from the defendants, who in turn considered they were entitled to make deductions to the extent of £44 from the plaintiff's bill. After a long hearing the jury gave a verdict for the full amount, and judgment was entered for the plaintiff with costs.

Bricks and Mortar.

APHORISM FOR THE WEEK

It is a horrid thing for a fond architect to find his monuments received in silence.

R. L. STEVENSON.

Our Plates. THE foundation stone of the north-west portion of the west front of the extension of the Edinburgh City Chambers was laid recently. It is several years ago since the plans by Mr. R. Morham, city architect, for the extension of the City Chambers were sanctioned. About £200,000 are to be spent on the extension and improvement of the buildings. The work has gone on in sections. Chief among these was that part on the west side of the Exchange, and extending westwards to Warristoun Close, in which the new burgh court-room, council refreshment-room and museum are situated. The portion now arranged for will be continued along Warristoun Close, and will have a frontage to Cockburn Street and the north. On that side it takes the place of the house known as the City Hotel; but the new building, which has a massive tower-like face, will be carried up to the height of the present City Chambers. Our illustration shows the Cockburn Street frontage. From the pavement at Cockburn Street, with which it will be brought into line, this block will rise to a height of about 120ft. The first and second storeys, which are in one, and the third, fourth and fifth, will be built in deep rusticated courses, each stage being pierced with three windows; on the sixth floor the windows have broken coigned architraves; there is an entresol with lozenge-shaped openings; and the seventh and eighth floors, also in one, are elaborately and decoratively treated with pilasters, those framing the central window also carrying a broken pediment. At the wall-head there is an open balustrade, and the front is finished off by a group of statuary. In the two top floors is placed the new council chamber—a hall 65ft. in length, 36ft. in breadth, with an average height of 25ft.—its area being nearly three times that of the present council chamber, which is altogether too small for the number of members now constituting the council. The new council chamber is the leading feature of the part of the scheme now being built, the estimates for which amount to between £15,000 and £16,000. Lifts will be provided from Cockburn Street to the various stages of this block, both for passengers and stores. The chief contracts have been secured by Messrs. Turner & Sons for the masonwork, and by Mr. Colin M'Andrew for the joinerwork; and it is hoped that the extension may be completed by the end of next year. It is intended that the block will be faced with Prudham stone. The other parts of Mr. Morham's design still to be executed include the extension of the whole of the north face of the present City Chambers to the line of Cockburn Street, and its extension southwards by Allan's Close, but this important contract has not yet been gone into. In the Renaissance style of architecture, it embraces dignified and telling features, including on the top storeys a central section with columns, cornice and pediment, with side towers and domes, the whole crowned with a grand central dome and lantern.—The three cottages at North Cheam for Mr. A. Brock were built with local red bricks and hanging tiles, and Broseley tile roofs, by Messrs. R. Jones & Son, builders, West Street, Sutton, Surrey. "Harcourt," Christchurch Park, Sutton, Surrey, was built for Mr. A. Hobdell, of red bricks for the walls on ground floor, and rough-cast on the first floor. The principle aimed at in the design was to produce a symmetrical elevation with a plan containing two reception-rooms, billiard-room, and large hall available as the third sitting-room. The work was carried out by Messrs. R. Jones & Son, of West Street, Sutton, Surrey. The designs for both the cottages and this house are by Mr. H. D. Searles Wood, F.R.I.B.A., of 157, Wool Exchange, Coleman Street, London, E.C.

Roman Finds at Windermere Waterhead. AT a recent meeting of the Westmorland and Cumberland Archæological Society at Carlisle, a paper on the recent Roman finds at Windermere Waterhead by Mr. H. S. Cowper was laid before the members. The finds were made last year in excavating for the new sewage works on the Borrans road near the Roman camp at Windermere Waterhead. Mr. Cowper pointed out that this camp in former times was probably well protected on all sides by bog or morass, except on the east, where the ground was a little higher and harder; and that there was some evidence that the Rothay ran close to the western rampart, so that the position of the "castrum" was a fairly strong one. The finds were, first, at a place 500ft. from the north-east angle of the camp, from which place for about 230ft. the workmen found pavement, upright posts and transverse beams. Further south, close to the same angle of the camp, more piles were discovered, and a mass of black material, which may have been the site of a smelting furnace, although the evidence of this is insufficient. Few relics were discovered, the most interesting being a well-made Roman bell of bronze, and a leaden sling bullet. Pottery in fragments also occurred in small quantities. Mr. Cowper is of opinion that the most northerly patch of piles and beams are part of a "corduroy" road of beams laid across the marsh. He pointed out that the three roads which are supposed to have approached Ambleside camp may all have joined somewhere about Rothay bridge, in order that one single way might be formed across the moss to the camp. From a strategic point of view such an approach would be a good one, because an enemy marching on the camp over such a road would have to pass under the rocky points immediately north of the camp, on which slingers, archers and catapults could be stationed, and that the road being laid on a bog, the attacking party could not leave it to rush the position. But it must remain for further finds to prove or disprove this suggested line, which with the present meagre evidences can only be tentative.

New Belfast Architectural Society. THE Secretary of the Royal Institute of British Architects have received the following communication from Sir Thomas Drew, F.R.H.A., P.R.I.A.I.: "I am glad to inform you that at length, after many difficulties, a society of respectable architects has been established for the north of Ireland. Heretofore, as you may be aware, the position of the profession of architecture in the important city of Belfast (with a population of 380,000) has been a scandal and discredit to the position of architects in the rest of the kingdom. I cannot say that the perfect chaos of professional practice and usage, and the indecencies of rivalries and competition for fees at any amount, and the low social standard of a large body practising as architects in Belfast, is at at end, or even that for years the status of the architect may be in line with other cities of the kingdom. A good beginning, however, has been made by an association of the better class of architects, and prevailing scandals of architectural practice will be checked by notoriety and publication of them at least. This society will, for the present, be affiliated to and in harmony in its by-laws with our Institute of Architects in Dublin, and will practically, until its mature existence is assured, be under the influence of the Royal Institute of British Architects, through ours over it as an Allied Society. The members of the new society has done me the honour to insist that I shall be first president of it in my native town, with Mr. W. I. Gilliland as a working vice-president and Mr. Fitzsimmons as secretary."

Vandalism in Rome. WHEN a part of the Tiber embankment broke up and fell into the river last November, a commission was appointed to inquire into the circumstances of the catastrophe, and to propose a remedy for the erosion of the embankment foundations by the current. The commission has now reported, and some of its members have had the effrontery to propose that the classical island of San Bartolomeo should be destroyed in order to make greater room for the water. Fortunately, this proposal has no chance of being adopted. Its authors are already being covered by a storm of abuse and ridicule. A similar spirit is, however, being shown with regard to the arrangement of Piazza Venezia so as to give a clear view of the colossal monument to Victor Emmanuel II. which, at a cost of £1,300,000, is being very slowly erected on one of the sides of the Capitol Hill. It was originally intended to erect a monument to Victor Emmanuel near the railway station, and a French artist won the competition for the design. Signor Depretis and his friends, however, listened to the outcry against the idea of a French artist being allowed to construct the monument, and in order to obtain a pretext for annulling the competition, he decided to place the monument on the Capitol Hill, where an Italian artist, Count Sacconi, has slowly been erecting a huge pile at a heavy cost for the last twenty years. Now the monument is well on its way towards completion, and in order to render it visible it has been decided to demolish the wing of the Palazzo Venezia, known as the Palazetto, and thus to mutilate the historic headquarters of the Venetian Republic in Rome. The site of the fine Palazzo Torlonia, which stands opposite to the Palazzo Venezia, and which also obstructs the view of the monument, has been bought up by speculators, who intend to build in place of the Palazzo Torlonia a new hotel by the side of the new thoroughfare which is to be opened. The speculators have so far yielded to public opinion as to put a few more tons of stone, instead of brick, into the facing of their hotel, but they intend to fill the basement with glaring shops where barbers, chemists, greengrocers, or jewellers may find a home. Pressure has been put on Count Guisso, Minister of Public Works, to prohibit this outrage to artistic decency.

Decoration of the Royal Exchange. THE chronological scheme adopted by the Gresham Committee for filling in the panels of the Royal Exchange with works of art is as follows: 1. The Ancient Britons and Phœnicians trading on the coast of Cornwall (given and painted by the late Lord Leighton). 2. Alfred the Great repairing the walls of the City in the ninth century. 3. William the Conqueror granting a charter to the citizens of London (painted by Mr. Seymour Lucas, R.A.). 4. William II. building the Tower of London. 5. Henry II.: Foundation of the Hospital of St. Thomas of Acon. 6. King John sealing Magna Charta (painted by Mr. E. Normand). 7. Scene of a Folkmote in St. Paul's Churchyard. 8. Edward II.: The famous *iter* at the Tower. 9. Edward III.: The entertainment of the Vintners' Company to the five kings. 10. Richard II.: The insurrection of Wat Tyler. 11. Henry IV.: Sir Richard Whittington's charities (painted by Mrs. E. Normand—Henrietta Rae). 12. Henry VI.: The Charter of Philip the Good, Duke of Burgundy, to the Merchant Adventurers, 1446. 13. Henry VI.: Marching of the trained bands to Barnet. 14. Subject not yet settled. 15. The award of Lord Mayor Bittlesdon in the dispute as to the precedence of the Merchant Taylors' and Skinners' Companies (to be painted by Mr. Abbey, R.A.). 16. The Crown offered to Richard III. at Baynard's Castle (painted by Mr. S. Goetze). 17. Foundation of St. Paul's School by Dean Colet, *temp.* Henry VII. 18. Elizabeth: The opening of the Royal Exchange (painted by Mr. E. Crofts, R.A.). 19. Charles I. demanding the five members at Guildhall (painted by Mr. Solomon J. Solomon, A.R.A.). 20. The Fire of London (painted by Mr. Stanhope Forbes, A.R.A.). 21. William III. and Mary: Founding of the Bank of England. 22. William IV: Opening new London Bridge. 23. Queen Victoria opening the third Royal Exchange (painted by Mr. Macbeth, A.R.A.). 24. Modern commerce (being painted by Mr. Brangwyn).

ARTIZANS' DWELLINGS AT BATH.

LAST week the Dowager Lady Tweedmouth opened the first section of the workmen's dwellings erected by the Bath City Council in the Dolemeads. The construction of these houses is only a portion of the improvements recently effected by the Corporation in this flood-visited district of the city. Along the riverside a number of dilapidated old habitations have been demolished, and an embankment built to the Avon, which has been given increased width at this point. Before sanctioning the demolition of these cottages the Local Government Board required that provision should be made to accommodate as many families as were disturbed, and the Council decided to purchase about an acre of garden ground in the Dolemeads, and on this to erect model dwellings. Objection was taken to the houses being placed in a spot which is the first to be inundated when the Avon overflows, but this was overcome by raising the site above the highest recorded flood, that of 1894. In order to do this, the city surveyor (Mr. C. R. Fortune) had tipped on the land about 13,500 loads of material. The expenditure on the work (for which the Whitehall authorities originally granted a loan) was £10,500, of which sum £1,550 was for the purchase of property. But, in addition to that, £3,470 has been expended in acquiring property so as to widen the approaches. All the money has not been laid out, for though a tender of £6,340 has been accepted for building forty houses, only sixteen are completed so far, and these were opened last week. They are on solid concrete foundations, with slate and bitumen damp-courses, and built of best brick. Each house provides on the ground floor a parlour, kitchen and offices, while over are three bedrooms. They are thoroughly well built. They vary slightly in dimensions, and the rents paid will be 5s. and 6s. 6d. weekly, there being a considerable demand for them at these figures. It is hoped that as opportunity occurs other sites in the Dolemeads will be secured and raised. Mr. Toogood is the contractor.

WAKEFIELD CATHEDRAL EXTENSION.

THE memorial stone of the extension of Wakefield Cathedral, which is to be built in memory of the late Bishop Walsham How, was recently laid by the Archbishop of Canterbury. The plans prepared by the late Mr. J. L. Pearson, shortly before his death, and confirmed by his son, Mr. Frank Pearson, provide for the extension of the chancel eastwards, adding to the length of the choir. There is in addition to be a retro-choir, the approach from which, and forming a continuation of it, will provide a chapel, and thus afford accommodation for morning and special services. The chancel aisles are to be extended to the same length as the retro-choir. This extension will take the form of north and south transepts, with eastern aisles. A chapter-house and some vestries are also to be provided underneath. The altar will be removed one bay eastward, and then it will be separated from the chapel by an altar screen. Under an arch on the north side of the sanctuary it is proposed to place a canopied tomb, with a recumbent effigy of the late Bishop How. The position of the bishop's throne and choir stalls will also be altered, and various other internal improvements effected. The whole of the work was originally estimated at £20,700; but, in addition to this being exceeded by £10,000, another £10,000 had to be expended in enlarging the site. Messrs. Armitage & Hodgson, of Leeds, who erected the County Hall at Wakefield, and more recently extended the West Riding Asylum at Wakefield, were fortunate in securing the contract for the Cathedral extension, and they have made fairly satisfactory progress with the masonry work of the new chapter-house and vestries.

The death is announced of Mr. Larner Sugden, F.R.I.B.A., of Leek and Hanley, at the age of fifty. His remains were cremated at the Manchester Crematorium.

Keystones.

The "Architect and Contract Reporter" has been formed into a limited liability company under the title of Gilbert Wood & Co., Ltd., with a share capital of £30,000.

A Monument of Hoche, the famous French general, has been erected on the Quiberon Peninsula. The statue is the work of Dalou, and represents the soldier standing on a rock in an attitude of melancholy looking out to sea.

The New St. John the Baptist's Church, Great Meols, was opened recently. It provides seating for about 250 persons, and the new church has been built so that it may be added to the school accommodation, with a classroom intervening.

An Equestrian Statue of Roland, Charlemagne's famous paladin, has been executed by the sculptor, Pierre Granet; and the inhabitants of Cambo-les-Bains have opened a public subscription for raising the money to purchase it. Cambo-les-Bains lies in the shadow of the great mountains where the paladin met death so heroically.

The New Blue Coat Hospital at Wavertree is to be erected from designs by Messrs. Briggs, Wolstenholme, Hobbs & Arnold Thornely, of 14, Castle Street, Liverpool. Mr. W. D. Caröe was the assessor in the competition, fourteen Liverpool architects being invited to compete, and four being selected for the final competition. The building is estimated to cost £90,000.

A New Workhouse that is not Wanted.—The Greenwich Guardians have decided that it is advisable to sell to some other body their new and, as yet, unoccupied workhouse, which was erected at Grove Park at a cost of about £250,000. It is stated that the present workhouse provides sufficient accommodation to meet all the requirements of the borough. Notice was given of a motion to appoint a deputation to the Local Government Board on the matter.

New Clock and Tower at Foxdale, I.M.—The dwellers in the mining village of Foxdale St. John's, I.M., have the honour of being the possessors of the first public monument erected to the memory of her late Majesty Queen Victoria in the United Kingdom. It consists of a clock tower 40ft. high, built of local stone with corner-pieces of concrete, and at the base has eight supporting buttresses. It has been designed by Mr. John Nicholls, engineer of the mine. The stonework has been done by the masons attached to the works. The clock has been supplied by Messrs. J. B. Joyce & Co., of Whitchurch, Salop.

The Berwickshire County Buildings at Duns are undergoing alterations and additions. The front elevation to Newtown Street is unchanged, and the new rooms and offices have been placed at the back. On the ground floor are offices for the sheriff clerk, a record-room, office for the county sanitary inspector, an additional room for the police, and two more cells. On the second floor the present court-room will become a county-council room, with an office adjoining for the county clerk. A new court room has been provided and furnished with a jury box. There are also rooms for the sheriff, procurator fiscal, law agents, jurors and witnesses, and an office for the county medical officer. The work will cost about £3,000.

West of Scotland Technical College.—At a meeting of the Governors of the Glasgow and West of Scotland Technical College recently, it was intimated that the donations to building fund now amounted to £85,500. The report from the special committee appointed to arrange for the selection of an architect for the new college buildings was considered, together with a detailed report from the board of studies upon the competitive designs for the new buildings, and a report from the measurers upon the areas shown in the various schemes and the probable cost of each. It was thereupon unanimously resolved, in accordance with the strong recommendation contained in the report from the board of studies, to approve the design submitted by Mr. David Barclay and to appoint him architect for the new buildings. Mr. Barclay's plan shows a floor area of about 144,000 sq. ft., and it is estimated that the cost of the building will be about £150,000.

A Stained-Glass Window at Chipping Sodbury parish church has been erected to the memory of the late Rev. J. P. F. Davidson, vicar of the parish for eleven years.

Society of Architects: Visit to Oxford.—The society proposes to hold its summer excursion this year at Oxford on Saturday, July 27th, under the leadership of Mr. N. W. Harrison, of Oxford. Members may introduce a limited number of friends, and ladies are specially invited. Those desirous of taking part in the excursion should send their names at once to the secretary (St. James's Hall, Piccadilly, W.). No excursion will be held unless at least twenty names are received.

Houses of Foreign Styles in Paris.—The scheme for the erection of houses *à l'Italienne* at the Champ de Mars has aroused the ire of Parisian architects and artists, and they have addressed a protest to the Municipal Council. It is urged, first, that the houses to be erected on the famous ground shall be constructed in the French style; secondly, that the trees to be planted shall be of French origin; and, thirdly, that the garden shall be designed not in the English but in the French fashion.

The Foundation of the Hospital of St. Thomas of Acon, which is to form the subject of one of the panels in the ambulatory of the Royal Exchange, was due to a sister of Beckett, who twenty years after his murder built a chapel and hospital of Augustine Friars close to Ironmonger Lane, on the site of the very house wherein he was born. The building derived its name from the fact that Beckett's mother was born at Acre. It was Henry VIII. who permitted the authorities to connect the building with the garden of Grocers' Hall by means of a gallery over Old Jewry.

Carving in Sledmere Church.—There has just been wrought at Sledmere Church, East Yorkshire, the last of a series of very elaborate diapers in stone. Last year saw those at the east end of the aisles completed; now the carvings at the end of the chancel are finished. The diapers at the north side are all square patterns, and embrace renderings of oak leaves and acorns, vine leaves and grapes, lilies, roses, etc., treated in the more or less conventional manner of the period, as well as some leaves which are entirely conventional in their treatment. The whole of the work has been designed and executed by Mr. John Baker, of Kennington, S.E., and he is now engaged upon another church at East Layton, which was built from plans by Mr. Mitchell in 1895.

A New Wesleyan Church at Tanfield, Bedale, was opened on Friday, June 21st, the architects being Messrs. W. J. Morley & Son, of Bradford. The building is of stone, in the Decorated style, with tower and spire. The interior woodwork of pews and open waggon-headed roof is of pitch-pine, and the tracery windows are fitted with tinted leaded lights, a special feature being a figured transept window, which has been made by Mr. W. Lazenby, of Bradford. Accommodation is provided for about 250 persons, and there is a choir vestry, and one for the minister, from which convenient access is gained to the pulpit. A band-room is provided at the rear of the church, and the old chapel adjoining the new premises will be used as a school.

New Masonic Halls at Motherwell are being erected in Hope Street jointly by the two local masonic lodges—namely, Lodge St. John Dalziel, No. 406, and Lodge Livingstone St. Andrews, No. 573. The building, which is estimated to cost £3,500, was designed by Mr. J. L. Cowan, architect, Glasgow, who was awarded the first prize in competition. It consists of three floors. On the top floor there is a lodge-room and smaller hall for friendly societies, &c.; on the second floor a large hall suitable for concerts, socials, &c., with purveyor buffet and kitchen and smoking-room; while on the ground floor is the main entrance hall, reading-room, dwelling-house, &c. The halls will be fitted up with electric light. The contractors for the work are: Mason, Alexander Sym, Motherwell; joiner, Thomas Miller, Motherwell; plasterwork, James Craig, Motherwell; plumber, John Alston, Motherwell; slater, James Thompson, Motherwell; heating apparatus, Mr. Hamilton, Glasgow; the work, Haddow, Forbes & Co., Glasgow.

Competition for the New Board School at Aldershot.—The designs of Mr. C. T. Coggin, A.R.I.B.A., of London, have been selected. The buildings are estimated to cost £12,000.

A New Wesleyan Church at Hindley has been erected at a cost of about £8,000 from designs by Messrs. Waddington & Son, of Manchester. The style is Romanesque, and it is built of dressed Rainforth stone.

Mr. William Scott, Soane Medallist and Travelling Student of the R.I.B.A., who has resided for some years in Italy, has been invested by the King of Italy with the Order of the Crown of Italy, a distinction which is rarely conferred on foreigners.

A New Volunteer Drill-Hall at Horncastle is being erected at the south-east corner of the Wong. The total cost of the new hall will be about £2,500. The building will comprise a hall 98ft. long by 38ft. wide, an orderly-room, armoury, officers'-room, sergeants'-room, men's recreation room, canteen, magazine and band-room. The contractors are Mr. J. S. Heath and Mr. G. Y. Pike, of Horncastle, and the architect is Mr. Butcher, of Spilsby.

Thanet Place, the last of the exclusively residential courts in Fleet Street, is about to fall under the hands of the housebreaker. The ten prim little houses, with the gargoyled doorways and with windows surmounted by delicately carved work, are in excellent preservation ; but the space just in front of the Law Courts is so valuable that three-storey dwellings cannot remain there. The court has only a narrow entrance, no wider than the doorway of a garden. The courtyard, however, is of considerable width. There Dr. Johnson lived, at No. 4.

New Baths at Northam have been erected. There was a difficulty as to tendering for the work, but Mr. Bennett, the borough engineer, undertook the construction. The estimate for the cost of the bath was £915 11s. 2d., but the actual cost was £909 3s. 1d. An ornamental cast-iron clock column over 45ft. high, with a three-dial clock, has also been erected, and, together with the foundations, have increased the total to £1.239 7s. 2d. The total length of the bath is 150ft. by 30ft. wide, with 6ft. 6in. of water at the deepest and 3ft. 3in. at the shallowest end. The bath contains when full, 133,000 gals., and can be emptied in twenty-five minutes, thus ensuring efficient cleansing.

Exeter Guildhall.—A detailed report of the repairs to Exeter Guildhall front last year, for the city records, has been presented by Mr. William Weir, who carried out the work at the instance of the Society for the Protection of Ancient Buildings. It reveals the very dangerous state of portions of the front prior to the restoration, and wonder is expressed that some had not collapsed. Mr. Weir, speaking of the pliant nature of Beer stone (with which the front is faced), says : "It lends itself under such a strain to bend like a piece of wood, as seen in the existing mullions and transoms of windows, some of which are quite bowed, and show no signs of a crack." The total cost of restoring the front was £1.250 16s., which was money well spent. While the front is a mixture of Italian Renaissance and Tudor, dating from 1593, the beautiful hall which it masks is Gothic, and more than a century older. On the site of the present front there formerly stood a chapel.

A New Wesleyan Chapel at Birkenshaw is being erected at Westgate Hill, from designs by Messrs. Walker & Collinson, of Bradford and Morcambe. The new building will be in Decorated Gothic style. There will be a spire 100ft. high. Pitch-faced delph wallstones, relieved by Ashlar, dressings and Guiseley sandstone, is the material to be used, and the roof is to be covered with green Westmorland slates. The congregation will be all on one level, and the building will accommodate 540 persons, but over a central vestibule there will be a small end gallery to seat about 100 scholars. In the nave and transepts the ceiling is to be trefoil in form, the lower part being of plaster filled in between wood ribs, and the upper arch of wood, divided into panels by mouldings and arched roof trusses. The chancel will be set with marble pavings and a pulpit of oak will rest on a stone base. All the woodwork will be of pitch-pine and the windows will have stone tracery heads, filled in with leaded lights. The total cost will amount to £6,500.

A Statue of Sir S. Waterlow has been erected in front of the Westminster City School in Palace Street S.W. It is by Mr. F. M. Taubman.

A New Baptist Chapel has been opened at Southend-on-Sea, in Anerley Road. It will seat 230 persons, and is built of red bricks with stone dressings and tracery windows. The roof is of red tiles. The architect is Mr. J. E. Lose, of Southend, and the builder Mr. S. Moss, of the same place.

Sir Alexander Binnie has resigned his position as engineer to the London County Council. Sir Alexander was appointed to the present post in 1890. From 1862 to 1866 he was engaged on Welsh railways, and from 1868 to 1874 in the Indian Public Works Department. In 1875 he was appointed engineer to the city of Bradford, which post he held up to the time of going to the L.C.C. His best known works are the Nagpore Waterworks, the Blackwall Tunnel, and the Bradford Waterworks.

A Wesleyan Church at Sudbury is being erected to accommodate 400 people, and the estimated cost, including site, is £2,500. Eventually it is projected to add a Church Sunday School, a Church parlour, and vestries, at a further cost of £1,500. The architects are Messrs. Gordon & Gunton, F.R.I.B.A., of London. The new chapel will be situated at the junction of North Street and Melford Road. The style adopted is Gothic of the sixteenth century. The structure will be built with flint walling and Bath-stone dressings. The plan of the building at present contemplated consists of a church with nave, transepts, chancel, organ chamber and minister's vestry. There are four entrances and exits, two of them, in the main street, being provided with porches. The builder is Mr. H. Feast, of Haddenham, Cambs.

The Horniman Museum, Library, and Gardens, situated at Forest Hill, S.E., and presented by Mr. F. J. Horniman, M.P., to the London County Council for the use and enjoyment of the people, was opened last Saturday. It is now ten years since Mr. Horniman afforded to the public the opportunity of inspecting the curiosities he has collected in the course of his travels, and they had attracted a large number of visitors. He has now provided a large and well-arranged museum, on which he has spent £40,000, for the accommodation of his collection, together with a library. In presenting this museum to the London County Council he has included in the gift his former residence, Surrey Mount, with grounds, and also six residences, with five and a half acres of ground, standing between the museum and Lordship Lane Station, and producing an income of about £600 a year. The museum itself is 280ft. long by 61ft. wide, with a superficial area of 16,500ft. The contents are of great variety and value.

Trade and Craft.

Tracing Cloth.

We have received a sample of the "Koh-i-Noor" tracing cloth from Messrs. L. & C. Hardtmuth, of 12, Golden Lane, E.C. This tracing cloth, of English manufacture, is of extremely fine texture, making an excellent surface for drawing. It is blue in colour, has a dull back, and is extraordinarily transparent, showing the lines and colours most clearly through it, a desideratum that is of very considerable importance (the majority of tracing papers and cloths are very unsatisfactory in this respect, causing the draughtsman to be continually pressing them close down on the original, and, where fine or obscured lines occur, often necessitating the removal of the tracing for the inspection of the original). The "Koh-i-Noor" paper takes wash and colour well, and should prove a great boon to those who are tired of the many inferior articles at present on the market. As an instance of the high estimation in which it is held, we may refer to a letter received by the manufacturers from the Chief Constructor in the United States Bureau of Construction and Repair, Navy Department, saying that the "Koh-i-Noor" tracing cloth had been used in the draughtmen's room of that bureau for six months and had given every satisfaction.

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**
FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages :

Premium, 1/-	**£250** for Permanent Total Disablement. **£2 10s. 0d.** per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages :

Ordinary Risks, Premium, £3/-/-	**£500** for Permanent Total Disablement. **£6** per week for Temporary Total Disablement.
Hazardous Risks, Premium, £3/10/-	**£1 10s.** per week for Temporary Partial Disablement. **£30** Annuity. **£3** per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

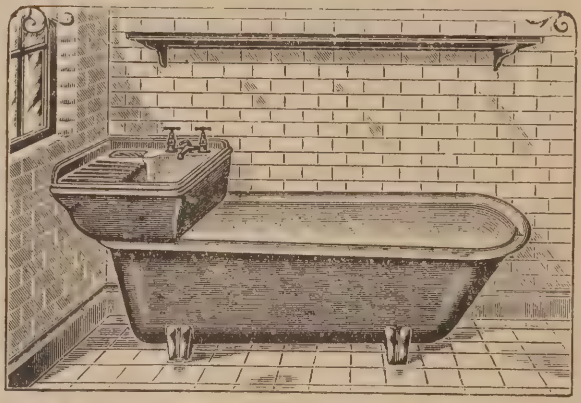
MORRISON & INGRAM'S
. . BATHS. . .



THE PATENT BRAMSTONE COMBINATION BATH & LAVATORY.

The success of the Bramstone combination justifies its introduction, and proves the need for the same.

It is now recognised that no house, however small, should be without bath and lavatory; and since an additional rental is needed of but 2d. per week to yield 5 per cent. on the outlay consequent upon the introduction of the cottage Bramstone Bath, this reform may now be deemed within the reach of all.

It affords economy of space, and a great saving of plumbing is effected.

Only one installation of hot and cold pipes required. It is also made for cold water only. Baths are made 5 ft., 5 ft. 6 in. and 6 ft. long. Prices from £3 11s. 8d. gross.

MAKERS OF ALL KINDS OF BATHS, LAVATORIES, WATER-CLOSETS, URINALS, SINKS, &c., &c.

Catalogues, Prices and Schemes of . . .
. . Sanitary Fittings supplied on application.

Property and Land Sales.

By order of the Mortgagee.

CHISWICK, W.—With possession.—In the centre of a thickly-populated and favourite residential district, just off an important main thoroughfare; 10 acres of Freehold Building Land, beautifully timbered and possessing a frontage of 900 ft. to Duke's Avenue, with its fine adornment of noble chestnut trees, and Barrowgate Road, affording an unrivalled opportunity for a successful building operation. Valuable beds of sand and gravel underlie portions of the Estate.

MESSRS. MATTHEWS, MATTHEWS, and GOODMAN will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Monday, July 22, 1901, at 2 o'clock precisely, in one lot, the very valuable FREEHOLD PROPERTY, known as Devonhurst, Duke's Avenue, Chiswick, comprising a noble mansion of modern construction, with fine suite of reception rooms, and 17 bed and dressing rooms, standing in its own grounds of about 10 acres.

Particulars, plan, and conditions of sale of Messrs. G. F. Hudson, Matthews, and Co., Solicitors, 32, Queen Victoria Street, E.C.; at the Mart, E.C; and, with orders to view, at the Auctioneer's Offices, as above.

To Builders, Speculators, and others is offered an excellent opportunity to acquire a very valuable Freehold Building Site in the heart of Walham Green.

Walham Green, S.W. — Close to Walham Green Station (District Railway) and Chelsea Station (West London Extension Railway).

MR. J. BURMAN ROSEVEAR is instructed to offer for SALE by AUCTION, at the Mart, Tokenhouse Yard, Lothbury, E.C., on TUESDAY, July 2, 1901, at 2 o'clock precisely, all that valuable and unique parcel of FREEHOLD BUILDING LAND situate in Harwood Road, Walham Green having a frontage to Harwood and More Park Roads of about 335 ft. by a depth in the centre of about 78 ft., and containing about 22,225 superficial feet. There being no restrictions on the land, the present forms an excellent opportunity of acquiring this valuable site for the erection of superior shops, with residential flats above. Three-fourths of the purchase-money may remain on mortgage at 4 per cent. Plans, particulars, and conditions of sale may be obtained of R. L. Butler, Esq., Solicitor, 70, Mark Lane, E.C.; of Mr. H. Eynon on the Estate; at the Mart; and of the Auctioneer, Pomona Auction and Estate Offices, 109, New King's Road, Fulham, S.W.

Capital £3,000 in £1 shares. The first directors are G. C. Ward, jun., and J. Judge (managing directors). Registered office: 2, St. Nicholas Buildings, Newcastle-on-Tyne.

Seaford West Company, Ltd.

Registered June 15th to acquire land, buildings, tenements and hereditaments in Sussex or elsewhere; in particular, to acquire certain lands and hereditaments in East Blatchington and Seaford; and to carry on the business of builders, decorators, contractors, carpenters, stone, sand, lime, cement, brick, timber and hardware merchants, paviors, land, house and property dealers, &c. Capital £24,000 in £1 shares. The first directors are R. Lambe, W. Lambe, T. Lambe and R. F. Lambe (all permanent).

William Brown & Co. (Ipswich), Ltd.

Registered June 17th to acquire the business of timber slate and coal merchants carried on at Ipswich and Woodbridge, Suffolk, by E. J. Brown, P. Brown and A. Brown, under the style of William Brown & Co., and to carry on the business (both wholesale and retail) of merchants of and dealers in timber, slate, tiles, stone, sand, lime, bricks, hardware, tar, plaster, cement and other building materials, &c. Capital £50,000 in £5 shares. The first directors are E. J. Brown (chairman), P. Brown and A. Brown. Registered office: Friars Road, Liverpool.

Bow Common Estate Company, Ltd.

Registered June 19th to acquire certain lands, messuages and hereditaments in the parish of St. Paul's, Stepney, devised by the will of the late William Cotton, and therein referred to as the Bow Common Estate; to lay out the same or any other lands acquired by the company for building purposes; and to carry on the business of builders, contractors, financiers, property owners and dealers, &c. Capital £112,000 in £10 shares. The first directors are A. B. Cotton, R. B. D. Acland and A. E. Cotton.

London and Provincial Estates Ltd.

Registered June 21st to carry on the business of land and estate owners, builders, contractors, surveyors, auctioneers, agents, brickmakers, &c. Capital £8,000 in £1 shares (4,000 five per cent. cumulative preference).

COMING EVENTS.

Saturday, July 6.

Northern Architectural Association.—Student's Sketching Club Excursions.

Tuesday, July 9, to Friday, July 12.

British Association of Waterworks Engineers.—Annual Meeting at Birkenhead. Inaugural Address by the President, Mr. W. A. Richardson, M.I.C.E. Mr. William Ingham, A.M.I.C.E., on "The Design, Construction and Cost of Service Reservoirs." Mr. William Watts on "The Pollution of Public Water Supplies." Mr. A. G. Cloake on "French Practice in the Manufacture of Cast Iron Pipes." Mr. William E. Plummer, M.A., F.R.A.S., on "Rainfall, the Cycle of Precipitation." Visits to various works in the neighbourhood.

Saturday, July 13.

Architectural Association.—Third Summer Visit to Medmenham Abbey, &c., and "Danesfield," both at Great Marlow, by permission of the Architect, Mr. W. H. Romaine-Walker.

THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD

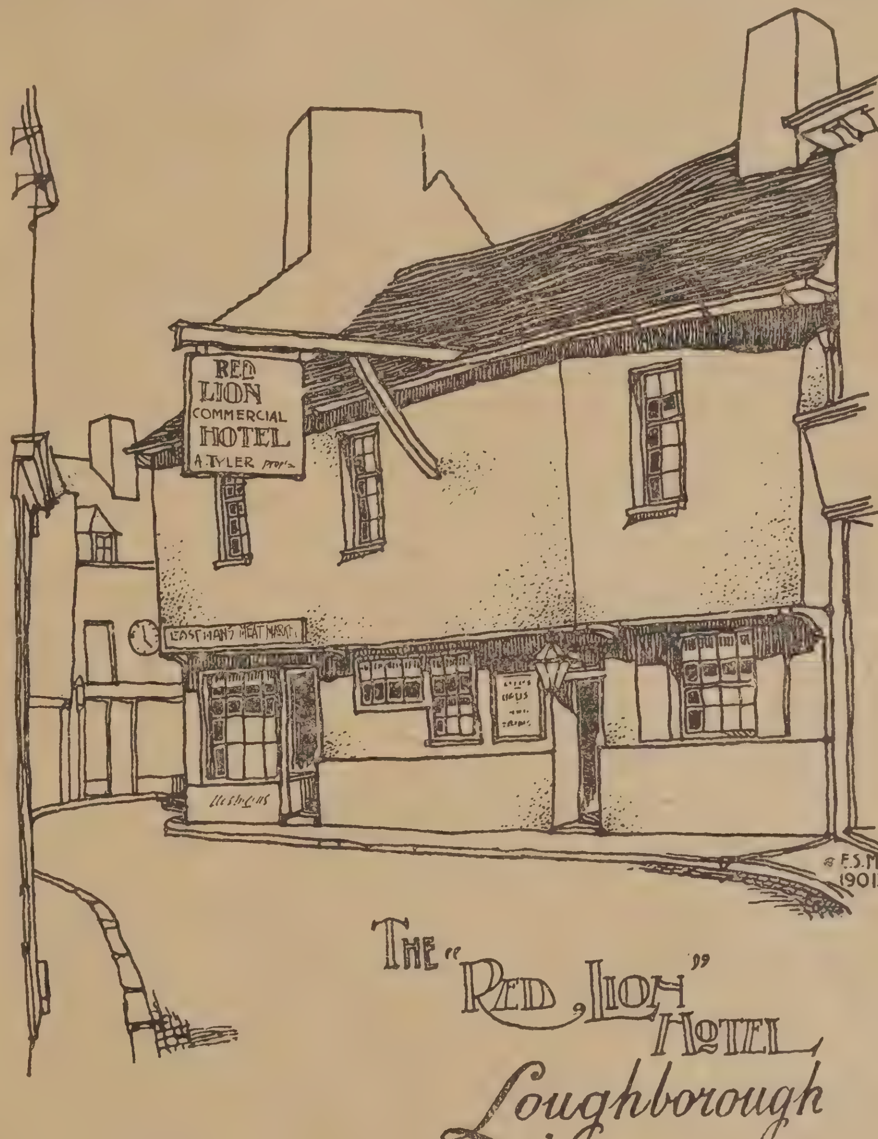
An Architectural Causerie.

A Further Protest. THE competition for the reconstruction of the Royal Infirmary at Glasgow has caused more dissatisfaction than any other recent competition. We have already given from time to time reports of what has taken place in connection with it, and this week we publish a copy of the letter sent to the Executive Committee by the Glasgow Institute of Architects further protesting against the conduct of those gentlemen who considered themselves better judges of architecture than Dr. Rowand Anderson, their assessor. It will, perhaps, be remembered that, as a set-off to the outcry raised against their decision, the Executive recently published an official statement, which, however, did nothing but confirm the opinion that the Committee had acted wrongly, a statement which drew from Dr. Rowand Anderson the stinging reply published on p. 362 of our issue for June 12th. The Glasgow Institute of Architects are now more than ever convinced that the plans as adopted "are in many vital particulars inadequate and out of date," and that if the reconstruction is proceeded with according to these plans the infirmary will not conform to the most modern standards of design in this class of building; they, therefore, urge the Executive to have the plans submitted to one or two independent authorities of standing for consideration and report, at the same time offering to pay for such expert opinion if it does not bear out their contention. For having worried the executive in this way the Glasgow Institute deserves much praise. The Committee have grossly blundered, but it is fortunate that someone is willing and zealous enough to continue to protest against their action till matters are remedied. We consider the Institute's offer a very reasonable and proper one, and we hope that the Executive will be wise enough to accept it. Competitions are only justifiable when conducted on equitable lines. When they are abused—like this one has been—they become intolerable.

Queer. ANOTHER complaint about a competition has reached us. Our correspondent states that a short time ago he sent in designs for a cottage hospital at Southwold. A few days afterwards they were returned by the secretary, who said that his committee had resolved to send back all plans as they did not comply with the conditions as to cost, no awards being made for the same reason. Our correspondent then wrote stating that his estimates had been under the supervision of a quantity surveyor, and asking the committee to allow him to submit a detailed estimate, in reply to which the secretary said that the competition had been closed and that other arrangements had been made for building the hospital, so that the proposal could not be entertained. With such insufficient data before us it is impossible to form a just estimate of the case, but the summary closing of the competition by the committee certainly seems to demand some explanation.

Sketch at Loughborough. LOUGHBOROUGH, about twelve miles from Leicester, is now a very busy centre for the leather trade, electrical works, &c., which mean employment for thousands of workmen; but these factories have quite spoiled the town—in fact, it now consists of rows and rows of dwelling-houses, all of similar design. Mr. E. Stanley Mitton, whose drawing of the "Red Lion" Inn we reproduce on this page, says: "One of the best buildings that have been erected of late is the bank in the Market Place. I believe the design was by Messrs. Goddard & Goddard, of Leicester. The chief feature of the town is of course the church, erected about 1500, which towers up out of the block surrounding it. The domestic work is very scattered. The 'Red Lion' is a fair example of old Loughborough: the quaint signs reach across the road in places. One gets a charming fragment down Woodgate; the thatched roofs and whitewashed walls, with half-timber construction mingled into one design, form a delightful group. Outside the town there is good sketching around Stamford."

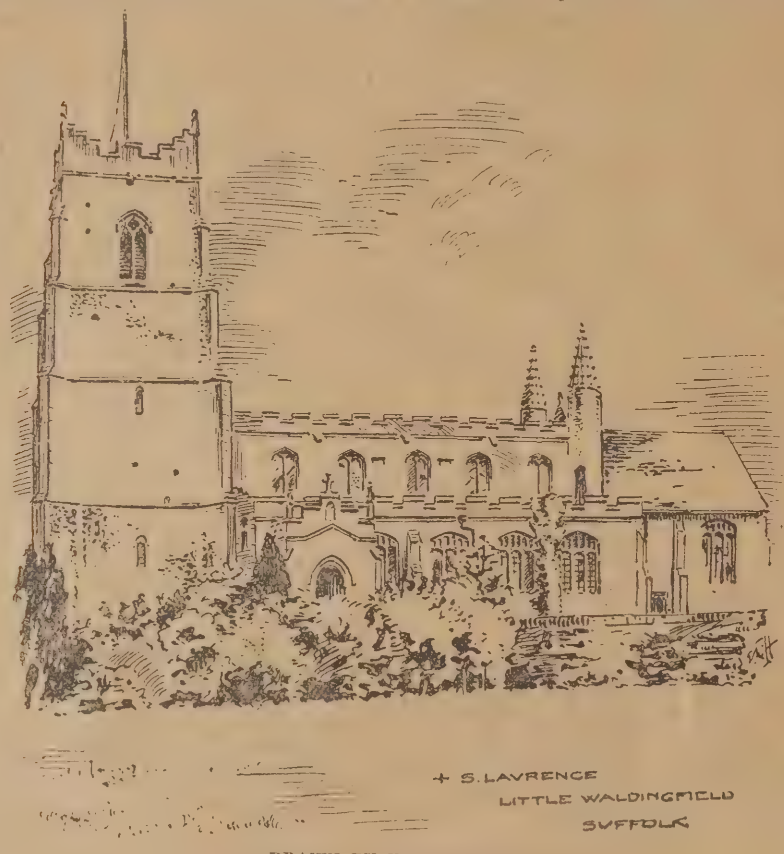


DRAWN BY E. STANLEY MITTON

Talk! Talk. A CERTAIN class of architects are never weary of talking of the evil practices of their fellow-workers. They are harsh critics indeed, and anyone who has not become hardened to their vapourings is bored to death and perhaps made despondent. These talkers are always looking for the motes in their brothers' eyes; but their chief offence is their hypocrisy, for in actual practice they have not the courage to follow the modes which they aver at public gatherings are the only true modes. No greater offender exists in the realm of architecture than the man who prates about things which he has not the slightest intention of putting into practice. There are men within our knowledge occupying prominent positions in the artistic and architectural world to-day (some of them charged with the duty of instructing the youth whom every president describes as the nucleus of a national style) who never practice what they preach—men who prate about truth in architecture and employ false half-timber construction; who hold up to scorn the architect that wickedly designs a building which he cannot personally superintend, yet err themselves in this respect on the very first occasion. We have had enough of their tattle. They weary us. What is needed is less talk and more work; less captious and rhetorical criticism of men who are trying to produce work of their own personality; less idealistic nonsense. Of ideals in architecture, as in socialism we have abundance. It is honest efforts towards realising them that we lack. When trade architects and the loquacious idealists see the folly of their extremes, and discard humbug for honesty, we shall see more beautiful buildings in our midst; but not till then.

LITTLE WALDINGFIELD CHURCH.

NOTHING is more characteristic of rural England, as it dwells in the memory of its people or presents itself to the Colonial or American rambler, than the country churches which lie far and wide in our villages, each a centrepiece to the picturesque cluster of tiled and thatched cottages whose own well-preserved age emphasises the cherished antiquity of the ecclesiastic building. A commercial age has somewhat militated against the extraordinary significance which the spire of the village church held in days when agricultural enterprise and the agricultural population was the base upon which the nation's strength and prosperity was built; but we still regard the country villages as the birthplace of England, and perhaps the changing ideals of the forefront of civilisation has added a certain preciousness to the true rural atmosphere, and has enhanced the general delight with which such scenes are viewed, and the untiring diligence with which the country village, unsophisticated by the implications of commerce, is sought out and made famous in the repute of holiday-makers and those who travel for pleasure and recreation.



DRAWN BY E. M. HICKS.

Little Waldingfield is just such an one of those retiring rural nooks which still lie undiscovered to the ordinary traveller; and its church is just such another of those fit and inconspicuous, though graceful and interesting, buildings, which characterise many of our villages; and in whose annals are embodied the traditions of the neighbourhood with the history of its inhabitants.

Little Waldingfield, with a population of some 400, lies among the pretty Suffolk lanes about four miles north-east of Sudbury. It has lately been shown that East Anglia is justified in the claims that natives have long loved to boast; and that of men and women whom posterity has proved to have been of conspicuous genius, a greatly disproportionate number are of East Anglian birth and origin. The fact that Thomas Gainsborough was born at Sudbury offers a reminder of this rare productiveness of the locality.

The road from Sudbury Station to Little Waldingfield reveals to the traveller the large market-place and parish church, which is only one of three interesting old churches in the place, and farther upon the way the church at Great Waldingfield is passed upon the left hand. A mile and a half further Little Waldingfield and its church reveal themselves. Of the church, which is illustrated in these pages by Mr. E. M. Hicks's sketches, there is not much to be said. In common with most Perpendicular buildings, and therefore in common with a large number of the village churches of Suffolk, a fine scale and good proportions are the most conspicuous features of the building. As is usual with churches of this period, and in particular with churches of an unassuming character, the roof of the building is low pitched with fine oak beams and rafters, which are perhaps none the worse for being devoid of the carving, colour and gilding which was sometimes so lavishly bestowed upon the timber roof of churches and halls of the period of the Perpendicular style. Unfortunately, the roof over the chancel is hidden by the lath and plaster of a later and uninspired taste, but the building has at least escaped the modern stained glass by which in these days any private person is allowed to perpetuate his own name under pretext of raising a memorial to a friend or relative. There has, indeed, been a window lately added, the work of a firm who have won a deservedly conspicuous place as designers and makers of modern church windows; but, except for this, the precious remnants of ancient stained glass which are scattered throughout the church have not been visited with any such ruthless treatment of restoration as has been dealt to its more ornate neighbour at Lavenham.

The altar and pulpit, which form the subject of two of Mr. Hicks's sketches, belong, as will be seen, to a later period than the church, and seem to owe their design to a homely rural appreciation of the designs of Elizabethan and Jacobean architects. There is also a reading-desk in this church of a similar design and craftsmanship, and there is one of those pleasing baluster altar-rails which, in a Gothic church, strikes the keynote of a new vogue which is rarely inharmonious. The chest and the door will be seen to belong to the years that raised the church with its battlemented caps, flat and somewhat coarse arch mouldings and attenuated labels. There was a priory attached to this church, which is now the rectory; but beyond a vaulted crypt below what was once the refectory, and glimpses of an open timber roof, there is little that recalls the Gothic origin of the building.

EXPERTS: A NEW CLASS.

THE technical expert holds a recognised place in the practice of architecture, which has become a much more complex business than it was in the century recently closed. As a necessary intermediary between the architect and the tradesman, the expert occupies a position that at one time was held by the foreman of the builder—say a carpenter or plumber. Any part of the construction that called for a more than usual amount of skill, such as the construction of a roof of wide span, or any ironwork, was left to the foreman to supervise, under the architect's general control, in the buildings of the day. We have now buildings in which the design, the structural work, the heating and sanitary arrangements, the electric wiring and light installations, hydraulic lifts, &c., are far beyond the acquirements of skilled mechanics. A new order of men possessing a higher standard of education, and who have been trained specially for these branches of construction, have arisen, to whom the architect has to trust special departments of his work.

May it not be worth while to consider the advantage or otherwise of the employment of experts in these special branches of construction, as colleagues or assistants of the architect? The late Sir Charles Barry and Sir Gilbert Scott engaged expert engineers to assist them in the design and construction of certain structural works, such as the great iron roof over St. Pancras Station of the Midland; and many of the principal iron roofs designed by architects have been supervised by experts. Sir Gilbert Scott called in Mr. Shields to assist him in the ironwork ties, &c., required in the restoration of Salisbury spire. For a building with a large roof of iron or steel construction, expert assistance in the supervision, and perhaps also in the design, appears absolutely necessary. We cannot expect the architect to know the proper size of sections for steel principals, struts or tie-rods; the best detail for a hinged joint, or for the seating of a long girder to allow for changes of temperature. Such details for a large span are better left to the structural engineer.

A building with complex ironwork affords a good opportunity for a division of skill and experience. The more complex the building, the greater is the need of expert supervision. A modern hotel with all the accessories of hydraulic-power lifts, electric lighting, sanitary fittings, and warming and ventilating arrangements; or an "up-to-date" theatre with fire-resisting appliances, hydraulic appliances for stage, fire extinction, ventilation, machinery, &c.; or a block of city offices fully equipped with the latest arrangements for warming, lighting and ventilating—is beyond the ordinary duties imposed on the architect. In the arrangement and details of these appliances he must seek the opinion and experience of the specialist, or leave them uncontrolled to the contractor or tradesmen. As the bricklayer, carpenter and mason require the guidance of the foreman, so the tradesmen who contract for the fixing of the hot-water pipes and apparatus, hydraulic-lifts or electric power and lighting installations naturally fall under the control and supervision of men who are experts in these branches.

Then there are the items of extra cost and labour to be considered. The engineering arrangements of public buildings like workhouses, asylums, hospitals, necessitate careful plans and estimates. The cold and hot water-supply, heating, lighting and power arrangements form, as we have been reminded, important items in the expenditure. Who will say that the architect is able to arrange these matters satisfactorily? Expert advice in the carrying out of the scheme would often make a considerable saving in the cost.—("American Architect.")

A New Jewish Synagogue at Brynmawr has been built on the Heathcock Tump, in Bailey Street, according to the plans of Mr. W. S. Williams, architect, of Tredegar, by Mr. John Jenkins, builder, Brynmawr, at a cost of £750. It comprises a classroom and ante-room in addition to the synagogue. It is seated with pitch pine, stained and varnished, and has a gallery at the west end for the female portion of the congregation. It is lighted by gas fittings with incandescent burners and shades erected by Mr. A. E. Webb, Brynmawr.

A LEADING FRENCH ARCHITECT —J. A. BOUVARD.

By RENÉ DE CUERS.

WHEN M. Alphand died the people of Paris experienced a thrill of sorrow with which was mingled a certain amount of anxiety as to who would venture to assume the onerous task of taking his place. Parisians still retained a vivid recollection of the wonders he had achieved in 1889, at the time of the Universal Exposition. It was he who drew, or supervised the drawing, of all the plans; it was his magic wand that caused buildings to spring up, galleries to extend themselves, and nearly 200 acres of bare ground to change into a veritable city—a city of which all the streets were gardens and all the houses palaces.

But the public were quickly reassured. It was known that M. Alphand had been wise enough and disinterested enough to train a number of pupils, not wishing, as some selfish men might have done, that his work should perish with him; and from the ranks of the army of devoted collaborators who had helped him in his gigantic and courageous enterprises there stood forth one name which met with almost unanimous approval—that of M. Bouvard. Rarely has a choice been more completely justified, as will be seen from the following account of the career of the talented architect who was chief of the Architectural Department of the Exposition of 1900.

M. Bouvard was born on February 19th, 1840, at Saint-Jean de Bournay, in the Department (County) of Isère, and became an orphan at the age of eleven years. Having entered the office of an architect of Vienne he soon acquired a passionate fondness for his art.

But the field of study which offered itself to him there was too limited, and, like all artists who desire to see and learn, he made his way to Paris, where he was admitted into the Ecole des Beaux-Arts. When he left that school he was the possessor of several first-class medals. One of his masters, M. Constant, detecting special aptitude in his youthful pupil, made a friend of him, and this valuable intimacy has had a happy influence upon his after-career.

In 1864 M. Bouvard entered the service of the city of Paris as conductor of the works of the church of St. Laurent, to which was then being added its present main doorway, in the Gothic style. Soon afterwards he took part, as Inspector of Works, in the erection of the new Town Hall at Belville, a district in the eastern part of Paris. During the war of 1870 M. Bouvard was in charge of all the works connected with the defence of the nineteenth and twentieth wards of the capital. But this participation in the struggle between France and Germany, however useful, did not seem to him sufficient, and, in the month of November, he left his post. which he considered too sedentary, in order to play a more active and more perilous part. He joined a company of foot and was wounded in the fight at Buzenval.

When peace came M. Bouvard wanted to resume his former position in the service of the city of Paris, but it was occupied. He was, therefore, obliged to wait. Under M. Constant Dufeux, he co-operated in the works at the Luxembourg Palace, and had immediate charge of the preparing of this edifice for use as municipal offices, the City Hall having been burnt down by the Communists in May, 1871. As a reward for these labours M. Bouvard was restored to his old position in the central administration of the city. From this period dates his connection with M. Alphand, who soon made him one of his most trusted auxiliaries, and from that time forward never failed to speak in the highest terms of M. Bouvard's activity and his talent as an architect.

When the Senate and the Chamber of Deputies quitted Versailles and returned to Paris the various services of the Prefecture of the Seine had to be transferred to the Tuileries, and it was again M. Bouvard who was entrusted with the fitting up of the portion that still remained of the former imperial residence. Within three weeks the Pavilion de Flore was ready to be used for its new purpose. This was a great feat, and the city government did not stint its praises to the skilful architect who had so cleverly rescued it from an awkward predicament.

These several pieces of work had not yet brought M. Bouvard in contact with the public, but the Exposition of 1878 provided him with an opportunity to draw attention to himself. Already, at Vienna in 1873, at London in the following year and at Brussels in 1876 the assistance rendered to M. Alphand by his lieutenant had been remarked, and expositions had almost become his specialty. Consequently, when, acting on the report of M. Viollet-le-Duc, the City of Paris determined to show visitors to the Exposition the machinery of its organisation in a special pavilion, M. Bouvard seemed to everybody to be the proper man to erect that edifice.

Having only a limited sum at his disposal M. Bouvard wisely confined his ambition to providing a good lodging for the city's exhibits. Nevertheless he constructed a pavilion which was sufficiently agreeable in appearance to save it from destruction when the Exposition came to an end. The City of Paris's building was dismounted piece by piece and reconstructed on the Champs Elysées, where it remained until torn down in order to clear the ground for the Exposition of 1900.

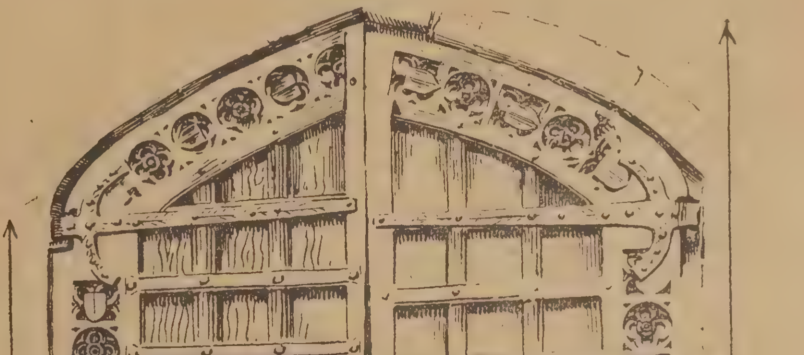
When the Primary Education Act was passed in 1882 M. Bouvard was charged with the duty of providing speedily the means to enforce it in the city of Paris. This afforded him an occasion to achieve another feat. In less than six months he built fifty-two temporary schools. Simultaneously with this pressing work our indefatigable architect undertook the erection of a large number of permanent schools which were planned according to a general programme based on considerations of economy, hygiene and pedagogy.

M. Bouvard's work is extremely varied, and he does not disdain any subject. Thus, besides the examples already mentioned and those described further on, we see him undertaking the reconstruction of the entrance gate of the Carnavalet Museum.

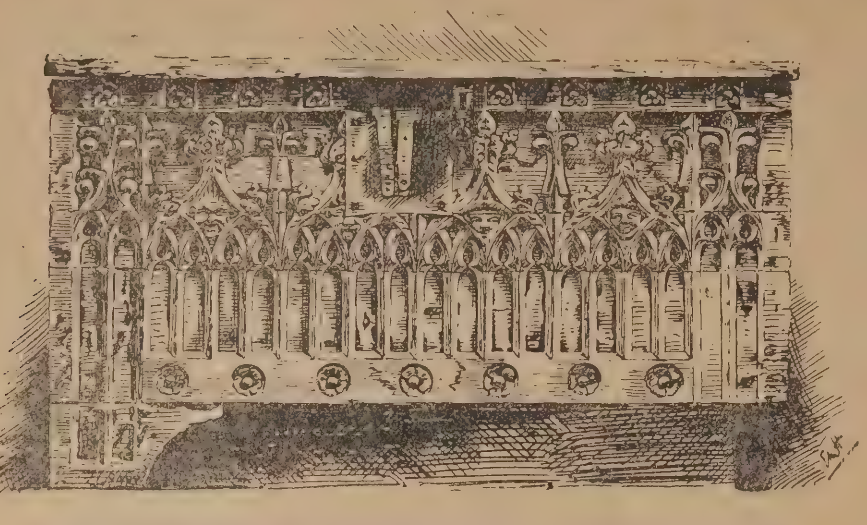
The old Carnavalet mansion, which was occupied for some years by Madame de Sévigné and her daughter, is the property of the city of Paris, which has transformed it into a museum intended to contain everything in the way of fragments of architecture, books, publications, and so forth bearing on the history of Paris. The entrance-gate having to be remade, the task was entrusted to M. Bouvard, whose work was especially delicate from the fact that it was necessary to keep close to the sentiment of a piece of architecture which is regarded as a model of its kind. Consequently, the congratulations he received were all the warmer when it was seen that he had coped successfully with the difficulties of the undertaking.

The Universal Exposition of 1889 furnished a further proof of the suppleness of M. Bouvard's talent, for there he was called upon, with the eyes of his master, M. Alphand, benevolently watching him, to design the Palace of Various Industries, and the much-admired central dome.

The latter presented a peculiarity worthy of notice. Instead of being lighted, as is customary, by a skylight turret, its upper part was solid, while its lower part was glazed between the trusses. Such an arrangement would be inapplicable to a stone edifice, but with metal it became both easy and rational. It had, moreover, the advantage of admitting daylight into the interior of the cupola under conditions which showed up its extreme lightness and set off its multi-coloured decoration in the best possible manner.



NORTH DOOR (INSIDE), LITTLE WALDINGFIELD CHURCH. DRAWN BY E. M. HICKS.



OLD CHEST, LITTLE WALDINGFIELD CHURCH. DRAWN BY E. M. HICKS.

In 1878 M. Bouvard had been created a Knight of the Legion of Honour, and for his central dome he was rewarded with the Officer's Cross in that distinguished order. It was a well-merited recompense for the industry of an architect who, while achieving such results at the Champs de Mars, had found time to construct at the other end of Paris an edifice which subsequently was destined to acquire great notoriety. We refer to the Bourse de Travail, which was founded by the municipal council for the use of working men's organisations, and which had afterwards to be closed by the Minister of the Interior, M. Charles Dupuy.

This establishment is situated near the Place de la République. It consists of an underground basement, a ground floor with partial entresol and five storeys above. Its length is 361·3 meters, and it is 40 meters in depth. The principal departments are grouped around a central courtyard, whence they receive light, the irregularities of the perimeter, which is bounded by party walls, being utilised for the subsidiary services, exit staircases, water-closets, air shafts, &c. Three large doors give access from the street to a spacious vestibule communicating with a gallery, which leads to all the ground floor offices and to the four staircases, by which the basement and the upper floors are reached. In the centre is the large glazed courtyard, arranged as a hall for holding big meetings. The principal rooms are so disposed as to allow them to be thrown into this hall when special mass-meetings are held.

This article would be incomplete if, before showing M. Bouvard in his role of decorator of the city and organiser of all the grand fêtes, we did not say just a word concerning the municipal disinfecting ovens which have been built after his plans, in the Rue des Récollets, near Saint Martin's Canal.

This establishment is arranged in a most ingenious manner, and the architect has strictly followed the programme laid down. There is a complete separation between the articles to be disinfected and those already purified. The establishment has two doors, one for bringing in the infected articles, opening on to the arrival courtyard, and the other for the removal of the disinfected articles, which opens on the departure courtyard. All contaminated articles that are transportable are brought to the stoves in air-tight conveyances. The articles are immediately disinfected and then carried back to the house whence they came in different conveyances and by different men from those which brought them. After each operation the conveyance used for transporting the infected articles undergoes disinfection.

It is certainly remarkable to see that an architect who is able to organize such a prosaic establishment as this, even its smallest details, is equally capable, when required, of transforming himself into a clever scene-setter and giving an artistic stamp to the embellishments (sometimes ephemeral ones) of the city. This invaluable aptitude has displayed itself on two occasions in particular, in the month of October, 1893, when the Russian Admiral Avellan came, and in 1896, when the Russian sovereigns visited Paris.

In 1893 it was a veritable scene from fairyland which presented itself to the countless multitude of people assembled in front of the Hôtel de Ville. Among the most pleasing of the motives were two ships, designed by M. Bouvard. They were flanked on the right and left by pylons supporting immense shields with the Russian arms on them. Around these pylons were maritime engines bearing commemorative inscriptions. On board these ships were orchestras and choirs, which discoursed an admirable programme of music while the banquet of 600 covers, presided over by M. Carnot, was taking place inside the Hôtel de Ville. At half a score of other points in Paris M. Bouvard gave proofs of the versatility of his imagination, and the luminous pylons which he installed on the Place de l'Opéra, near the Military Club, where the Russian officers were lodged, elicited unbounded admiration from the vast crowds which congregated at that spot.

In 1896 it was again at the Hôtel de Ville that M. Bouvard distinguished himself. He surpassed all his previous efforts by the magnificent display which he prepared for the occasion of the reception of the Russian rulers. Within the Hôtel de Ville there was an unprecedented profusion of lights and flowers. A grand staircase was improvised in the great central courtyard, in order that the illustrious visitors might proceed direct to the hall where stood the monumental vase presented to the city by the Tsar Alexander III. Outside M. Bouvard confined himself to garnishing the principal entrance with a rich awning, so as not to disfigure the fine facade of the edifice by overloading it with ornamentation. On the square, in front of the building, two hemicycles with elegantly designed colonnades were erected for the choirs. At the corners of the square rostral columns, with the city arms, and masts entwined with flowers and surmounted by the imperial eagle, completed the decoration.

Throughout Paris evidence is to be seen of his handiwork, sure and yet light. It is he who conceived the delightful notion of putting flowers around the trees at the Rond-Pont of the Champs-Elysées. The decoration of that avenue, the Place de la Concorde and the Terrace of the Tuileries were also effected by him.

The Government, urged by public opinion, not long ago set a new seal upon M. Bouvard's reputation by conferring on him the grade of Commander in the Legion of Honour. This is probably not the last distinction which will be bestowed on this gentleman, who, in the midst of his heavy labours, is always urbane and good-humoured.

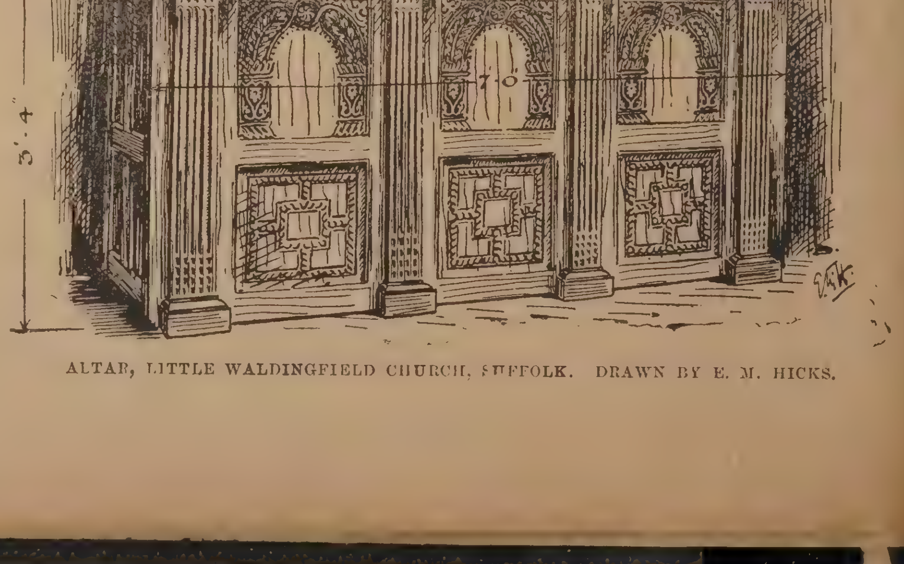
DOMESTIC ARCHITECTURE IN AMERICA.

By A Well-known American Architect.

SPEAKING of American domestic architecture Mr. Frank E. Mead, of the well-known firm of Philadelphia architects, Keen & Mead, says in "Carpentry and Building":—

The change in taste in country-home building is most marked and gratifying. There is at present a decided tendency to make the residence and its surroundings an artistic whole. This tendency has developed very recently. A few years ago the average home builder was content with a very ordinary house with ordinary accommodations. If there was any attempt at æsthetic adornment, it found expression in tasteless tinsel and hybrid decorations that bore no relation to the purposes of a home or any ideal of art.

This is all changed now. Every man who is building a country house wants the architect to embody artistic principles that are basic. He wants his house livable. He desires primarily to plan his house to fit its surroundings. He demands the combination of comfort, convenience and utility with a harmonious artistic effort. Dignity in simplicity is the keynote of the present tendency. It is the keynote of success in architecture, as it is in everything in life. This tendency is taking us back to the old Colonial principles in house construction And therein is being laid the foundation of a



ALTAR, LITTLE WALDINGFIELD CHURCH, SUFFOLK. DRAWN BY E. M. HICKS.

greater architecture than the world has known, with the possible exception of the Greek. Conditions in America are specially suited to such a development.

Natural Aids.

There is no more beautiful scenery in the world than you will find outside Philadelphia. The climate is equable. Practically everything grows—an important feature in the development of your architecture on lines of co-operation with nature. Every country house now wants its garden. The love of flowers demands concentrated organisation. Here is a decided reversion to old Colonial days. The best examples of floral development about the country house to-day are seen in quaint Colonial gardens, with winding paths, trim box rows, cool nooks and corners, flowers and shrubbery.

More attention is being given to the location of the house, so as to take advantage of environing scenery. Every detail of comfort and pleasure is worked out with exacting care. Bedchambers and living rooms must face south, or south-west, if possible, giving the fullest advantage of summer breezes and protection from the north winds in winter. The modern architect is no architect at all unless he is a landscape gardener as well.

A Reversal to Old Colonial Principles.

The new country house of Samuel Megargee near Bryn Mawr, illustrates the radical reversa toward old Colonial principles, the best extant examples of which are seen in the James River Valley in Virginia and in old Chester county farms, with their heavy masses of white columns supporting the heavy overhanging roofs. There is a total absence of anything ornate for its own sake. Whatever decoration is there is thoroughly simple and structural. This applies both to the exterior and interior. The highest art is gained by a rigid conformity to nature. Gingerbread decoration is, fortunately, dying out. The people really want better art than they can get, or could get heretofore; for it is the fault of the architects themselves that we have had a gingerbread architecture. The people really want a combining of wholesome, strong, simple effects, and especially good livable things, with fair and moderate cost. And that is what the present generation is getting at last.

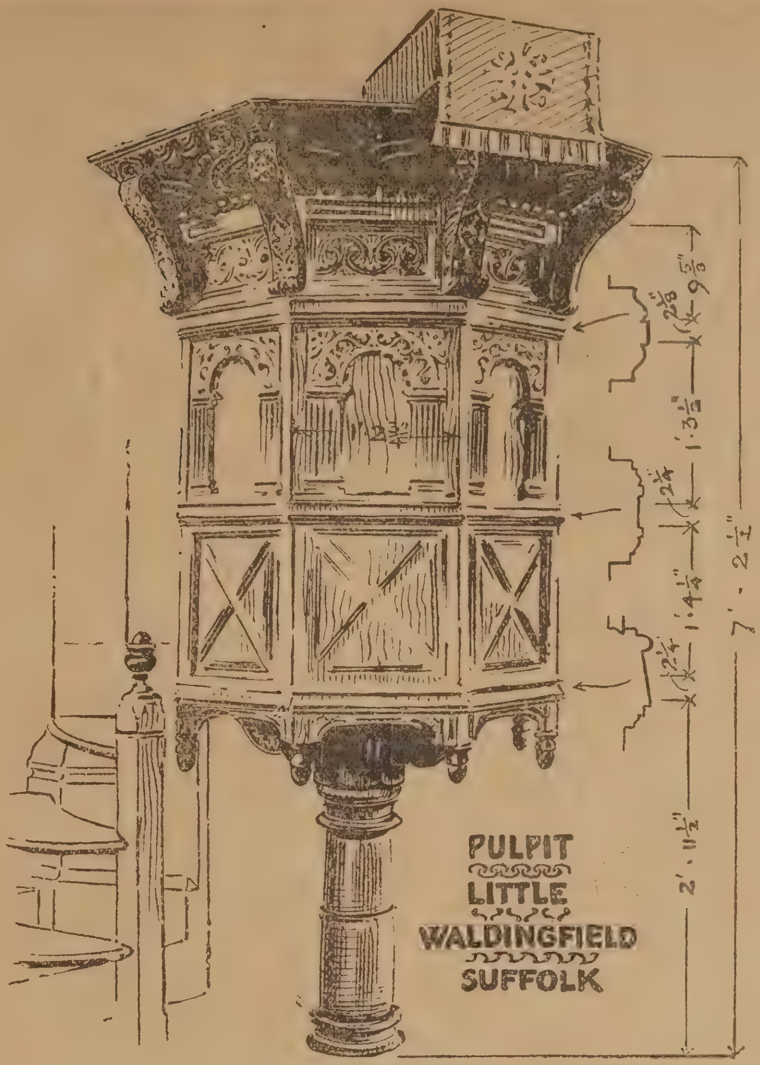
A fine example of the tendency back to the old Colonial principles is seen in the Red Rose Inn at Villanova. Here is exemplified pure common-sense in building. It embodies the Colonial ideas in the selection of the site for advantageous scenic effect; the beautiful garden adjoining the house; a thoroughly simple and well-built house, with heavy timbers showing inside and outside; dry and well-seasoned lumber, well-burnt bricks, great columns, heavy doors, large and airy windows, with small panes of glass, ponderous exterior chimneys and great massive roofs of unbroken shingles.

The early Colonial was based on Doric ideas, which were extremely severe. Inside you had the large airy halls, giving a big sense of welcome and hospitality. You had the great living-rooms, with their wide generous fireplaces filled with the heavy pungent logs. The colour treatment was borne in mind as shown in the Megargee house. The basic line of the exterior is white, the great shingle roof being stained a dark old greenish-brown, reproducing a weather-beaten effect.

Modern Changes.

The most marked tendency in present interior construction looks to the entire elimination of the parlour. Ordinarily, the parlour is a useless room. The great central hall is the thing nowadays. The plan of dividing houses into a lot of little uncomfortable apartments is giving way. That means that the house now boils down to a great open central hall, combining in itself all necessary things, with library and living-room in one. About the great fireplace are lounging seats. There is plenty of fresh air, and comfortable easy stairways open to upper floors. This is an important step in the common-sense direction.

The dining-room is isolated. There servants can prepare the tables quietly and without disturbing those in the living-room. Of course, the kitchen is separated, and this is a most important apartment. Proper sanitation is here paramount. The architect must know a good deal about cooking and cleaning. The offensive odours of cookery must be taken into practical consideration.



DRAWN BY E. M. HICKS.

Houses are now getting down to two storeys, with servants' apartments in a partial third storey. Ventilation of the upper storeys, which are devoted to bed chambers, is receiving practical attention. Servants are receiving much more consideration than heretofore in suitable accommodation, including baths, &c.

Interior Decoration

is important. The tendency in country houses is toward quaint old effects, produced by a high simple wainscotting, brick and wooden floors, great fireplaces with massive andirons supporting heavy logs, large flues, which prevent smoking, &c. It is now quite common to follow the old Colonial method of carrying the side paper on to the ceiling, thereby producing another quaint effect.

In the use of the word "Colonial" I do not mean the present so-called Colonial architecture. The Colonial has been hashed beyond recognition. But, properly used, as indicating the fine old, simple, common-sense, livable construction, there is nothing more desirable in truly artistic house-building. And it is a notable fact, and a gratifying one, that the dominant tendency is back to this beautiful and comfortable and honest architecture of our sturdy forefathers.

The International Exhibition of Decorative Art which is to be opened in Turin next year will be held under the patronage of the King of Italy; and the committee of management has for its president the Duke of Aosta, and for its vice-president Signor Villa, president of the Italian Chamber of Deputies. The site of the exhibition will be in the Valentine Park, where the Italian exhibition of 1898 was held. All practical applications of decorative art will be included among the exhibits.

WORKMEN'S HOME AND CLUB AT LIVERPOOL.

AN EXPERIMENT.

A WORKMEN'S home and club and public hall is to be erected in Liverpool by Mr. B. W. Levy out of the moneys of the David Lewis Trust Fund, somewhat on the lines of the People's Palace in London. The site is that upon which old St. James's Market stood. The building has just been commenced, and is estimated to cost £50,000. Mr. J. Francis Doyle, of Liverpool, is the architect. The main frontage, in Great George Place, will extend 174ft. The side frontage, in Nile Street, will have a length of 146ft. In all, the site measures 220ft. by 176ft., and the buildings will be set back from the boundary about 21ft. The architecture may be called a free adaptation of the Renaissance. The materials used in facing the main outer walls will be a special brick and terra-cotta, with green slates on the roof. The main entrance to the public hall and clubroom will be from Great George Place, and will be 12ft. wide. The hall itself will be 90ft. by 42ft. and 35ft. high. It will be in the centre of the building, and will accommodate 800 persons.

The club will consist of a number of large rooms—a billiard-room 67ft. by 30ft.; two committee-rooms, three social clubrooms, each 50ft. by 26ft.; and also a special clubroom and toilet facilities for females. To the south of the clubroom, on the same side, ample space is left for the subsequent erection of a gymnasium 132ft. by 54ft. The home will be entered from Nile Street through turnstiles. Just over the threshold the visitor will find himself at the office, and adjacent to this will be the master's house. The quarters assigned to the superintendent in the north-east corner of the building will be commodious and conveniently placed. The halls and corridors will be very spacious, the fireproof main staircase being 21ft. sq., with a hall 21ft. by 20ft. The reading-room will be 50ft. by 20ft. In a central position between this room and the dining-room, with an area of 20ft. by 15ft., will be the provision shop. There will be lifts connecting the shop with the kitchens in the basement. The dining-room will be 80ft. by 41ft. It will contain two ordinary fireplaces and a special cooking fire, with a lodgers' scullery and every appliance which can count for comfort and cleanliness. The kitchens, sculleries, pantries and stores will be in the basement. In the basement will also be numerous lockers, and storerooms for the accommodation of articles belonging to the boarders at the home. On the upper floors, approached from the large main staircase by three independent gangways, will be the sleeping cubicles. These will be arranged in groups for easy working and control. There will also be two other stone staircases. The number of cubicles for which arrangements have been made in the designs is 381. Over the billiard-room will be a large flat roof, which it is intended shall be for the use of the men who sleep in the home, and who will thus be offered an opportunity of getting fresh air under good conditions.

The club will not only be for the use of the boarders domiciled within the home, but also under certain conditions the inhabitants of the locality will be able to avail themselves of its privileges. According to present intentions, a charge of sixpence each per night will be made to occupants of the sleeping cubicles, who in addition to the lodging accommodation will, subject to good behaviour, be entitled to the advantages of the club. It only remains at present to add that the heating, ventilating and electric lighting arrangements are of the most modern, elaborate and efficient description. The work of erection has been entrusted to Mr. Isaac Dilworth, the clerk of the works being Mr. J. W. Gilling.

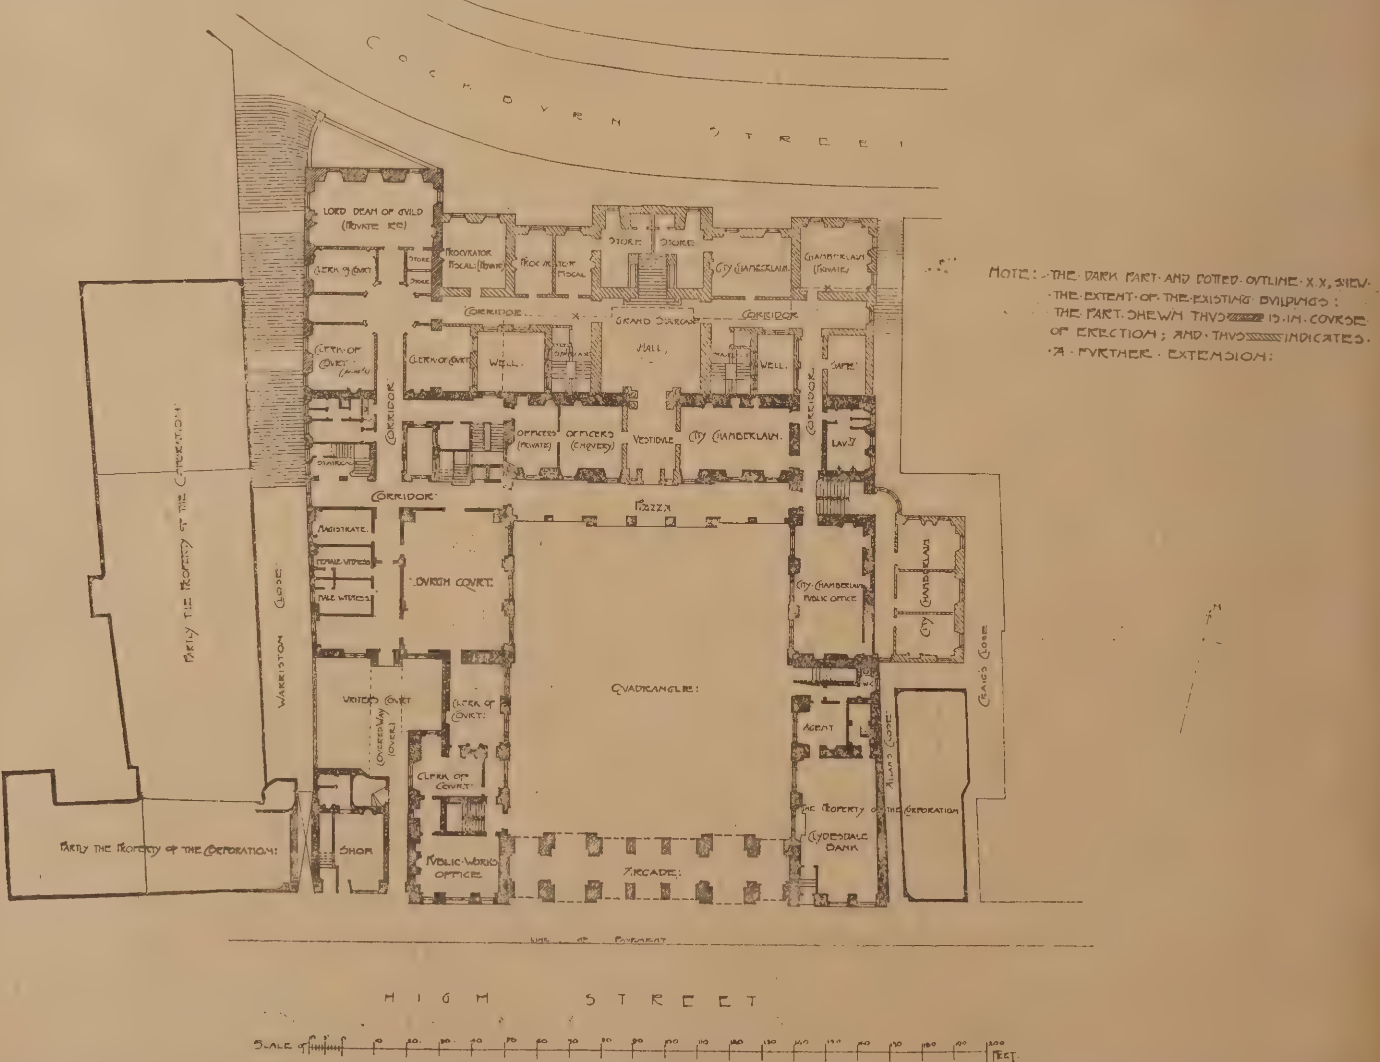
A NEW CHURCH FOR EUXTON.

A NEW Wesleyan Church is being erected at Euxton, Chorley. The buildings will consist of a chapel, with orchestra and vestry, and will provide accommodation for about 200 adults, or for a mixed congregation of about 240 persons. The principal elevations are to be faced with Accrington bricks, relieved with Lancashire stone dressings. The chapel roof will be partially open, being sealed at the collar beam, with visible timbers, wrought and varnished. The internal walls and ceilings are to be of plaster, and the internal joinery throughout will be of selected pitch-pine. The pews will all be open, being provided with solid bench ends. The floor will have a good rise from the rostrum. The orchestra is placed immediately behind the rostrum, and connected with the chapel by an arched opening. Ample space is reserved in the orchestra for the provision of a larger instrument than that now in use. All the church and orchestra windows will be glazed with lead lights of special designs. The heating of the building is to be by hot water, with low pressure. The architect is Mr. W. H. Dinsley, of Chorley, and the contractor Mr. William Hampson, of Chorley. The cost of the building will amount to about £1,300.

Edinburgh City Chambers Extension.—Plans are given on this and the opposite page of the two principal floors of the proposed extensions of the Edinburgh City Chambers and will explain the arrangements which are complicated by so much of the building being an adaptation of existing buildings, and so much new. There is the further peculiarity that the level of Cockburn Street, which the building fronts on the north, is from 65ft. to 70ft. below that of the quadrangle entering from the High Street. A perspective view of the Cockburn Street frontage was given in a double-page plate in our last week's issue.

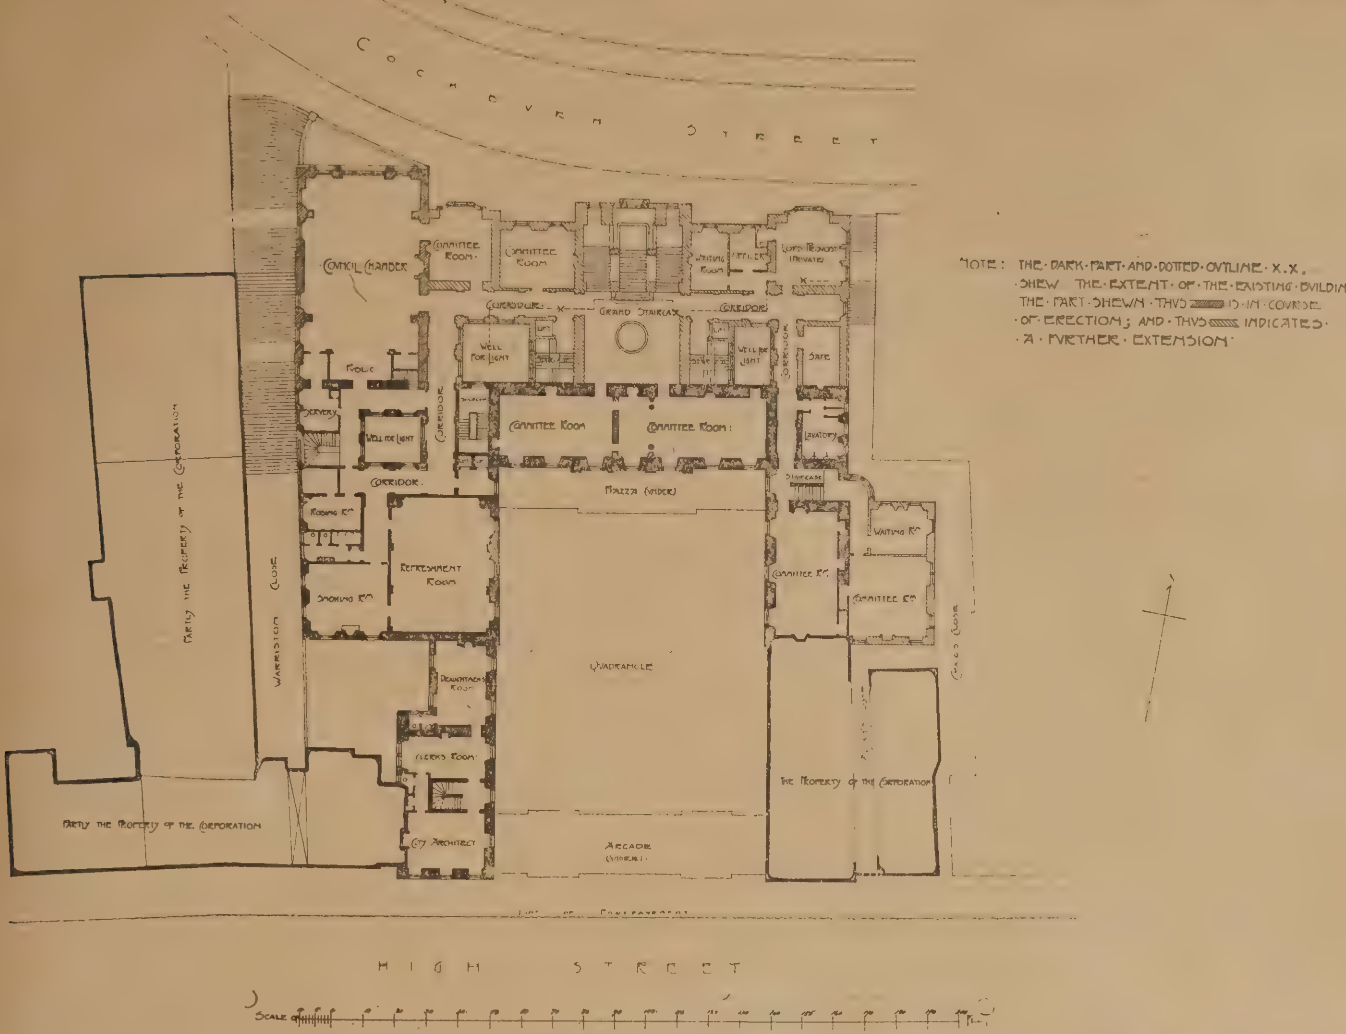
UNDERGROUND ARCHITECTURE.

HOWEVER interesting they may have been in other aspects, it does not appear that the Troglodytes or other Earth Dwellers troubled themselves much about the architectural character of their abodes. And yet it is probably from some prehistoric race of these peoples that the almost universal adoption of subterranean constructions was derived, producing in many cases works of stupendous magnitude. Many of the accounts of such that have come down to us have been discredited by modern critics, not seldom for no other apparent reason than that to some minds the primary meaning of a tradition is something to be disbelieved in. Whether there was truth or not in these old traditions, it is certain that at a very early date men had the idea of underground architecture. Herodotus tells us that in the time of Sardanapalus certain thieves anticipated Sherlock Holmes's Red-Handed League, and dug a subterranean passage from their own dwelling to the Royal treasure vaults. Zalmoxis, who was worshipped as a deity by the Getæ, is said to have acquired his supernatural reputation by having a secret underground dwelling prepared, into which, after asserting his own immortality, he disappeared for three years, after which he again exploited himself as proof positive of the truth of his boast. Demosthenes, again, is said to have acquired his powers of eloquence by constant solitary practice in an underground chamber which he had constructed for the purpose. In our own country there is the early tradition which tells of the underground palace made by Locrinus, son of Brutus, for his *chère amie*, the Saxon Princess Esynt. Beyond the fact that this palace was "in London," the old chronicles leave us in doubt as to its locality. There is no restriction on conjecture, so we may if we please associate this with that rather better authenticated product of underground architecture, the



Note:—The dark part and dotted outline x x, shew the extent of the existing buildings: the part shewn thus ▨ is in course of erection; and thus ▤ indicates a further extension:

EXTENSIONS TO EDINBURGH CITY CHAMBERS (MUNICIPAL BUILDINGS): PLAN AT BURGH COURT AND QUADRANGLE LEVEL. R. MORHAM, CITY SUPERINTENDENT OF WORKS, ARCHITECT.



EXTENSIONS TO EDINBURGH CITY CHAMBERS (MUNICIPAL BUILDINGS): PLAN AT COUNCIL CHAMBER LEVEL (FIRST FLOOR ABOVE QUADRANGLE). R. MORHAM, CITY SUPERINTENDENT OF WORKS, ARCHITECT.

passage which led from Baynard's Castle to a certain house on Paul's Wharf, which was occupied, so Court scandal averred, by another frail beauty, the famous "Fair Rosamund," whose royal friend was thus able to visit her without undue publicity. It is possible that Peel's old ballad, embodying some of the popular slanders against Queen Eleanor, wife of the first Edward, referred simply to supernatural agency, and was guiltless of any suggestion of underground locomotion. Those, however, who delight in discovering cryptic prophecies in unlikely places, may be of opinon that the Inner Circle or some other modern subterranean City railway is not obscurely hinted at. For what says the ballad?

> "At Charing Cross she sank
> Into the ground alive,
> And, after, rose to life again
> In London at Queenhithe"—

a description quite applicable to the royal lady taking a ticket at the former place, and being disgorged by the "elevator" at the latter.

There are, however, numerous traditions of other achievements of underground architecture which are not altogether or all unauthentic. There is the often-talked-of passage from Highgate or Hampstead to St. Albans, invariably associated with the redoubtable Dick Turpin. Certain traces are said to have been found, and of the many hazarded explanations perhaps the most plausible is that which suggests that it was the commencement, in Roman times, of an enormous military work between London and Verulamium. There was said to be an underground passage in connection with Sir Thomas More's house at Chelsea, though neither its destination or dimension seems to be known. Tradition asserts, too, that there was a similar way from the Tower of London to the Old Palace at Eltham; and a less shadowy authority declares that it was from a subterranean passage at Hampton Court that Charles I. effected his escape from the gaolership of Colonel Whalley. Relating to the other principal actor in the grim drama of rebellion and regicide is the tradition of an underground passage from Cromwell's house at Westminster, and readers of Dumas will not forget the effective use he makes of this belief in "Twenty Years After." It is only natural that many of these traditions of underground passages and dwellings should associate them with religious houses or churches, the obligations of sanctuary, the political importance of ecclesiastics, and the fluctuating relations between Church and State, making secrecy of transit and abode often absolutely essential. There was the alleged subterranean communication between Southampton and Netley Abbey; another between Warwick Castle and St. John's Priory; another between the Castle and Priory at Lewes. From the famous Abbey of historic Tewkesbury there ran, it was said, a passage underground to Malvern—possibly to the monastery founded there by the confessor.

From Durham Cathedral, "half church of God, half tower against the Scots," the monks could pass to the beautiful abbey of Kirkstall; from the stately Benedictine church at Reading, whose massive walls, 8ft. thick, had a circumference of half a mile, a similar passage ran, so the story goes, to Caversham. When any of the mighty Nevills, lords of Middlesham, needed ghostly counsel, it was said that a confessor could come, all the way underground, from the distant abbey of Gervaux; and the Percies or Seymours of Wressil could in like unseen manner attend mass or evensong at Howden Church, four miles or more away. The pious nuns of Watton, concerning whose rigorous discipline Fosbroke relates so many quaint particulars, were wont, tradition said, to attend the Holywell at Kilnwick, and there perform miracles of healing. But what doubtless seemed the greatest miracle of all was how they got there, till the mystery was put an end to by the discovery of a subterranean passage to the nunnery. From Guisborough Priory a tunnel ran for a mile and a half to a place called Toccotes, and in the midst of this, so we learn from Ord, was a mighty chest of gold. Easy enough to be plundered, it would seem, since its only guardian was a raven—but this raven, like Poe's,

> "Had all the seeming
> Of a demon that is dreaming,"

and when any venturesome wight approached with felonious intent, the seeming came true and the dreaming ended, and the Foul Fiend himself stood revealed. There was a passage, the old books tell us, between Someries Church and St. Mary's, Luton, and another from Newnham Abbey to the priory at Bedford, some two miles distant. This appears to be fairly well authenticated, and perhaps the same may be said of the tunnel between Larkbeare House, in Exeter, to the castle and cathedral, and of that between Sawley and Whally abbeys, in Yorkshire, stated to have been seven miles long, and of which traces are said to be found. Intervening water was as little of an obstacle in those days as now, always assuming the existence of these reputed passages. From Pontefract, for instance, a tunnel was said to run under the moat and have its exit at a mound a mile distant; and from Richmond Castle a similar passage led to St. Martin's Priory, on the other bank of the River Swale. Still more staggering are the legends which affirm a submarine communication between the Giant's Causeway and Rathlin, a distance of eight miles, and between the coast of Wigtonshire and the Isle of Man, about thirty miles! These find their parallels in the legendary passage from Naples to the Castle d'Elmo, and that convenient tunnel, four miles long, which led from the mainland to the delightful island of Capri. But there is nothing new, more especially in the way of underground architecture, and we need not, accordingly, be astonished at reading that ancient Egypt boasted its subaqueous passage between Assouan and the Island of Elephantiné.—(From the "Evening Standard.")

R.I.B.A. JUNE EXAMINATIONS.

PASS LIST.

Preliminary.

Bagot, W. H. (Aldgate, South Australia).
Benjamin, A. F. (Lond., W.)
Billings, P. U. (Sale).
Birkett, S. (Manchester).
Booth, A. (Barnsley).

Intermediate.

The following have passed the Intermediate Examination, the names being given in order of merit as placed by the Board of Examiners :—

P. B. Dannatt; J. S. Brocklesby; B. Greig; E. G. H. Gunn; A. G. Maitland (Tain, N.B.); W. Greenwood (Blackburn); J. H. Belfrage; R. T. Longden (Burslem); E. P. Archer; E. Quiggin (Liverpool); H. Ryle (Newcastle-on-Tyne); C. F. Callow (St. Leonard's-on-Sea); H. Black; T. F. Amery (Sheffield); W. E. A. Brown; J. A. Fletcher (Leicester); W. J. Delbridge; S. Bridges; H. P. Gordon; H. E. Rider; G. E. Elkington; R. Wylie (Gateshead); G. M. Page (Lincoln); H. M. Pritchard (Cardiff); J. O. Raymond (Tring); G. S. Salomons (Manchester); J. Green (Birmingham); F. G. Newton; F. J. Toop (Lincoln); W. E. Brooks; H. Drury; E. H. Walker; F. J. Lucas; R. J. Archibald (York); A. F. Warth (Birmingham); W. P. Watson (Coventry); J. A. Hossack (Banff, N.B.); A. N. Campbell; J. Boyle (Bolton); H. F. Buckley (Halifax); F. J. A. Corfield; B. Drummond (Fleetwood); E. F. M. Elms; F. J. Forster (Darlington); E. T. Goff (Lowestoft); L. A. Loades (Morpeth); H. J. Mauchip (Bristol); S. Salisbury (Harpenden); J. H. Shearer (Exeter); W. H. Watkins (Bristol).

Final.

The following have passed the Final Examination, qualifying for Associate R.I.B.A. :—

J. P. Bishop (London); W. M. Dean (Gravesend); L. G. Delmar (London); L. W. Ensor (Huddersfield); C. H. Gage (London); L. C. Gregory (London); J. P. Hall (London); S. J. Halse (London); A. G. R. Mackenzie (Aberdeen); C. Stretton (Leicester); E. J. Pullar (London); R. C. Wrinch (Ipswich); F. D. Clapham (London); W. B. Dawson (London); E. G. Page (London); C. E. Power (London); T. W. Aldwinckle (London); C. H. E. Bridgen (London); D. J. Brundrit (Cheshire); H. Cayley (Cambridge); H. D. Day (Godalming); T. N. Dinwiddy (Greenwich); K. Gammell (London); G. R. C. Harding (London); C. L. Hall (Lancs.); A. Holstead (Alnwick); E. V. King (S. Shields); A. Pickup (Blackburn); L. E. Pryke (Surbiton); A. H. Roe (London); R. B. Rowell (London); J. G. Walker (Wakefield).

A NEW MEMORIAL HALL AT LAURENCEKIRK.

The new Dickson Memorial Hall, Laurencekirk, was opened recently. The hall has been given by Mr. Patrick Dickson, of Barnhall, and his sisters, Misses Dickson, Frogfield, Laurencekirk, and Mrs. Morrison, Aberdeen, to the Kirk-session of Laurencekirk parish church as trustees for the congregation. The building, the total cost of which will be about £2,500, consists of a main hall, with subsidiary classroom and retiring-rooms. In character the edifice is ecclesiastical, and the style is Late Gothic. The hall, which will accommodate an audience of about 300 persons, is 63ft. in length by 25ft. in width inside, with side walls 12½ft. high from the floor to the eaves, and is covered by a very strongly framed open timber roof, the apex of which is about 33ft. above the floor level. The principals are of the hammer-beam type, with arched ribs and brackets, forming a trefoil-shaped opening under each principal. The common rafters and boarding are carried upon massive purlins resting on the principals, the whole construction and covering being visible from the hall. The ends of the hammer beams are decorated with carving, angel heads with wings alternating with the gridiron and palm branches of St. Lawrence. At the north end of the hall is placed a permanent platform, raised about 2ft. above the floor. At the south end is a small gallery, over the vestibule, which is separated from the hall by a screen, glazed with clear glass in ornamental lead quarries. The hall is lighted by five two-light windows with traceried heads on the west side; by a two-light and a single-light of similar character on the east side; by a large three-light mullioned and elaborately traceried wheel window in the south wall behind the gallery. A feature of the interior is the stone arcade between the hall and the classroom, measuring 24ft. by 15ft., giving the classroom something of the effect of an aisle. The classroom may be divided into two portions, and it may also be shut off from the hall by heavy woollen curtains. The whole of the stone used in the building is freestone from Lauriston; and all the dressings to the doors, windows, piers, arches, &c., inside and outside the building, are moulded and finely scabbled; the walling outside is of broken jointed, squared, snecked Ashlar, with the quarry face on the exposed surface. The hall outside is distinguished by its steep gables, its massive buttresses at all corners, its traceried windows, and by a tall porch, which almost connects the vestibule with the footpath of the Station Road. Some character has been given to the porch by its spreading buttresses, its tall traceried lancets, and especially by the treatment of the doorway, over which there is a pointed arch as well as a lintel at the springing. The lintel has been richly decorated with carving, and the stone tympanum is also richly diapered and carved. In the gable of the porch is a flush panel, lozenge shaped, bearing the date 1900. A conspicuous feature of the building is the timber flèche, every portion of which is covered with lead. The flèche rises to a height of 18ft. above the ridge of the roof, and the top of the copper weather vane to about 4½ft. farther. The roofs are covered with slate of a particularly pleasant greenish-grey colour from Preselly. The glazing throughout the hall and classroom is entirely of leaded quarries, mostly of white glass, clear or slightly obscured, and enriched by bits of strong colour of fine quality in the heads of the windows. The hall has been furnished with an oak reading-desk, table and chairs, and also with stained and varnished pitch-pine benches.

The masonwork was done by Mr. Alexander Watt, builder, Laurencekirk. The other departments of the work were carried out by the following tradesmen :—Carpenter work, Messrs. Hendry & Keith, Aberdeen; plumber work, Mr. Robertson, Aberdeen; plaster and concrete work, Mr. Sellar, Aberdeen; slater work, Mr. Davidson, Aberdeen; heating apparatus, Messrs. McKenzie & Moncur, Edinburgh. The furnishings were supplied by Messrs. James Garvie & Sons, Aberdeen, who also did the glazing work. The architect was Mr. William Kelly, of Aberdeen.

A NEW RAILWAY HOSPITAL AT CREWE.

In connection with an immense concern like the great works of the London and North Western Railway Company at Crewe—the largest works of their kind in the world—it is practically an impossibility to guard against accidents of a more or less serious character frequently occurring. In spite of all the precautions and the various means adopted by the railway company for the protection of their servants, accidents must of necessity occur from time to time, and, unfortunately, it sometimes happen that they are attended with results of a shocking character. It is in such cases as these that the benefit of efficient and skilled hospital treatment is appreciated, and the directors of the company have now provided proper hospital accommodation, with an able surgical staff, for cases of accident. The new building is in Mill Street, and has just been completed. It has been erected at a cost of between £7,800 and £8,000. It is lighted throughout with electricity, and the entire work has been carried out by the railway company themselves under the personal direction of Mr. F. Webb, the superintendent of the works. Its situation is so central that it is within easy access of the works, and also the steam sheds and railway station, and it is also near either the Manchester, Liverpool or Chester lines. There are two wards, each containing eight beds. At the side of each bed there is an electric-light switch, and also a small cupboard for the use of the patients. The wards open out on to a large verandah by means of French windows, and beyond the verandah is a garden. There is a commodious entrance hall, leading to the wards, and to the centre there is a novel table, the top of which consists of a portion of the trunk of a huge English elm tree. It has been cut according to the exact shape of the tree, and then polished. The operating-room is in close proximity to the wards, and is fitted up with porcelain and glass, the floor being paved with wood blocks, and covered with a casing of lead so as to guard against any possibility of damp. All the corners of the room and also the cornices are rounded, with a view of preventing the lodging of dust. The room is well lighted, and is equipped with all kinds of surgical appliances. Adjoining the operating-room there is a bathroom, with a movable bath, and to the left of one of the wards there is a room that is specially set apart for the use of the nurses. A long corridor leads to the patients' sitting-room, the kitchens, scullery, pantries, &c., and at the end of the corridor there is an isolation ward containing two beds. The mortuary is in the hospital yard, and is divided from the main block of buildings by double gates, which provide an entrance to the hospital from the work. On the side nearest to the street a surgeon's house has been erected, and this is to be occupied by Dr. and Mrs. Lawrence. Its style of architecture is in keeping with that of the hospital. It contains a study, drawing-room, dining-room, sitting-room, kitchen, pantries, scullery and all other necessary conveniences. The whole of the premises are heated with Langford's hot air apparatus, and Tobin's tubes provide the means of ventilation. It may be interesting to state that in the department over which Mr. Webb presides there are now some 18,000 men employed, about 12,000 of whom are engaged either in Crewe Works or in other parts of the local department at Crewe. There is in addition a large staff connected with the traffic department, and several hundred men are also employed in the permanent way department.

Law Cases.

Reversible Casement Windows: Interesting Patent Action.—Judgment was recently delivered at the Essex Assize Court, Chelmsford, in the case of *Clare and others* v. *The Crittall Manufacturing Co., Ltd.* This was an action to recover £50 due and damages for breach of contract under an agreement made with the defendant company in October, 1898. In opening the case for the plaintiffs counsel said they were the inventors of a patent reversible casement hinge which was developed in October, 1893. It consisted of a stiff vertical bar with horizontal arm top and bottom, joined together so as to become one rigid [-shaped appliance to be hinged at the side to the frame and at the end of the arms to the top and bottom rail of the casement, in order that the casement might be opened in the usual way on the side hinges and by releasing a catch reversed on the horizontal arm hinges. The object of the device was to enable the outside of the glass to be cleaned from the inside. A model of the invention was taken to the Crittall Manufacturing Co. in October, 1898, and after some negotiations a provisional agreement was drawn up by which the defendant company obtained the sole right to manufacture the device under certain royalties. The plaintiffs received £50 down from the defendants, who agreed to pay another £50 when the final specification was produced, together with an expert's opinion as to validity. Upon searching the patent records the plaintiffs found that other devices had been previously patented by a German named Rump and another by an Austrian named Osternberg. The latter failed to complete his English patent, and it therefore became public property in this country. Though resembling the plaintiffs' device, neither of these two inventions possessed the strong vertical bar connecting the two arms. In January, 1899, the defendants suggested that the matter should be concluded. In the following July plaintiffs obtained the final specification and produced a report by Mr. Bousfield, K.C., stating that in his opinion Clare's patent was not an infringement of any similar patent. In June, 1899, the defendants advertised the casement widely, calling it the "Crittall Safety Casement," and up to the present time had been manufacturing and selling it extensively, some marked Rump's patent and some not marked at all. Counsel produced various models of the different inventions and called evidence to show the difference between plaintiffs' device and those of Rump and Osterberg. The jury at this juncture expressed the opinion that no further evidence was needed on that point. Mr. J. A. King, agent for the "Mack" slab, of Queen Victoria Street, London, was then called to prove that he and a friend had seen the Crittall Manufacturing Co.'s stand at the Building Trades' Exhibition this year, and their representative told them that they had tried to make the casements satisfactorily without the vertical connecting bar, but found that this was absolutely indispensable. Counsel for the defendants submitted that the plaintiffs had no case and that the validity of the plaintiffs' patent was not proved. Mr. F. H. Crittall, managing director for the defendant company, said he went to Hamburg in May, 1899, and entered into an agreement with Rump to acquire the sole right to manufacture his patent, and since then he had manufactured under that agreement, although it was admitted that casements had been fitted that were not marked Rump's patent, which he regretted. Mr. Brunton, manager for Messrs. Crompton & Co., Chelmsford, stated that superficially the casement made by the defendant company was like the plaintiffs' patent, but in principle it was Rump's. The jury decided that plaintiffs' patent was the best they had seen, that it was a valid one and that defendants had been working under plaintiffs' patent. The judge gave judgment for the plaintiffs for £50 with costs and ordered an account to be furnished to plaintiffs. Stay of execution for ten days was granted.

An Impossible Patent.—The case of *Case* v. *Cressy* came before the Court of Appeal last week. This was an appeal against the decision of Mr. Justice Buckley that the plaintiff's patents (No. 14,115, of 1896) is invalid for want of proper subject matter. The patent is for the "improved construction or arrangement of shore groynes." In the final specification the nature of the invention was thus described: "This invention has for its object constructing shore groynes from a combination of upright or angle-wise-arranged timbers in couples, with lower ends set in concrete beds, preferably from about mean sea level to low-water mark, and landwards from the same point to the shore or sea-wall, the spaces between the upright or angle timbers having horizontal planks let in or slipped down to form intermediate screens." The specification added that metal uprights and plates, or a combination of metal and wood, might be employed. The plaintiff claimed "the construction of shore groynes in the manner described by preparing braced uprights, inserting them in holes, fitting them by cement-concrete, and finally screening the intermediate spaces by horizontal planks or their equivalents, as set forth, the structure taking the form shown in the annexed drawings." Mr. Justice Buckley was of opinion that the plaintiff had not invented anything, though he had made a discovery, but it was not proper subject matter for a patent. The plaintiff appealed. It was stated that his method of constructing groynes has, among other merits, those of cheapness and rapidity of construction. The court dismissed the appeal. Lord Justice Rigby said that, though he felt sorry that he could not adopt the view put forward on behalf of the plaintiff, he

STREET · LONDON · W

thought the learned judge was quite right in holding that the plaintiff's method of construction was not a novelty, though the application of it might be a novelty. Lord Justice Collins was of the same opinion. It seemed to him that what the patentee had done was merely to use upon the seashore a fence which was well known and had been already used upon land. Lord Justice Romer agreed.

Ancient Lights.—In the Chancery Division of the High Court of Justice on June 25th Mr. Justice Cozens Hardy had before him the action of *Welborn* v. *Harrogate Central Arcade Co.*, by which the plaintiff asked for an injunction to restrain the defendants from erecting on their premises on the west side of Back Beulah Street, Harrogate, any building which would darken, injure or obstruct any of the ancient lights or windows of the plaintiff's premises. The plaintiff had received an offer from the defendants not to build higher than 14ft. 6in., and under those circumstances the question resolved itself into one of costs. Mr. Justice Cozens-Hardy granted an injunction in the terms of the letter referred to, and gave the plaintiff costs of the action, except those of bringing up the witnesses from Harrogate.

GLASGOW ROYAL INFIRMARY.

ARCHITECTS' REPEATED PROTEST.

THE following is a copy of a letter sent to the Executive Committee by the Glasgow Institute of Architects:—

Gentlemen,

I duly received your letter of 18th ult., which has already been acknowledged, and I am instructed to state that the Glasgow Institute of Architects regrets that no more explicit reply has been vouchsafed to its protest and appeal, by the Managers and the Executive, than what is contained in the official statement issued to the public (see p. 321 of the issue of the Builders' Journal for May 29th last). Nothing in that statement in any way answers or refutes the objections previously raised by the Institute. The statement, indeed, rather confirms them; and the Institute therefore remains of the opinion that the plans as adopted "are in many vital particulars inadequate and out of date": that their distribution on the site, particularly with regard to the "Jubilee Block," facing Cathedral Square, is bad, and that in consequence, if the reconstruction is proceeded with according to those plans, "the infirmary will not conform to the most modern standards of design in this class of building."

The criticisms of the Institute on the previous occasion were chiefly concerned with (1) the manner in which the competition was conducted, according to which solutions of the problem other than those put forward by the managers did not receive unbiased and adequate consideration; and (2) the insistence on the Jubilee Block as an integral part of the scheme. Such a block the Institute considered to be objectionable, because (*a*) it would shut out from the rest of the buildings the sun and air from the southern and most open part of the surrounding area, and (*b*) it would dwarf and irretrievably injure the external appearance of the cathedral.

With regard to the first of these two points, while the managers in their letter refer to the block plans which they have prepared with much time and labour as being "suggestive and illustrative only," and this is repeated in the statement and appeal of the Executive, one learns also from this latter that "when the final selection was made the Executive Committee fixed on a plan which the assessor reported as being one of two which most closely conformed to the sketch plans." *i.e.*, those drawn up by the managers. As further reason for the adoption of this particular plan the Executive give a list of special characteristics in respect to internal arrangements which they consider to be essential or desirable features, yet these were all contained in other designs submitted, which were at the same time free from the radical defects referred to.

As to the Jubilee Block, the managers now state, as their sixth conclusion, "That the new hospital, and not a section of it, should be regarded as alone worthy of the City of Glasgow, and as a fitting memorial to the sixty-three years' illustrious reign of the Queen." This is exactly the position adopted by several of the competitors and by the Institute, while objecting, from practical reasons already stated, to its inclusion as part of the scheme. With reference to the cathedral, it is therefore quite beside the point for the Executive to state that "the buildings must be lofty if the hospital requirements of the public are to be adequately met," for, while the buildings must be lofty, on other portions of the site (if that site is to be retained) there is no necessity for their being lofty in the direct alignment with the cathedral, nor, indeed, for there being any buildings at this point at all, as was shown in one or more of the plans submitted. The Institute does not admit that the injury to the cathedral is a question of architectural style; it is one of comparative height and scale. As regards these, the plan adopted is especially objectionable in that not only is the block itself seven storeys high, but it has in addition a lofty spire which would further and quite unnecessarily assist to dominate and destroy the effect of the cathedral.

The Institute of Architects feel it to be their duty in the interests of the public (for whom they speak as a body of technical experts in such matters) to thus repeat and emphasise their protest, and to again most earnestly urge the Executive, before committing themselves and the public to the erection of any portion of the building, as designed, to have the plans submitted to one or more independent hospital authorities of recognised and outstanding position for consideration and report. Further, should the Executive object to the outlay involved in such a course, the Institute would be prepared to arrange for it and to meet the cost provided the report did not bear out their contention, while submitting beforehand the name or names of the experts proposed, on obtaining the necessary facilities from the Executive.

(Signed) C. J. MacLean, Secretary.

A NEW CHURCH AT MUSWELL HILL, N.

THE foundation stone-laying of the L.B.A. Church, Muswell Hill, N., took place on Wednesday last. The design was selected in a limited competition held recently. The main gable is flanked on the right by a bold tower terminated by a spirelet and weather-vane, and on the left by a dwarf tower, both of which contain fire-proof staircases to the gallery. A bold projecting Narthex, containing the main entrance to the ground floor, forms a feature in front. A notable point in the plan is that the whole of the seating is arranged in a semicircular form, so that the entire congregation directly faces the preacher. The ceiling is vaulted in woodwork with a central crossing between four wide arches supported on columns. This vaulting is surmounted by an octagonal dome which conducts the foul air into an air-shaft, and is thence expelled into the open air through a patent air-pump ventilating flèche on the roof. The baptistery is to be kept open, and is lined with marble, having a bold moulded oak handrail in front supported by wrought-iron and copper standards on a marble curb. Ladies' and gentlemen's choir and baptizing vestries are placed immediately behind the pulpit and have direct access from the baptistery under the pulpit; this arrangement preventing the necessity of candidates passing before the congregation after immersion. Deacons' and pastor's vestries are also provided. A large schoolroom, with all necessary classrooms, ladies' working - room, superintendent's room, infants' room, kitchen and heating chamber, &c., is provided under the church; the level of the land making this desirable. The materials to be used are red brick facings with Bath and Costessey stone dressings. The roof is to be slated. A special system of ventilation is adopted, the form of ceiling lending itself to a very good treatment. The adult seating accommodation, reckoning 20in. for each sitting, is about 472 on the ground floor, 30 in the choir and 268 in the gallery. This gives a mixed congregation of about 900 persons. The architects are Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, of 5, Clement's Inn, Strand, London, W.C. The contract is let to Messrs. Mattock Brothers, of 219, Isledon Road, N., for £6,408 16s. The architect's estimate was £6,780.

New Patents.

These patents are open to opposition until August 12th.

1900.—**Brickmaking Machines.**—12.132. J. G. Lowood, Five Oaks, Sheffield; W. J. Gardner, 8, West Hill, Huddersfield; and J. W. Armstrong, 20, Meersbrook Road, Sheffield. This invention relates more particularly to "silica" bricks. It consists of a double-action brickmaking machine having automatic devices for filling the moulds with clay; dusting the upper surface; pressing and delivering the brick; and returning to its original position.

Fixing Glass in Windows.—13,371. A. G. Spencer, 77, Cannon Street, London. The pane of glass is held in the rebate of the sash by strips of wood or other suitable material, a strip of india-rubber being interposed to render the joint water-tight.

Brickmaking Machines.—13,919. T. C. Fawcett, Ltd., Whitehouse Engineering Works, Hunslet Road, Leeds; and J. W. Bottomley, of the same place. Means are provided to prevent the sides of bricks moulded in cylinder moulds being forced up in the die box and so spoiling the brick. Another part of the invention, relating to screw brick and tile presses only, provides means (in conjunction with a friction drive) for automatically stopping the machine each time the pressing rammer is withdrawn from the die box.

Firegrates.—16,643. G. R. Keel, 67, Beaconsfield Street, Newcastle-on-Tyne. It sometimes happens that the front of a fire is dull while the back portion is bright and glowing. According to this invention the grate proper is circular and may be rotated so as to bring any part to the front.

Builders' Cradles.—17,995. J. Coppard, 207, Pentonville Road, London. The cradle is hung by ropes and is provided with a cog-wheel and drum for raising and lowering purposes.

1901.—**Centre-Bit Drills for Iron.**—1,549. A. W. Watson, 8, Russell Road, Lea Bridge Road, Leyton. This bit may be used in an ordinary brace, and is for drilling iron—such as iron tanks. It resembles the drill for wood except that the centre portion is shaped at the point similar to an ordinary iron drill.

The following specifications were published on Saturday last, and are open to opposition until August 19th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—12,386, Millane, roller-blind fittings. 13,274, Whitaker, excavating apparatus and cranes. 14,028, Cottier, sliding windows. 14,097, Shanks, urinals. 14,098, Shanks, ships' water-closets. 14,179, Mechan, cowls. 14,219, Beer, glass tiles. 14,318, Murgatroyd & David, water-waste preventing cocks. 14,520, Doulton, flushing arrangements for latrines. 14,773, Meyer, pumps. 14,785, Mackintosh, apparatus for enlarging designs. 15,728, Tonks, Ltd., & Hollins, roller-blind furniture. 15,940, Schwarz, manufacture of limestone. 18,339, Christie, coverings for walls and ceilings. 21,580, Morrison, tap or valve. 23,428, Ward, & International Oil Furnace Co., Ltd., portable furnace for application to single or double flued boilers, kilns for bricks, &c.

1901.—281, Budd, construction of sheet metal spoke blanks for pulleys. 367, Lundberg & Lundberg, multiple wall connections for electric lighting, heating, &c. 439, Jirotka & Roth, acetylene lamps. 1,220, Mackintosh, manufacture of repeat patterns for textile fabrics, wallpapers, &c. 1,288, Beresford, valves for water-closets. 2.861, Barreto, apparatus for slaking lime. 6,773, Hughes, holder for paint brushes or liners. 7,188, Beck, acetylene gas generators. 7,240, Hennebique, construction of quay walls, retaining walls, &c. 8,275, Boult (*Soc. Lumière Boule*), incandescent or bunsen gas burners. 8,278, Boult (*Dugins*), roller for blinds and mode of operating them. 8,281, Boult (*Soc. Lumière Boule*), mantle supports for incandescent gas burners. 8,547, Vollmann, apparatus for cooling and purifying air. 9,739, Beny & Heinrigs, apparatus for slaking lime. 9,956, Brookes (*New Haven Novelty Machine Co.*), couplings for lead pipes, &c. 9,989, Chesterman, engineers' squares. 10,018, Speidel, manufacture of profiled articles of ornament.

A REMNANT OF OLD BRISTOL.

A BRISTOL newspaper has been supplied with some interesting particulars relating to four ancient houses between Messrs. Robinson's new factory and St. Thomas's Church. The earliest record of these houses (which have lately been renovated) dates from 1566. They then belonged to St. Thomas Church, and how long before that period they so belonged is not known; but they were probably built on land belonging to the church when it was founded in the twelfth century. The premises consisted at the above date of three tenements with their appurtenances, one of which was called the Church House. The next mention that can be traced relates to 1636, when the premises seem to have been converted into one messuage in the occupation of Thomas Bright, butcher, with a wool hall or loft adjoining, together with shops, slaughter-houses and chambers. In 1659 they appear to have been in somewhat the same condition, but between that date and 1689 they were converted into four dwelling-houses, and to that period may be ascribed the present buildings, as they are similarly described, without mention of any alteration in 1717, 1746, 1761 and 1789, and were still in that condition in 1822, when an investigation of the Bristol Charities was made by a Government Commissioner, and they have not since been structurally altered except by the addition of a shop front a few years ago.

The backs of the premises are immediately adjoining the churchyard, and against the opposite wall of the churchyard, within the memory of the present clerk of the church, the old stocks of the parish were fixed. These stocks were for many years kept within the precincts of the church premises, but cannot now be found, much to the regret of the present wardens, who would like to have retained them amongst other ancient remnants of the church fittings, &c. Previous to its removal to Temple Meads about sixty years ago the cattle market was held every Thursday in Thomas Street, and against the houses in question and others and the church were the pens for sheep and pigs attached to the walls and pavement by iron rings, and leaving passages only to the doorways. It was only a few years ago that the iron rings in the church wall were removed. A view of the pens and animals against the church wall is still retained as an ornament on the forms on which the vestry notices are issued.

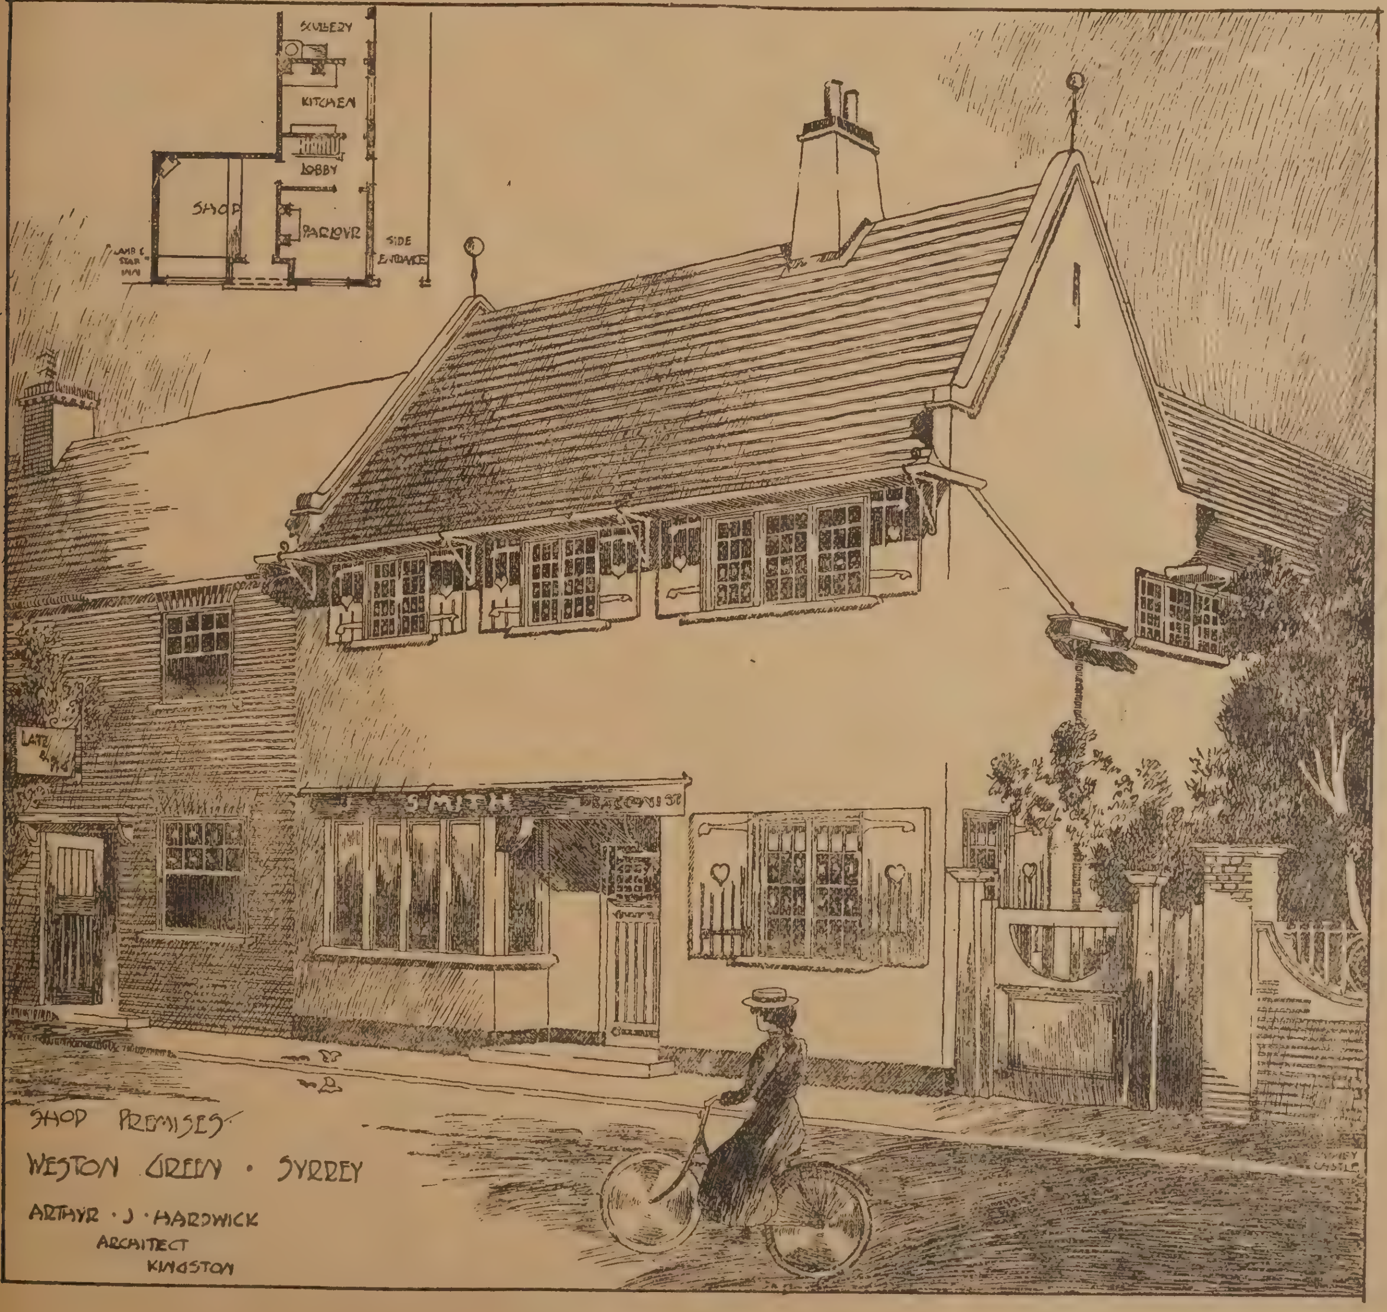
Cottage Shop at Weston Green, Surrey.—This shop, for Colonel Walter Campbell, is now in course of erection. It is to be carried out in white rough-cast with green slates. The plinth is formed of cement tarred; the woodwork to shop is in oak. The outside paintwork generally will be a dull green, and the window will be glazed with lead glazing. Mr. A. J. Hardwick, of Kingston-on-Thames, is the architect, and Mr. T. Adkin, of Surbiton, the contractor for the works.

QUEEN VICTORIA MEMORIAL.

The Committee Inspect the Designs.

THE Queen Victoria Memorial Committee met on Thursday last at St. James's Palace, and not only inspected the designs by the five selected competitors, but took into consideration various suggestions made by outside persons. They seem to have adopted the proposal that models of the designs should be submitted as well as drawings, a plan which was followed in the case of the monument in Edinburgh to Sir Walter Scott with excellent results, a Gothic design, which, although not such a grandiloquent one as the Albert Memorial, is far superior to it.

After examining the designs and models at St. James's Palace the committee adjourned to His Majesty's Office of Works, at Storey's-gate, and sat there until a late hour. Considerable time must elapse before the committee come to any decision, and their recommendations will, of course, be submitted for the approval of the King. His Majesty will, indeed, have the final decision in the matter, although no doubt his opinion will be influenced to an extent by the views of Viscount Esher, Lord Windsor, Sir Edward Poynter, Mr. Sydney Colvin, and the other gentlemen who constitute the committee. In the absence of Sir Arthur Bigge, who is on tour with the Duke and Duchess of Cornwall, Viscount Esher is acting as secretary to the committee.



Bricks and Mortar.

Aphorism for the Week.

But this pinnacle and flamework which has set your little heart on fire is all vanity; and you will see what it will come to, and that soon; and none will grieve for it more than I. And then everyone will disbelieve your pretty symbols and types.—Ruskin.

Our Plates. In the pair of semi-detached houses to be erected for Miss Charlotte E. Waters at Southborough, Tunbridge Wells, from designs by Mr. Sidney V. North, A.R.I.B.A., the cornice, columns and entablature are of wood to be painted white, with rough-cast from the first-floor level and red brick below. Wooden bays, iron casements and leaded lights will be used, and the roofs covered with Broseley tiles.—The line drawing by Mr. C. E. Mallows illustrates a partial reconstruction that Mr. W. D. Caröe carried out three years ago of the Whewells Courts at Trinity College, Cambridge.—The drawing of the workshops for the Birmingham Guild of Handicraft, by Mr. Arthur S. Dixon, was in the last Arts and Crafts Exhibition.—The residence at Windermere is built of local stone, rough-casted and lime whitened, covered with green slates from the neighbouring quarries. Messrs. Thomas H. Mawson and Dan Gibson, of Windermere, are the architects.

Capetown Cathedral. We have received from Major G. E. W. Malet, the organising secretary of the Capetown Cathedral Memorial Fund, whose address is Church House, Westminster, some particulars of the proposals with regard to this building. It is proposed to erect in Capetown a building which shall serve both as a memorial to those who have fallen in the South African War and as a thank-offering for those whose lives have been spared. In pursuance of the precedent of the erection of the English church at Constantinople after the Crimean war, it has been decided that the present memorial shall take the form of the eastern portion of the cathedral about to be erected in Capetown from plans by Messrs. H. Baker & Masey, architects. It will be seen that it is not proposed to add to the old cathedral at Capetown as was stated on p. 411 of our issue for last week. For this memorial portion of the new cathedral, which will be Gothic in style, a sum of at least £30,000 is required. Opportunity will be given to preserve on the walls of the building the names, as far as may be possible, of all those who have fallen. Towards the adjacent portion of the new cathedral a sum of about £20,000 has already been subscribed, mainly from Colonial sources.

Want of Taste in Exeter. A correspondent of the "Morning Post" who has been devoting a holiday to cathedral cities declares that Exeter has turned him into a dynamiter at heart, if not in practice. "It would be rude to speak of Deans and Chapters of the past as blockheads, but they are certainly wonderful blockers. They have had the charge of one of the great architectural masterpieces which reflects our national history. They have shut out the view of its magnificent east end with a hideous house for a canon. Dynamite! Its west end sent Freeman into raptures. But it cannot be seen for a quite superfluous church, which really need not have been rebuilt, just opposite. Dynamite! Inside, the blockers have been equally active. The unbroken line of roof is longer than that of any other cathedral in the country; the east window and the lady chapel are of exceptional beauty. But perched on the top of the chancel screen and filling up almost the entire arch is an organ of a particularly clumsy shape which effectually cuts the buildings into two halves and destroys its grandeur. It is a fine instrument, but obstructively out of place anywhere but on the floor of the transept. Finally, the glass which fills the exquisite tracery of the west window is too atrocious for words. It is of third-rate material; it belongs to the worst period; it is for the most part of a staring yellow, which has partly faded but is still flaunting. And so my first impression of the shrine of Bishop Quivil was that every attempt had been made to spoil the best points of view inside and out, while my last reminiscence is of a gaudy blaze of ugly colour."

A Swiss Convent. Architectural tourists in Switzerland this summer may find pleasure in visiting the Normal School of the Canton Aargau, at Muri, a little village on the Limmat, near the town of Baden, in Aargau. This school is established in a Cistercian convent dating from the thirteenth century, which is practically intact, only such changes having been made in it as were necessary to adapt it to the uses of the school. The convent has its legend, which is to the effect that the knight Heinrich von Rapperswyl during a pilgrimage to the Holy Sepulchre was in great danger from a storm, and vowed to establish a convent in honour of the Virgin Mary if he should be spared to reach home in safety. At that moment a star appeared through the clouds to signify that his prayer had been heard, and the storm soon abated. Returning home, he looked about for a suitable place for his convent, and while wandering in the wilderness the same star appearing in the sky, showed him that he had reached an acceptable site. He went to work with great energy, and in 1227 the convent was dedicated. In 1232, a year after the death of his wife, the good knight himself took the vows in his convent, and died there some years later. The Convent of Muri offers a very complete example of a well-organised monastic establishment, certain portions dating from the early Renaissance being very richly adorned with splendid woodcarving of the period.

CHOIR BENCH END, MIDDLETON CHENEY CHURCH, NORTHANTS.

The Tottenham Excavations. By the invitation of Mr. C. W. Sharrock, the manager of the works, a large party of the Essex Field Club recently visited the excavations for the East London Water Company's new reservoirs at Tottenham and Walthamstow. When completed these reservoirs will double the storage capacity of the company, raising it to 2,400,000,000 gallons. By these works the Lea will be diverted from its old channel into a new course which has been formed. The party inspected the so-called Viking ship, which had been uncovered in what had been a backwater in the river channel at some period. The archæologists of the party, however, were by no means satisfied that the ship had a rightful claim to anything like so high an antiquity, and it was considered that from 200 to 400 years was the greatest age that could be allowed. The discovery of fragments of coarse ware, certainly not earlier than the sixteenth century, in the same bed as the ship, and not far from it, supports this opinion. Another trip took the party to the offices, where in a shed near they saw the dug-out boat, about which there can be no doubt that it is early British. It was found on a bed of fine sandy silt, mixed with fresh-water shells, apparently the bank of an old river. Within a hundred yards from it, and practically in the same bed, the workmen discovered several pieces of Roman pottery and a well-made iron spear-head. From the constant shifting of the river-bed, due to floods, it would, however, be unsafe to lay much stress on this fact. It was hoped to secure this interesting relic for the Club Museum at Chingford, but the British Museum has established a prior claim.

The View from Richmond Hill. Mr. Henry Clarke, writing to the "Times" with reference to the statement that the City Corporation some generations ago had intervened for the purpose of preserving Richmond Park, and the suggestion that the London County Council and the Corporation should take steps to preserve the view from Richmond Hill, gives particulars of this action. "In the reign of Edward I. in the thirteenth century there existed a royal palace at Richmond which occupied about 10½ acres of ground. The only portion remaining of it is the gateway of the Wardrobe Court. The palace was surrounded by 350 acres of garden and park land, a portion of which now forms part of Kew Gardens and another portion forms the Old Deer Park. Charles I. extended the park in 1637 to the magnificent dimensions of over 2,000 acres; in fact, Richmond Park to-day is about the size of Regent's, Hyde, St. James's, the Green, Victoria, Southwark, Battersea, Greenwich, Finsbury and West Ham Parks altogether, with Kensington Gardens thrown in. In the Cromwellian period the Commonwealth probably hesitated about selling the additions made by the late king, and the Corporation was found willing to undertake the charge of the park, and by a resolution of the House of Commons in 1649 it was given to the City for ever. The Corporation, with its customary enterprise, managed this beautiful place of recreation until the Restoration in 1660, when the citizens, having probably learnt that his Majesty Charles II. wished it, restored it; the king graciously accepting it not as restored but as freely given unto him by the City."

After Four Thousand Years. The results of the last season's work obtained by Professor Petrie, at Abydos, and Mr. Randall-Macivor, at El Amrah, for the Egypt Exploration Fund, and by Mr. J. Garstang, at Beit Khallaf, for the Egyptian Research account, are, like those of previous years, now being exhibited at University College, Gower Street, and will remain on view till July 27th. The most interesting broad deduction from the objects brought together in this exhibition is the existence of a high standard of artistic excellence in Southern Europe as early as the first dynasty. The conclusion to be arrived at seems to be that Hellenic and Egyptian civilisation were separate from and independent of each other, but with points of contact. Last season, as in the one before, specimens of early Ægean pottery were discovered. The forms are of great beauty, not unworthy of the best days of Hellenic workmanship. Of the earlier work, the specimens of the casts, part is assigned to the prehistoric age and part to the first and third dynasties. "The prehistoric results," we are informed, "have been obtained from two cemeteries—one belonging to the first half of the prehistoric age, the other extending from the earliest time down to the first dynasty, and covering, therefore, the interval between the prehistoric series and the historic, which has not yet been well defined." These include slate palettes, worked flints, maceheads, whorls, marbles, pieces of ivory, domestic pottery, &c. Some pottery cylinder jars came from the tomb of King Ka—the earliest yet known; and with pieces of large pottery jars, all having his name incised on them while wet. An interesting but somewhat obscure object is a gold bar of King Mena—circ. 4777—with his name Aha engraved on it. This bar weighs 216 grains, the amount of the earliest standard for weighing gold. But its use has not been ascertained or conjectured. The Queen of Zer's bracelets—Zer was the second king of the first dynasty—were the most important finds of gold work, of which the originals are in the Cairo Museum. Four bracelets were found in the *débris* left by the builders of the Osiris shrine, by the Coptic destroyers and the Arabs employed by the French mission. The exhibition must arouse infinite delight in the specialist and speculative wonder in the ordinary educated visitor.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Openings for Architects' and Builders' Assistants in Canada.

CHELMSFORD.—G. H. writes : "I propose next spring to emigrate to Canada. I am thirty years of age and have had good experience in the building trade, but find it so crowded here that a bare living wage is all I can command. My education has been good and I have plenty of energy. Do you think I might reasonably hope to succeed out there ?"

Obtain from the Emigrants' Information Office, 31, Broadway, Westminster, S.W., the quarterly circular on Canada and the Australasian and South African Colonies (free), a copy of their handbook on Canada (price 1d.), and one of their "Professional Handbooks" (price 3d.). Also write to the "Canadian Architect and Builder," published by the C. H. Mortimer Publishing Co., Confederation Life Building, Toronto, Canada.

Septic Tanks.

NOTTINGHAM.—X. Y. Z. writes : "I have understood until recently that in the septic drainage system the septic tank should be constructed so as to exclude light and air as much as possible in order to encourage the microbes in their work, but I am now informed that *open* tanks are being used and are just as effective. Where can the latest and most trustworthy information be obtained, other than that contained in Sutcliffe's 'Modern House Construction'?"

Numerous methods have been devised for the systematic utilisation of bacterial agency in sewage purification by the construction of tanks, contact beds, &c. Amongst these may be mentioned the Exeter or septic tank, Scott-Moncrieff, Dibdin, Lowcock and Ducat systems. Each method claims certain advantages. One of the best books dealing exhaustively with the general principles underlying bacterial sewage purification and describing the various systems introduced is "Sewage, and the Bacterial Purification of Sewage," by Dr. S. Rideal, D.Sc., published by R. Ingram, Pleydell Street, Fleet Street, E.C. ; price 14s. T. E. C.

Paint on the Eiffel Tower.

STOCKPORT.—STOCKPORT writes : "What kind of paint is used for the ironwork at the summit of the Eiffel Tower, Paris ; how is it made ; what is its composition and its price ; where can it be obtained ; and how long is it supposed to last ?

We are unable to supply the required information. Red lead is considered to be the best paint for iron, and it may be used with boiled oil and a little turpentine for the first two coats. The iron must be thoroughly dried before painting. Perhaps querist may find some information in the paper on "The Preservation and Ornamentation of Iron and Steel Structures" in the Transactions of the Society of Engineers for 1883" (E. & F. N. Spon, Ltd., 125, Strand, W.C. ; price 10s. 6d). Last year "Hints on Painting Structural Steel" was published by the U.B. Publishing House, Dayton, Ohio, U.S.A. This little book, though it contains no mention of the Eiffel Tower, supplies much information on the composition of paint. It is intended to be a study of practical conditions in steel-making, the reasons for failure in metal coverings, the character of the materials to be used and the best methods of protecting steel products.

Renaissance Buildings in Bath.

LONDON, N.W.—P. J. H. writes : "What Renaissance buildings in Bath would be suitable to measure for the R.I.B.A. final examination ?

The best Renaissance buildings in Bath are undoubtedly the modern works of the late J. M. Brydon, such as the Art Gallery and Library. But why not measure the ancient Roman Bath itself ? It is small and in a comparatively good state of preservation, and one of the very few examples of actual classic architecture within easy reach of the English student, outside the British Museum.

G. A. T. M.

Bond of Octagonal Shaft.

WALTHAMSTOW.—C. J. W. writes : "Which is the correct way to set out the bond of an octagonal shaft ? Would it be correct to set it out from the centre of each panel, with cut bricks at each angle, or start from the angle of each panel and work to the centre, having the cut bricks in the centre ?"

Neither method is more "correct" than the other. It is purely a question of balancing the advantages of each, and consequently plans are given of two courses of each of two systems. Referring to the accompanying illustrations, bond No. 1 is devised from the centre, with closers and cut bricks at the angle, and is obviously much more troublesome and more likely to be badly done than is bond No. 2 with its specially made angle bricks, marked A, B and C, and its closer or cut brick in the middle. In any event, having closers near the angles means *two* weak places on each face, and closers in the middle only *one*. On the other hand, in an uniformly tapering chimney the effect of central closers would be to accentuate the taper to all appearance, and probably the chimney would not look quite so well as if the closers were near the angles ; but appearance is of much less moment than stability in such a case as this.

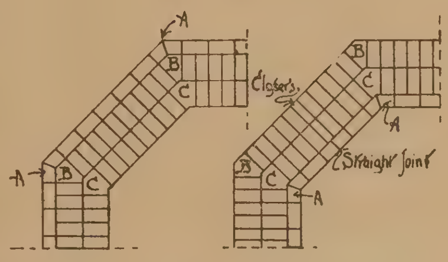
BOND NO. 1.



BOND NO. 2.

BONDS OF OCTAGONAL CHIMNEY SHAFT.

English Renaissance Architecture.

BRADFORD.—BRADFORD writes : "Which is the best part of England for studying Renaissance architecture, London excepted ? I am thinking of spending five or six days measuring and sketching old buildings. Please state what places I might visit in that time."

Where many districts are good it is a trifle difficult to say at once that one is best, but the triangle lying between Leicester, Peterborough and Northampton would be hard to beat for beauty and variety of English Renaissance architecture, mainly Elizabethan. The principal buildings would include Apethorpe Hall (two miles from King's Cliffe) ; Burghley Hall, Stamford ; Kirby Hall, near Weldon ; Rushton Hall, with its triangular lodge, near Kettering ; Rothwell Market House ; the town of Oundle, which contains much seventeenth-century work ; and Canons Ashby,

G. A. T. M.

Sketching at Leicester.

SOUTHPORT.—H. L. writes : "Kindly name some places in or within a few miles of Leicester that are suitable for sketching and measuring."

This is to a great extent answered in the reply to "Bradford," Yorkshire. In the town of Leicester there is the so-called Saxon church of St. Nicholas and three other good churches, St. Mary, St. Martin and St. Margaret ; while the town and county gaols were built respectively in 1792 and 1791, and the Free Grammar School in 1573. G. A. T. M.

Water for Boilers.

BARNSLEY.—G. W. S. writes : "What is the effect of rainwater on a cast-iron and on a wrought-iron boiler ? What kind of a boiler would be most durable for a small supply when rainwater is to be used ? We have at present a wrought-iron boot-boiler. The only alternative kind of water we have is extremely hard, and it coats the inside of boilers, &c., with a hard limey substance, which very soon blocks up the pipes. Will you kindly say what is the cause of this, and whether it could be cured ? At another place we have a large steel steam-boiler, the water supply to this being mixed, partly spring and partly rainwater ; it has become so very deeply pitted all over the inside so that it is about done. It has been worked about there days a week, and has only had a life of ten years. Will you please tell me what is the cause of this, and what would be the best remedy ? Is the rainwater the cause of the mischief ? This is the cause the boiler-maker gives for it, but I do not know whether he really understands. I can scarcely think the rainwater is the sole cause."

Steel is more liable to corrode than wrought-iron, and the latter more than cast-iron. Corrosion takes place more rapidly when partially exposed to wet than when wholly dry or covered with water. Iron in a state of vibration rusts more slowly than when at rest. Iron-rust is chiefly red oxide of iron with a little ferrous oxide and carbonate, and is produced by the action of the moist carbonic acid of the air and subsequent oxidation. It will thus be seen that rainwater, which contains a considerable quantity of carbonic acid, formed by the absorption of carbon dioxide (commonly called carbonic acid gas) from the atmosphere in falling, is more corrosive than water which contains a less quantity of free carbonic acid. The hardness of water is generally due to the solution of chalk by the carbonic acid in rainwater, which falling upon the surface of the ground soaks through the chalk, dissolving some on its way, reappearing as springs or is obtained from wells. When this hard water is heated the carbon dioxide is driven off and the dissolved chalk is precipitated to the sides of the vessel, forming the furr or calcareous coating our correspondent refers to. This hardness can be removed by adding lime to the water before admission to the boiler, the lime combining with the carbon dioxide to form chalk which is precipitated and with it the chalk originally held in solution by this same carbon dioxide. The water must be allowed to stand for some time to allow the chalk to settle. This process of softening water is known as Dr. Clark's. The hardness that can be removed by boiling is termed temporary hardness, but there is a permanent hardness which prevents soap lathering, due to calcium or magnesium sulphates or chlorides, which is not removed by boiling, for these compounds are soluble to a considerable extent in pure water, but as they are not deposited are not objectionable in a boiler. Another method of removing temporary hardness is by adding sal ammoniac, which decomposes the chalk and itself into ammonium carbonate, which volatises with the steam, and the very soluble calcium-chloride which remains in the boiler. When the water becomes after a time too much impregnated with this latter it has to be emptied and refilled. In reply to the other queries, a cast-iron boiler would be most durable for a small supply with rainwater ; the pitting of the steel boiler is due to the intermittent working, its being of steel, and the use of rainwater. We would advise the use of a cast-iron boiler, filled with water when not working, and softened spring or well water, not rainwater. If of steel, the same recommendations apply.

SOUTH KENSINGTON EXAMINATIONS.

QUESTIONS AND ANSWERS IN BUILDING CONSTRUCTION.—Honours: Part 2.

[NOTE.—The questions and answers in the Elementary stage were published in our issue for June 12th, those in the Advanced stage in the issue for June 19th, and those in Honours, Part 1, in the issue for June 26th. In the Honours examination, Part 2, it was not allowable to answer more than five questions, one of which, and not more, was to be selected from each of the first two divisions. No candidate was eligible for this examination who had not obtained a previous success in Honours, Part 1.]

DIVISION I.

61. *Sketch as Grecian Doric—stylobate, column and entablature (at a corner); show entablature up to next column. Sketch vertical section of entablature, also profile of capital, a quadrant of the cross-section of the shaft, and any other details you think necessary to explain the order.*

62. *English pointed architecture: draw elevation of upper part of a three-light window with tracery; give half cross-section across lights; give profile of section of moulding of window head, extending it into the tracery. State the period your drawing illustrates, and explain its special marks and tokens.*

We do not think it necessary to give these sketches. In answering question 62 it would be advisable to give an example illustrating a definite style, not a transition example.

DIVISION II.

63. *Write a specification for a water-closet on a first floor; the space is 8ft. by 5ft. and 10ft. to ceiling; the door is to be in a 5ft. side, the wall opposite door and the wall to the right are outside walls, and they show surface damp though apparently dry when cut into; the wall to the left and that in which the door is are stud partitions. The joists of an existing floor run lengthwise of the space; they are 10in. deep, 13ft. between their bearings, extending across the passage outside the door; the water-supply enters from above in the left-hand corner. The work is to be of the best kind, with floor tiled and walls for a height of 4ft. 6in. also tiled; provide also washhand basin and waste, and complete the work to connection with sewer (inclusive); the sewer is within 10ft. of the bottom of the wall (opposite to the door); provide window. Illustrate clearly by sketches and specify exactly. Floor, door, window, plastering, &c., all included.*

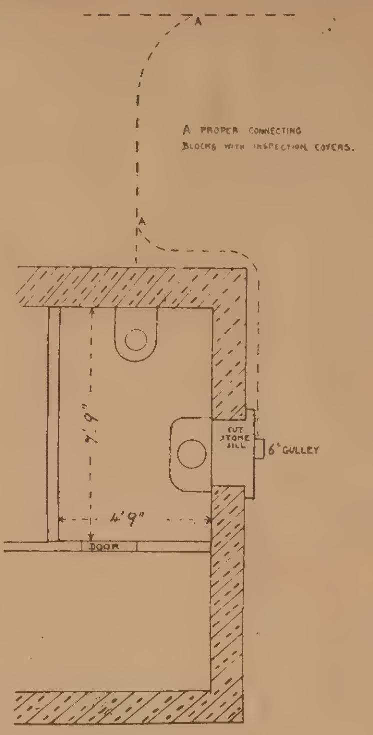
Specification of works to be done for such alterations in the existing building as shall be necessary, and to complete all the works herein specified to construct a water-closet, &c., at
for

All the materials shall be the best of their several kinds. All dimensions given are to be taken as finished dimensions. The work shall be done by capable men under proper and sufficient control.

The contract embraces and includes all items of tools and other appliances, labour and materials, and the proprietor shall have delivered to him on or before the day of a complete work perfect in every respect, all reinstatements executed and the place given up in clean tidy condition.

Excavator.—The necessary excavation and refilling shall be made for connection with the drain and for the drain.

Mason, &c.—The opening shall be carefully made for the window specified below, and for the soil and waste exits. The drains shall be carefully laid and connection made as shown on sketch. The concreting for tiling shall be composed of 1 part Portland cement and 5 parts coke broken to the proper sizes. It shall be laid on the place prepared for it and finished smooth for tiles at one operation. The tiler shall see that the walls are properly prepared for the tiles. The tiles shall be: for the floor No. , and for the walls No. ————————'s catalogue. Build in window and make good soil and waste openings.



SOLUTION TO QUESTION 63.

Carpenter and Joiner.—The flooring boards shall be taken up, side slips shall be nailed against the joists 4in. down, and the top corners shall be roughly chamfered off; the old flooring boards shall be cut in short lengths and placed between the joists resting on the slips.

Provide and fix complete window 5ft. by 2ft 6in. (sash dimensions), with 2in. sashes, double-hung single-pane sashes, glazed with obscured glass in lower sash; pulley-boxes, fastener, jamb-linings, 5in. architraves; to be at a level to suit height of washhand basin, and to be finished neatly. Batten the two outside walls for plasterer. Place in stud partition a 7ft. by 2ft. 9in. by 2in. framed and panelled door, to match in every respect the other doors in the passage, complete with frame, mortice-lock and special inside bolt; three 4in. hinges; inside architrave 5in.

Provide and fix proper ways and covers for pipes, the covers to be put on with screws. Timber to be best red Baltic.

Plasterer.—The outside walls shall be well raked out to the height of the wall tiling, and worked out in cement to the proper thickness, so that the surface of the tiles and plaster will be in the same plane. The stud partitions shall be lathed for this height, with expanded metal between the lathings. It shall be lightly filled with wood shavings to prevent cement plaster going through and falling down. It shall be properly plastered in cement mortar for the tiler. The walls shall be finished with three-coat work in grey, fit for painting. The cornice shall be brought out to suit battened walls.

Plumber.—Provide complete closet No. ——— ———'s catalogue, and No. ————————'s catalogue washhand basin. Fix as shown on sketch. Connect water-supply. Soil-pipe shall be 4in. heavy cast-iron, coated with Dr. Angus Smith's solution. Leaded joints properly connected to drain, rising 2ft. over eave, and finished with copper-wire dome. Soil-pipe from closet to be of 4in. heavy lead, having brass thimble for leading into branch of cast-iron pipe. Bath waste to similarly connect with 3in. outside waste, discharging over 6in. gulleys connected with drain.

Painter.—The door, window and casing to be primed, knotted, stopped, &c., four coats plain (other painter's work shall be postponed till plaster is seasoned).

64. *Write a specification for a lean-to conservatory 20ft. by 10ft.; break a door from drawing-room; provide door from outside. Sash bars iron. Sketch plan, and front and end elevations; the work is to be of a good class; glaze, supply stands, &c., complete.*

Specification of works to be done to supply and erect complete in every respect a conservatory at for ,

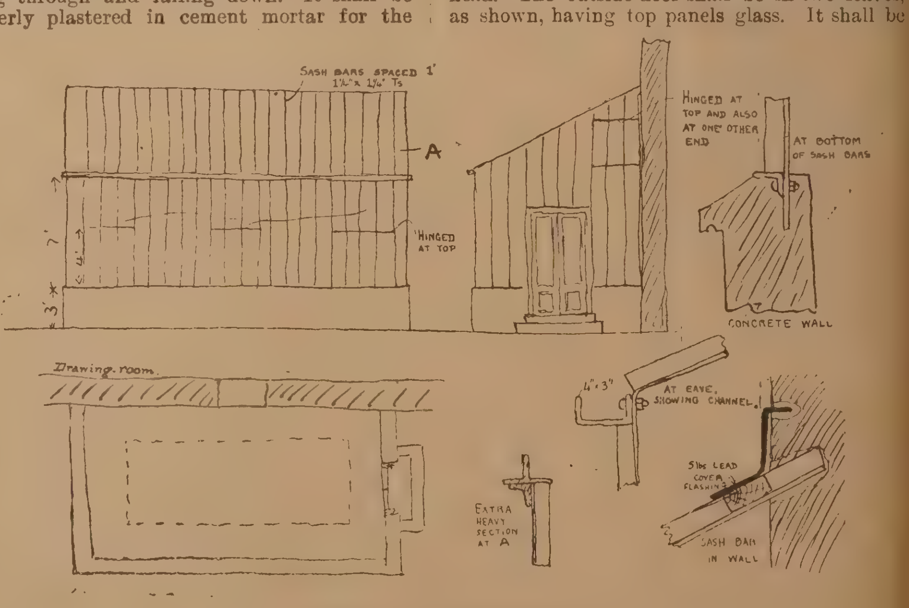
All the materials shall be the best of their several kinds. Any dimensions specified are to be finished dimensions. The work shall be done by capable men under proper and sufficient control.

The contract embraces and includes all items of tools and other appliances, labour and materials, and the proprietor shall have delivered to him on or before the day of a complete work perfect in every respect, all reinstatements executed and the works given up in clean tidy condition.

Excavator.—Excavation shall be made 2ft. deep and 2ft. wide for the foundation of the wall.

Mason, &c.—The wall shall be of concrete resting on a concrete footing 9in. deep and 15in. wide. The wall shall be 9in. thick. It shall rise to the height shown, it shall have the sash bars let in as shown, and it shall be finished smooth in cement mortar. The path round the stands shall be 2ft. 6in. wide of red 6in. tiles on concrete foundations 6in. thick, and this shall rest on a sufficiently hard foundation (stones or brick rubbish: the margin and space under stands shall be filled with good vegetable soil). The door into drawing-room shall be carefully broken out, and the door-frame properly built in and made secure.

Carpenter and Joiner.—The door and door-frame from the drawing-room shall be complete in every respect, with brass mortice-lock, three 4in. wrought-iron butt hinges, architraves, &c., to match the other doors, except that this door shall have the stiles, &c., narrowed to 2in. and have two plate-glass panels from lock-rail to head. The outside door shall be in two leaves, as shown, having top panels glass. It shall be



SOLUTION TO QUESTION 64.

a 2¼in. thick framed door in a 3in. by 4in. frame with three pairs of heavy 4in. wrought-iron butt hinges, top and bottom heavy tower bolts, and a good heavy mortice-lock having heavy brass handles on other leaf.

The stands shall be of 1½in. stuff well nailed to sufficient bearers.

Ironwork.—The sash bars shall be continuous. They shall enter the wall of the house, in which they shall be given a good hold (6in.) secured with cement mortar. They shall also enter the concrete wall. The sketches show some details. The sizes shall be extra large—for sides of door, sides of ventilating openers, and at corners, 2¼in. by 2¼in. ┬s. The opening lights shall be made with welded └-iron rim; sash bars, riveted. Good strong hinges and casement fasteners.

Glazier.—The glass of roof shall be ⅛in. thick, Hartley's rolled plate; in walls 32oz. sheet glazed on primed sash bars with raw oil putty.

Painter.—The whole shall be painted with four coats of best white lead and oil paint.

Plumber.—The flashing shown shall be put on in short lengths housed into a regular and sufficient raglet and made good with cement mortar.

Heating.—Provide sufficient small-bore high-pressure tubes under stand for heating. Carry pipe in suitable jacketing to laundry fire, in which place a proper coil. Supply expansion-pipe, test cocks, &c., complete.

DIVISION III.

65. *What is meant by saying that the height to which a pyramid of any building material may be raised is three times the height of a column of uniform section? Show how, by attending to a cardinal principle of construction, you can build a tower of brick or stone of very great height.*

A column of uniform section should be no higher than the number of ft. equal to the number of cub. ft. of the material which will make the safe load per sq. ft. The volume of a pyramid or cone is one-third of the volume of a column of uniform section on the same base and of the same height: and the same material will reach three times the height of a column if shaped as a pyramid or cone.

It is following a cardinal principle of construction to make your material do equal duty everywhere, as nearly as possible. In a column. each course has less to do per sq. ft. as it rises The area is constant, and the volume diminishes as the upper fraction of the height. In a cone or pyramid the area diminishes as the square of the upper fraction of the height, but the volume diminishes as the cube, *i.e.*, more rapidly. What we have to do is to shape our tower so that the weight on any cross-section will bear to the cross-section a constant ratio.

66. *With reference to the previous question:—A brick tower of efficient design is built on a square base 60ft. by 60ft.; it is 500ft. high. Allowing 6 tons per square foot as the safe load on a cross-section, and taking 120lbs. as the weight of a cub. ft. of brickwork, what is the area of the top? What weight in tons may be safely placed on the top?*

Given:—log. 111 = 2·04532, *log.* 112 = 2·04921, *log.* 4086 = 3·61130, *and log.* 36 = 1·55630. *You may assume* 1*ft. courses.*

Take 1 sq. ft. of base. Weight of a 12in. course (a cubic foot) $= \frac{120}{2240} = \frac{3}{56}$ tons. The area which will carry this load at 6 tons per sq. ft. $= \frac{3}{56 \times 6} = \frac{1}{112}$ sq. ft.

∴ each area should diminish by $\frac{1}{112}$th of the area of the course immediately below it if we assume 12in. courses.

$$\text{Area}_0 = 1.$$

$$\text{Area}_1 = 1 - \frac{1}{112} = \frac{111}{112}.$$

$$\text{Area}_2 = \frac{111}{112} - \frac{1}{112} \times \frac{111}{112} = \left(\frac{111}{112}\right)^2.$$

$$\text{Area}_3 = \left(\frac{111}{112}\right)^2 - \frac{1}{112}\left(\frac{111}{112}\right)^2 = \left(\frac{111}{112}\right)^3.$$

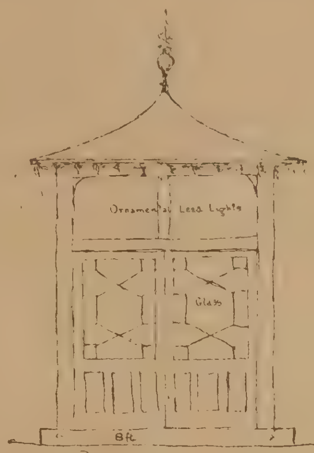
$$\text{Area}_n = \left(\frac{111}{112}\right)^n.$$

$$\therefore \text{Area at 500ft.} = 3600 \times \left(\frac{111}{112}\right)^{500}.$$

∴ log. area = log. 3600 + 500 (log. 111 − log. 112).

Area at top = 40·86 sq. ft., and at 6 tons to the sq. ft. it will carry 245·16 tons. The question is a compound interest question

67. *A well 20ft. deep affords at all times a supply of 1,000 galls. a day, sufficient for a country house; the well is 150ft. away from the house; the tank for a proposed water-supply may be placed in the roof between two king-post trusses of 25ft. bearing, but these will require to be strengthened. Design shelter for hot-air engine, which being in front of the house should be nice; provide for engine, piping, tank, &c., complete.*



SOLUTION TO QUESTION 67.

If we make a tank to hold 1,000 galls., which is advisable, the tank, when filled, will weigh (approximately) 5 tons. The king-post truss will provide sufficient lateral stiffness: it will be sufficient to bolt on to its members 4in. by ¼in. plates, making a jointed structure of the plates. Proper cross-bearers should he laid from tie beam to tie beam, and a regular floor should be formed and covered with a tray of lead turned up at the edges, with a proper overflow to the outside of the roof. The tank should be made of 2in. timber well bound and tied across the top and lined with 8lb. lead. It should rest on the tray, and be of such dimensions as will best fit the roof and hold 1,000 galls. The service pipe should come from the bottom. The tank should have an overflow of sufficient capacity led outside the roof. There should be a ball-valve on the supply main, but care must be taken if this is done to have one—or better two—relief valves on the main, which will lift and give relief when the engine pumps against the closed ball-valve.

The pumping engine should be as near the well as possible, because the shorter a suction pipe is the better. The shelter for the pump need not be large. It is not much larger than will hold the hot-air engine and a small box for coke. It is convenient to have this in the shape of a square kiosk, the four sides to open on hinges like doors so that every part of the engine may be easily got at for cleaning and repairs. The roof to be of lead and the sides of glass so that the engine may be seen at work from the outside. One of the relief valves (set easiest to open) should be here to give warning that the tank is full.

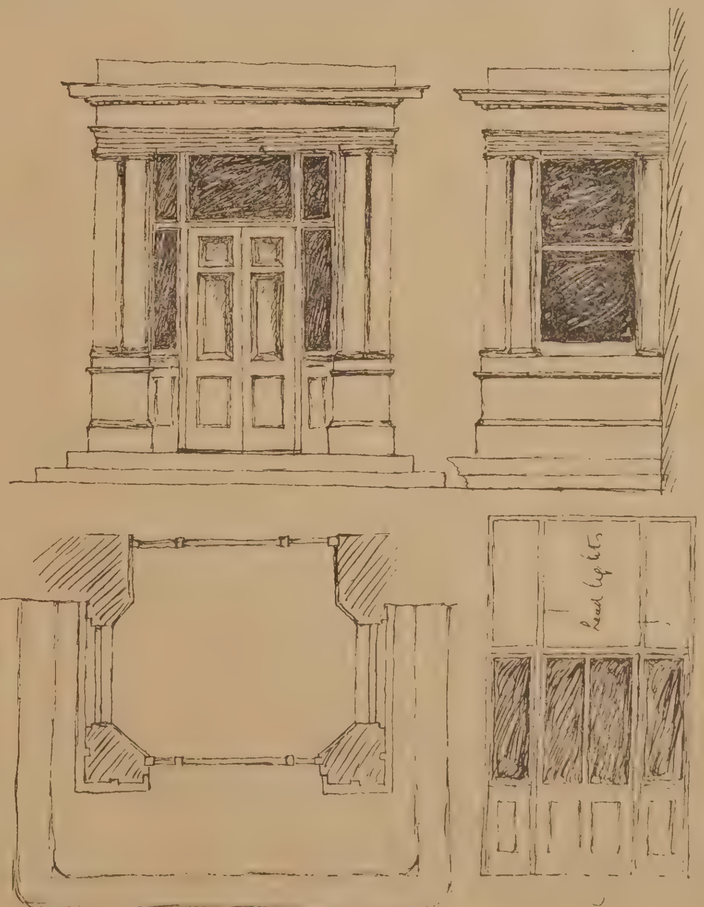
The engine should be ½ h.p. to enable it to take the load easily and to provide for its having to work no more than a reasonable time per day. There should be a hand pump independent of the pumping engine, to provide for accident and repairs. The pipe should be heavy 1¼in. lead pump pipe.

68. *Design and sketch two elevations and sectional plan of a porch for a country house (any style); show elevation of glass door and screen to vestibule. Give full details of your proposals, both by sketches and explanations in writing; take rough quantities and estimate the cost.*

(See accompanying illustrations.)

It is necessary to have the porch enclosed. It is also generally advisable to have as much light through the vestibule door as possible: for this reason plenty of light is provided in the porch and the panels and sidelights of the vestibule door are in plate glass. The top lights may be in lead-lights.

It is proposed to build the porch in clean small stones and cement mortar (or concrete) finished in cement.



SOLUTION TO QUESTION 68.

	£	s.	d.
Concrete, 8 cub. yds. at £1 10s.	12	0	0
Doors and windows, 210 sq. ft. at 5s.	52	5	0
Plasterwork outside	10	0	0
Ceiling jambs, &c., inside to be finished in pitch-pine	10	0	0
	£84	5	0

The concrete top should be well let into the wall of the house, and if this work is carefully done no lead will be needed for the top of the porch. The foundation being rock, the concrete will stand without lintels of any kind.

69. *Design and sketch a double labourers' dwelling in a rural district; show the necessary conveniences and the enclosure. The site is close to a public road. Take accurate quantities and price them.*

(See accompanying sketch.)

Painting, lump sum	3	0	0
Total for a single house	£153	13	6

70. *Draw up a specification and give careful and minute instructions for the inside repairs and thorough cleaning, painting and decorating—including outside painting, &c.—of a town house of, say, £100 valuation. How would you arrange to get tenders, and what steps would you take on accepting a tender? Carry out the complete work as agent for the owner.*

You are to design schemes of colour and decoration for the principal rooms.

Specification of works to be done to repair inside and paint the house No. for

The contract shall embrace and include every item of every kind necessary for the complete execution of the work, workmanship and materials being everywhere of the best description.

The whole of the house from top to bottom shall be thoroughly washed down and cleansed. Ceilings shall be washed clean, old paper removed, painted work shall be pumiced smooth or the paint removed by burning, and any loose paint on painted walls shall be scraped off.

The drawing-room shall have the ceiling in light sulphur-yellow, the cornice picked out in white and shades of warm yellow: the enrichments in various shades, and the prominent parts gilt. The frieze shall be of a warm terra-cotta colour, and the walls below the picture rail light sage-green. The dado, which is in low relief lincrusta, shall be cream tinted white. The ceiling and frieze shall be in Duresco, and the enrichments, walls and dado in oil paint finished flat. The doors, windows, trimmings, shall be in best white enamel with gold lines on the mouldings. The floor-margin shall be stained dark-oak colour.

The dining-room shall have a blue ceiling: cornices and enrichments in shades of gold-yellow picked out in gold; frieze of light chocolate, walls darker, dado dark. Doors and trimmings, &c., to be of Indian red enamel. Library with light-green ceiling, shades of green on cornice, and enrichments in light orange; frieze walls dark sage-green, doors, trimmings, &c., in dark-green enamel. Breakfast-room same as dining-room, but with lighter shades. Floor margins stained dark and varnished.

All the work shall be done in the best manner, and so many coats shall be given as shall be sufficient to bear out and give a uniform finish and tint at every part. Before the work has proceeded too far the contractor will draw up a complete detail scheme showing his interpretation of the colours specified; and when this is agreed to by the architect he will sign it as having been approved.

Specify repairs to plaster, windows, doors, trimmings, mantelpieces, locks, keys, handles, window-fasteners, grates, ranges, flues, gas and electric fittings, water-pipes, bath and water-closets, cocks, traps, pipe casings, sash cords, broken glass, blind furniture, bells; lacquered work to be redone, polished work repolished, &c.

Outside painter's work—windows, doors, ironwork, stucco (after mending). Entrance door in hard varnished colour. The other work in plain colour as shall be directed.

Basement walls and ceilings in Duresco, woodwork plain painted. Bedroom ceilings distempered, tinted to match papers, cornices picked in colours, walls papered, woodwork flat tinted to match papers. Papers to average 1s. 6d. a doz. Margins of floors stained and varnished dark oak. Staircase, ceiling, distempered walls papered 2s. 6d. a doz., and varnished dado and margins painted; doors enamelled cream-white. Greenhouse painted white inside and outside. All things usually painted are included in the above, and all things are to be done to make the work perfect in every way, equal to the best work done.

Have this specification manifolded on the typewriter, and send it round to a few house-painting contractors asking for proposals. Select a contractor to the best of your judgment, prepare a short agreement for him to sign, and see that he carries out the work in accordance with the agreement. Inspect the work in progress, and pay reasonable instalments for any work completed.

Surveying and Sanitary Notes.

New Refuse Works at Gallangad for treatment of the scavenging refuse of the Vale of Leven have been opened. The works consist of brick buildings in which are placed machinery and apparatus for separating the rough material from the manure, this screened manure being considered saleable and of use to farmers. The motive power is a 7-brake h.p. oil engine. A railway siding has been constructed about a quarter of a mile from Caldarvon Station, and ten waggons have been purchased to convey the refuse from Alexandria.

Lifting a Street. — The Northwich Urban Council have commenced the stupendous task of literary lifting all the shops and buildings in Northwich High Street. This has been rendered necessary by the gradual subsidence of the street, which has sunk 4ft. 6in. during the last eight years. It is now to be raised 3ft. 6in., the buildings being lifted by hydraulic jacks. Some shops in which business is being carried on as usual are wedged up 4ft. or 5ft. above the present road level. A portion of the heavy expenditure entailed by this "shop-lifting" will be borne by the Salt Compensation Board.

Lime Water for Street Watering. — Dr. A. Eddowes, writing to a medical journal, suggests that the use of lime water, prepared fresh, for watering the streets in hot weather would prove to be a practice productive of sanitary comfort. The advantages claimed for the practice are said to be those, first of aggregating together loose particles of manure and thus to prevent them being diffused by the wind; second, of exercising a certain antiseptic action; third, of preserving wood paving; and, fourth, of rendering wood less slippery. The idea should be worth considering by the local authorities entrusted with the care of the streets, and an energetic surveyor might make trial of Dr. Eddowes's plan on an experimental basis.

The Drainage of Paris.—At various times within the last eight years notice has been given by the Paris municipal authorities that within a certain period after the completion of stated portions of the sewerage system the owners of houses within the district concerned would be obliged to connect their houses with it; and in 1897 a list of streets, comprising the greater part of all the streets in Paris, was published, with a formal notice that all buildings abutting on those streets must be connected with the sewers in them before the first day of January, 1901. This order, which gave more than three years for making connection, hardly seems unreasonable, but the Parisians did not think it necessary to hurry themselves, and connections have been made only at an average rate of about two thousand a year. Now the time allowed for making them has expired, and there are still more than twenty thousand buildings in the district without sewer connection. In addition to these, new sewerage districts have been formed and similar notices issued for them, so that thirty-five thousand additional houses must soon be connected with the new sewers, the limit of time for most of them being January 1st, 1904. The Municipal Government, very naturally, does not like to see its ordinances disobeyed, and is considering what steps should be taken in regard to the delinquents; while the latter, who plead as an excuse the difficulty due to the increased demand of getting competent workmen to lay house-drains have formed a "Houseowners' Protective Association" to resist as a body, if necessary, attempts to discipline individuals. How the affair will be settled it is difficult to say. With sixty thousand of the great Parisian tenement-houses to have their plumbing rearranged and connected with the sewer within the next three or four years, the demand for plumbers, which has hitherto made it difficult to finish two thousand houses a year, is not likely to diminish.

Artificial Asphalt Pavements.—Nearly 40,000,000 sq. yds. of artificial asphalt pavements have been laid in the United States. The practice is to lay a binder course immediately on top of the concrete foundation. This binder course is a mixture of stone broken to from ¾in. to 1in. and asphalt cement, and is laid in thicknesses of 1in. to 1½in. The binder is said to prevent the shoving or rolling which occurred when the asphalt wearing surface was laid direct on the concrete foundation. The stone used is first heated, and hot liquid asphalt cement is then added in sufficient quantity (usually 3 to 4 per cent.) to cover each particle of stone. It is important not to add too much of the cement, whilst if too little is used the whole mass will break up under the roller. The wearing surface consists of a mixture of siliceous limestone ground to pass a 200-to-the-inch mesh, with 9 to 11 per cent. of bitumen. The amount of bitumen varies with the quality of the aggregate, and in practice the proper proportion is ascertained by taking a small sample of the hot asphalt mixture and pressing it between two sheets of smooth brown wrapping-paper. If the bitumen is in the proper quantity there will be a scarcely perceptible stain on the paper; but if too much the stain will be blotchy. The proper stain is learned by experience.

Builders' Notes.

Mr. James Palmer, a retired builder, of Hallam Road, Clevedon, died recently at the age of seventy-five years.

Mr. C. Higginbotham, builder, of Castle Street, Dalkey, died recently. He erected a number of houses and terraces in the district, including the new Town Hall, the Parochial House and an addition to Bullock Church.

Mr. James Harris, of The Rest, Commercial Road, E., died recently at the age of seventy-five. The deceased was a native of Tisbury, Wiltshire, and after having been in business as a builder at Corsham and London, he went to Woking forty-four years ago. The business founded by Mr. Harris proved a most successful one, and probably he was more closely identified with the development of Woking than any other resident. His first large contract in Woking was the building of the central hall at the Oriental Institute, and among other buildings which he erected were Christ Church, the Catholic Church in Sutton Park, the Baptist Chapel, Police Station, &c., while as sub-contractor he did a great deal of work at the Crystal Palace.

Mr. S. Hanson Rowbotham, son of Mr. Thomas Rowbotham, the well-known builder and contractor of Birmingham, recently attained his majority, in celebration of which a large number of friends were entertained by Mr. and Mrs. Rowbotham at their county residence, Gilbertstone Grange, South Yardley. A large ballroom and dining-room were erected in the grounds, and in the course of the festivities the health of Mr. Hanson Rowbotham was proposed by Mr. E. Wood, architect, of West Bromwich, Sir James Sawyer proposing the health of Mr. and Mrs. Thomas Rowbotham. The "young master" received his early training in the building trade under the direction of Mr. Henry Martin and Mr. W. H. Bidlake, M.A., and is now engaged in superintending the large building contracts (amounting to about £300,000) being carried out by his father for the Greenwich Union. A gold watch was presented to him by the foreman and office staff in his father's employ.

The German Emperor and the British Fire-Prevention Committee.—At the meeting of the executive of the British Fire-Prevention Committee held last week Mr. Edwin O. Sachs, the chairman, announced the receipt of an appreciative message from the German Emperor in connection with the visit of the committee's deputation to Berlin last month, transmitted through Baron von Richthofen. On the occasion of the opening of the Berlin Fire Congress, the French delegate, acting under instructions from his Government, requested permission to call for cheers for the German Emperor, a courtesy which, coming so officially from France, created a considerable sensation. It was at the subsequent banquet given by the London committee, and attended by the British ambassador, that Mr. Sachs took upon himself to propose the Emperor's health, remarking that, although not instructed by his Home Government, as was the case with his French colleague, such instructions were of course quite unnecessary as far as Englishmen were concerned, seeing what a great pleasure it was to them to acclaim the Emperor as one of the three most popular men in the British Isles. Mr. Sachs' remarks were not only received with considerable enthusiasm at the time, but led to very considerable comment in Germany, as showing the difference between a spontaneous and an official compliment.

London County Council.—At last week's meeting the Finance Committee's return of the estimated and actual cost of works completed during the half-year ending March 31st, 1901, was received and adopted. This showed that the approximate expenditure on estimated works for the half-year was £155,000. On the total amount of work comprised in the statement, namely, £83,924, there was a balance of cost under final estimate of £391, or 0·5 per cent. Most of the works had been carried out at a cost somewhat less than the final estimates as certified by the chief engineer or architect. There were six cases in which the cost had exceeded the final estimate, but in only two was the excess considerable, namely, Redcross Street fire station, £1,023, or about 9 per cent; and Cobham Buildings, £1,129, or about 10 per cent. With regard to jobbing works, the results for the half-year were as follows: 593 works executed at a cost below schedule value of £1,207 7s. 6d., and 621 at a cost of £349 17s. 6d., making 1,214 works executed at a balance of cost below schedule value of £857 10s. 1d., or 6·9 per cent. At the present time the department had twenty-nine works in progress (exclusive of jobbing works), representing a total estimated cost of £733,350, in respect of which work to the cost of £546,507 had been executed up to March 31st, 1901. There were also thirteen other works not begun, the estimates for which amounted to £124,985. The General Purposes Committee reported that they had received a letter from Sir Alexander Binnie resigning his appointment as the chief engineer to the Council, as he desired to enter upon the private practice of his profession (see page xi of our last issue). The committee, reporting upon this, stated that they thought it very desirable that Sir Alexander should retain his position until the end of the year. It was recommended that the resignation should be accepted, and that it should take effect as from December 31st. The report was adopted after several of the leading members had testified to Sir Alexander's service and distinguished ability.

Views & Reviews.

Algebra.

This new elementary text-book on algebra is one of the best we have seen. It is extremely clear in demonstration and is easily read, avoiding the usual faults of science text-books in employing too much summarisation, with sentences often badly phrased and involved. In this book the author, who is the headmaster of King Edward's Grammar School, Stourbridge, has endeavoured to allow the rules of algebra to grow out of the rules in arithmetic, the student thus being led to associate the operations in the former with the operations in the latter, so that one set of rules serves for both sciences. This is undoubtedly the correct method, and has been adopted by all the best teachers and textbooks. Mr. Deakin has also endeavoured to encourage thought from the very beginning, the student being impressed with the importance of examining every question before he begins to work it out and to try to anticipate the answer. A useful chapter is included on mistakes made by beginners in algebra and the detection of these mistakes. The proofs of the rules are deferred to the latter part of the book, when the student has become familiar with the simpler rules, but this has allowed them to be given more fully than is usual with elementary text-books. We are glad to see that a chapter has been included on the graphic representation of functions, not usually dealt with in elementary books, for too often persons go through the various branches of elementary mathematics without any clear notion of their correlation. This is, of course, one of the great objections to the method of dividing science up into numerous divisions. The only adverse criticism we have to make on this book is that chapters should have been given on harmonical progression, permutations and combinations, the binomial theorem and logarithms, which are quite capable of being treated elementarily, and gain by being brought into clear and evident sequence with the remainder.

"The Tutorial Algebra. Part I., Elementary Course." By Rupert Deakin, M.A. Price 3s. 6d. London: W. B. Clive, 13, Booksellers' Row, Strand, W.C.

The Office Proper.

This is a book of systems for office management. The author says in his introduction that whatever else an architect or engineer may elect to put aside as not being absolutely essential to his success in life, he certainly cannot afford to neglect the cultivation of methodical work and a business-like system in carrying on his avocation, and his object in writing this book is to supply the need for a treatise on the business and office side of architecture and engineering. It is the result of many years' experience, only those methods being recommended that have survived the test of regular daily use. Among members of any profession there are always many who disdain to adopt some sort of system in the conduct of their business, and this is especially the case with the architectural profession, in which the anti-systematic art feeling exists to a large extent. Much, however, as it is desirable to work on a definite system it is possible to overdo the matter, thus stepping into the bounds of faddism. This is our complaint against the book under consideration. The author employs innumerable books. First, there are the diaries: the assistant records all he has done during the day; the principal has one diary for appointments and another for general professional work done; the draughtsman has a diary in which he enters what he has been doing every hour; there is an attendance diary, in which each member enters the exact hour of his arrival (though the time at which he leaves is not entered); a callers' book; and another engagements' book kept by the junior clerk. Letters next come under consideration. The author rightly emphasises the necessity for the stationery to be of good quality, and points out that if the writer's name is made unduly prominent followed by a long alphabetical display, the person to whom the letter is addressed may be led to conclude that the name is hardly sufficient to stand by itself, while "the absence of any such embellishment may be taken as an indication that the writer is, or believes he is, like the good wine which needs no bush." Should the name be omitted from the head of the note-paper, the writer is urged to refrain from making his signature an undecipherable cryptograph. All letters received are to be put in special marked baskets, numbered and entered in a letter register; then when replied to they are placed in another basket, and afterwards in a basket labelled "This Week's Letters." Files and cabinets are used, and a journal is kept in which requests and instructions in the letters are noted. The principal is to look over the envelopes to see that they are addressed properly, and all enclosures have attached to them a gummed label indicating the letter to which they belong. Finally, there are letter books and letter-despatch books. The same system applies to catalogues, which are not to be consigned to "some vile dusty place, unknown, unwrapped, unheeded and unsewn," but divided into sections and sub-sections, classified numerically, labelled, indexed and kept in presses and on shelves. After such an orderly discourse the author deals with specifications, drawings, estimates, certificates and reports, how they should be kept and prepared, concluding with chapters on cash-books and ledgers. Much useful information is supplied on these subjects, together with some excellent forms, but we feel that two many different books are employed, requiring too many entries to be made—so much so that in some cases it becomes almost ludicrous. This will perhaps be appreciated from the numerous books already referred to, but in addition there are several others not mentioned, such as the estate register, the sanitary register, the certificate book, the works book, the returnable documents register and the estate maps book. It is well to be systematic, but, as already pointed out, a system may be carried too far; and this is our feeling about this one in particular. Moreover, we think that the price of the book is double what it might have been considering its nature.

"Office Management: A Handbook for Architects and Civil Engineers." By W. Kaye Parry, London: E. & F. N. Spon, Ltd., 125, Strand. Price 10s. nett.

Deductions in Euclid.

This small book of deductions from propositions in Euclid, Books I. to IV., should prove of considerable use to students, teachers and others as a systematic summary of proofs of *a priori* propositions to those in Euclid, usually set as riders in the various text-books. It also serves a useful purpose in systematising the proofs of facts which are in every-day use by architects, engineers and draughtsmen in the applied sciences. We advise students of Euclid to use this book side by side with the ordinary text-books, for, being arranged in the same order, when a Euclidian proposition has been mastered this book can be taken up and all the subsidiary resultants followed out. The exercises or riders on Euclid at first are usually found by students very hard to master owing to their inability to clearly perceive the system of principles underlying the bare Euclidian propositions, and yet for the young brain these exercises are undoubtedly some of the finest stimulants and training to logical and coherent thought. What is now urgently needed is a book arranged upon a logical system for the solution of riders, giving hints upon methods of going to work and with numerous exercises. Then such a book as this by Mr. T. W. Edmondson will become enhanced in value as a book of answers to the problems.

"Deductions in Euclid." By T. W. Edmondson, M.A. 2s. 6d. London: W. B. Clive, 13, Booksellers' Row, Strand, W.C.

Calculations with Lead.

These tables of weights and measurements of sheet lead have been compiled for the use of lead rollers, plumbers, hardwaremen, builders, architects and measurers. They save considerable time in arriving at the estimated weight of a given length and breadth of sheet lead at so many pounds to the sq. ft. We need not enlarge upon their usefulness, which will be apparent to everyone. Like all of Messrs. Spon's handy-sized pocket note-books, this is got up in the very best style, having a neat leatherette cover and clear type.

"Weights and Measurements of Sheet Lead." By James Alexander. Price 1s. 6d. London: E. & F. N. Spon, Ltd., 125, Strand, W.C.

Engineering Notes.

A New County Bridge over the Derwent at Eddie Ford, in the parish of Muggleswick, was formally opened for the use of the public recently. The structure has taken the place of a footbridge and ford, which, especially in winter-time and after a heavy rain, were somewhat dangerous to cross. The new bridge has two segmental arches, with a span of 35ft. each, and is altogether 101ft. long and 25ft. high. The roadway is 15ft. in width. New approaches have been made to the extent of about 600ft., the old highway having been diverted. The cost is about £1,300. The contract was let to the late Mr. Thomas Westgarth, of Tow Law, and carried out under the supervision of Mr. Lowson Westgarth; Mr. J. E. Parker, of Blackhill and Newcastle, being the designer and engineer.

Power from Bubbles.—One of the most interesting devices by means of which natural water-power is rendered available for the use of man is the "Taylor System" of utilising the compressed air forced under the surface of a river by a cascade. The water is made to fall in such a way that the largest possible amount of air is drawn under, and the bubbles thus formed are trapped in chambers, whence their highly-compressed contents are distributed through pipes. The waste or "tail" race rises sufficiently near the level of the supply to sustain the pressure on the air chambers. This system of providing power has been in practical use in Magog, Province of Quebec, for more than a year, and a company has just been formed to utilise the waterfall of the Lachine Rapids for the benefit of Montreal.

The Largest Generating Station for Electric Power in Existence will be that which is to supply the New York Elevated Railway with electric traction—a great boon, by the way, to those coal-strewn avenues along which the elevated road at present runs. The normal capacity of the power station will be 65,000 horse-power, and the maximum capacity 100,000 horse-power. The steam plant will be made up of eight compound engines, which will be capable of running at a continuous productive capacity of 12,000 horse-power. It is, perhaps, interesting to observe that even these great engines are less in power than those which fill the engine-room of a great ocean liner. The "Deutschland's" quadruple-expansion engines, for instance, run at 18,000 horse-power. An electric train is already running along Second Avenue in New York. Like the trains of London prospective tubes, a motor will be attached to the front and the back of each train.

The New Weir at Windsor.—The picturesquely-situated weir which the Thames Conservancy has just completed between Romney Island and the Eton shore of the main river at Windsor is already proving a most useful factor in the controlling of the water in its district. The construction, which is perhaps the most remarkable feature on the Thames above Staines, is a novel piece of engineering, accomplished with no little difficulty under the personal supervision of Mr. Fenton, who has had charge of most of the conservancy work that has been carried out upon the river during the last few years. The central portion of the structure consists of a roofed gallery supported upon strong piles driven firmly into the bed of the stream. The cleverly-designed windlass can be easily run to and fro with the greatest ease whenever the massive iron panels are to be raised or lowered. During the recent drought the stream has been somewhat low, but by means of the new weir the water can be husbanded and kept as much as possible at "head" by drawing up the panels. In summer it was formerly somewhat risky for heavily-laden launches to approach the landing places at Thames side owing to the shallowness of the river and the possibility of their grounding or tilting. The new weir has, however, obviated this danger. The weir will also prove most serviceable in winter, as those in charge will be able to carry on their work easily in the roughest weather and quickly pass away the surplus water when the river is much flooded.

The Incorporated Association of Municipal and County Engineers held its annual conference at Leicester recently. Mr. E. G. Mawby, borough engineer for Leicester, who was elected president for the year, in his presidential address pointed out the great importance of having an adequate number of well-qualified building and sanitary inspectors as the best means of safeguarding the health of the community. He pointed out the danger in large towns of leaving in use defective and dangerous sewers of the worst type such as used to be laid before the days of their association. He had himself condemned 32 miles of such sewers in Leicester, and he was now carrying out a scheme to replace them at an estimated cost of £128,000. Certain experiments which he had submitted to the Local Government Board had resulted in that board sanctioning eight miles of a tributary sewerage scheme with ventilation by shafts without any surface grids whatever. The president described how the scheme of sewage disposal at Leicester, designed by the late Mr. Joseph Gordon, had proved so successful that the river Soar, which had been a black stream of offensive sewage matter, had been converted into a pure stream. He also described the three sets of baths provided by the Leicester Corporation, and added that they were about to add a fourth set at a cost of over £50,000. Mr. W. Howard Smith read a paper on the construction of permanent ways for electric tramways. Mr. Edward Manville (London) contributed a paper on the methods of safety for the overhead electric trolly system. Perhaps, he said, there was more liability to accident and more difficulty in guarding against it in connection with the trolly arm than with any other portion of the system. In the event of the trolly wheel becoming entangled it was difficult to prevent the trolly head being itself pulled off the trolly arm. For this reason the trolly arm should be long enough to carry the head free of the car, so that should it be dropped it would fall clear of the passengers. Electric shocks to passengers were exceedingly rare, and should not occur at all if the precaution was taken of thoroughly "earthing" all the metallic parts of the car, including the trolly standard itself.

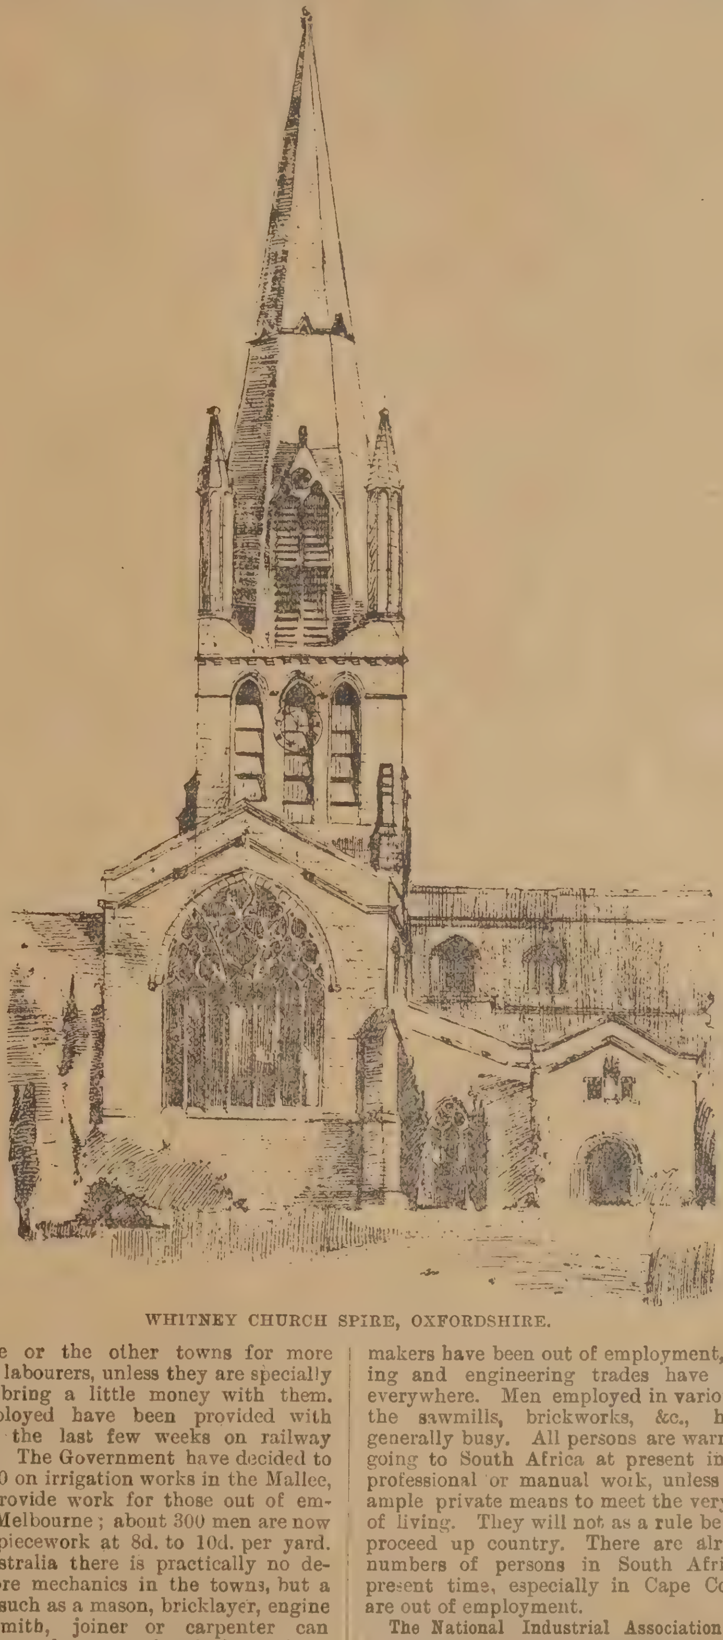
Masters and Men.

The Masons at Burton-on-Trent have struck work for an advance of 1d. per hour in wages. The present wages are 8½d.

The Scarborough Stonemasons' dispute has been settled. Early this year the operative stonemasons gave six months' notice to the Scarborough Master-builders' Association for an increase of wages from 8d. to 8½d. per hour and alterations in working rules. The Builders' Association considered the matter, but, taking into consideration the state of the building trade in Scarborough, they decided to offer the operative masons a reduction of ½d. per hour. An amicable arrangement has now been arrived at, the result being that the wages remain as at present, and certain modifications in the working rules have been made.

The Paviors in the employ of the Bradford Corporation have for some time past, through the Paviors' Union, been agitating for increased wages and for certain concessions with regard to their method of employment. They say that at present their pay works out at 7¾d. an hour, which is much below that paid in other towns where agitations have been successfully conducted. The Street and Drainage Committee of the Corporation have expressed themselves as being perfectly willing to receive a deputation of their own men, but they object to the presence of an official of the union, so that no interview has taken place. The men who are members of the union have now come out on strike. It should be said on their behalf that most of the paving work is let by the Corporation to subcontractors—old paviors who have been in the employ of the Corporation for many years. It is contended that the men's wage under this system is just what they choose to make it; in the summer months it would amount to more than 7¾d an hour. About fifty men will be concerned in the strike.

Labour in the Colonies.—The July circulars of the Emigrants' Information Office, whose address is 31, Broadway, Westminster, S.W., show the present prospects of emigration. This is the best season of the year for emigration to Canada. There is a fair demand for general labourers and for certain mechanics such as carpenters, blacksmiths and iron and steel workers, but not at St. John, New Brunswick, or at Winnipeg, Manitoba. Clerks and persons having no particular trade or calling, or otherwise unfit for manual labour, should not emigrate to Canada unless they have situations offered to them or have means of their own. In New South Wales a report from Sydney states that trade continues good, more especially for plumbers and builders, and the engineering trade has perhaps never been so busy. There is plenty of opening for good artizans in the engineering and general building trades, as well as for general handy men. In Victoria there is practically no demand in Melbourne or the other towns for more mechanics or labourers, unless they are specially skilled and bring a little money with them. Many unemployed have been provided with work during the last few weeks on railway construction. The Government have decided to spend £16,000 on irrigation works in the Mallee, which will provide work for those out of employment in Melbourne; about 300 men are now engaged on piecework at 8d. to 10d. per yard. In South Australia there is practically no demand for more mechanics in the towns, but a skilled hands such as a mason, bricklayer, engine fitter, blacksmith, joiner or carpenter can generally find employment after looking about for a little. Owing to drought and scarcity of employment emigrants are not recommended to go to Queensland at present unless they receive nominated passages or take a little money with them. In Western Australia, at Perth and Fremantle and Katanning there is a demand for mechanics in the building and other trades, good men getting constant employment at Perth; but elsewhere the supply is either sufficient, or, as at Coolgardie, in excess of the demand. At Jarrahdale there is a steady demand for sawmill hands and fellers. It is difficult for clerks, accountants, book-keepers and that class of labour to find employment anywhere. In Tasmania the supply of labour is, generally speaking, equal to the demand. In New Zealand, with the exception of a few places such as Dunedin, where some carpenters and boilermakers have been out of employment, the building and engineering trades have been busy everywhere. Men employed in various parts in the sawmills, brickworks, &c., have been generally busy. All persons are warned against going to South Africa at present in search of professional or manual work, unless they have ample private means to meet the very high cost of living. They will not as a rule be allowed to proceed up country. There are already large numbers of persons in South Africa at the present time, especially in Cape Colony, who are out of employment.



WHITNEY CHURCH SPIRE, OXFORDSHIRE.

The National Industrial Association has been formed to bring about an association of societies interested in trade questions, as employers, employed or as merchants; to keep before the minds of the employers and employed that the practical recognition of their common interest will strengthen and promote British trade and commerce; to enquire into and report on matters affecting British trade and commerce, with a view to enabling our manufacturers to hold their own in the markets of the world; and to create and cement between employers and employees a feeling of common interest: to provide an association where employers and employees can meet on all occasions on the same plane, and to create permanent machinery for conciliation which will be available in case of any threatened dispute between employers and their men. This association hopes to be able to act in perfect harmony with the federations or unions which may be in existence for the promotion of the interests of employers or employees; or with any boards of conciliation, or with any other associations or chambers which have for their object the promotion of trade and commerce. The *modus operandi* will be by instruction by the dissemination of suitable literature adapted to the education of the men for whom it is intended; the bringing of points of interest home to members of Parliament; the collection of matter from foreign Consuls, and the circulation of it in the proper quarters; the sending of joint deputations of employers and employees to the various markets of the world, with a view to discover in what way our trade with particular markets can be improved; the organisation of meetings of employers and employed in different trade centres, which should be addressed by speakers sent by the federation and the promotion of general discussion of subjects of commercial interest; to obtain the co-operation of chambers of commerce and mercantile associations throughout the country; judicious agitation in the press, and the re-printing and distribution of articles dealing with the subject. The association already has received support from numerous organisations and expressions of sympathy from eminent members of both Houses of Parliament and other gentlemen. Such an association would be most useful, and we hope that every large trade society in the building and engineering trades will join. Anyone desiring further information can obtain it from Mr. John Lockie at either of the following addresses: The Federation Offices, 124 and 125, Palace Chambers, Westminster, S.W.; 21, Dean Street, Newcastle on-Tyne; 8, 9 and 10, Great St. Helen's, E.C.; or Stonehall, Stonehouse, Devon.

Trade and Craft.

Bacterial Sewage Disposal.

We have received a copy of a new bacteria bed book from Messrs. Adams' Patent Sewage Lift Company, York, of which, whilst dealing especially with Mr. S. H. Adams' apparatus as applied to different systems, gives a very useful summary of the various types of bacterial disposal beds. The air-controlled feed apparatus is used in many different ways. The way in which the transmission of air to the interior of the apparatus causes an air-lock to shut off the supply, is not only unique but extremely simple and positive. With this feed a given amount of liquid may be delivered for a given time, or beds may shut off their own supply when full, and in each case feeds may be stopped and started in any desired sequence. The manufacturers have apparatus now in hand for weirs up to 5ft. in width. The timed overdraw siphon for discharging bacteria beds is helpful for use with "contact" beds, the length of contact being very readily determined when it is used. For simple beds, whether domestic or municipal, the alternating siphons are widely used. The storage of sewage and its discharge alternately to the beds not only ensures the delivery to the beds of sewage in a suitable form, but long periods of rest for recuperation. In all, the absence of moving parts has been made a *sine quâ non* with this apparatus. All the various operations are brought about by the simple application of natural laws—the pressure due to the liquid itself transferred through the medium of confined air to the apparatus to be controlled. Whilst the patent sewage lift is not specially dealt with in this useful catalogue, the application of this apparatus for automatic raising of sewage to bacteria beds is shown.

Keystones.

A New Parochial Room at Roundhay, in Lidgett Park Road, has been erected.

A Mortuary Chapel with a groined roof is to be erected at Hawarden Church, and will contain an altar tomb bearing the recumbent figures of Mr. and Mrs. Gladstone, for which Sir William Richmond has become responsible.

The Queen's Tower in Conway Castle is to be restored as a memorial to Queen Victoria. It is estimated that for about £200 the tower can be re-roofed, re-floored with oak and the windows re-glazed. By doing this a place will be provided to receive and store all local records, antiquities and curios.

In connection with the Church of St. James the Less, Bethnal Green, new buildings have been opened. They comprise clubrooms, gymnasia, dispensary, nurses' home, schools, rooms for cookery classes and other apartments. With the renovation of the church, vicarage and churchyard nearly £30,000 has been expended within the last four years.

Mr. Robert Wilson, architect to the School Board of Edinburgh, died last week. A native of Edinburgh, he was trained to his father's business, to which he succeeded after some preliminary experience in London. From his office have emanated the plans for the various schools erected from time to time under the Edinburgh School Board.

An Exhibition of Chinese Art will be opened towards the end of this month at the Whitechapel Art Gallery. It is to be the first of a series which will deal with the artistic and industrial productions of various nations, and will illustrate all kinds of national crafts. The director of the gallery is issuing in connection with this first exhibition an appeal for examples of Chinese art and for contributions towards the expenses.

The Architectural Association new Common Room has been opened to members at No. 56, Great Marlborough Street, W. The alterations have been carried out by Messrs. Shuffrey & Co., under the supervision of Mr. W. H. Seth-Smith, the president. The common room, offices and library will now be lighted by electric light. When the classes meet in October refreshments will be supplied, and members will be able to meet their friends and read the papers, professional or otherwise, during library hours. Stationery will be provided and smoking permitted.

A New Parish Church at Brockhampton is being erected on an eminence of the Home Farm near the new lodge, from plans by Mr. W. R. Lethaby, architect, of 2, Gray's Inn Square, London. The building is being erected of local stone only, namely, red sandstone from Caplar Quarry and greenstone from the Falcon, both of which are on the Brockhampton estate. A feature of the edifice will be the unusual thickness of its walls for a modern erection, namely, 3ft. It is intended to seat 135 worshippers (as against eighty in the old church), and is being built in the form of a cross. A lantern over the east end of the church will take the place of spire or tower, and the highest part of the building will not be more than 30ft. An oak belfry will be erected over the porch and the vestry will be under the chancel.

A New Fire Station for West Hampstead is being erected by the London County Council in West End Lane on land fronting the old village-green of West End. The site has cost £1,756 9s. 10d., and has an area of 16,000 sq. ft. The cost of the building will be about £11,373. The plans, which have been prepared by Mr. W. E. Riley, architect to the Council, contain several new features, such as the provision of an increased number of sets of quarters for the firemen and their families. Four of the sets of quarters will take the form of separate cottages, each with its own garden, at the rear of the station proper. Accommodation will be provided at the station itself for a steam fire-engine, horsed escape, and a hose pump, and there will also be a workshop, watch-house, recreation-room, stabling for four horses, and quarters for the station officer, five married firemen and two coachmen. The whole of the premises will be lighted by electricity.

A Monument of the "Maid of Orleans" has been erected at Mehun-sur-Yèvre. The statue is from the chisel of the Duchesse d'Uzès.

A New School at Vickerstown is being erected by the Barrow School Board to accommodate about 650 children. It is to be erected on the Central Hall principle, with classrooms adjoining. Mr. H. T. Fowler is the architect and Mr. Varley the contractor.

The Spanish Art Loan Exhibition at the Guildhall has been so popular that it has been decided, with the consent of the lenders of the works of art, to keep the exhibition open until August 28th, instead of closing it at the end of this month, as was at first arranged. The collection has been visited by over 200,000 persons.

A New Dispensary in Exmouth has been erected in Church Street. Standing in its own grounds, it contains vestibule, hall, waiting-room 22ft. by 15ft. consulting-room 15ft. by 14ft., dressing-room, dark-room, dispensary and caretaker's rooms. The building was designed by Mr. E. Ellis, and built by Mr. J. Lacy.

A New Congregational Church at Churchtown, Southport, has been opened recently. It has seating accommodation for about 750 persons, including the gallery which runs round three sides, the fourth side being occupied by endeavour room, minister's vestry, classroom, choir vestry and organ chamber. There are three entrances in the front and one at the side, and two staircases are provided for the gallery and a separate staircase for the choir. The seating and other woodwork is of pitch-pine and the roof is of an ornamental character. There is an octagonal tower on the south-west angle of the front, with a battlemented parapet, the principal elevation being in red pressed-brick with all the finishings to doors, windows, &c., in Cullingworth stone, finely tooled. A large four-light richly traceried window occupies the centra position, the work generally being of fifteenth-century character. The cost is about £2,800 and the architect is Mr. Francis P. Halsall A.R.I.B.A., of Southport.

Housing in London.—A conference betwee London County Councillors and Borough Councillors was held at the County Hall, Spring Gardens, S.W., recently on the Housing Question under the presidency of Mr. A. M. Torrance chairman of the London County Council. Mr D. Waterlow, chairman of the L.C.C. Housing Committees, said he was authorised to tell th conference that it would be ready to give to th Borough Councils all the benefit of its experience in the matter of building dwellings. Wit the County Council, the City Corporation an the twenty-eight borough councils all empowered to build under Part III. of the Housin Act some solution ought now to be found for th terrible housing evils under which London wa suffering. There was some danger that one o more authorities might compete for the sam piece of ground and thus force up the pric and he hoped as a result of their conferenc that a plan would be devised for avoiding th danger. In accordance with this suggestio several resolutions were passed, and the conference decided to meet again in the autumn.

Mr. William Vaughan has been appointed architect to the Bradford School Board from sixty four applicants. The position is a new o under the board. Owing to the accommodatio at the offices being already fully taxed, separa premises have been arranged for adjoining th building in Manor Row as the architect's offic Mr. Vaughan for nineteen years has been th chief architectural assistant to the Bradfor Corporation; and during that time has had larg experience in architectural work under Mr. Co He has been actively engaged upon the Car wright Memorial Hall, and amongst his rece designs may be mentioned the new baths West Bowling and the new gates in Bowl Park. The board of late have had a system holding competitions for work which has need the service of an architect, but the appointme of a permanent official to do the work is hop to turn out a means of reducing the expenditu For many years the architectural work und the board has been shared by Mr. E. P. Peters and Mr. C. H. Hargreaves, but neither of the gentlemen applied for the post allotted to M Vaughan.

A New Police Court and Station at Howden has been erected for the East Riding County Council at a cost of something like £4,000.

A New Mission Church at Wimbledon, dedicated to St. Peter, has been erected in Haydon Road, to seat 300. It is a chapel-of-ease in connection with All Saints' Church.

A New Church at South Lynn, dedicated to St. Michael and All Angels, has been erected near the railway station at a cost of £1,500. Schools have also cost another £800. Mr. L. F. Eagleton was the architect and Mr. R. Dye, the builder.

A New Hospital at Bristol is being erected for the Kingswood district. The site, of about four acres, stands on one of the highest points in the neighbourhood, and is nearly 370ft. above sea-level. Mr. A. J. Saise (surveyor) is the architect. The new hospital will have a south-west aspect and accommodation will be provided for about fifty cases.

A New Church at Cape Hill, Smethwick, dedicated to St. Chad has been erected. The style of the building, which has been erected in red brick with stone dressings, at a cost of £5,000, is a plain treatment of Early English Gothic, and accommodation is provided for 600 persons. The nave is 80ft. long and 24ft. wide, and divided from the aisles by arcades each of five arches. The chancel is 30ft. by 24ft. feet. Clergy and choir vestries are provided, as well as a large organ-chamber. The main entrance of the church is from a porch on the north side, near the corner of Edith and Shireland Roads. The interior of the building is faced with red brick dadoes and quoins to all windows, the remaining portion of the walls being plastered. The roof is open timbered, of pitch-pine and red deal; the windows have been glazed with leaded lights, and the heating of the building will be by the low-pressure system. The edifice is lighted from ornamental wrought-iron coronas, suspended from the nave arcading. Messrs. J. Harley & Son have carried out the work from designs by Mr. F. G. Gill.

EXAMINATIONS AT THE ECOLE DES BEAUX-ARTS.

THE WAYS OF THE STUDENTS.

THE spring entrance examinations of the Ecole des Beaux-Arts are unlike any others outside of Paris. For six months previously the ateliers or studios are filled with men preparing for these examinations. Early on the chosen day the streets in the Quarter are filled with men carrying drawing boards and other utensils, and when at eight o'clock the gates of the Ecole are thrown open hundreds of young men file in, shouting at the top of their voices. As his name is called each goes past the guard and up the stairs to the little rooms, or *loges*, to secure a place in which to do his work. These *loges* are about 10ft. by 12ft. each and hold six men comfortably. They are by no means ideal working-rooms, being dirty and ill-lighted, and opening off a long narrow passage: altogether they are about as uninspiring as one can imagine.

To the average person the idea of an examination suggests an ordinary room, presided over by a dignified professor with the utmost quiet prevailing, so that one can almost hear the scratch of the pencil. Who can picture an examination held while hundreds of men are singing, whistling or yelling and running up and down a passage? Yet this is just what happens at the Beaux-Arts when the men are making the sketches of a given subject (required to be completed in twelve hours) which determine whether or not they shall enter the greatest architectural school in the world.

The uproar is constant, the noise deafening. From the moment the men assemble in the court till the last one leaves the school at night this noise is constant. First one set and then another takes it up. One wonders that any work can be done.

At the last examination there were no professors in sight, only guardians, whose principal occupation seemed to be to sell food and drink to the students and afterwards to dispose of the beer and wine that were left. As a result, at about four o'clock the guardians, who were supposed to see that the men did not make use of books or photographs, were assembled in one of the vacant rooms discussing politics and drinking and adding to the noise made by the students.

But notwithstanding all the apparent drawbacks the drawings were being made. After studying all the morning on the schemes, most of the men would eat and then start on the finished sketches. As time went on and darkness set in out came candles, for there is no gas or electric light in the rooms; and about six o'clock some of the men handed in their finished work. Others, a little pressed for time, would be working with a will to finish before it was too late. When a party of visitors make their appearance at the door of this *loge* the busy one would call out "*Charette!*" And this would be respected, for it means, "I am in a hurry; need all my time. Don't bother me." At eight the guardians collected the drawings, most of which were completed. Then the men went out, still shouting.

On Sunday the professors went over all the drawings and marked them. On Monday afternoon the results were announced. As early as 4 p.m. hundreds of men assembled in the court of the Ecole to wait until the doors were opened at seven. If noise prevailed before, it was nothing compared with that which now was heard. With nothing to do but wait, and with every nerve strained in expectation, it is perhaps excusable if the 500 young men let themselves loose.

Finally the doors of the great hall were thrown open and the men crowded in. The noise was stilled in an instant, and one could almost have heard a pin drop as the names of the men and the marks they received were called out. Thus the examination was conducted.

New Companies.

Gerrard & Sons, Ltd.

Registered June 22nd to acquire the business carried on by J. Gerrard, T. L. Gerrard, S. Gerrard and J. A. Gerrard, at Swinton, Lancashire, as J. Gerrard & Sons, and the business of a builder carried on by William Richardson at Swinton, and to carry on the business of land and estate owners, builders, contractors, joiners, masons, decorators, shopfitters, undertakers, builders' merchants, sawmill proprietors, house agents, financiers, &c. Capital £30,000 in £1 shares. The first directors are J. Gerrard, T. L. Gerrard, S. Gerrard, J. A. Gerrard and W. Richardson.

Wire-Wove Wood Co., Ltd.

Registered June 24th to carry on the business of manufacturers of and dealers in wooden, metal or textile mats, matting, parquetry, carpets, linoleum, oilcloth, and wooden, metal or other pavements, makers of blinds and shutters, cabinet-makers, stonemasons, engineers, contractors, &c. Capital £5,000 in £1 shares.

J. F. Elton & Co., Ltd.

Registered June 25th to adopt an agreement with S. F. Dean for the acquisition of the business carried on by him at Archer Works, 80, Liverpool Road, Stoke-on-Trent, as J. F. Elton & Co., and to carry on the business of dealers in, agents for and manufacturers of china, earthenware, glass, pottery, terra-cotta, coloured, glazed or other bricks and tiles, &c. Capital £3,000 in £1 shares. The first directors are J F. Elton, A. Sherratt and J. E. Brunt. Registered office: Archer Works, 80, Liverpool Road, Stoke-on-Trent.

Decorators' Supply Co., Ltd.

Registered June 25th to acquire the business of paper-hanging merchants, oil and colour men, &c., carried on by F. Deecker, at 20–22, Tulketh Street, Southport, and 178, Lytham Road, Blackpool, as the Decorators' Supply Company, and to carry on the said business. Capital £5,000 in £1 shares (1,250 preference).

Snaith Plaster and Cement Co., Ltd.

Registered June 26th to acquire the business carried on at Cropwell Bishop, Nottinghamshire, as the Cropwell Plaster and Cement Company, and to manufacture and deal in plaster-of-Paris, cement, plaster, bricks, pipes, tiles, paper and other substances made from clay, earth, gypsum, iron, ironstone, &c. Capital £10,000 in £1 shares. The first directors are E. Gerrish and D. W. Snaith. Registered office: 41, Church Street, Birmingham.

Patent Weather-proof Window Co., Ltd.

Registered June 26th to acquire the patents of James Boardall for a new or improved weather-bar for windows and for improvements in sashes, and to carry on the business of glass and other window manufacturers, &c. Capital £1,000 in £1 shares. Registered office: 8, Old Bank Chambers, Bradford, Yorkshire.

Jesse Tildesley, Ltd.

Registered June 26th to acquire the business carried on by Jesse Tildesley at Willenhall, Staffordshire, and elsewhere; to adopt an agreement with F. T. Tildesley, T. P. Wood and S. J. Wood, and to carry on the business of manufacturers of iron and steel bridges, viaducts, girders, roofs, buildings, boilers, gasholders, tanks, doors, rooms and all kinds of engineering and constructional iron and steelwork. Capital £30,000 in £10 shares. The first directors are F. T. Tildesley, T. P. Wood and S. J. Wood.

International Wall Paper Co., Ltd.

Registered June 27th to adopt an agreement with N. T. Beard and to carry on the business of wall paper manufacturers, designers and dealers, and manufacturers of wall hangings of every description, builders, house decorators and contractors, &c. Capital £30,000 in £1 shares. Registered office: 25, Victoria Street, S.W.

Elliott Bros., Ltd.

Registered June 25th, to acquire the business carried on by F. H. Elliott and W. P. Elliott as Elliott Bros. at Southampton and Beaulieu, and to carry on the business of cement, lime, coal and brick merchants, carpenters, joiners, timber merchants, sawmill proprietors, ironmongers, builders, contractors, &c. Capital £20,000 in £1 shares. The first directors are F. H. Elliott, W. P. Elliott, F. E. E. Elliott and A. W. Pearce. Registered office: Millbank Wharf, Millbank Street, Northam, Southampton.

Morgans (Birmingham), Ltd.

Registered June 28th to adopt an agreement with John Morgan to carry on the business of timber merchants and sawmill proprietors. to deal in timber and wood of all kinds, and to carry on the business of general merchants, carriers, &c. Capital £1,000 in £1 shares.

Standard Range and Foundry Co., Ltd.

Registered June 29th to acquire and carry on the business of a hardware and oil and colour merchant carried on by J. A. Pratt at the Central Hardware Stores, Watford, and elsewhere. Capital £10.000 in £1 shares. Registered office: Central Hardware Stores, Watford, Hertfordshire.

Barnsley Brick and Tile Co., Ltd.

Registered June 29th to acquire land and buildings in Yorkshire or elsewhere, and to carry on the business of land, mine, quarry and brickyard owners, brick, tile, terra-cotta and earthenware manufacturers, builders, contractors, lime, stone, sand and brick merchants, &c. Capital £6,000 in £1 shares. The first directors are C. Wray, H. Owram, W. Foulstone, W. G. England and W. Dunk.

Lloyd's Milton Brick Co., Ltd.

Registered June 29th to carry on the business of brick, tile, pottery, pipe, slate, brick and stoneware manufacturers, clayworkers, cement, lime and terra-cotta manufacturers, &c. Capital £10,000 in £1 shares (8,000 five per cent. cumulative preference). The first directors are T. Lloyd and A. Youngman.

COMING EVENTS.

Tuesday, July 9, to Friday, July 12.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—Annual Meeting at Birkenhead. Inaugural Address by the President, Mr. W. A. Richardson, M.I.C.E. Mr. William Ingham, A.M.I.C.E., on "The Design, Construction and Cost of Service Reservoirs." Mr. William Watts on "The Pollution of Public Water Supplies." Mr. A. G. Cloake on "French Practice in the Manufacture of Cast Iron Pipes." Mr. William E. Plummer, M.A., F.R.A.S., on "Rainfall, the Cycle of Precipitation." Visits to various works in the neighbourhood,

Wednesday, July 10.

INSTITUTE OF SANITARY ENGINEERS.—Meeting of the General Purposes and Finance Committee, at 4 p.m.

Saturday, July 13.

ARCHITECTURAL ASSOCIATION.—Third Summer Visit to Medmenham Abbey, &c., and "Danesfield," both at Great Marlow, by permission of the Architect, Mr. W. H. Romaine-Walker.

Thursday, July 18.

BRITISH ARCHÆOLOGICAL ASSOCIATION.—Annual Congress begins at Newcastle-on-Tyne.

Saturday, July 20.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, Newcastle-on-Tyne.—Council meeting at 1.30 p.m.

Monday, July 22, to Saturday, July 27.

ARCHITECTURAL ASSOCIATION.—Annual Excursion.

Wednesday, July 24.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Annual Dinner at the Whitehall Rooms. Presentation of Harben Gold Medal to Professor R. Koch, of Berlin.

Thursday, July 25.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Congress opens at Eastbourne.

Saturday, July 27.

SOCIETY OF ARCHITECTS.—Summer Excursion to Oxford.

CONTRACTS OPEN.

COUNTY OF SOUTHAMPTON.

TO BUILDERS.

NEW POLICE STATION AT WOOLSTON.

Persons desirous of TENDERING for the ERECTION of NEW POLICE STATION at Woolston may see plans and specifications and obtain bills of quantities and all other information at the office of Mr. W. J. TAYLOR, County Surveyor, the Castle, Winchester, on and after MONDAY, 8th July, 1901, between the hours of NINE a.m. and FIVE p.m., Saturdays NINE a.m. and ONE p.m.

A deposit of five guineas will be required for the bill of quantities, and will be refunded on receipt of a bonâ-fide tender.

Tenders, endorsed "Police Station, Woolston," to be on forms supplied by the County Surveyor, and to be delivered to me on or before SATURDAY, 20th JULY, 1901.

The County Council do not bind themselves to accept the lowest or any Tender. (Signed) H. BARBER,
Clerk of the County Council.

The Castle, Winchester.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDERS MAY BE OBTAINED.
	BUILDING:		
July 12	Pennan, Aberdeenshire—Coastguard Buildings	—	Director of Works Department, Pennan.
„ 13	Little Bolas—Abutment and Wing Walls	—	A. T. Davis, Shirehall, Shrewsbury.
„ 13	Hellesden, nr. Norwich—Additions to City Asylums	Norwich Corporation	A. E. Collins, City Engineer, Guildhall, Norwich.
„ 13	Auldearn, Scotland—Cottages	—	J. Grigor, Carpenter, Auldearn.
„ 13	Chester—Shedding, &c.	Agricultural Society	T. A. Beckett, Secretary, St. Werburgh's Chambers, Chester.
„ 13	Church Coppenhall, Cheshire—Cloakroom Accommdn.	School Board	J. A. Atkinson, 18, Hightown, Crewe.
„ 13	Finsthwaite—Dwelling House	Misses Coward	J. Coward, Stott Park Mill, Lake Side, Finsthwaite.
„ 13	Greetland, Halifax—House	—	J. F. Walsh & G. Nicholas, Lancs and Yorks Bank Chbrs., Halifax.
„ 13	Halifax—Villa Residence	—	G. Buckley & Son, Architects, Tower Chambers, Halifax.
„ 13	Hexham—Public Slaughter-Houses	Urban District Council	R. T. Surtees, Surveyor, Hexham.
„ 13	Rhymney, Wales—Two Villas	Rev. R. E. Peregrine and W. D. Thomas	J. L. Smith & Davies, 50 High Street, Merthyr Tydfil.
„ 13	Sale, Cheshire—Additions to Technical School	Urban District Council	W. Holt, Engineer, Council Offices, Sale.
„ 13	Warminster, Wilts—Cottage	W. F. Morgan	W. H. Hardick, Architect, High Street, Warminster.
„ 15	Erith, Kent—Electric Light Station Works	Urban District Council	W. Egerton, 12 Queen's Road, Erith.
„ 15	Trealaw, Wales—Twenty Cottages	Ynyscynon Building Club	Mr. Lewis, 14 Sherwood Place, Llwynypia.
„ 15	York—Brick Wall	Lunatic Asylum Governors	Demaine & Brierley, Architects, Lendal, York.
„ 15	Slateford, Edinburgh—New Laundry	Caledonian Railway Company	Company's Engineer, Buchanan Street Station, Glasgow.
„ 15	Leeds—Underground Conveniences	Market Committee	City Engineer's Office, Municipal Buildings, Leeds.
„ 15	Leeds—New Premises	West Riding Union Banking Co., Ltd.	Oliver & Dodgshun, Architects, Park Square, Leeds.
„ 15	Macclesfield—Epileptic Ward & Nurses' Home at Asylum	Chester County Council	H. Bestwick, County Architect, Newgate Street, Chester.
„ 16	London, E.—Two blocks of Workmen's Dwellings	London County Council	Architect's Department, Housing of the Working Classes Branch, 18 Pall Mall East, S.W.
„ 16	Kingston-on-Thames—Addition to Nurses' Home	Union Guardians	W. H. Hope, Architect, Hampton Wick.
„ 16	Bury, Lancs—Retaining Wall	Sewering and Paving Committee	A. W. Bradley, Borough Engineer, Bank Street, Bury, Lancs.
„ 16	Gulval, Cornwall—Cloakroom, &c., at School	School Board	T. H. Cornish, 8 Parade Street, Penzance.

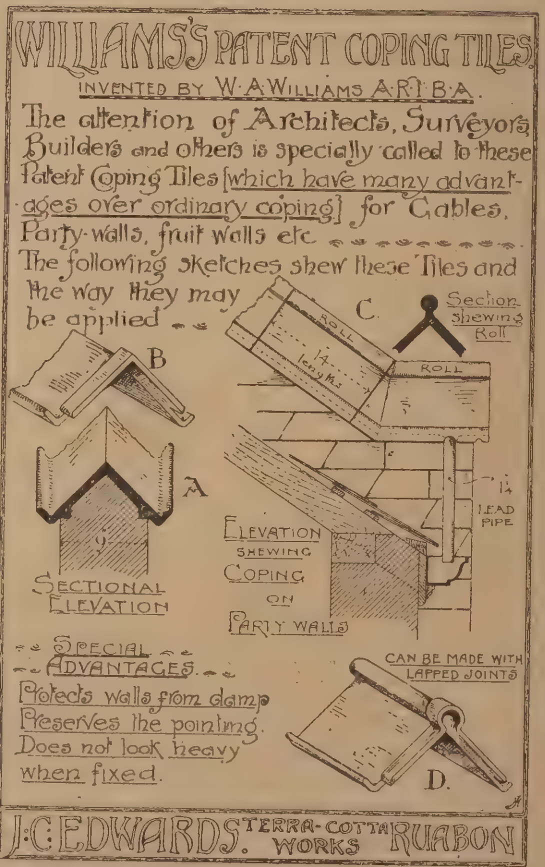
IMPROVED COPING TILE
(*PATENTED*)
For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES.
INVENTED BY W. A. WILLIAMS A.R.I.B.A.
The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc. The following sketches shew these Tiles and the way they may be applied.

SPECIAL ADVANTAGES.
Protects walls from damp.
Preserves the pointing.
Does not look heavy when fixed.

J. C. EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage.

No other ordinary Coping answers the same purpose.

Property and Land Sales.

By order of the Mortgagee.

CHISWICK, W.—With possession.—In the centre of a thickly-populated and favourite residential district, just off an important main thoroughfare; 10 acres of Freehold Building Land, beautifully timbered and possessing a frontage of 900 ft. to Duke's Avenue, with its fine adornment of noble chestnut trees, and Barrowgate Road, affording an unrivalled opportunity for a successful building operation. Valuable beds of sand and gravel underlie portions of the Estate.

MESSRS. MATTHEWS, MATTHEWS, and GOODMAN will SELL by AUCTION, at the Mart, Tokenhouse Yard, E.C., on Monday, July 22, 1901, at 2 o'clock precisely, in one lot, the very valuable FREEHOLD PROPERTY, known as Devonhurst, Duke's Avenue, Chiswick, comprising a noble mansion of modern construction, with fine suite of reception rooms, and 17 bed and dressing rooms, standing in its own grounds of about 10 acres.

Particulars, plan, and conditions of sale of Messrs. G. F. Hudson, Matthews & Co., Solicitors, 32, Queen Victoria Street, E.C.; at the Mart, E.C.; and, with orders to view, at the Auctioneers' Offices, as above.

TELSCOMBE CLIFFS, near BRIGHTON. On the South Downs, facing the sea.—LAND SALE, SATURDAY, JULY 20th, 1901, in a MARQUEE on the Estate. Luncheon at ONE o'clock. Sale at THREE o'clock, when 100 Choice Sites will be sold, Freehold, land tax and tithe free. Repayment by instalments if desired. Free conveyances. A special train will leave Victoria and London Bridge at Ten o'clock on the sale day, calling at Clapham Junction and East Croydon. Return tickets, including luncheon, 5s.

MESSRS. HARMAN BROS. have received instructions to SELL by AUCTION on SATURDAY, JULY 20th, 100 valuable FREEHOLD BUILDING SITES, in choice situations facing the sea, and main avenues on the estate, which is delightfully placed on the summit of chalk cliffs facing the English Channel.—Particulars, plans, and tickets may be had of T. H. E. FOORD, Esq., Solicitor, 15, Philpot Lane, Fenchurch Street, E.C.; of Messrs. WARD, BOWIE, & CO., Solicitors, 7, King Street, Cheapside; of Messrs. HOOKER & WEBB, 4, High Street, Croydon; of Messrs. FAIRBROTHER, MORAN, & CO., 26, Queen's Road, Brighton; and of the Auctioneers, 25, Ironmonger Lane, Cheapside, E.C.

By EDWIN FOX and BOUSFIELD, at the Auction Mart, on WEDNESDAY next, July, 10th, at Two o'clock. Upset price, £1,800.

ISLE OF WIGHT.—22 Acres Building Land on the Sea Front.—FREEHOLD BUILDING PROPERTY, known as the Bouldnor-on-Sea Estate, well situate, close to Yarmouth, about a mile from the railway station; the property, which covers an area of about 22 acres, has extensive frontages to the high road from Yarmouth to Newport, and to other good roads, and affords uninterrupted sea-views across the Solent to the Hampshire coast; it is available for the erection of villa residences and bungalows, and from the invigorating climate, as well as its sheltered position, part of it is eminently suited for the erection of a good hotel or hydropathic establishment. Possession on completion; if not sold in one lot, then in building plots. Particulars of the Vendor's solicitors, Messrs. Edwards, Heron & Co., 24, Laurence Lane, Cheapside, E.C., and at Messrs. EDWIN FOX and BOUSFIELD'S Office, 99, Gresham Street, Bank, E.C.

SMALL BUILDINGS or RESIDENTIAL ESTATE of nearly eight well-wooded acres, on gravel and sand soil, in a charming position on the summit of Kingston Hill, adjoining, and with immediate access to, the highest part of Richmond Park. Thirty minutes' train ride from City and West End. Easy walk to Norbiton and Malden stations, and admirably situate for the erection of small healthful residences for the occupation of City clerks, &c. TO BE LET on Building Lease, or FREEHOLD TO BE SOLD. Part of purchase-money may remain on mortgage.—Agents, MORANT & CO., 91, New Bond Street, W.

STEEL JOIST BUSINESS.—150 TONS of STEEL JOISTS to be disposed of, with GOODWILL of only BUSINESS in town of population of 100,000 on South Coast.—Apply to Messrs. Bramall, White, and Sanders, 23, Leadenhall Street, E.C.

FLEMING'S "TEON" BELT.

THE BEST & STRONGEST BELT FOR DRIVING IN HEAT, STEAM, DAMP, WATER, OR OUT OF DOORS.

A Contractor writes:—"I shall be glad to recommend it as superior to any other Belting I have in use."

* Accepted.

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

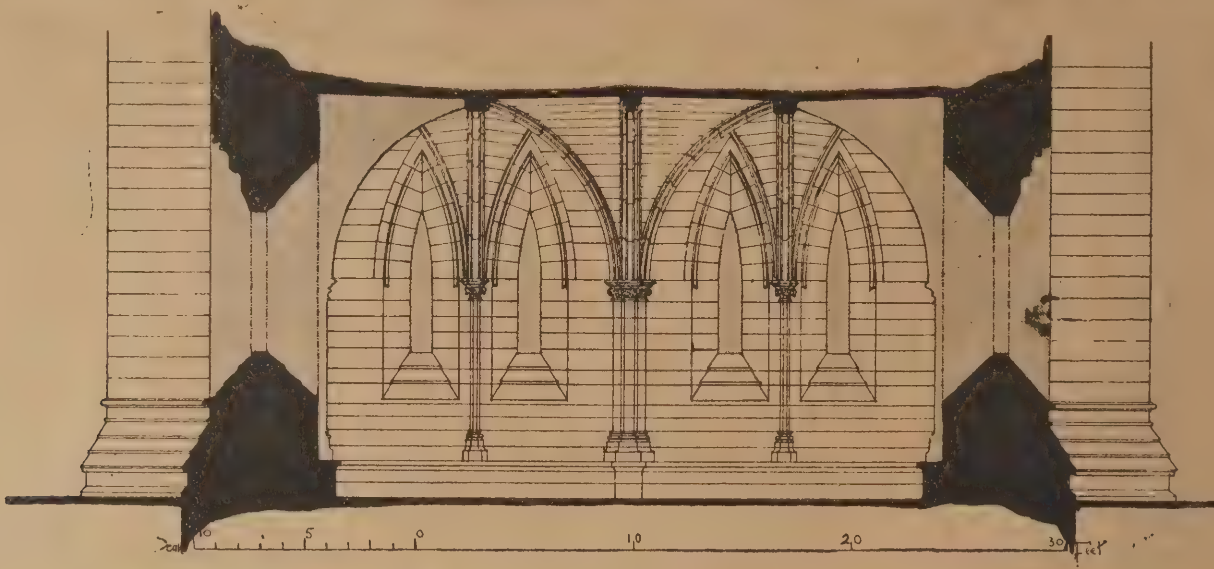
Rural Building By-laws.

THE Local Government Board has just issued new model by-laws with regard to new buildngs and certain matters in connection with building in rural districts. These have been badly needed for a long time. The local councils have always had power to alter the suggested by-laws of Part III. of the Act of 1890, which were certainly too stringent in rural districts; but it is a fact that in but few cases have local by-laws been altered from those suggested, rural and urban authorities usually swallowing them whole, as their by-laws having to be approved by the Local Government Board it was but natural they should think such would only be sanctioned by it. Much agitation has been going on in regard to these by-laws for some time past, and the Royal Institute of British Architects has twice deputed the Secretary to the Board to get them altered. The old by-laws drawn up under the Public Health Act of 1875 have considerably aided in the depopulation of the country, with the consequent aggravation of the housing problem in large towns, by forcing the cost of houses up beyond what could be afforded by landowners and tenants. We hope much from these new by-laws, which on the whole are very sensible. The suggested new by laws are confined to matters affecting health, and in the memorandum accompanying the by-laws attention is advisedly drawn to the powers the local authorities have of altering them should they desire to adopt them, and this can be done for part only of a contributory place. The present series contains no clauses dealing with questions of stability or the prevention of fire, or with the level, width and construction of new streets—matters that have been the chief cause of increased cost of building, and of hampering artistic building. Provision is made for excluding from the operation of the by-laws practically all buildings which are not dwelling-houses, or used wholly or partly for human habitation, or for the habitual employment of any person; thus the erection of buildings for agricultural purposes and outbuildings is wholly unrestricted. The by-laws make special provision for securing the dryness of the ground surface beneath buildings, and for preventing the entrance of damp exhalations or of impure ground air, but this clause only applies where the dampness of the site or the nature of the soil renders such a precaution necessary. A damp course is required in every wall of a new building for human habitation, and also a double wall to act as a vertical damp course where any part of the lowest storey is below ground, and the soaking of water through parapets is provided against. In other respects, as to size, material, position, strength, &c., the builder is entirely unfettered. Other by-laws provide for a proper space to secure a free circulation of air, that required in front being allowed to extend over the public highway, and at the back allowance being made in exceptional cases such as where parks or other open spaces occur. With regard to the ventilation of buildings, no undue restrictions are made on the position or shape of windows or fireplaces. A space beneath the building is stipulated for in order to allow of damp or foul air being dispersed and of preserving the timbers from decay. This is all very well in regard to a timber floor, but provision should, we think, have been made for allowing a tiled or brick floor upon a non-porous concrete layer; many old buildings have this and are perfectly healthy. Another by-law requires the drainage of the subsoil of a new building, but it will only need to be observed in cases where the site is naturally damp. The lowest storey is not to be placed at such a level as will prevent it being drained. Where drains are used but ordinary good work is insisted upon. Water-supplies are protected. It will be seen from this that the new by-laws merely insist upon the mere necessities of proper building, and it behoves architects and societies to urge their adoption in every district where they can reasonably be expected.

The Workmen's Compensation Act.

THE case of *Edwards* v. *Botting* reported on p. 460 of this issue affords another instance of absurd and faulty character of the Workmen's Compensation Act. This case was dependent upon whether the ridge-tile was on at the time of the accident or not, and as to whether the stipulated height of 30ft. should be measured from the bottom of the footings to the ridge. The restriction of the Act to buildings over the exact height of 30ft. is absurd, and it passes all understanding how ever such a clause should have been put in and passed. That the Act should be amended is a crying necessity; that a workman injured on a building through no fault of his own, and where the work is not of a hazardous nature and taken by the man in consequence of allowance being made him for the risk he takes, should be compensated by his employer is only fair. However, it is to be regretted in regard to this present case that no decision has been given in a higher court than that of a county. It is a well-known fact that when lawyers and other unpractical laymen get hold of questions in regard to building what a hash they make of them, and this especial case is only a further example. To rule that directly the first brick was laid the building commenced, is ridiculous; if the question is as to where the building starts it seems to us absurd to ignore the concrete foundations, for what are they in a general sense but footings, their object being to distribute the pressure over a larger area; but of course the case should not be dependent upon this, for with exactly similar buildings the foundations can and should vary with different soils. Then, with regard to the ridge-tile being reckoned in the height of the building, this might mean anything, for the difference of the ridge being off or on does not affect the height of the building materially at all so far as the workmen are concerned, and on this count the extra height of a finial might bring the building within the Act.

HOUSE AT COBHAM, SURREY. M. H. BAILLIE SCOTT, ARCHITECT.



CHAPTER-HOUSE, GLASGOW CATHEDRAL: SECTION LOOKING NORTH. MEASURED AND DRAWN BY ALEXANDER T. HEATHCOTE.

IMPRESSIONS OF GLASGOW CATHEDRAL.

BY J. JEFFREY WADDELL.

ALTHOUGH Glasgow Cathedral is comparatively small, it is most interesting both architecturally and archæologically, and it is the most complete mediæval building in Scotland. The exterior of the cathedral, however, is somewhat disappointing. Viewed from the north or south, the long line of the roof, unbroken save by the central tower and shallow transept, is uninteresting. The want of the western towers is consciously or unconsciously felt. The east end, while effective enough from the interior, always appears, viewed from without, to be patched and unworthy of a cathedral like Glasgow.

Seen from the Cathedral Square the aspect of the cathedral is more noble. Its grand west doorway is seen to advantage, the outline is good, and the ancient monuments in the foreground and the Necropolis in the background round the whole into an harmonious picture. The knowledge, however, that the cathedral once possessed western towers and that they were ruthlessly destroyed is a mental discord to what would otherwise be a completely satisfactory picture.

Probably the best general view of the cathedral—but one from which it is unfortunately very seldom seen—is from the Necropolis. Here the ground rises from the level of the banks of the Molendinar to a height from which the cathedral may even be looked down upon. Viewed from the banks where once the Molendinar ran, the cathedral appears firmly planted in stateliest fashion upon the opposite bank, towering far into the sky in outlines at once bold and graceful, vigorous and delicate. Here the long and somewhat harsh line of the roof is lost, and in its place we see a compact but shapely mass gathered round and supporting the spire. Especially fine does it look when its tower and crow-stepped chapter-house appear silhouetted against the brightness of the evening sky.

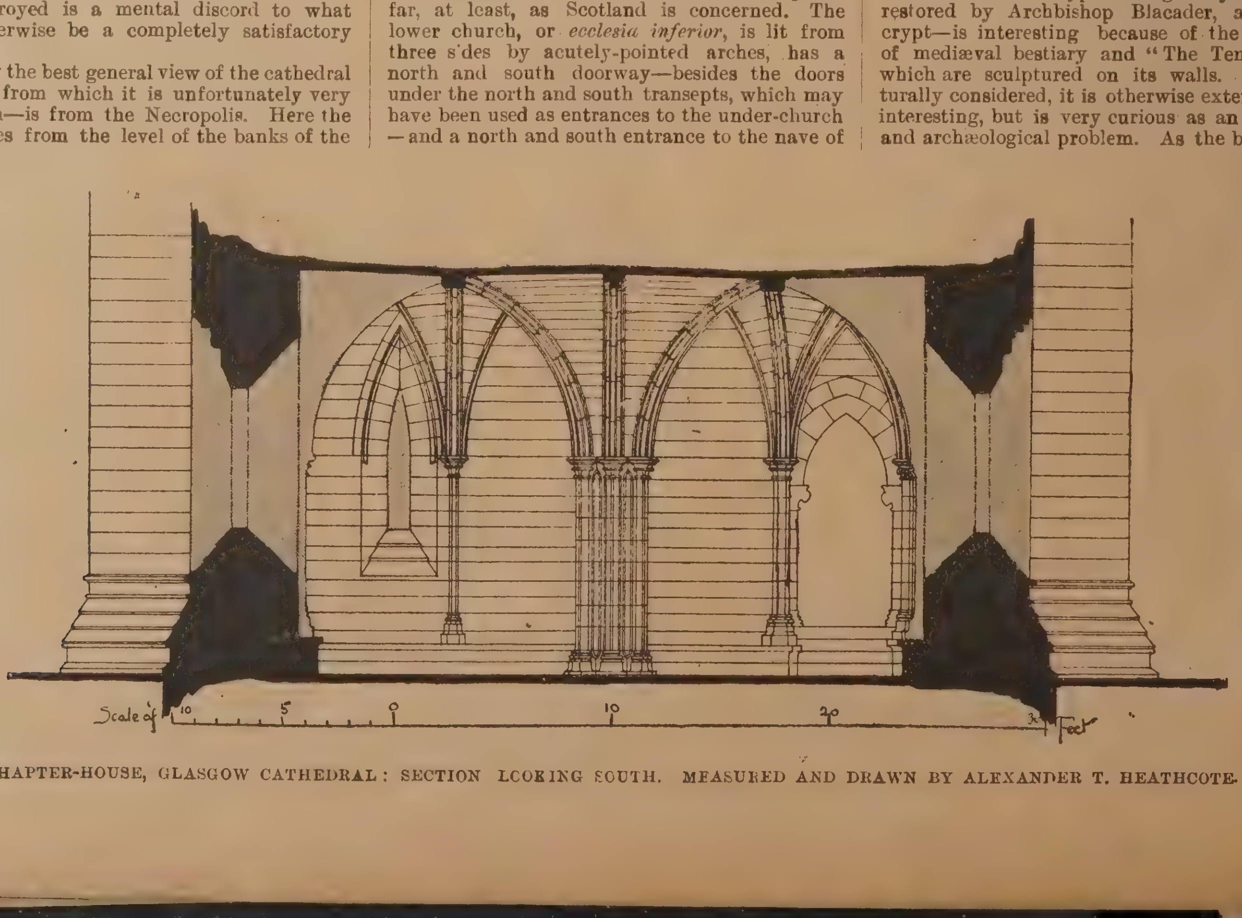
In spite of the fact that the cathedral has been built at so many different periods the result is wonderfully harmonious. Even the modern work rounds off and completes the old and is singularly unobtrusive—if it has no other merit, it is at least inoffensive—and, considering what one sees which passes for "restoration" in other cathedrals, Glasgow may consider herself fortunate. It is greatly to be regretted, however, that the mouldings and carvings have been so largely and recklessly "restored," and in so unsatisfactory a cement.

Viewed from the north, south or east, one is at once struck by the fact that the cathedral is two-storeyed, and that it is therefore unique as far, at least, as Scotland is concerned. The lower church, or *ecclesia inferior*, is lit from three sides by acutely-pointed arches, has a north and south doorway—besides the doors under the north and south transepts, which may have been used as entrances to the under-church—and a north and south entrance to the nave of the cathedral, and therefore cannot be properly termed a crypt. This lower church is, especially internally, the glory of Glasgow Cathedral.

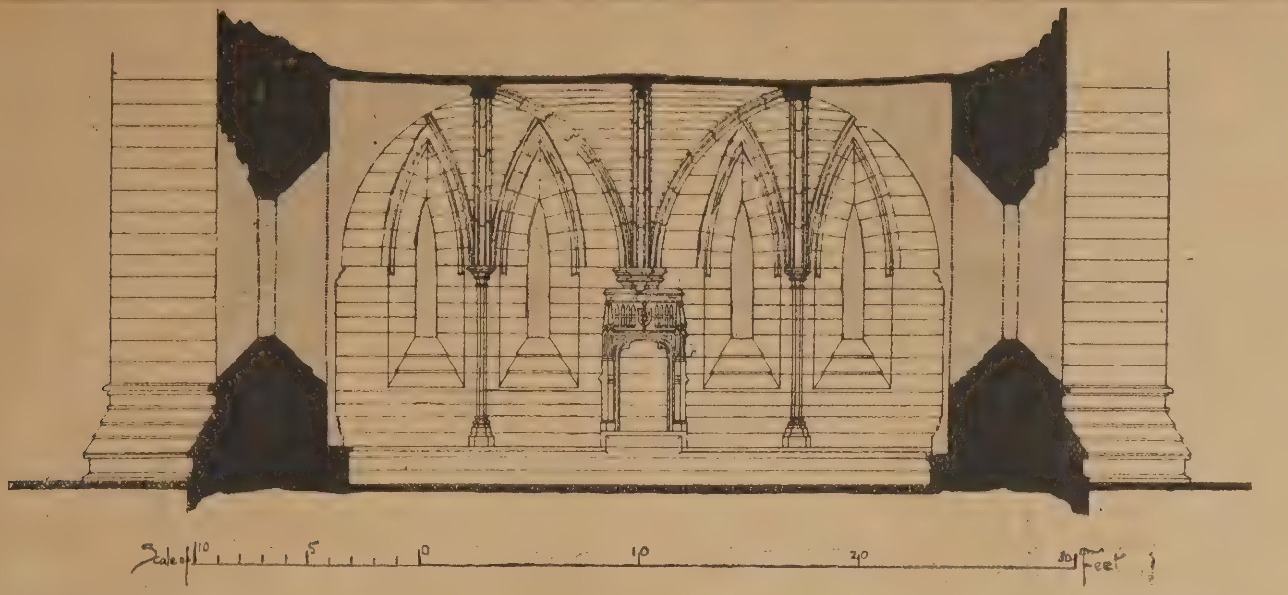
But the exterior is not to be despised. The doorways are very fine, especially the south porch, which is one of the finest of its class. Although it does not project beyond the line of the buttresses and is only covered with a lean-to roof, yet with its side arcading and benches it is quite an admirable piece of design. The north porch is neither so elaborate nor so good. It is not roofed over, and the side arcading, visibly cutting as it does into the side buttresses, looks weak.

But while the architect has not been so successful here, he has proved himself very ingenious in the way in which he has managed to overcome the difficulty of finishing the two centre windows of the east end. As the width of the choir between the aisles is considerably less than twice the width of the aisles, some variation of the design had to be made; so the centre butt was reduced by 6in., and 3in. were taken from either side by set-offs on the inner sides of the two centre bays and the two lights were spanned by the single hoodmould.

The exterior of the abandoned south transept called Blacader's Crypt—though only roofed and restored by Archbishop Blacader, and not a crypt—is interesting because of the examples of mediæval bestiary and "The Temptation" which are sculptured on its walls. Architecturally considered, it is otherwise externally uninteresting, but is very curious as an historical and archæological problem. As the base of the



CHAPTER-HOUSE, GLASGOW CATHEDRAL: SECTION LOOKING SOUTH. MEASURED AND DRAWN BY ALEXANDER T. HEATHCOTE.



CHAPTER-HOUSE, GLASGOW CATHEDRAL: SECTION LOOKING EAST. MEASURED AND DRAWN BY ALEXANDER T. HEATHCOTE.

nave is carried up to either side of the door from the church, it is evidently an addition which was not contemplated, as some suppose, at the time when the erection of the nave had proceeded at least as high as the top of the door. The base of this aisle is also different from that of either the nave or the choir.

With regard to the windows, the chief of these, the great west window and the windows of the north and south transepts, are "restorations" or, to be more correct, modern designs; the others are very simple, and with the exception of those of the choir north aisle are of the usual early type. The last-mentioned windows, however, are exceedingly original—not to say peculiar—and cannot be said to be very satisfactory as pieces of design. The window is divided into three lights of about the same height by two broad mullions with bold mouldings, and the tympanum is pierced in the centre by a quatrefoil, and on either side there are trefoil-headed openings with little shafts with caps to receive the mouldings.

The windows of the south aisle of the nave are very different in design from those in the north aisle, are of a later date and have their tympanums filled with geometrical tracery. The lower two-light windows in the transept gables have also geometrical tracery springing from caps of shafts on jamb and mullion. The composition of these is admirable. The nave clearstory windows are simple two-light windows with tracery, but without cusping. These externally somewhat resemble those of the choir; and as the centre aisle of the cathedral was never intended to be vaulted no flying buttresses are used, so that without these and so short a transept the clearstory appears almost continuous from one end of the cathedral to the other.

Both the aisles and the clearstory are surmounted with a heavy parapet supported on corbels and pierced at intervals by large gargoyles many of which are quaint and grotesque.

The most typically Scotch part of the cathedral is the chapter-house and sacristy. With its crow-stepped gables—which give it quite a semi-domestic appearance—its picturesquely-weathered buttress tops, its curiously but effectively-weathered shields, its attenuated but equilateral-headed windows to the sacristy, but with its acutely pointed but stumpy lancets beneath—all contribute to make an exceedingly picturesque and interesting structure. Like the aisle of Car-Fergus, it was founded in the thirteenth century (by Bishop William, as the inscription on the dean's seat declares), but was not roofed over until the fifteenth century, when Bishops Lauder, Cameron and Turnbull completed it, and the first inserted the dean's seat.

One of the finest features of the exterior is the central tower. Seen diagonally, with its angle turrets projecting to their full extent, it appears at first sight to be somewhat squat, at least in comparison with most modern work; but this very squatness, which the vigorous visible entasis accentuates, gives the spectator the idea that the spire is a stone one, and not only that, but that it is built up of comparatively small blocks of stone—a truthful expression which most modern stone spires do not convey. The parapet is pierced with quatrefoils and bears the arms of Archbishop Lauder.

In spite of the fact that the north wall of the nave leans outwards, and that the south-east corner of the choir is considerably off the plumb, the cathedral as a whole has a very substantial appearance. There is a solidity and sturdiness about it which extends itself even to the top of the spire. This is, no doubt, the feeling which Sir Walter Scott had when he makes Andrew Fairservice in "Rob Roy" exclaim, "Ah! it's a brave kirk—nane o'yer whigmaleeries and curliewurlies and open steek hems aboot it, a' solid, weel jointed mason wark that will stand as lang as the warld, keep han's and gunpowther aff it."

The usual entrance to the cathedral is obtained through the south doorway to the nave. This is not, strictly speaking, a porch, but the nave wall is thickened and the doorway deeply recessed. Above, there is a circular window with tracery similar to that of the other windows of the south aisle, and the buttresses at each side of the door are adorned and enriched with projecting canopied niches of the "early pointed type." The design of the whole is very effective.

The great western doorway is a fine, delicate and dignified, though extremely simple, double doorway. This doorway, however, is unfortunately seldom if ever used, entrance being gained to the cathedral, as already stated, by the door in the south aisle of the nave. This to some extent gives a bad impression of the cathedral; for if we enter by this doorway instead of seeing the full length of the nave and choir, we only see the nave piers opposite, and when we step into the centre of the nave we do not get the same long perspective view as we would have obtained had we entered by the west door; and as the average visitor never thinks of surveying the cathedral from that point of view he thus misses one of the finest impressions of it.

On entering the cathedral one of the first things that strikes one is the bare and empty not to say useless appearance of the nave. It is architecturally plain and simple, there being no carving with the exception of the little leaf at the intersection of the hoodmoulds of the

CHAPTER-HOUSE, GLASGOW CATHEDRAL: DETAIL OF NORTH-WEST BAY. MEASURED AND DRAWN BY ALEXANDER T. HEATHCOTE.

nave arches, and this plainness is accentuated and rendered almost painful by the fact that there are no fittings and that it is unseated.*

Surely this state of matters ought to be remedied by the inhabitants of the city which boasts of being the second in the empire.

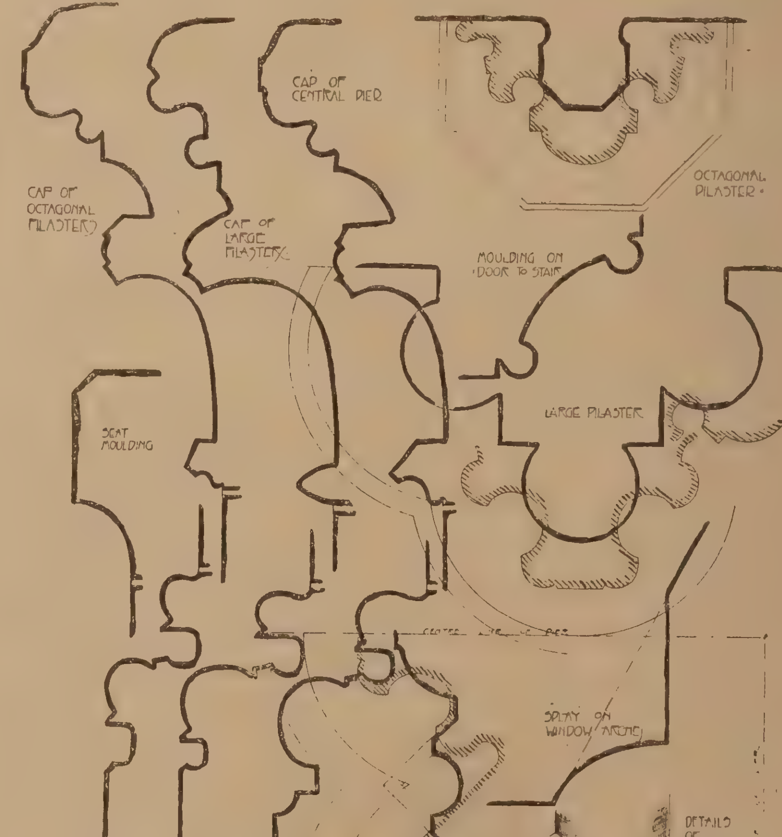
The nave, arches, triforium and clearstory are fairly well proportioned, but the effect is somewhat marred by the want of a good roof (the present roof is one of the "renovations" of Blore) and also by the fact that the shaft from the roof stops on a corbel at the triforium string course instead of running to the floor. On the whole, however, the effect of the nave is interesting as showing what can be done in even a cathedral without the use of carving.

(*To be concluded.*)

STRAIGHTENING A CHIMNEY STACK.

THE work of bringing back to the perpendicular one of Messrs. John Lysaght's stacks at Bristol was begun the week before last.

Built of brick, in substantial proportions, the chimney has done duty for about twelve years, and is amongst the prominent landmarks of St. Philip's Marsh; but during the last two or three years it has developed a list, the summit having at length gone about 5ft. out of the perpendicular. The trouble was occasioned at the foundations, which extend about 10ft. or 15ft. underground and are embedded in masonry fixed on piles. Reaching a height of about 175ft., the chimney has a diameter of 15ft. at the base, and it tapers slightly, being reduced in width about a yard at the top, where it is fitted with ironwork weighing 4 tons. Its walls have a thickness of about 4ft. The onerous task of remedying the existing defect was entrusted to a firm of specialists—Messrs. W. J. Whitehead & Co., of 82, Queen's Road, Liverpool, who have given particular attention to the straightening of chimneys. They have carried out exacting work at dizzy heights in such huge chimneys as that of the Weston Works, near Runcorn, which is no less than 330ft. high, and on Murphy's Vauxhall chimney at Liverpool, which, 310ft. high, dwarfs a number of neighbouring stacks; whilst the firm have



CHAPTER-HOUSE, GLASGOW CATHEDRAL: DETAILS.

---

* I am glad to be able to say that since this was written it has been proposed that the nave be seated with chairs.

established a record by laddering a chimney of 450ft. high in 11½ hours, such a work usually occupying a fortnight. The chimney was that of the United Alkali Co. at Glasgow.

There are preliminary measures to be taken, there is overhauling to be done and care is taken not to precipitate anything even approaching an inelegant and risky wobble of the chimney. Thus it is that, first of all, a series of ladders, each 15ft. long, are secured against the wall of the chimney from bottom to top, and at Messrs. Lysaght's they were fixed on the side to which the structure inclined. The sections fit into sockets, and each is fitted in position by irons driven into the wall, so that the ascent of the chimney may be made at the outset. The arrangement of the ladders is on a plan which Mr. Whitehead has made specially his own. Next two stout iron bands are bolted around the chimney, about 2ft. apart—the lower band being about a yard from the ground—and it is within this space that the whole of the cutting and wedging take place. With chisel and hammer bricks are chipped away in a thin line on what may be termed the outer side of the chimney—that is, the side from which the stack has fallen out of the perpendicular—and supports are introduced into the gaps, whilst on the opposite side of the chimney broad wedges are driven into the wall. As the aperture broadens on the outerside constant play has to be made with wedges and other material to prevent jamming, and on the opposite side of the chimney the wedges continue to be driven home with further force, everything being at the same time kept fairly taut so that there may be no fear of excessive oscillation. So the process goes on, occupying some days, and Mr. Whitehead makes a point of always being on the scene until the task of straightening the chimney is safely accomplished.

Wolverhampton Municipal Buildings.—The Wolverhampton Town Council propose to extend and improve the municipal buildings. The present town hall was open in 1871, but owing to the rapid growth of the town and the gradual development of its municipal undertakings the buildings is now quite inadequate to meet the Corporation requirements. A scheme has been prepared by Mr. F. T. Beck, who estimates the cost at carrying it into effect at £14,314.

WELBECK ABBEY.

Last Saturday week the members of the York Architectural Society visited Welbeck Abbey by char-à-banc from Worksop. The park was entered by the imposing gateway to the Bolsover Drive, which has been made through a pleasant wood of lofty Spanish chestnut, fir and other trees. In front of the mansion the party were met by Mr. J. Wallace Stevens, an old member of the York society, who conducted them over the grounds. The mansion facade consists of a series of gables in striking contrast to the later addition of an extensive Italian wing. The latter, unfortunately, has been greatly damaged by fire, but is now in course of reconstruction. A small ornamental garden with centrepiece is receiving an addition of an alcove at the side. Passing along the exterior of the latest addition from the designs of Mr. H. Wilson, and noticing a clock dial showing the month and day of the week, the party proceeded under an archway and entered the house. The entrance hall is richly furnished, the walls panelled, overmantel sculptured, with the family arms, and ceiling with ornamental plaster. The Gothic room has a fan-traceried vaulted ceiling; on a table stands a model of the horse St. Simon. Another apartment had overmantel and mirrors of Chippendale character. In the drawing-room is a bust of the late Queen Victoria. There are several paintings by Vandyck, amongst which is a full-length figure of the Earl of Strafford, who at one time occupied the King's Manor at York. Over the doorway is a portrait of Archbishop Laud. There are some interesting miniatures of Queen Elizabeth, Mary Queen of Scots, &c., magnificent cabinets, inlaid tables, and model of the ship that brought King William III. to England. The doors in all these rooms are polished. In another apartment were portraits of Queen Elizabeth and King Edward VI., and a large red jewel case of Queen Mary, wife of William III.

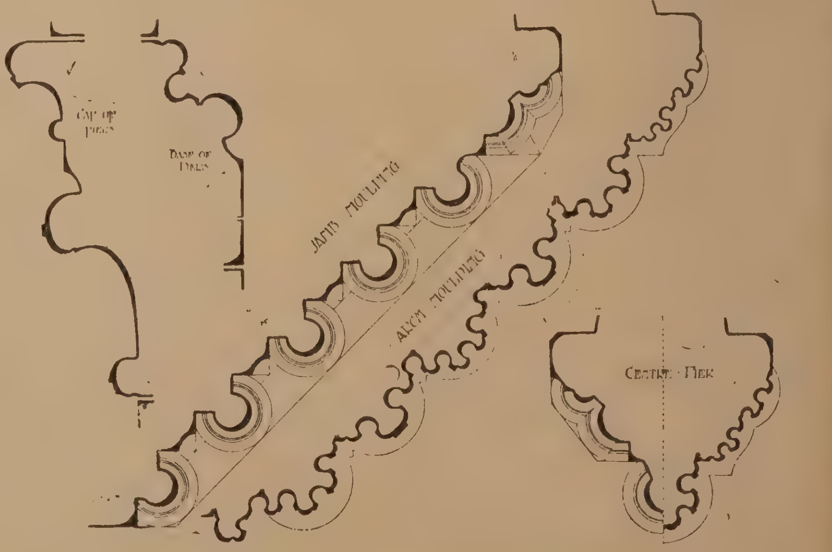
The old school of architectural design was now left for the new school of to-day. The recent additions designed by Mr. H. Wilson came in for a good deal of attention. The library consists of several apartments; it has a plaster ceiling following the rake of roof and cutting across same, enriched with flat ornament and circular panels depicting the zodiac, &c. The tall entrance arch and that to Ingle Nook is of rouge marble. Near the latter is a bust of William, Emperor of Germany. The chapel consists of centre and sides separated by columns supporting an entablature. The oak seats have carved subjects and carved texts from the Scriptures. The lectern of metal is an imposing object. The altar frontal is a metal one with large subject panel in relief.

The print gallery contains a valuable collection of prints of old Roman buildings, &c. The picture gallery, known as Underground, was now visited. It is 159ft. long by 63ft. wide. In it is a cabinet, the "Green Dale Oak," constructed out of that tree, and having subject panels relating to its history. The kitchens were then seen; these are the oldest portions of the house, occupying the vaulted undercroft of the abbey buildings, and are of the time of Henry II.; the doorways are of the usual transitional character. The kitchen being so far from the dining-room, a tram line connects them.

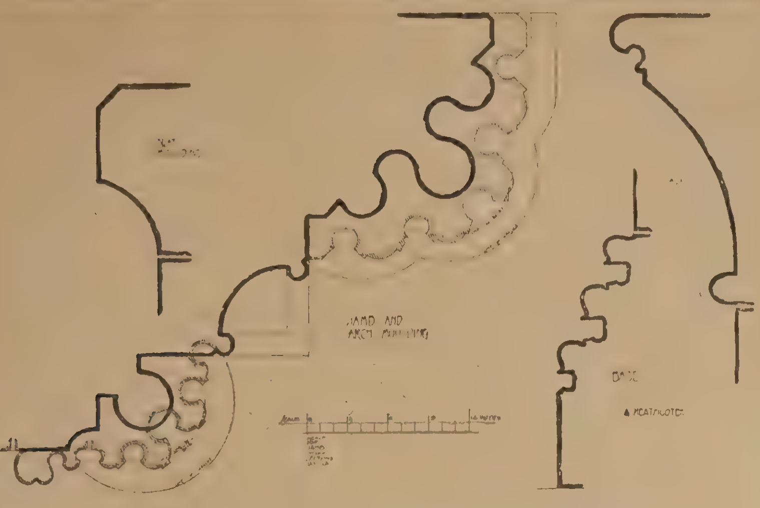
The house was now left for the riding school, 400ft. long by 100ft. wide. It has a wide centre, covered by curved iron and glass roof, with side aisles. A drive was now taken to Belf, where Mr. Stevens entertained the party to tea, at the conclusion of which Mr. Channon, F.R.I.B.A., moved a vote of thanks to Mr. Stevens for his valuable services, which was carried with acclamation.

Law Cases.

Fire-resisting Construction between Trade and Private Premises.—The case of *Dicksee* v. *Hoskins* came in the Court of Appeal last week before the Master of the Rolls, Lord Justice Vaughan Williams and Lord Justice Stirling. This was an appeal from the judgment of a Divisional Court, the Lord Chief Justice and Mr. Justice Lawrance, on a special case stated by a Metropolitan police magistrate on allowing an appeal under the London Building Act, 1894, from a notice of objection to a proposed building served by the appellant, who was a district surveyor under the Act, upon the respondent who was a builder. The case was reported on p. 248 of our last issue for May 1st last. The question was whether the proposed building was one to which section 74, subsection 2, of the London Building Act applied. That subsection provides as follows: "In every building exceeding ten squares in area used in part for purposes of trade or manufacture and in part as a dwelling-house the part used for purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials." The proposed building was the re-erection of an old beer-house. It would, when built, exceed ten squares in area, and was intended to contain—in the basement, beer and wine cellars; on the



WESTERN DOORWAY, GLASGOW CATHEDRAL. MEASURED AND DRAWN BY R. M. MCKISSOCK.



DOORWAY, CHAPTER-HOUSE, GLASGOW CATHEDRAL.

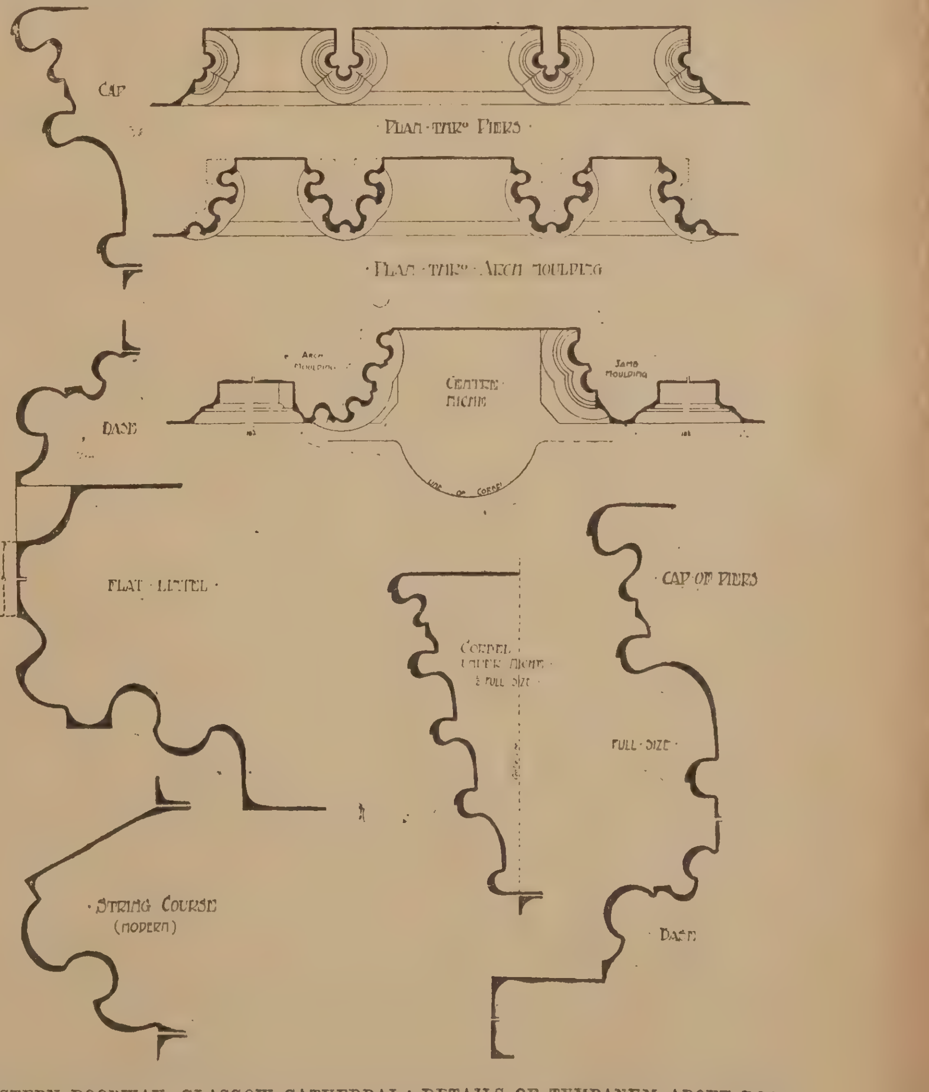
ground floor, a bar, public lobby, saloon bar, private bar, parlour and a public room; on the first floor, a sitting-room, three bedrooms and a kitchen; and on the top floor, attics. It was intended to be licensed and used for the sale of wine and beer to be consumed on or off the premises under the Beerhouse Act, 1830, and the Refreshment-house Act, 1860. The trade of the beerhouse was to be carried on on the basement and ground floor, and the licensee and his family were to reside in the upper floors of the building. The whole of the building was to be covered by the justices' certificate and Excise license. The floors separating the ground floor from the first floor and the staircase leading to the first floor were not intended to be constructed of fire-resisting materials, and the learned magistrate found that, if sub-section 2 of section 74 of the London Building Act applied to the building, the provisions of that section would be contravened. The learned magistrate also found as a fact that the basement and ground floor of the building were intended to be used for the purposes of the trade of a beerhouse, and that the part above the ground floor was intended to be used as a dwelling-house for the licensed occupier, but held that the case was governed by the decision in *Carritt* v. *Godson* (1899, 2 Q.B., 193), and allowed the appeal and overruled the objection of the district surveyor. The district surveyor appealed to the Divisional Court, and they dismissed the appeal. He now appealed to the Court of Appeal. The Court allowed the appeal. The Master of the Rolls said that, personally, he did not agree with the findings of fact found by the learned magistrate, but he was bound by them. The magistrate seemed to him to be inconsistent in finding as he had done and also holding that the case was governed by *Carritt* v. *Godson*. But accepting the findings, it followed of necessity that the appeal must be allowed. Lord Justice Vaughan Williams said he concurred reluctantly. Lord Justice Stirling also concurred.

A Blackpool Solicitor's Building Transactions.—The case of *Morgan and others* v. *Todd* came before the Court of Chancery of Lancashire last week. This was an action brought by the trustees of the late Thomas Thomas, a builder, of Blackpool, and by Young Willie Thomas and Matthew Eden, also builders, of Blackpool, against James Todd, chartered accountant, of Preston, the trustee in bankruptcy of Arthur Kay, a solicitor formerly practising in Blackpool, who absconded about the end of 1898, for the purpose of establishing a partnership between the plaintiffs and Kay in the purchase and development of a large plot of building land in Dickson Road, Blackpool, on which some twenty-one houses and two shops were erected. Counsel for the plaintiffs informed the Vice-Chancellor that the case had been settled upon the terms that the defendants should pay the plaintiffs a sum of £315 and their costs of the action, and that this should be in settlement of all claims by the plaintiffs against the defendant or the defendant against the plaintiffs. Counsel for the defendants said that Mr. Todd had received a certain sum from the sale of part of the property, and the amount mentioned by Mr. Mansfield would be paid out of that sum. An order was made accordingly.

Wages due from a Builder.—At the Chelmsford County Court, before Judge Tindal Atkinson last week, James Strowger, carpenter, Broomfield, sued Myer Cohen, builder, Beach Road, Dovercourt, on a judgment summons for £7 18s. 11d. for wages due. Plaintiff stated that defendant carried on business as a builder at Dovercourt; he believed defendant had now four houses in course of construction there; plaintiff also believed defendant had bought land, and that he employed about ten men. Defendant said he was a builder until about nine months ago, but he had been sold up by the sheriff. There were a lot of judgment summons against him, but he was trying to pay all his debts, and was willing to pay plaintiff 10s. a month. He was superintending the erection of some houses at Dovercourt for his mother, and was making about 30s. a week. His Honour made a fresh order for the defendant to pay 10s. a month.

Workmen's Compensation.—At the West Bromwich County Court last week an interesting case under the Workmen's Compensation Act of 1897 was heard. The executors of Ezra Hadley, deceased, brickmakers, of Round's Green, Oldbury, brought an action to set aside an arbitration award granted to Samuel Yates, of Summer House, Round's Green, in respect of an injury he sustained at the applicants' works on the December 13th, 1899. An award was made on July 18th, 1900, under which the respondent received 14s. a week. The applicants now offered the respondent a situation and contended that the compensation was excessive, adducing evidence to show that he was in a fit state to perform certain work. Drs. Buttery and Martin Young, however, deposed that Yates was now in a worse state than when the award was made. The judge, in summing up, said he had never heard a more utterly hopeless application to set aside an award. He complained that the applicants' manager had attempted to coerce the respondent, and he characterised his conduct in the matter as highly improper. The application would be refused.

Earl Carrington and Building By-laws.—Earl Carrington, who has lately developed his estate in the vicinity of High Wycombe for building purposes, was summoned last week by the town council of that borough for breaches of the by-laws. Two summonses charged him with making roads of insufficient width and one with failing to deposit a plan. The hearing lasted six



WESTERN DOORWAY, GLASGOW CATHEDRAL: DETAILS OF TYMPANUM ABOVE DOOR. MEASURED AND DRAWN BY R. M. MCKISSOCK.

hours, at the end of which two summonses were dismissed, with costs against the Corporation, the defence being that the streets were made in accordance with an old by-law. The third summons was withdrawn. Earl Carrington, who was present, refused to take his costs, but asked the prosecution to accept the decision of the Bench as final. Counsel for the Corporation, however, resolved to appeal against the decision.

St. Leonards Architects' Claim.—In the Sussex County Court recently Messrs. Piggott & Oxley sued Mr. Meads and others to recover fees for services rendered in preparing plans and quantities, getting out tenders, and work generally, the amount claimed being £85 15s. 3d. The case was heard by a common jury. Mr. Charles Archer Piggott, of Saxon Chambers, St. Leonards-on-Sea, architect, said in the year 1898 he met defendant Meads, who asked witness if he could have one of the plots. Witness said he would try to arrange it, and Mr. Meads entered into a building agreement with the owner on January 17th, 1898. In the latter part of the year witness met Mr. Meads and a conversation took place with regard to the plans and drawings of a villa. On October 31st, 1898, Mr. Meads came to his office and brought with him a rough sketch. The cost was to be £1,200. Witness looked at the sketch and said it would be impossible. Mr. Meads asked witness to get out a proper sketch. Witness did so. Mr. Meads wrote to witness on November 6th, 1898 saying, "I think the plan will do very well." On November 7th, 1898, Mr. Meads came to witness's office with the plan. Witness showed him a proper drawing, saying defendant could not possibly expect the villa to be erected for the sum named, £1,200. Witness then got out quantities and prepared specifications, sent them to London, and issued them to various builders, and obtained various tenders. On December 13th, 1898, witness received some tenders, and opened them in the presence of Mr. Meads. The lowest was for over £2,000. Defendant said he was not prepared to pay so much money, and asked witness to reduce the plans and alter the style of the work and material so as to get it down as low as possible. Witness told him he thought they might reduce it to £1,600. Witness received a letter from Mr. Meads on December 14th, in which he stated he had talked the matter over with Mrs. Meads and she was willing for certain alterations to be made. On January 17th witness saw Mr. Hatton, who had submitted the lowest tender, and Mr. Hatton arranged to carry out the work. Defendant would not allow witness to reduce the size of the rooms. On April 17th, 1899, witness sent in his account to the defendant with particulars. On December 19th Mr. Meads asked for a month to pay. At the end of the month witness sent in his account, and subsequently put the matter into the hands of his solicitors. His charges were fair and reasonable. Cross-examined, witness said that originally the price was not to be more than £1,200, but it was not correct that this price was adhered to all along; Mr. Meads said he wanted expenses kept as low as possible. Mr. Oxley, one of the plaintiffs, bore out the evidence given by his partner, Mr. Pigott, as to interviews when Mr. Meads brought the sketch and returned the plans. Mr. William Meads, a dentist, of Bexhill-by-Sea, said he had to pay just over £700 for the freehold. Witness asked Mr. Pigott what he could have a house built for, who said for any sum. Witness said he did not want to spend more than £1,000. Witness got out a rough sketch, and Mr. Pigott thought it would do very well with a slight alteration. Neither Mr. Pigott nor his partner suggested that the building would cost more. Witness afterwards said, "Keep as near as you can to £1,000; only don't go over £1,200." Mr. Pigott said, "Very well." On the night before the tenders were sent out witness had a special interview with Mr. Oxley and asked him if they had everything down. Mr. Oxley said he thought so. Afterwards witness said he could not be quite certain whether they could get it for their £1,000, but he thought they were well within the mark. Defendant said that that being so he was willing to go forward, but he would not undertake it if there was any doubt. Mr. Oxley again said he thought they were well within the mark. Witness was dumbfounded on receipt of the tenders. Witness said on several occasions that if Mr. Pigott could not reduce the amount to £1,200 he would not go on. At this stage the case was stopped by his lordship and judgment given for the plaintiffs for the amount claimed.

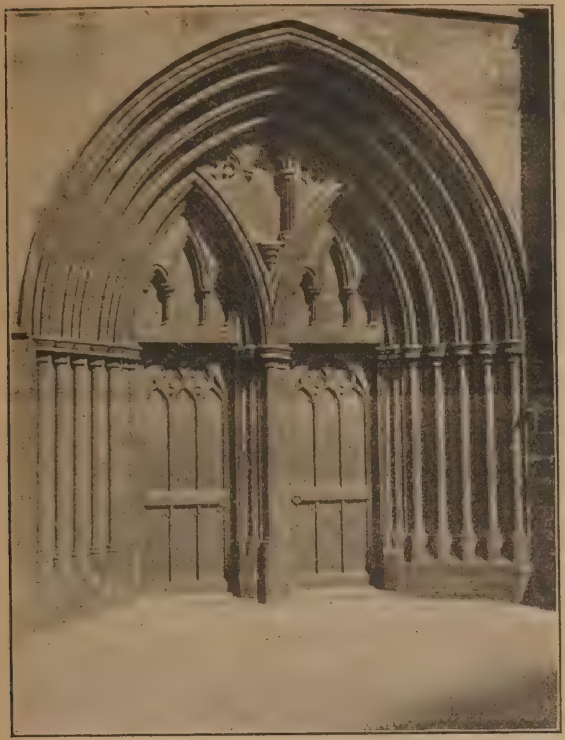
TOWER AND SPIRE, GLASGOW CATHEDRAL.

Workmen's Compensation: Height Measured from the Footings to Ridge.—At the Bromley County Court Judge Emden recently decided the case of *Edwards* v. *Botting*, in which the plaintiff, William Edwards, a carpenter and joiner of Sidcup, claimed £13 compensation from the defendants, Mr. and Mrs. Botting, in respect to a fractured wrist which he sustained while at work on their new house, America Villa, Sidcup. Mr. Chester Jones, instructed by the solicitors to the Society of Carpenters and Joiners, was for the applicant, and Mr. George Weller for the respondents. Mr. Chester Jones said that the applicant claimed for thirteen weeks at £1 a week, which was the limit allowed by the Act, for injuries resulting from a fall of some 10ft. while at work on the respondents' building on January 21st of the present year. He was incapacitated for fifteen weeks but the Act allowed no claim to be made until the expiration of a fortnight. On the day in question the applicant was putting down the flooring around the well-hole of the staircase, and as no cramps had been supplied he was using a board as a strut, and this board gave way, letting him down and fracturing his wrist. The only material objection of the respondents seemed to be that the building was not more than 30ft. high. If the applicant was entitled to take the footings into consideration in considering the height of the building, then the building would would be 30ft. 6in. high. If not, it would be 9in. lower. In the case of *Hoddinott* v. *Newton Chambers*, which went to the House of Lords, it was laid down that the ridge of the roof could be included in the measurement, but the Master of the Rolls declined to say anything as to the measurements underground, as it was unnecessary to do so. Therefore the question was left open. The only judicial announcement was one by Judge Parry, of the Manchester County Court, reported in the "Law Times" of March 9th, vol. 110, p. 431, who ruled most decidedly that the footings should be included in the measurements. His Honour said that Judge Parry did not go so far as at first appeared. He excluded the foundations, but said he should measure from the lowest brick. Mr. Robert Thomas Brown, surveyor, of 1, Gray's Inn Place, London, produced a plan of the building which he had made from measurements on June 13th. The height from the footings, inclusive, was 30ft. 6in.; excluding the footings, it was 6in. less. In many places the footings were exposed. For the defence, Mr. Botting was called and stated that he had measured the building as it was on the day of the accident, and from the ridge in the roof to the damp course was 29ft. 2½in. He did not include the height of the ridge-tile, for that was not on at the time of the accident. Mr. Robert A. Jack, M.S.A., said he measured the house. From the top of the footings to the underside of the slate-batten nearest to the top of the ridge-piece was 29ft. ½in. The slate-batten was fixed close to the ridge-piece, and it was impossible to measure the exact height to the top of the ridge-piece without removing the slate-batten and the tile. His Honour said that such points as these illustrated the shockingly loose wording of this Act. Witness, continuing, said the height to the top of the ridge-tile from the top of the footings was 29ft. 9¾in. If they added two courses of brickwork for the footings that would make 30ft. 3¾in. Mr. Chester Jones said that the fact that he measured from the height of the ridge-tile from a drawing supplied by Mr. Botting probably accounted for the difference of 3in. William Edwards, the applicant, in reply to his Honour, said he was not absolutely certain, but he believed the tile was on at the time of the accident. There was scaffolding all round the building. The judge said the whole question turned on the question of the ridge-tile. The respondent Botting was then re-called, and examined, and he was very positive as to the ridge-tile not being on; but in reply to the judge admitted that he went by his wages-book and the fact that the duck ladders were on the roof. He could not give the names of the men who put the tile on. They were from Deptford and were engaged casually. He had made no effort to call them. His Honour, in giving judgment, said that as to the building, he was going to apply ordinary common-sense in dealing with it. First of all, as to the ridge-tile. There was great uncertainty as to whether it was on or not. But he must decide one way or other, and he would hold that it was on for this reason: that the respondent was fully able, if he so desired, to bring proper evidence on the point which he knew he was going to raise, and which the applicant knew nothing of. But he deliberately abstained from doing that. Then as to the height, he would hold that directly the first brick was laid the building commenced to be erected, and therefore the height must include the footings, which made it 30ft. 6in. His judgment would therefore be for the amount claimed, viz., £13. Eventually costs were allowed on Scale B.

Surveying and Sanitary Notes.

Sanitary Conveniences for Manchester.—A Local Government Board enquiry was held recently into the application by the Manchester Corporation for sanction to borrow £3,380 for the purchase of land at Moston to be used as a public recreation ground, and £21,000 for the erection of public sanitary conveniences in different parts of the city. There was no opposition to either application.

The Strand Improvement.—At Bow Street Police Court last week the London County Council applied to Sir F. Lushington to appoint a surveyor to value various premises situated between New Church Court, Strand, and the Law Courts. The buildings in question are to be pulled down in consequence of the Strand improvement scheme, and the Council has been unable to agree with the parties interested as to the amount of purchase-money. The magistrate agreed to appoint Mr. Guy, surveyor, of Bedford Row. The Council will obtain possession by paying the money into Court in accordance with his valuation.



WESTERN DOORWAY, GLASGOW CATHEDRAL. PHOTOGRAPH BY A. G. HENDERSON.

WEST LONDON ELECTRIC TRAMWAYS.

THE formal opening of over 15 miles of electric tramway line laid down by the London United Tramways Company in West London took place last week. Electric tramcars have been running between Hammersmith and Kew Bridge, Shepherd's Bush and Acton, and Shepherd's Bush and Young's Corner (about 7½ miles in all) since before Easter, while a further section of three miles from Kew Bridge through Brentford to Hounslow was brought into operation last Saturday week. The extension from Acton to Southall was the only part that had not been used for public traffic previous to the formal opening. It has a special interest for two reasons. First, because two miles of it are technically a light railway, though there is not the slightest difference to outward view between this "light railway" and the other three miles, which are an ordinary tramway; and, secondly, because its lines were laid in an extraordinarily short time—at the rate of almost a mile of track in a week. But these 15 miles represent only a fraction of the system which the company hopes it will be working in a few years. Already it has obtained authorisation to lay extensions to Uxbridge in the west and to Hampton Court in the south, which will bring up the total mileage to 40, while other proposed new lines—some 15 miles of which have already received the sanction of the House of Commons—amount to another 40 and run as far afield as the Maldens, Thames Ditton and Kempton Park. Over all these lines the ordinary fares charged average about ½d. a mile, with workmen's fares at half that rate, and the extent of the traffic that it will be possible to accommodate may be imagined from the fact that on Whit-Monday, on only 7½ miles of line, 210,657 passengers were conveyed.

The central station, where is generated the electrical energy required to work all these lines—constructed and projected—stands in the Chiswick High Road, alongside the Hammersmith Station of the North and South Junction Railway, and is claimed to be one of the finest of its kind in the country. The building, which contains the boilers and engines, is of red bricks, with freestone dressings and ornaments; it has a frontage of 154ft., with a depth of 102ft. Internally, it is divided into two portions—the engine-room and the boiler-house. The interior walls are faced with white enamel tiles and its floor paved with mosaic. To the right on entering, the end of the room is filled with a low gallery on which are mounted the switches by which all the different sections of the line are controlled. High overhead is a 25-ton travelling crane, worked by three electric motors. Down the middle are arranged the main engines and generators—now three in number, but soon to be increased to five. Each of them is apparently quite isolated, and there is an almost complete absence of the usual paraphernalia of steam-pipes—too frequently with steam-hissing from imperfect valves—for all the connecting-pipes, &c., are brought up through the floor from the basement below. Each engine stands 25ft. high, and the fly-wheel, which revolves between the two inverted cylinders thrice in every two seconds, is 20ft. in diameter and weighs 36 tons. All the engines are compound, the steam-pressure at the throttle-valve being 150lb. to the sq. in. The first two have two distinct continuous-current generators mounted on their shafts, one on each side of the fly-wheel, and each with a capacity of 250 kilowatts at about 500 volts. These are used to supply current to the lines in the vicinity of the station. For the more outlying portions of the system the third machine is employed—a 500 kilowatt three-phase alternator, yielding a current at 5,000 volts, which is transformed down at the sub-stations at Hanwell and Hounslow and distributed to the lines near them as a continuous current with a voltage of 500. The two last machines, which have yet to be installed, will be of the same character, but of two or three times the capacity. The engine-room also contains subsidiary machinery for various purposes—two boosters, a rotary converter, which may be used either to transform continuous current to alternating, or *vice versâ*, and therefore forms a stand-by to any one of the main machines, a couple of dynamos for supplying light and power to the offices and car-sheds, and condensing apparatus for the engines.

Behind the engine-room, and of equal length with it, though somewhat narrower, is the boiler-house, which contains five pairs of Babcock and Wilcox water-tube boilers, each pair capable of evaporating 22,000lb. of water per hour at a steam-pressure of 150lb. per sq. in. Coal is fed into the furnaces by automatic stokers driven by electric motors, and each pound as it comes down from the bunkers above the boilers is weighed by automatic apparatus. These bunkers are also filled automatically, the coal being carried up in a series of buckets fixed on a endless chain; these buckets automatically take their load from a receiving hopper, and automatically tip it out into the bunkers. The same conveyor also removes the ashes, the buckets running along the basement in front of the ash-pits and dumping the waste material into the receptacles provided for the purpose. Besides the coal-bunkers, the floor above the boilers contains two feed-water tanks, with a combined capacity of 12,000 gallons, and the flue, which is a steel shaft 6¼ft. wide and varying from 3ft. to 13½ft. in height. The smoke stack into which this discharges has some remarkable features. It is 260ft. high, and has an internal diameter at the top of 10ft. The upper portion (200ft.) is of uncommon construction, for it is made not of brick but of steel plates in rings, lap-jointed and riveted together, with a lining of firebrick. The foundations for this structure were carried down 28ft. to the blue clay, water being met with at from 8ft. to 10ft. from the ground. This water gave rise to some trouble while the concrete foundations were being put in, but it has compensatory advantages, for after passing through a softening apparatus it now forms the source of supply for the boilers.

To come to the tramway itself, the whole of the lines are equipped on the overhead trolly system, in which the current passes to the cars along an overhead copper wire, and after doing its work in the motors returns by the rails on which the car runs. This wire is usually supported from steel standards erected on each side of the road, but in some places—Ealing, for instance—central poles have been adopted. To prevent accidents from telephone wires breaking and falling on the trolly wire and so establishing a short circuit, these standards carry a system of guard wire. It is conceivable, of course, that these might break, or even the trolly wire itself give way, though that is not likely since it has a breaking stress of 5,000lb. But in neither of these contingencies would the public in the streets be exposed to the dangers of "live" wires, for the electrical arrangements are such that the moment a broken trolly wire, or a broken telephone wire in contact with it, touches the earth, the heavy current which would immediately pass throws over an automatic switch at the central station, whereby the current is entirely cut off from the section and the broken wire becomes "dead" and harmless. The entire route is divided into half-mile sections, and not only each section, but each trolly wire in each section, has its own separate feeder, so that it is possible to have an interruption in the electrical supply of one pair of rails without the other pair being affected. It may be mentioned here that the rails, which are of steel, are carefully connected with copper bonds so as to ensure as good electrical continuity as possible, and that they weigh more per yard (92½lb.) than those in use on many railways.

The cars which run in the electrical service are far superior at once in size, speed and accommodation to the horse-drawn vehicles they have displaced. Mounted on two four-wheeled bogie-trucks and propelled by two 25 h.p. motors, they can carry sixty-nine passengers.

In conclusion, it may be noted as an interesting fact that all the buildings, lines, &c., were designed and constructed by the company itself, without the intervention of contractors, the engines, dynamos, cars, &c., having been purchased from manufacturers on designs prepared by its own engineers.

A Bust of Marie Antoinette, the work of Pajou, dated 1774, and a statuette of Napoleon, both in Sèvres ware, have been presented to the Musée Carnavalet, Paris.

BUILDING CONTRACTS.[*]

BY H. H. RICHARDSON, Clement's Inn Prizeman, 1879.

THE term "building contract" may be applied to any legally-binding agreement which has for its subject matter, or principal subject matter, the erection of buildings or the execution of works of the nature of buildings, and, as generally used, it may be more particularly defined as an agreement by which one person, or body of persons, undertakes for a consideration to erect or construct for another buildings or other works of that nature.

The first necessity in the case of such a contract is, of course, that a site for the proposed buildings or works is to be provided; and as the usual occasion for a building contract is where the owner of a site desires to have it built upon, the term "building contract" is usually understood to import that the proposed buildings are to be erected upon the land of another for his use and benefit.

As the terms "contract" and "agreement," as commonly used, have essentially the same legal signification of a legally-binding agreement, that is to say, an agreement enforceable by law, so there is not, strictly speaking, any inherent or essential difference legally or grammatically between the terms "building contract" and "building agreement"; but, in fact, the former term has come to be used so as to import that the works to be done are to be done for the use and benefit of the owner of the land, whereas the term "building agreement" is usually confined to agreements providing for a grant to the builder of a lease of or other interest in the land upon completion of the building.

Although therefore either term may be applied to any agreement which provides for the erection of buildings, the term "building contract" naturally suggests to the experienced that the buildings are to be for the use and benefit of the building owner or employer, and consequently that the consideration is to be a money payment or something of the like nature, *e.g.*, payment in shares of a company; whereas the term "building agreement" suggests that the builder is to acquire in consideration of his building a lease of or other interest in the land built upon.

Instances of Contracts and Agreements.

As illustrations, a simple instance of a "building contract" would be where—

> A., a builder, agrees with B., a landowner, to build him a house upon his land, in consideration of a lamp sum to be paid on completion of the work.

And a similar instance of a "building agreement" would be where—

> A., a builder, agrees with B., a landowner, to build upon B.'s land in a specified manner, in consideration of B. granting to him a lease of the land and buildings.

The rent of such a lease is, of course, fixed at a sum considerably below the rack-rent of the property as built upon, and the amount expended in buildings is, in fact, equivalent to a premium paid for having the property as built upon at a rent below the rack-rent thereof. Although a contract to pull down a house comes within the Statute of Frauds as relating to an interest in land, and must be in writing, a contract to build a house does not.

Provisions.

In the case either of a building contract or building agreement, as above defined or distinguished, provisions will be found (1) on behalf of the landowner, (2) on behalf of the builder, and these are usually followed by provisions for the prevention or settlement of disputes which should be on behalf of both parties, but are in most cases found to be framed rather in the interest of the building owner or employer. The general object of the provisions on behalf of the building owner or employer is, putting it quite generally—

> (*a*) That the buildings to be erected shall be of the desired nature and quality, and be completed within a specified time.
>
> (*b*) That the builder shall not be entitled to his remuneration or consideration unless and until he has fulfilled his part of the bargain.

And the object of the provisions on behalf of the builder is—

> To put him into a position to claim his remuneration as soon as he has earned it under the stipulated terms.

Although these objects may be stated thus simply and shortly in a general way, the complicated nature of building operations and the many unforeseen occurrences which may intervene render numerous and elaborate precautions necessary for the prevention of disputes during the progress of, or after the completion or (it may be) the previous abandonment of the works. The provisions embodying these precautions have now settled down into a number of well recognised clauses, the more important of which are to be found in any well-drawn building contract or agreement. These more important clauses it is proposed presently to consider in detail, with special reference to the legal bearing and effect thereof and to certain judicial decisions thereon.

The subject of the present paper is building contracts in the ordinary sense as above distinguished, *i.e.*, contracts for the erection of buildings or construction of works on the land of another person for the use and benefit of that other person. It is in the case of building contracts in this sense, particularly, that the elaborate provisions to be presently considered are necessary in order to secure that the work shall be done in exact accordance with detailed requirements.

Value and Character of Buildings.

In the case of a building agreement, as an immediate lease or grant of the property is intended to be made to the builder, it is, as a rule, only necessary to provide that the buildings shall be sufficient to secure the intended rent and, perhaps, also to preserve the character of the neighbourhood. For these purposes it is generally sufficient to provide that the buildings shall be of not less than a certain value and shall have a more or less uniform character. The builder himself, having or being about to acquire an interest or estate in the property, may be relied upon to build so as to give the property a marketable value. Consequently, it is not usually found necessary in building agreements to go into any great details as to the buildings to be erected.

When, however, buildings are to be for the use and benefit of the building owner, his first and foremost care will be that the agreement shall be framed so as to secure his getting what he wants in every detail, and to secure this is, consequently, the main object of the provisions of the contract on behalf of the employer.

Ruskin's Houses.

Now if the buildings contemplated were nothing more than what Mr. Ruskin somewhere says is all that the ordinary British householder requires—namely, four brick walls and a drain pipe—the employer might possibly be able to decide for himself whether that desideratum were supplied, and the services of an architect or surveyor might be dispensed with. *Pace* Mr. Ruskin, however, and, fortunately for the profession of architects, our needs and aspirations in the matter of building are seldom so simple; and, moreover, it is not only the demand of increasing wealth and luxury, but the elaborate requirements of modern building Acts, which have to be met. Consequently building contracts are frequently required to provide for the proper execution of most extensive and costly works in accordance with most minute and detailed particulars. Hence the introduction into the contract or transaction of a third party in the person of the architect or surveyor of the building owner, whose duty it is to bring his expert knowledge to the assistance of the building owner as a guarantee that the work to be done shall be done in the way in which an expert knows it ought to be done. One of the most important things to be considered is, therefore,

The Position of the Architect or Surveyor,

both as regards the owner and the builder, and the nature of the authority, duties, rights and liabilities involved in that position.

Before proceeding to details, it is to be observed that, as in the case of all instruments where the salient provisions have settled down into recognised form, this has been the result of a gradual growth, faults and deficiencies being rectified and supplied as experience has shown such rectification and supplement to be necessary. The case of conditions of sale will readily occur as an example of this growth or development. In preparing these, particular provisions to meet such particular case are required and are inserted by the draftsman as his skill and experience dictate; but beyond these special provisions there will be found a number of general forms which experience and the results of judicial decisions have shown to be necessary or expedient in every case, if disputes are to be avoided.

General Form of Building Contract.

We come now to consider the general form which a building contract for the purposes and in the circumstances aforesaid has come to assume. In contracts for elaborate works, and especially in the kindred contracts usually known as engineering contracts, the instrument frequently commences with a series of definitions (—*a*) of persons, *e.g.*, building owner or employer, surveyor, engineer, clerks of works, &c.; and (*b*) things, *e.g.*, works, plant, drawings, schedule of prices, &c.

These, however, are rather matters of convenience and not of necessity, and need not be here considered.

For the reason before indicated—namely, that the employer, not usually being an expert, and so not being competent of himself to specify precisely what he requires or to see that what is supplied is such—he will in the first place have employed an architect to prepare the plans and specifications for the proposed buildings, and the builder or contractor will be required to undertake to build them in accordance with such plans and specifications, and under the direction and to the satisfaction of the architect. The contract thus sets out by defining the work to be done, namely, that shown by the plans and specifications, and by providing a guarantee that it shall be properly done by requiring it to be done to the satisfaction of the building owner's architect or surveyor.

Completion and Remuneration.

The question which naturally arises next is that as to the time for completion; and, consequently, the clause or clauses indicating the nature and extent of the work to be done is usually associated with or followed by provisions for securing completion within due time and fixing the damages or penalties in default.

Next will naturally follow the question of the consideration or remuneration for the work with provisions as to the time, manner and conditions of its payment. Then, in order to prevent undue rigidity, will follow provisions as to alterations and deviations.

It will then be found convenient to provide as far as possible for all matters or contingencies which, or the consequences of which might if left unprovided for, give rise to dispute or doubt, and of these the following may be here mentioned, namely: Rectification of defects subsequently appearing, property in materials and plant, assignment and sub-letting of contract, bankruptcy of contractor, and, lastly, there will be provisions for the prevention and settlement of disputes.

A Convenient Form of Contract

is, first, to define or indicate the work to be done, the time for its completion and the nature and conditions of the consideration or remuneration, and then to schedule or otherwise annex the general conditions of the contract. These general conditions are, as above indicated, frequently very numerous and exhaustive, and it is not within the scope of this paper to consider them in detail, but it is proposed to select a few of the more important which have been the subject of judicial decision, and to consider them with reference to those decisions.

Before proceeding to consider the first group of clauses, namely, those relating to the work to be done, the time for its completion, the payment or remuneration therefor, we may here consider the position of the architect—(*a*) as regards the employer; (*b*) as regards the builder.

---

[*] A paper published in "The Architects' Magazine" (the official publication of the Society of Architects).

The Employer.

(*a*) As regards the employer. The bargain between the architect and the employer for the preparation of the plans, &c., and his remuneration therefor, is of course a separate contract not concerning the builder, and as to this bargain three points only need be here considered—(1) the remuneration; (2) the ownership of the plans; (3) personal nature of the contract.

As to (1), it has been held in a case of *Whipham* v. *Everitt* ("Times," March 22nd, 1900) that though not legally binding on a building owner the charges of architects sanctioned by the R.I.B.A. are evidence of the reasonable nature of the architect's charges if in accordance with the schedule.

As to (2), if there is no special agreement as to ownership the employer is entitled to the plans when he has paid the architect his reasonable remuneration (see *Ebby* v. *McGowan*, "Times," Nov. 17th, 1870).

As to (3), the contract being personal—*i.e.*, the personal skill of the particular architect being deemed to be relied on—the contract is dissolved by the architect's death. This is not so in the case of the builder, although it may be made so by express contract. Apart from stipulation to the contrary, if the builder dies, his representatives are bound to carry out his contract. Further, and this concerns the position of the architect as regards the builder also, he is the general agent of the employer for the purposes of the work he has to superintend (see *Kimberley* v. *Dick*, L. R. 13 Eq. 1), and as a result of this position of agency all dealings between the architect and the builder must be free from any suspicion of collusion; and if any collusion or secret dealing between the architect and the builder can be established, it will amount to a fraud on the employer and entitle him to damages or recission of the contract (see *Panama and South Pacific Telegraph Co.* v. *India Rubber Telegraph Works Co.*, L. R. 10 Ch. 515).

Following the clause or clauses defining the work to be done as the main object of the contract, there usually follow a number of

Ancillary or Subsidiary Clauses

indicating various preliminary and other matters and things to be attended to or done by the contractor, *e.g.*, giving of requisite notice, fencing, compliance with statutes, paying compensation for damage, indemnifying employer against risk.

The number and extent of these obligations, of course, largely depend on the nature and importance of the main works to be done, and the object is to throw upon the contractor the expense of all preliminary and subsidiary matters which may be necessary to be done or settled in order that the main work may proceed to completion without any further expense to the employer than the stipulated cost. It is sometimes stipulated in the contract that all materials be provided by the contractor at his own cost, but, apart from such stipulation, a person who contracts to build a house impliedly undertakes to provide all necessary materials.

The Architect's Powers.

Resuming the question of the contents of the contract, we proceed to deal with the first group of clauses. The architect or surveyor is, as we have seen, the agent of the employer to see to the work on his behalf. In this capacity he is empowered (*a*) to inspect it, and, if necessary, to uncover and look into work for inspection: (*b*) to require any inferior materials to be taken out and replaced by good, and any inferior or unskilful work to be redone or rectified.

If the architect's supervision is thorough, and his powers to cause bad work to be made good are unflinchingly exercised, the probability is that a proper compliance with the contract on the part of the builder will thus be secured. But however careful the architect may be, defects of material or work may possibly be overlooked, and to meet this the clause known as the "defects and maintenance" clause is inserted, providing for the rectification by the contractor of defects subsequently appearing in the work. The contractor, however, cannot reasonably be expected to rectify defects appearing at any time—however long—after completion, and consequently his liability under the defects and maintenance clause is always limited in time.

The clause is, in fact, in the nature of a guarantee that the work is done so as not to give way through defect in material or workmanship, and may be compared to a guarantee given with, say, a watch or a bicycle, and, like such a guarantee, is limited to a period in which such defects (if existing) might reasonably be expected to become apparent.

Such is the nature of the usual provisions for the prevention and rectification of defects. But even apart from such provisions in the contract, if the work is inefficiently done, the owner may deduct from the contract price a reasonable sum in respect of defective work, and if payment has been made, he may obtain damages for such defective work (see *Davis and Hedges*, L. R. 6 Q.B. 187). And if the work is so improperly done as to be useless, he may decline to pay altogether.

Time for Commencement and Completion.

The contract usually provides that upon execution or at some fixed date the builder shall be entitled to enter on the land for the purpose only of executing the works, and so as not to create any tenancy or confer any further interest.

If the buildings are contracted to be finished within a certain time and are not so completed, the owner of course will have an action for damages for such breach of the contract. It is, however, usually deemed inexpedient to rely upon this remedy only, and consequently it is usually provided that in the event of non-completion by the stipulated day a penalty is fixed by the contract of so much for every day beyond until actual completion. These, unless they are excessive or unless there is something in the contract to show them to be included as penalties in the legal sense, are construed as liquidated damages [see *Low* v. *Local Board of Redditch*, L. R. (1892) 1 Q.B. 127].

For the protection of the builder, provisions are also usually inserted to meet the case of delay through unforeseen or unavoidable circumstances, *e.g.*, stress of weather, strikes, disputes with neighbours, &c. In these cases a reasonable extension of time is provided to be allowed by the architect or surveyor. Another cause for extension of time which is usually provided for, though no doubt it would be allowed without express provision, is in the case of extra work being found to be and in fact required.

Consideration or Remuneration.

The simplest case is that where a lump sum is to be paid upon completion. Usually, however, at any rate in large contracts, the builder requires money as the work proceeds, and he therefore stipulates to be paid certain sums at certain stages. In both cases it is usually provided that the certificate of the architect shall be required as a condition precedent for payment, and this provision has given rise to various questions as to the conclusiveness of and necessity for the certificate. It has been decided that it is final and conclusive as between the builder and building owner, even if given without reasonable care (*Stevenson* v. *Watson*, L. R. 4 C. P. D., 148, and *Rogers* v. *James*, 1891, 8 "Times" Law Reports, 67).

This evidently puts great power into the hands of the architect, and much reliance must be placed upon professional honour. The builder has no remedy against him in case of mere negligence or merely unreasonable conduct. In this, however, as in all other matters, actual fraud will give a right to relief; consequently, if the certificate is withheld fraudently and in collusion with the employer, the builder will have a right of action both against the architect for the fraud and against the employer for work done, even though the certificate be withheld.

It is, however, to be remembered that where the contract provides for payments in advance upon the certificate of the architect that so much work, or work of such and such value, has been done, these interim certificates are not final, and when the time for final payment and settlement comes they may be revised and readjusted *Tharsis Sulphur Co.* v. *McElrov*, 3 App. Cases 1040).

Form of Certificate.

The contract may provide that this must be in writing or in some particular form, but in the absence of such provision, it need not be in writing, and may be by word of mouth, and in any form amounting to a certificate, but it must be so expressed as to be in fact a certificate, and not as it were a mere admission.

In the recent cases *Chambers* v. *Goldthorpe* and *Restell* v. *Nye*, 84 L. T. p. 444, it was held that the architect in giving his certificate was in the position of an arbitrator, and so not liable for negligence in so doing. Lord Justice Romer, however, dissented from this view, and considered that on giving his certificate the architect was acting simply as the agent of the building owner, and was consequently liable to him for negligence.

Deviations and Extra Work.

It probably but seldom happens that in carrying out works of any extent they are carried out exactly in accordance with, and without any deviations from, the original plans. As the works proceed, either unforeseen difficulties present themselves, or the works themselves suggest improvements in the original design, or the employer alters his mind as to some idea or detail; acting on the principle that it is the unforeseen which happens, the draftsman takes care to provide for such contingencies as are above mentioned.

The two things to be provided for are (*a*) the extra remuneration for the extra work; (*b*) the further time to be allowed.

(*a*) May be fixed either by reference to schedule of prices, or by the surveyor; and as to (*b*) the contract may stipulate that no further time be allowed, or it may provide that the architect or surveyor may allow such further time as he may think reasonable. If no such provision is contained in the contract, and extra work is ordered, no penalty can be recovered for delay (see *Dodd* v. *Churton*, 1897, 1 Q.B. 562).

It may here be observed that where the contract provides that the architect may order extra work to be done, this does not give him authority to require deviations or alterations amounting to an alteration of the general plan as originally proposed, but only alterations in matter of detail (see *Rex* v. *Peto*, *Younge and Jervis*, 37).

The question frequently arises,

What is Extra Work?

and to this the answer is that it is work outside the contract as originally entered into. If it is necessary for the execution of that work, although not specified it is not extra, and must be done for the price originally stipulated for (see *Sharpe* v. *San Paulo Railway Co.*, L. R. 8, Ch. 597).

Assignment and Sub-letting of Contract.

In order to secure the services of a particular builder in whom the employer has confidence, it is usual to provide against sub-letting or assignment, and also to give power to the employer to determine the contract on the bankruptcy of the builder. In this case, in order to terminate the contract, the employer must do some act indicating his clear intention to exercise the power.

Property in Plant and Materials.

In order to give better security for payments in advance, it is usual to provide that all materials and plant brought on the land shall be the property of the landowner. It would be insufficient merely to give power of seizure upon bankruptcy, for that would not prevail against the claim of the trustee—for this purpose it is necessary to vest the ownership in the employer. Moreover, apart from the question of security, it would obviously be inconvenient to risk the intrusion of the trustee upon the works, and the delay which might be caused by uncertainty as to what he could claim. Of course when materials are built in upon the land they form part of it and belong to the landowner *ipso facto*. It is only in the case of loose materials and plant that the provisions against claims by the trustee in bankruptcy are necessary.

Arbitration and Prevention of Disputes.

The contract usually concludes with a clause or clauses, the objects of which are (*a*) to prevent disputes; (*b*) to settle disputes.

For the prevention of disputes, the architect or surveyor is sometimes empowered to decide finally, and without being arbitrator. This prevents his decision in the absence of fraud being called in question. But it has been held that where the architect has given to the employer an assurance that the cost shall not exceed a certain sum, he is not considered to be in such a position of impartiality as to render his decision unassailable, and if such facts be proved the builder might claim a greater amount (see *Kemp* v. *Rose*, 1 Giff, 258 and *Kimberley* v. *Dick*, L. R. 13, Eq. 1). For the

Settlement of Disputes

which may arise, notwithstanding provision for their prevention, an arbitration clause in the usual form is generally inserted. It is in the interest of all parties—employer, builder, and architect—that the work should proceed smoothly. Every possible question therefore that is likely to arise should be provided for; hence it is of the utmost importance that building contracts should be very carefully drawn, and architects, employers, and builders should endeavour to acqaint their legal advisers with any practical difficulty that may arise in a particular case, with a view to its being obviated in the future, whilst the lawyer's part is to carefully watch the course of judicial decisions bearing on the matter and to frame his contracts from time to time in such a way that the dispute which gave rise to the case in question shall not arise in respect of the contract drawn by him.

Perfection in legal draftsmanship is, perhaps, not possible of attainment, but, if the course I have suggested be taken, we may hope in time and by experience to produce a form of building contract as nearly perfect as it is possible for such a contract to be.

Adderbury Church . Oxon

THE FIRST BUILDERS.

SOME PARTICULARS OF THEIR MONUMENTS.

FROM the East of Asia to the West of Europe, even along the Northern margin of Africa, monuments still remain which, though rude in execution, could not have been reared without long and arduous labour. One group of these consists of the rude stone structures in England sometimes called cromlechs, but on the Continent dolmens, and in certain cases giants' graves. To a great extent their occurrence depends upon the presence of suitable material. Thus monuments of great stones are rare in eastern and southern England, and would probably be altogether absent were it not that here and there huge flattish blocks of hard sandstone, called sarsens, are scattered about. The best known example in Kent is Kits Coity, or Cotty House, hardly three miles from Aylesford. Two huge "sarsen" slabs, about 8ft. square and more than 18in. thick, lean slightly towards a third, more irregular in shape—the three supporting a capstone still larger than those at the sides. This monument stands alone on a bare shoulder projecting from the scarp of the North Downs, whence it overlooks the undulating fertile valley of the Medway. Below it, a third of a mile away, are the runs of another and larger one, as we can infer from Stukeley's drawing. Probably, however, Kits Coity House is only part of a larger structure, and was once hidden by a cairn, though not a trace either of that or of other stones can now be found.

These cromlechs or dolmens are far from rare in Cornwall and in many parts of Wales; they occur occasionally in the Lake country and Scotland, and more frequently in Ireland. In some parts of Brittany they abound, and are scattered in France over a broad belt as far as the Gulf of Lyons; they fringe the Pyrenees and the Cantabrian Mountains; they extend far down Portugal; they are sprinkled over Grenada, and can be followed across the Mediterranean completely through Algeria, even to the eastern side of the Gulf of Sidra. They are also numerous in Northern Germany, Denmark and Southern Sweden. Elsewhere they are at least uncommon, even in places where suitable materials might be obtained. But we find them in Syria, and the builders have left their mark yet farther east in various parts of Asia; while the tribes of the Khasia Hills, south of the Brahmapootra, still erect traditional copies, as we may call them, of ancient monuments.

The structures are built on several patterns. The most simple is a chamber, more or less open on one side. Three broad upright stones, for instance, are placed on as many sides of a square; a fourth, generally rather larger, covering them like a lid. The next stage in dolmen building is to construct a short passage of uprights with smaller capstones as an approach to the entrance. Recesses are sometimes added to the chamber like alcoves or side chapels, or even a second one is constructed. In all these types the plan is rectangular, and the stones used are of considerable size. Sometimes, however, though rarely, the inner chamber is polygonal or circular; in others the passage widens out like the neck of a champagne bottle; in another the tomb becomes all passage, or the ground plan, instead of being a square, as in the first case, is a very elongated oblong, though it is still constructed with uprights and capstones. To this form some antiquaries restrict the term giants' graves.

All these monuments are generally believed to have been buried beneath a cairn of stones, which, however, has often entirely disappeared. But in another and rarer class of monuments the whole was buried deep beneath a great mound, so that it became a kind of pyramid, but of loose stone instead of masonry. These, no doubt, mark the resting places of exceptional personages, and not improbably they are rather later in date than most of the others, for the stones are sometimes rudely sculptured. The most remarkable example of this kind is to be found in Southern Brittany, on the shore of the inlet called the Morbiham, near the village of Lokmariaker, which seems, from the number and size of its monuments, to have been a kind of Iona in prehistoric times.

In a few—probably later—instances a kind of rude masonry has been introduced. Under a large mound the Mont St. Michel, between Lokmariaker and Carnac, is a square chamber approached by a long gallery. Here, however, the walls are formed of a kind of masonry—that is, of large blocks laid in rude courses. New Grange, a few miles from Drogheda, is an example of another type. Here the roof of the inner chamber is formed of slabs, each overlapping the one below, till at last they are capped and held in place by a single stone. Such first attempts at vaulting are found elsewhere; for instance, in the tombs of the kings at Mycenæ. Some of the stones at New Grange are also engraved with the usual patterns.

These monuments cover a long period, extending from early in the Neolithic, or later Stone Age, into that of Bronze. But this does not help us much to exact dates, which, indeed, would not correspond in all countries. Some archæologists have thought that in Scandinavia, where civilisation was no doubt late in arriving, the later Stone Age may have lasted from 2000 B.C. to 1000 B.C, and the Bronze Age down to about 500 B.C. But the tendency of recent investigation has been to carry such dates backward rather than forward. The Dolmen builders can hardly have passed across the valley of the Nile when it was held by a powerful race; yet the Pyramids are not much less than six thousand years old. So we can say little more of these rude stone monuments than that they probably differ much in date, and that some of them were very old when the ploughshare traced the walls of Rome.

ricks and Mortar.

HORISM FOR THE WEEK.

f the king is in the palace, nobody looks the walls. It is when he is gone, and the se is filled with grooms and gazers, that we n from the people to find relief in the majestic that are suggested by the pictures and the hitecture.—EMERSON.

Our Plates. PARTICULARS of the proposed new cathedral at Cape Town re given on p. 442 of our issue for last week. e portion to be erected as a memorial to those o have fallen in the South African War will the choir transept, choir and memorial chapel wn on plan.—The measured drawings illuste the article on Glasgow Cathedral on p. 454 his issue.

Preservation. f the National Gallery. THE Select Committee of the House of Commons appointed to consider the Government measure entitled National Gal- y (Purchase of Adjacent Land) Bill sat last ek, Mr. Akers-Douglas presiding. The Bill ls with the acquisition of a small piece of d on the west side of the National Gallery. e National Gallery is not itself entirely lated. It stands in a block, of which the jor portion is taken up by St. George's rracks. On the west side there are a series shops and some stables belonging to Lord nsdale, and the object of the Bill is to make a ce on the west side of about 38ft. broad, exding to the back of Lord Lonsdale's stables l taking land on which some shops are at sent situated and a portion of a court called nmouth Court and a couple of cottages. This n space will be of great service in case of fire. e Bill is in the form adopted in the Public rks Sites Act of 1897, and deals with the de of taking the land, incorporating a portion the Lands Clauses Acts which are suitable to h acquisition, and also dealing with the lition of the land tax and the extinction of hts of way. The measure also contain saving uses for the County Council and for the protion of the works of gas, water and electricity npanies, and to provide that the expenses ll be paid by Parliament by annual votes. The mmittee passed the Bill for third reading.

Housing Question. THE annual conference of the Urban District Councils Association was held recently in ndon, over 400 urban district councils being resented. The chairman, Alderman P. Wilson ffan, Monmouthshire, read a paper on "The using of the Working Classes." He conded that urban district councils were bound deal with the question unless they were tent with a lax administration of the law inst overcrowding and insanitation. Experience had abundantly proved that it was useless urn people out of their present houses, howr unsuitable these might be, unless there was newhere else for them to go. He alleged that m one-fourth to one-third of the working sses of the country were improperly housed. half a million workmen's cottages were cted by the local authorities, there would l be no overplus. There was really a house nine in the country, but he believed that it s a house famine artificially created by the ners of land, who kept desirable sites out of market in the hope that their value for lding purposes would be increased by the ssure of population. The taxation of land ues was the real remedy for this state of ngs, and he believed that if this were secured problem would largely solve itself.

Hartland Church. THE fine old church of Hartland narrowly escaped destruction by fire recently. It is of the most interesting of the many ancient red edifices in Devon. The church was forrly attached to Hartland Abbey, said to have n founded by the consort of Earl Godwin, escaped death from drowning just at that t of the wild Devon coast. The church is licated to St Nectan, and from an architecal standpoint possesses great merit. It has ost curious font, numerous memorials, an old een in perfect condition, an ancient stone r, and a pulpit of the time of James carved in black oak. This pulpit has the figure of a curious animal said to be a tusked goat, and on it the legend, "God save King James, Finis." It has been suggested that Finis was the name of the carver and the goat his escutcheon. In the pavement there is an old stone dated 1055. Supposing that the figures be genuine they carry us back to eleven years before the Norman Conquest. To the right of the east window is a monument erected in 1610. There are many other relics of past times.

The Abbey Church, Malmesbury. THE Bishop of Bristol appeals for help towards making safe the Abbey Church of Malmesbury, used as the parish church since the Reformation, and preserving from further decay the very interesting portions of the central tower and the west front which remain in a ruined state. No place can claim more unbroken ecclesiastical and educational continuity between the Irish, British and English churches as Malmesbury. Aldhelm's Saxon basilica of stone was standing at the time of the Norman Conquest, and, like his other great church at Sherborne, it was spared by the Norman architects. Dunstan had given to it an organ, probably made by himself. It was not till after William of Malmesbury's time that the monks built the present Norman nave, about 1140–60. Six of the bays of their nave remain, and form the present parish church. The three western bays and the west front are in a ruined state; but so much of them remains that no great cost is needed to make them quite safe, while retaining, and indeed in some respects enhancing, their picturesque appearance. The noble northern arch of the central tower needs careful attention. The Bishop of Bristol says that when he was first appointed the condition of the parish church caused him very great anxiety. The flying buttresses and parapets were actively dangerous, and there were grave fears lest a double buttress at the south-west point should give way, in which case the singularly noble south porth would have been destroyed. By great exertions the people in and near Malmesbury have raised between £3,000 and £4,000, and this has enabled almost the whole of the six bays used as the church to be made safe. The more ruined parts of the old building now need attention, and the sum of £10,000 requires to be raised.

The Ecole des Beaux-Arts. A CURIOUS instance of redtapeism has occurred at the Ecole des Beaux Arts, Paris, in connection with the work sent home by the winners of the Prix de Rome. As is well known, those who obtain this prize have to submit specimens of their work once a year to the authorities of the school, where these are publicly exhibited. This year M. Tony Garnier, an architect, sent a drawing representing a "Cité Industrielle," and it was rejected because it was not in accordance with the regulations, which provide that architects must send only plans of restoration or copies of monuments representative of the best periods of Latin art. Of course, this means that the student has no initiative while studying in Rome, which is surely an absurd system. M. Garnier is evidently a young man of courage, for he wrote on his design: "All forms of architecture are based on false principles; ancient architecture is an error. Truth alone is beautiful." This radical declaration must have shocked the school directorate.

Control of Public Advertising. THE National Society for Checking the Abuses of Public Advertising have addressed a memorial to the President of the Local Government Board. The memorial says:—"We desire respectfully to represent the expediency of legislation by which municipal authorities would be empowered to frame and enforce regulations for the control of advertising display in public places. In 1899 the corporation of Edinburgh obtained a private Act powers for this purpose. Since then many other municipal bodies which were promoting Bills have inserted provisions, following more or less closely the lines of the Edinburgh scheme. The case of Dover is peculiarly interesting as an illustration of the absolute need of restrictive power. An American firm have erected, in positions which make them visible against the face of the cliffs, two huge boards, which, in the judgment of most observers, destroy the beauty of a scene of which every Englishman is proud. The firm in question, though requested by the town council and by a 'deputation representing the London bill-posting interest,' refused to remove the erections. There is a general feeling that the absence of any restraint upon the power of individuals to assail the eye of persons using public thoroughfares causes a grievous loss of comfort and of pleasure to the community. We respectfully urge that municipal bodies should have general authority to frame suitable by-laws, and that they ought not to be put to the expense of promoting special private legislation for the purpose. We would, therefore, ask that the Government should either give facilities for the consideration of the Bill prepared by the Society for Checking the Abuses of Public Advertising, or should themselves introduce a measure dealing with the subject." Among the signatories to the memorial (150 in all) are: The Lord Mayor of London, Mr. A. M. Torrance (chairman London County Council), Lord Monkswell, Mr. Lionel Cust, Mr. Sidney Colvin, Sir Reginald Palgrave, Lord Avebury, Lord Kelvin, Sir W. H. Preece, Sir Edward J. Poynter (President of the Royal Academy), Mr. G. F. Watts, R.A., Mr. Alfred Waterhouse, R.A. and Mr. T. G. Jackson, R.A. The reply of the Local Government Board was that no promise could be given that the Government would initiate legislation on the subject. The subject, however, appeared to be worthy of attention, and if in a future Session a Bill was introduced into Parliament by a private member on behalf of the society the Government would carefully consider its provisions and would watch its progress with interest.

In Explanation. MR. RICHARDSON EVANS, the Secretary of the Society for Checking the Abuses of Public Advertising, states, with reference to this correspondence: "Since the memorial was prepared the proprietors of the commodity advertised at Dover have courteously sought an opportunity of assuring us that, in deference to public feeling, they offered to remove the boards on condition that the town council compensated them for the bare cost of erection: and that they would before this have withdrawn them if they had any assurance that the site would not be used for others of a similar character. We have reason to hope that the clauses giving the Dover Town Council the necessary powers in such cases will not be opposed in the Private Bill Committee of the House of Commons. They have already been approved by the Peers. In the separate recommendations by Lord Balfour of Burleigh attached to the final report of the Royal Commission on Local Taxation the Secretary for Scotland urges that 'large powers of taxation as well as other powers for the control of advertisements should be conferred on municipalities as a right properly belonging to the guardians of the beauty and dignity of thoroughfares and public places.' We regard this expression of opinion from so high an authority as most encouraging. Some of the business organisations which will be affected by the legislation we advocate have imputed to us intentions which we desire to disclaim. Let me repeat that we aim at no censorship on grounds of taste, at no prohibition of any particular type of bill or sheet. The only interference we contemplate on the part of municipalities or county councils with the display of posters or ordinary wall announcements would be a refusal to allow the use of hoardings or other erections on such a scale or in such positions as would be an unjustifiable impairment of the local amenities. We should expect that the municipal bodies, while still content to act only in deference to the well ascertained views of the residents in the places affected, would take cognisance of many abuses which do not come under the head of 'advertising' in the stricter sense of the term. Sky signs, field boards, huge letters on house fronts, roofs, and chimneys would claim attention so far as they be of a nature which average local opinion, as constitutionally expressed in the council, condemns. The factors in determining the use made of statutory powers would in brief be the character of the immediate locality as regards natural beauty, architectural interest, the sensibilities and the pursuits of those who would be subject to the display."

Builders' Notes.

Mr. J. W. Haigh, managing director of the Ruabon Brick and Terra Cotta Works, died recently at Harrogate, at the age of about fifty years. He was a native of Todmorden.

The New Union Infirmary, Kingston-on-Thames, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Brighton Building By-laws.—The Improvements and Buildings Committee of the Brighton Town Council recently submitted draft amendments of and additions to the building by-laws, and recommended that they should be approved and forwarded to the Local Government Board for their preliminary approval. The by-laws are those recommended by the Local Government Board and almost exactly similar to those which had been carried out in Hove. On the motion of Councillor Holloway an amendment that the consideration of the by-laws should be deferred for a month was carried in order that the committee might invite the views of one or two builders on the council.

A Working Class Inquiry.—At last week's meeting of the London County Council the Housing of the Working Classes Committee recommended an expenditure of £500 in prosecuting inquiries with regard to the distribution of working-class population in London. Several members spoke of the inadequacy of the sum to be provided if the inquiry was really to be of any value, whilst others thought that any such examination had better be left to the borough councils. Mr. Waterlow (chairman of the committee) said that, in view of what had taken place at the recent conference between the Council and the borough councils on the subject of housing, he was willing to take the report back. The report was then referred back.

Partnerships Dissolved.—The partnership subsisting between Messrs. John Scott Flower, Walter Flower and David Flower Parker, carrying on business as builders and contractors, at Wakefield, in the county of York, under the style or firm of Flower Brothers, has been dissolved by mutual consent as and from the 1st day of January, 1901. All debts due to and owing by the said late firm will be received and paid by Messrs. Walter Flower and David Flower Parker.—The partnership subsisting between Messrs. John Scott Flower and Walter Flower, carrying on business as brick and tile manufacturers, at the city of Wakefield, under the style or firm of The Windhill Brick Co., has been dissolved by mutual consent as and from the 1st day of January, 1901. All debts due to and owing by the said late firm will be received and paid by Mr. Walter Flower.

Peterborough Building By-laws.—Mr. Pine, in proposing the adoption of model building by-laws which came before the Peterborough District Council recently, said under the present regulations the surveyor had only power to interfere where sanitary concerns were involved; he had no authority to stop anyone running up a jerry-building and placing on it a roof of wood. The by-laws in operation in Peterborough were very good, and the effect was an altogether improved class of building. Before they were instituted, however, some rascally things were tolerated. Mr. S. Vergette advocated adherence to the existing rules. The council took considerable pains in framing them, and he thought they were sufficient. In rural districts very little building was undertaken, and as far as experience went the work was very fairly done. This meddling on the part of officials was often more a nuisance than anything else. Mr. Dean supported Mr. Vergette, remarking that if the council insisted upon the observance of model regulations there would not be another workman's cottage built in the district for the next ten years, except perhaps by some big landowner. An agricultural labourer could hardly be expected to pay more than £5 or £6 a year in rent, and no man could afford to build a model cottage for such a small return. There was no comparison between an urban and rural area. The chairman said he remembered perfectly well that the model set were more stringent, and he thought many of them could be omitted. On the other hand he thought it was possible that if they went into the matter again they might find some very good laws that might be incorporated in those already adopted. The matter will be revived at the next meeting with a view to its delegation to a committee.

St. Paul's Foundations.—St. Paul's Cathedral is built on a somewhat unsatisfactory foundation. Dean Milman devoted a good deal of attention to the matter and left the result of his researches on record. Old St. Paul's rested on a layer of loam, and when Sir Christopher Wren had this examined he found that it gradually diminished towards the south from a depth of 6ft. to 4ft. Beneath this he found loose sand, then a layer of fresh-water shells and more sand, before reaching the London clay. At one point of the north-east corner the present foundations rest on the clay, but the remainder is built on a less secure soil. Quite early in the history of the present structure the great weight of the dome caused some of the piers to sink from 1in. to more than 2in. The cracks and fissures were repaired by Edward Strong, whose work is described by the antiquary Clutterbuck. The cathedral authorities are aware of the importance of avoiding any interference with the subsoil; and when the City authorities proposed to carry a sewer along the road to the south of the cathedral strong representations were made by Dean Milman and the cathedral surveyor, and the project was abandoned.

Builders in Conference.—The members of the National Federation of Builders, of which Mr. A. Krauss, of Bristol, is president, met at Glasgow last week, and the Institute of Builders also met in the city at the same time. Both bodies were present at a reception given by the Lord Provost and ex-Bailie Shearer, and the courtesies of the reception were acknowledged by Mr. King, of London, on behalf of the Institute, and by Mr. Krauss for the Federation. The latter, in the course of his remarks, referred to the erection of buildings in Glasgow without outside scaffoldings, which process, he said, they had been unable to carry out in the South of England. The half-yearly meeting of the Federation was held afterwards, and several matters affecting the interests of the building trade were discussed, among them being the restrictions imposed by operative trade unions in regard to the fixing of ready-made joinery and worked stone which had been prepared in places other than those in which they were to be fixed. Members gave instances of operatives refusing to fix material which had been prepared in other districts, notwithstanding that the rates of wages in those districts were higher than in the district in which the material was intended to be used. A resolution was passed expressing the opinion that the restrictions were not only harsh in regard to their application to employers, but hurtful to the general welfare of the trade.

New Patents.

These patents are open to opposition until August 19th.

1900.—Urinals.—14,097. J. Shanks, Tubal Works, Barrhead, Renfrew. The vertical partition slabs of urinals do not extend to the back slab or wall as ordinarily. It is claimed that the space thus left behind the whole length of the bays keeps the urinal cleaner and lessens the number of joints in which deposits can lodge.

Glass Tiles.—14,219. F. Beer, 125, Boulevard Exelmans, Paris. The key for attaching the glass tile to the wall with cement or plaster is made by coating the glass with a mineral cement formed of a soluble silicate mixed with powdered carbonate of lime.

1901.—Construction of Quay Walls, Dams, &c.—7,240. F. Hennebique, 2, Rue Danton, Paris. In order to get over the difficulty of constructing the foundations of walls of quays, &c., on alluvial ground, caissons or troughs of strengthened beton cement are moulded of variable length open at their upper part which is to form the top of the wall to be erected and capable of being floated to the place where they are to be used. These caissons are then filled with masonry and form a section of the wall, which in its entirety is constructed of a series of such troughs connected by a joint of cement run between the adjacent lateral walls.

Engineer's Squares.—9,989. W. Chesterman, Bow Works, Sheffield. The square has its blade held on the stock by screws and pressed against a shoulder of the stock at right angles to its sides by eccentric washers under screwheads.

The following specifications were published on Saturday last, and are open to opposition until August 26th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—11,030, McDougall, machinery for securing wood plugs in vitrified bricks. 11,606, Klopp & Klopp's Patents, Ltd., cocks or taps. 11,779, Criswick, fastenings for doors. 13,109, Asbell, valves for water-closets. 13,793, Ransome, mould for building concrete walls and structnres. 13,896, Soc. H. Croizier & Cie, manufacture of artificial stone blocks, &c. 13,911, Polson & Polson, pumps. 14,697, Thomson, woodblock flooring, mosaic, tile and other paving. 14,778, Croizier & Thomine, manufacture of artificial stone. 15,136, Wust, hoists. 15,388, Koenen, concrete floors. 16,985, Lane & Leeds Forge, Co., Ltd., manufacture of doors. 23,130, Burns & Mercer, locks.

1901.—357, Urquhart (*Kubin*), acetylene lamps. 816, Byrens, Drew & Pearson, windows. 4,202, Marx, manufacture of artificial stone. 4,318, Shone, picks, hammers, &c. 6,234, Köhler, portable buildings and like structures. 6,884, Hudson, protecting covers for pipes, &c. 7,766, O'Brien, tap or faucet. 8,688, Richter, water-pipe systems. 8,715, Weber, apparatu for heating air. 8,817, Boult (*Soc. Lumière Boule*), high-pressure incandescent gas-lighting plant. 9,069, Foster & Compton, apparatus for heating buildings. 9,111, Thompson (*Kane & Taylor*), metal pipe. 9,376, Czèrmak, manufacture of imitation marble. 10,209, Haddan (*Bullock*), cisterns or tanks for water-closets 10,211, O'Shea, construction of floors and ceilings. 10,297, Von Forell, manufacture o Portland cement. 10,301, Hartmann, mean for preventing water-closets from freezing 10,400, Clarke, water or weather excluder fo doors.

THE CEMENT INDUSTRY OF THE UNITED STATES.

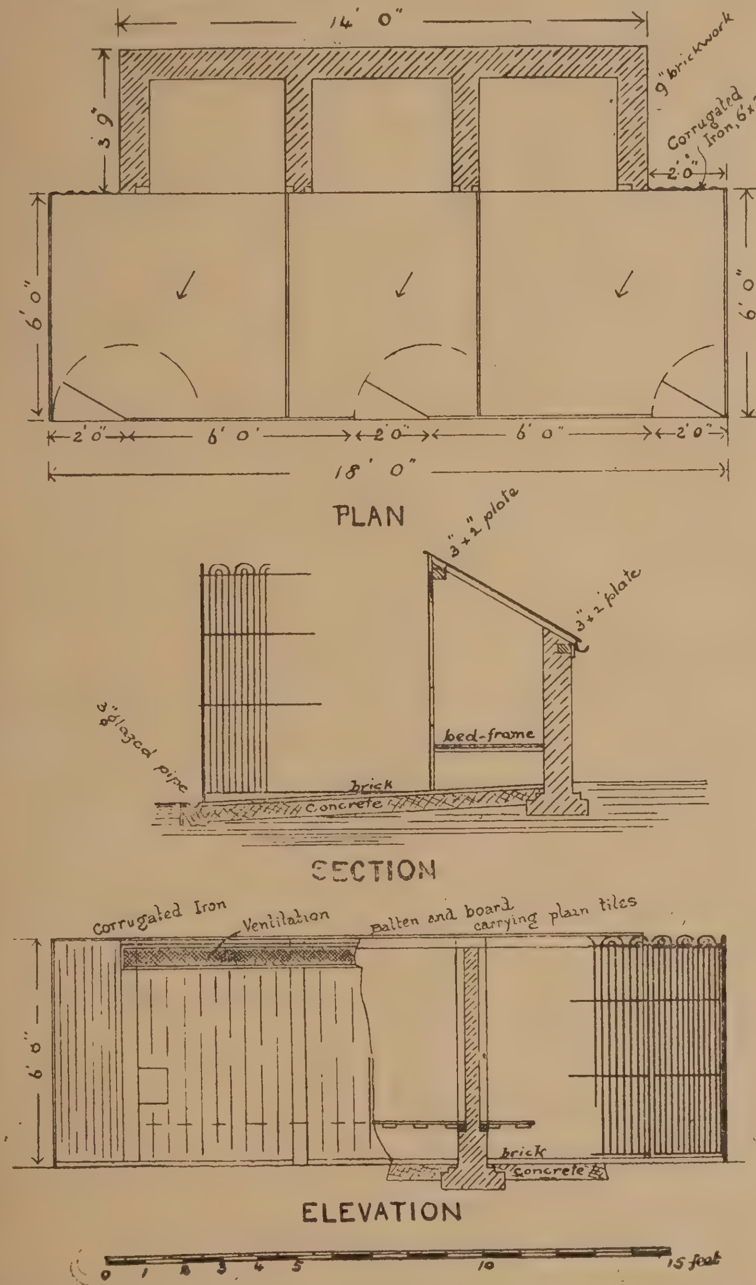
THE British commercial agent in the Unite States in a recent report on the cemen industry there states that this is not receivin from British manufacturers the attention i deserves. The production of Portland and othe cements in America is increasing, yet the importation is still large, and does not exhibit th decrease which might have been anticipated The demand for cement is increasing, and ther has long been a prejudice amongst America engineers and contractors against the hom product; but this feeling is dying out and n doubt in time the country will supply its ow requirements. In 1891 only 13·2 per cent. c the cement used in the United States was c home manufacture, while in 1899 the proportio was 73·9 per cent. British cement has varie from 9 to 15 per cent. of the total imports sinc the beginning of 1899; Germany has the larges sale in foreign cements, its import amounting t about half the whole foreign imports. It seem that German cement is cheaper than the Britis is more energetically advertised and pushed, an some think, better in quality. Upon this las point, however, there is some difference c opinion. Belgian cement, though inferior to th British, is much cheaper, and makes its way o this account. Last year the total of the cemen imported was little short of 1,000 million pound weight, of which New York, San Francisco, an Baltimore took nearly half. In 1899 the tot production of the thirty-six works in the Unite States was over 5½ million barrels, valued a 8,000,000 dols., being an increase of 53 per cen in quantity and 35 per cent. in value over th previous year. The Lehigh Valley in easter Pennsylvania is the chief seat of the industr and produces more than the rest of the country together. Two cement works there are said to be larger than any other in the world. One of them produces 8,000 barrels a day. Mr. Bell expects a sharp fall in the prices of the home product in the United States owing to the keen competition, and he believes that the present rate of increase in the production cannot be continued without disaster. The rotary kiln is now used generally in the industry on account of economy, and every known mechanical device is introduced wherever possible to handle the materials rapidly and efficiently. Besides Portland cement, large quantities of natural rock cement are manufactured, chiefly in the States of Indiana and New York. In 1899 the production of this cement was 9,868,179 barrels, that of Portland cement 5,652,266 barrels, while the importation of Portland cement was 2,108,388 barrels, making a total consumption of all cements in the United States in that year of 17,628,833 barrels.

The Matriculation Directory for June, 1901, has just been published by Messrs. W. B. Clive & Co., of 13, Booksellers' Row, Strand, W.C., price 1s. nett. This issue of this excellent guide to the London University examinations gives the subjects for the next examinations, with suggested text-books to study, the papers set at the June examinations with model answers, and various other information.

DOG KENNELS FOR A SMALL ESTABLISHMENT.

By G. S. MITCHELL, F.S.I.

THE situation of dog kennels should be high and dry, and though open enough to secure a good circulation of air, it should be sufficiently retired to avoid the nuisance caused by the dogs constantly barking at passers-by. Kennels should not face due south unless plenty of shade be afforded, or they will be very hot, and besides may cause some annoyance by effluvia. The writer has found a small range of kennels as shown in the drawings here given to be very convenient in use and economical in construction.



RANGE OF DOG KENNELS FOR A SMALL ESTABLISHMENT. BY G. S. MITCHELL, F.S.I.

Lodgings.—The walls of the "lodgings" are of 9in. brick up to the level of the framing of the "bed"; above this, their thickness is reduced to 4½in., and the set-offs thus made form the rests (2¼in. in the centre and 4½in. at the outsides) which carry the "bed" frames. The size of the "lodgings" should not be greater than about 3ft. square, and the "bed" should be from 12in. to 18in. above ground line. The walls are furnished with damp-courses and footings in the usual way.

The roofs deliver the rainwater to the back, and not into the "runs," and a bit of 4in. half-round spouting must be furnished to prevent the water soaking into the walls. The covering should for preference be tiles or slates laid on ¾in. rough boarding, but if desired galvanised and corrugated iron sheets may be employed. If wall plates 3in. by 2in. or 4in. by 3in. be placed on the back and front walls, the ¾in. boarding may be nailed on to them (*i.e.*, up and down the roof) and battens fixed on top of the board to take the roof-covering. Especially is it desirable to have battens as well as board if corrugated iron be employed, that a more equable temperature may be maintained in the "bed-place."

The runs are about 6ft. by 6ft., and a convenient method of arranging them so that only the standard 6ft. lengths of fencing shall be employed is that shown in the plan. The fencing shown is free of any sharp points, with their possible injury to a dog should it attempt to jump the railing. It is of wrought-iron 6ft. high, having 4ft. horizontal bars each 1in. by 1½in., and ⅝in. round verticals spaced at from 2in. to 2½in. intervals. Its cost is from 7s. to 7s. 6d. per yard run. If preferred a shorter fence may be utilised by fixing it on the top of a dwarf wall, but I prefer all the railings to go down to the ground level because the passage of air through the runs is not then impeded. If it be found afterwards necessary to shut off the dogs in one compartment from their neighbours a corrugated iron sheet or two may be employed—temporarily or otherwise. The gates shown are made to match the railings, and are of 2ft. opening and cost about 30s. each, complete with proper standards and slip bolt. Each of the two outer runs is completed by means of a corrugated iron sheet fixed in an upright position as shown, and secured by angle irons to the brickwork of the lodgings and by bolts to the iron railings. Should it be found that the dogs jump—retrievers especially are apt to do so—it will be necessary to cover in the runs with ordinary galvanised wire netting laced to the top of the fences.

The floors of the "runs" and "lodgings" are laid with a very good fall (6in. is not too much in such a case) as the smell from kennels with insufficient run is very unpleasant. The drainage should therefore be very complete and ample facilities afforded for flushing everything down periodically. The floors are formed of hard paving squares or quarries laid on 6in. of cement concrete—paving bricks on end all round the margins keeping the squares in position. An open drain of 3in. half-round glazed socket pipes is laid along the front of the runs (outside) upon a cement concrete foundation and securely kept in position by a margin of paving bricks on end. In the upper part of the run a hollow is formed in the quarries and concrete of the exact size to receive a water-trough. This is of glazed stoneware, and is furnished with a flat rim to rest on the paving all round the cavity; the trough should be loose in order that it may be removed at any time for cleansing purposes by slipping a knife blade or spade under the rim—the trough I have used costs 2s. 6d., is made by Messrs. Oates & Green, Ltd., of Halifax, and is described in their catalogue as a poultry trough (No. 530).

Bed places.—Upon the ledges formed in the brick walls, as already described, spar-framed beds of about 1½in. by ¾in., with slightly stouter ledgers, are formed to fit in each lodging; they simply lie loosely and are kept in position by the wooden fronts to the bed-places, which are formed of narrow ¾in. boards with light ledgers and are kept in position in their turn by turn buttons on the face of the division walls to the lodgings. Entrance holes are cut to the bed-places at a little higher level than the spar frames in order that straw if used for bedding may not be dragged out by the animals when emerging. Should the dogs bite the edges of the openings a little hoop iron may be tacked on. The whole of the woodwork, fronts, beds, &c., is arranged to come clear away for cleaning or disinfecting purposes. Efficient ventilation is provided by wire gauze along the whole front of the lodgings, and all the exposed iron and woodwork (including roof if corrugated iron be used) should be painted three coats in good dark tints; indian red or purple brown are both good wearing colours.

The Society of Architects has cancelled the arrangements which were being made for the visit to Oxford on July 27th, owing to insufficient names having been received.

Engineering Notes.

Grimsby Dock.—The Select Committee of the House of Lords last week considered the Humber Commercial Railway and Dock Bill. under which power is sought to construct a new dock at Grimsby. The Committee found the preamble of the Bill proved, if the parties could agree to a clause which, when the new dock is built, will not deprive the Great Northern of its fish traffic.

A Branch Railway Line from Kilbowie Road, on the Lanarkshire and Dumbartonshire Railway, is being carried across the Forth and Clyde Canal in the vicinity of the Singer's Factory. A swing bridge has been erected. The line is to connect public works on the north bank of the canal at Dalmuir, but it is possible it may yet be extended further in the direction of Duntocher. A start has also been made with the sewage purification tanks and dock for the Corporation of Glasgow at Low Dalmuir in connection with the western district sewage scheme. The work will take several years to complete. Messrs. Robt. M'Alpine & Sons are the contractors on both schemes.

Dundee Gasworks are being reconstructed. All the brickwork, ironwork and slaterwork in connection with the new retort house and coal stores is now completed. The north chimney was completed on May 30th, and the south chimney is now completed to a height of 50ft. All the stone piers and girders for carrying the high level railways in the coal stores have been completed, and as many sidings laid down on the high level as can be done at present owing to the continued slow progress that is being made with the excavation of the rock and the building of boundary and retaining walls. The erection of pumping engines and boilers has been commenced, although the rock has not been excavated from behind them, but they will be protected as far as possible by wooden erections to prevent any accident occurring to them while the rock is being excavated. The contractors for coal breakers, stoking machinery, &c., are making good progress with the carrying out of their contracts. The erection of the foul mains between the new retort bench and the existing condensers is almost completed. The narrow gauge light railway is well advanced.

Yorkshire Electric Power Bill.—The Select Committee of the House of Lords last week allowed the Yorkshire Electric Power Bill to proceed. Under the Bill power is sought to supply electricity for power in a district 1,820 square miles in extent in the West Riding of Yorkshire. The capital of the scheme is £2,000,000, with borrowing powers of £666,000 more. The chief opposition was offered by the corporations of Leeds, Sheffield and Bradford, who desired absolute power to prohibit the company from supplying in their areas, even to the limited extent proposed—viz., to railways, water companies and canals; and they also objected to the company's proposed power as to wayleaves to carry their cables through these places in order to supply to places beyond. The committee found the preamble proved and gave the power sought to supply railways, canals and water companies in the areas of the corporations, but they fixed certain districts in the centres of the towns named within which the company were not to lay their mains.

Light Railways in Middlesex.—At Wood Green last week the Earl of Jersey and other Light Railway Commissioners concluded an inquiry into an application by the Middlesex County Council for sanction to a scheme for the construction of five lines of light railways in the county. These included lines in Hornsey, Tottenham, Friern Barnet and Wood Green, making a total of 73 miles. For the county council it was contended that tramways were needed because the railways did not and could not satisfy the demand for intercommunication in the county. The county council felt that they should be the tramway authority, as they alone could put forward a comprehensive scheme to cover the whole county. Mr. James Bigwood, M.P., a member of the Middlesex County Council in giving evidence in support of the scheme, said that the idea of the council was that these light railways should radiate from London like the spokes from the hub of a wheel, and the council thought that, wherever a tube railway debouched, there should be in connection a light railway to carry people further out into the country. The scheme was opposed on behalf of the Hornsey District Council, on the ground that the proposed lines in Hornsey were local lines, and, if required, should be constructed by the local authority. The line from Archway Road, Highgate, along Muswell Hill Road to Muswell Hill and the Alexander Palace was strongly opposed, the Hornsey District Council having received a memorial signed by 415 householders at Muswell Hill in opposition to the undertaking. The district council also opposed the proposed line along Tottenham Lane, Hornsey, on the ground that the thoroughfare was a narrow one, and no provision was made for the necessary widenings. At the conclusion of the inquiry, Lord Jersey said that the Commissioners could not recommend the sanctioning of the Muswell Hill line, but they would recommend the sanctioning of the Tottenham Lane line, subject to the roadway being widened to 50ft., or, with the approval of the Board of Trade, to a minimum of 45ft. where 50ft. could not be obtained. They would also recommend that the construction of the other lines be sanctioned.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Sinkage of Floor, and Mahogany.

Leicester.—R. G. writes: (1) "Three years ago I built two houses, living in one myself. They are both on the same level. There is waste ground about 18in. lower than the causeway on the outside of one and outside the other is a garden about 18in. lower than the causeway. They are on a clay subsoil. Last December a heavy rain fell and the houses were flooded, the water getting into the kitchens of both houses from the front part under the floors through the air bricks, but it soon disappeared. A few hours after, on walking into the tile-paved passage, I felt a movement, and on examining it found it had sunk, a 1¾in. fracture of the tiles being caused where marked on the plan (not reproduced). It has, however, not gone further, being quite solid. The tiles were laid in cement on a bed of lime concrete 6in. thick. The passage in the other house only sunk about ⅜in. What do you think was the cause? The builder and I disagree as to it; I think it was not sufficiently rammed when filled up, and he gives the reason that the fine stuff, if any, would be carried away, but I cannot see how that would be when the area of the passage was enclosed within brick walls. (2) Is Cuban the same as Spanish mahogany or are they separate varieties? If the latter, what are their chief qualities and characteristics?"

(1) The settlement is probably due to the shrinkage of the 18in. of filling placed under the tile-paved floor; more especially as a somewhat similar subsidence has occurred under the tiled floor of the adjoining house, whilst the walls themselves are apparently unaffected. This shrinkage may have resulted from insufficient ramming or consolidation of the filling, or might have been caused by the use of unsuitable material for raising the ground level. If clay-filling has been used, then the subsequent immersion and saturation resulting from heavy floods, &c., would readily account for the settlement. In such situations the most satisfactory method is to bring up the surface of the ground to the required levels in concrete; or if the strictest economy is essential, then a hard compact material such as gravel or broken brick rubbish should be provided and thoroughly well rammed in thin layers.

(2) Mahogany from the West Indian island of Cuba is known as "Cuban" or "Spanish" mahogany, and the terms refer to the same description of timber. Mahogany obtained from the adjacent mainland of Central America (in the district around the Gulf of Honduras) is known as "Honduras" mahogany. The latter timber is coarser in grain than "Spanish" mahogany. T. E. C.

Queen's Hall.

Chatham.—J. S. A. writes: "Has the Queen's Hall, Langham Place, been illustrated?"

Two full-page illustrations, with a plan of Queen's Hall, appeared in the "Builder" for February 14th, 1891. It may also be found mentioned, with a plan, in a paper on concert halls and assembly rooms in the "Building News," April 17th, 1896. G. A. T. M.

Compensation for Delay due to Strike.

Striker writes: "A builder contracted to alter premises and complete within six weeks. When he signed the contract he had received notice of a strike to commence one month ahead. He omitted to inform the building owner and his architect of this impending strike, as he might not have got the work (the owner and architect were not local and knew nothing of the strike). The usual contract form was used. The owner now claims compensation for damage, as he had engaged staff and ordered stock, and the work is still standing unfinished. What is the builder's position; can he shelter under the strike clause? The owner could have given work to another contractor to carry out who was not affected by the strike."

As an expression of opinion, it is considered that the builder can claim an extension of time for the delay due to a strike occurring during the progress of the work. T. E. C.

Payment for Overtime.

Essex.—Honorarium writes: "What would be a fair rate of remuneration per hour for overtime work in the preparation of one-eighth scale and working drawings for schools, residences, offices, &c., &c. The architect in whose employ I am pays me a salary of £102 per annum and offers 1s. per hour remuneration for overtime work. Is not this a rather small amount? What could I fairly ask per hour?"

More friction between employer and assistant arises over the question of overtime than almost anything else for want of a clear understanding upon the point when the assistant is first engaged. It is purely a matter for special arrangement, and if no arrangement has been come to the assistant is under the necessity of accepting whatever his employer may offer unless he is prepared to throw up his berth—with the added risk of being stigmatised as "unwilling" in any testimonial or recommendation for which he may apply. In very many offices it is the rule not to pay at all for overtime, but to increase the salary, if an increase be demanded, to a sufficient extent to compensate. If the overtime, however, is quite occasional and varies in duration, payment at the same rate as for daywork plus a sufficiency to pay for any meals taken at a restaurant instead of at home is fair remuneration for the first two or three hours per diem. After that time the strain becomes more severe, and it is only reasonable that time-and-half should be paid up to midnight, and double-time after midnight. G. A. T. M.

Thrust of Roof.

Sunderland.—Enquirer writes: "The sketch herewith shows a roof over 31ft. span. Will there be any thrust outwards on the walls? Will the 11in. by 3in. rib counteract the thrust if bolted to 9in. by 3in. collar and 9in. by 3in. principal by setting up a strain in rib alone? In Middleton's "Strains and Stresses," p. 111, he says that it will not: 'It cannot change the direction or lessen the amount of the thrust against the top of the wall until such thrust becomes active by the spreading out of the walls.' If Mr. Middleton is right, then the thrust will be resolved into the wall and buttress combined."

In the truss shown, if the parts be properly fitted and bolted up tightly, there will be practically no thrust on the walls due to the spreading of the feet, but it is desirable to strengthen the walls by buttresses where the trusses occur to provide against faulty workmanship and to improve the appearance. The design of truss is imperfect, as will be seen by reference to the frame and stress diagrams where the members 10–11, 11–13 and 13–14 are found to have no stress, and might therefore be omitted. In the diagram the 11in. by 3in. rib has been slightly extended to avoid a cross strain on tie beam, but otherwise the outline fairly represents the course of the stresses. Thick lines show compression. HENRY ADAMS.

An Old Architectural Book.

London.—Interested writes: "I recently bought an interesting old book entitled 'The Architecture of Leon Batista Alberti in Ten Books, of Painting in Three Books, and of Statuary in One Book; translated into Italian by Casimo Bartoli and into English by James Leoni, Architect; illustrated with Seventy Five Copper Plates, engraved by Mr. Picart, in One Volume. London, MDCCLV.' The volume measures 16½in. by 10½in., is in a perfect state of preservation, and bound in worn brown leather. The plates are well engraved and peculiar, and the 276 pp. of writing exceedingly old-fashioned and amusing reading, the last word on each page being reprinted at the head of the following page, as in old MS. I should be interested to know if this work is of any real value, and whether the architect or his translator are famous."

The author, who was born in 1405 and died in 1472 A.D., was one of the greatest architects of the Italian Renaissance, and did much towards the revival of strict Classic architecture. His most important buildings were the Palazzo Rucellai and the Gate and Corinthian Logia of Santa Maria Novella at Florence, the church of San Francisco at Rimini, and the churches of San Sebastino and San Andrea at Mantua. Yet, although his buildings were of importance and considerable beauty, his book had even a higher reputation, and during the eighteenth century was considered the greatest authority on the Italian architecture of the fifteenth. The Royal Institute of British Architects possesses a copy in Italian, but not in the original binding. English translations are both rare and valuable. The translator, James Leoni, does not appear to be of great note. The original was written in Latin. G. A. T. M.

Stone Pillar.

Gloucester.—P. L. writes: "What is the reason that one of the pillars in the nave of one of our churches is perished up a distance of about 12ft. It faces the south porch, and there is a large stove about 10ft. away from it, but it is perished all round. All the others are perfect. I think they are built of local stone."

Without personal inspection, which might reveal some other cause, it can only be suggested either that at some time in its history the pillar in question has been exposed to the weather, or that it was built of a different stone of inferior quality to that employed for the rest of the church. G. A. T. M.

Life of Rickman.

Leeds.—E. B. writes: "Who is the publisher of the 'Life of Rickman, by his Son'?"

"Notes on the Life and on the Several Imprints of the Work of Thomas Rickman, F.S.A., collected by his Son, Thomas Miller Rickman, F.S.A.," has ust been issued. The publisher is Mr. George . W. Pitman, of 140, Gower Street, W.C., and he price is 5s.

Society of Architects' Examination.

Bradford.—A. H. W. writes: "What books hould I study for the examination of the ociety of Architects, and is this examination eld in the North, and could I obtain a copy of he last examination paper?"

Full particulars can be obtained from the ecretary to the Society of Architects at St. ames's Hall, Piccadilly, W.

Roof Truss.

Newbury.—Enquirer writes asking us to answer an examination question requiring the explanation of what a reciprocal diagram is and giving one for a king-post roof.

We cannot spare space to answer such elementary questions as this; our correspondent is idently entirely ignorant of the rudiments applied mechanics, and to teach him would require us to repeat what is to be found in all the text-books at great length. He should consult either Rivington's, Allen's or Mitchell's books on building construction. If he intends to go in for building scientifically and thoroughly he should study the books on theoretical mechanics recommended on p. 122 of our issue for March 20th last.

Nuisance from Shows.

Cornwall.—An Old Subscriber writes: "The medical officer of an urban district council reports to the council that he has received complaints from residents near a field in such district which has been let by the owner to be used for steam roundabouts, hobby horses, shows and circuses both as to the noise and bad smells caused by such shows, &c., and calls the serious attention of the council to what he describes as grave objections both from a sanitary point of view and for other reasons. I presume the council can make by-laws and regulations controlling the tents, vans, sheds, &c.; but can they under section 91 of the Public Health Act, 1875, prevent such shows, &c., from being held in their district, and what steps should they adopt?"

The district council would do best to consult the Local Government Board and follow its advice. G. A. T. M.

THRUST OF ROOF.

Correspondence.

South Kensington Examinations.

To the Editor of The Builders' Journal.

Bromley, Kent.

Sir,—Referring to the correspondence on p. 422 of your issue for July 3rd re stone window sill, question 9, it is a pity you allow such a badly informed "expert" to occupy space in your valuable paper with such a solution of a stone sill as given by him on p. 366 of your issue for June 12th, and then to assert as he does in the issue for July 3rd that it is undoubtedly a better "job than a narrow sill with a metal tongue!"

Surely the South Kensington authorities would not advocate the use of this form of sill, which is wasteful and bad, for a more successful method for rotting the woodwork could not easily be devised. I also note in the same issue (p. 424) a section of a wood sill which the writer calls a "good" section; surely it would be a very poor affair not to be sunk and throated in addition. —Yours truly, J. E. J.

Kirkcaldy.

Sir,—I scarcely think Mr. Harrison's criticism has been fully appreciated, nor do I think the explanations given on p. 422 in your issue of the 3rd inst. could have been written by one conversant with the subject. In question 10, for instance, no sane person would adopt such a primitive or inexemplary method of fixing an eaves gutter on a new building, especially where a dressed stone eaves course is provided. The necessity of the packing pieces under the ceiling joists is ludicrous, when by simply laying the joists directly on the wall plate the work is done, and done as it should be.

In question 12 you seem to be quite mistaken in your application of the term "coursed" rubble to the class of walling referred to.

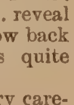
Neither is your illustration of solution to question 9 in order. There is no occasion for the stone sill projecting so far into the room, and few people would consider it prudent to sink the top surface so far back for the mere sake of forming the small lip, which to my mind is not to be compared with the efficiency of the metal tongue. The latter should exclude both wind and water, while the former would scarcely be proof against capillary attraction should the water get so far back. The wall in the recess is given as 10in. thick in the question, which with a 4½in. reveal and say 6in. for window causes the window back to be ½in. inside the recess, which is quite sufficient.

Altogether I think students should very carefully think over these answers before accepting them as correct.

J. FORBES SMITH, A.R.I.B.A.

Hertford.

Sir,—With reference to solution of question No. 9, is not Mr. Harrison quite right in saying that the stone sill as shown is a simple waste of material, when for the sake of a water bar a good deal of stone could be saved, which though not much in one sill, yet would soon mount up in a house with many windows. Also in answering Mr. Harrison you say that "it is undoubtedly a better job than a narrow sill with a metal tongue," but you do not give any reason for it being so. Would it not have been better if Mr. Harrison had put the water bar ½in. from the outside face of the oak sill as it would better prevent the rain when driven against the joint from penetrating any great distance under the sill and so rotting it (see sketch)? There would also be a saving in stone.—Yours truly,



S. H. J. MURCH.

The criticisms of the answers to the South Kensington questions have been interesting.

Our expert regrets that what he says does not meet with J. E. J.'s approval. He claims to be a tolerant man himself, and if he had had the marking of the papers he would have given full marks for a solution like that of Mr. Harrison. He says that an iron tongue in a ploughing is worse for the wood than no ploughing and no tongue; that in his view the method, like some other modern methods, is not an improvement. For ourselves we regret that our correspondent cannot give us unqualified approbation. This particular expert happens to have commenced his active professional work, after a university course, as a *foreman mason*, which may account for his partiality for stone; he is actively engaged as an architect, having buildings of some importance on his hands. He is, among other things, a Member of the Institution of Civil Engineers and a Gold Medallist in Science of a University, and if he leads some of our younger readers astray it ought not to be "because he knows no better." The sill shown on p. 424 is throated; it was a draughtsman's error to omit the sinking.

Mr. J. Forbes Smith, who says "No sane person would adopt such a primitive or inexemplary method," exhausts his bitterness with his first stroke. With his last sentence we cordially agree, "I think students should very carefully think over these answers before accepting them." These answers are not dogmatic doctrines and have no claim to infallibility; they are answers prepared by a practical man from the point of view of his own experience, and nothing that has been said affects his expressed opinion to change it in any degree. Mr. Harrison's proposal to rest his eaves gutter on stone corbels is a perfectly good plan; but in some cases where it is necessary to exercise economy, iron gutter hooks are used, and very much used. Economy of this kind is legitimate if it involves no permanent injury to the building, and it does not allow water to be conducted into the wall as is frequently the case when an iron eaves gutter is laid on a continuous course, and there is leakage at the joints of the iron gutter. If two or three extra inches of height of ceiling can be gained as shown in the answer, it is wise to gain these two or three inches of ceiling.

In regard to Mr. S. H. J. Murch's criticism both of Mr. Harrison's proposal and of ours, and his proposal to place "the iron water bar within half an inch of the outside face," he carries economy much too far. Long experience of oak sills has satisfied us that it is not at the side they rest upon that decay begins. They do not decay there at all. They fail on the top from wetting and drying, and it is precisely for this reason that we advocate the through stone sill. If in time there is a through shake which reaches behind the water bar, of what use is the water bar? Economy is no doubt a good plea, but there is "that which withholdeth more than is meet, and it tendeth to poverty."

We make no assumptions in regard to our correspondents' "sanity," length or character of experience. We are accustomed to curious differences of opinion about very simple matters. It is well to have these differences expressed in moderate language, setting a good example to students, who will, we hope, "think over these answers before accepting them." We strongly advise students to develop good common-sense opinions of their own. They can only succeed in this by observing practical building operations and comparing what they see with what they hear. We are accustomed to an assumed antagonism between "theory" and "practice." We know that we can have neither by itself, but practice, actual experience, gives proportion to our ideas in a special necessary way. Our business is not controversy. We have given our opinion, and we have given our reasons at sufficient length on these small questions in the Elementary stage.

There were also some small errors which escaped our expert in the proofs of the last article on these examinations: page 446, middle column, line 3, ¾ft. × 18ft. × 5¼ft. gables should be ¾ × 18ft., &c.; lines 11, 12, 13, 14, 15, first factors of lines should be 2, 4, 3, 2, 2 without ft. There is an error of arithmetic, third column, same page, 19ft. × 14ft. × 1·16 (sec. 30°) = 3 squares 8ft.; this will increase the estimate by £2 11s. 8d., making the total £156 5s. 2d.

New Streets.

To the Editor of The Builders' Journal.

Godalming.

Sir,—In reply to the enquiry by "One in Difficulties" on p. 423 of your issue for July 3rd, he should surely have been told that it is possible for an old highway to become a "new street" within the meaning of section 157 of the Public Health Act, 1875, and that in such a case the by-laws of the local authority will apply. In case of dispute this becomes a question of fact for the magistrates to determine.—Yours faithfully, J. H. NORRIS.

Gilford v. Taylor.

To the Editor of The Builders' Journal.

Wandsworth, S.W.

Sir,—Your verson of this case mentioned in your issue of June 26th, p. 401, is not correct. The facts I notice are not disclosed, and the result as stated would lead your readers to infer that, having employed the plaintiff to prepare certain plans, I had improperly refused to pay his claim and had been ordered to do so. What occurred was that the plaintiff having sent me in an account for £69 7s. for work and plans which I considered unsuitable and unworkable it was referred to Mr. Hilton Nash to say whether the plaintiff was entitled to this amount, and he, after looking at the plans, awarded him £37 10s. in lieu of the £69 7s. claimed.—Yours obediently,

GERTRUDE E. TAYLOR.

A NEW COTTAGE HOSPITAL FOR ABERGAVENNY.

A NEW Cottage Hospital is being erected at Abergavenny, in Hereford Road, adjoining and overlooking Bailey Park. The hospital, which consists of three wards (accommodating seven beds and two cots) together with the dispensary and all offices in connection therewith is on the ground floor, thus facilitating and greatly economising working arrangements. An operating-room is provided having all the most modern sanitary arrangements. There are no square corners or angles. The floor is to be paved with jointless terrazzo and the walls lined with glazed tiles. The indispensable north light is provided, together with special means for ventilation. There are lobbies having cross ventilation to all w.c.'s and lavatories, and there is also a small laundry and mortuary in connection with the outbuildings. The matron's room adjoins the front entrance, and the doctor's consulting-room and the dispensary, a separate entrance being provided for this department although in communication with the main building. On the first floor accommodation is provided for a parish nurse, together with bedrooms and other conveniences for the staff. Externally the building is of best pressed brickwork, the roof being covered with Broseley tiles. The building is of plain and economical construction. The contract, amounting to £1,925, has been let to Messrs. J. G. Thomas & Sons, the design being by Mr. E. A. Johnson, F.R.I.B.A., architect, of Abergavenny and Merthyr. It is expected that the building will be ready for occupation within twelve months.

WORKMEN'S DWELLINGS SCHEME FOR MIDDLESBROUGH.

THE General Purposes Committee of the Middlesbrough Corporation recently adopted the report of a sub-committee with regard to the provision of working-class dwellings. They recommended the adoption of the site offered by Messrs. Robson & Punch as set out on the borough engineer's plan. The area of the land, which is at Linthorpe, is about 20,000 sq. yds. The report stated that the borough engineer had drawn out a plan for laying out the land to the best advantage with the two types of houses approved by the General Purposes Committee and in accordance with the requirements of the Local Government Board, but, of course, their formal approval would have to be obtained to the scheme. The houses had been arranged upon the plan with front and back streets, there being ninety-eight houses of one type (block A), four-roomed, with a 15ft. frontage, and thirty-three houses abutting on the front roads, with set-back gardens of another (block B) type, six-roomed, with 17ft. 6in. frontage. The cost of these houses, blocks A and B, based upon the contract price for the gasworks cottages, will be about £158 per house for block A and £190 per house for block B; total cost for buildings only,

£21,754. The total cost of the whole scheme will be £29,350. The interest at 3½ per cent. and redemption for thirty years the sub-committee put at £1,595 18s. 2d. or £5 8s. 9d. per £100. The sub-committee reported that they considered that there is every reason to believe that there will be a considerable demand for these houses as fast as they are built. The block A will readily let at 5s. 6d. per week with a passage through, and block B at 7s. 6d. per week—ninety-eight houses block A at 5s. 6d. per week, £26 19s.; thirty-three houses block B at 7s. 6d. per week, £12 7s. 6d.—£39 6s. 6d. per week, That would give a gross income of £2,044 18s. per annum. The rates at £2 10s. per annum for the 5s. 6d. houses, and £5 per annum for the 7s. 6d. houses, would amount to £410, and the income tax at 1s. 2d. in the pound to £75 2s. 8d., leaving £1,559 15s. 4d. nett income, from which losses for empties and repairs must be deducted. In the Richmond cases that amounted to less than 1s. per £100.

QUEEN VICTORIA MEMORIAL.

THE Committee on the Memorial to Queen Victoria have met again. All the official plans and models have been under consideration, and in addition one important unofficial proposal received considerable attention. This, it is interesting to know, although it did not come from an architect, is one of the most ambitious of the many unofficial schemes which have been laid before the committee. The author is Mr. Lennox Browne, who, although he is better known as a throat specialist, is also a distinguished art amateur and a connoisseur. Mr. Lennox Browne's proposal is a very elaborate one, but it may be said briefly to consist of an adaptation of Buckingham Palace to the purposes of a memorial, by the addition of a storey at each end, the erection of a lofty central roof, and the facing of the building in red brick and stone. This would make a background, according to Mr. Browne's plan, for a great avenue leading from the east end of Piccadilly, opposite Devonshire House, to the Palace, in the line of the present footpath, while he further suggests an opening into Trafalgar Square. The forecourt of the Palace would be extended into a great semi-circle with arches emblematical of Great Britain's colonies. Mr. Browne also proposes to limit the statuary to a memorial to the Queen, and that, as is known, has been entrusted to Mr. Brock. It is interesting to note that several of the Colonial Agents-General have spoken enthusiastically of that portion of the scheme which provides for a series of Colonial arches. It does not follow, of course, that this or any other scheme will be adopted by the committee. It is stated that at a further meeting on Wednesday last the committee selected from among the plans submitted those which they considered most suitable. It is further understood that as a preliminary to publication of the name of the successful competitor and of details of his plans, the selected scheme will have to be submitted to the general committee and afterwards approved by the king.

Masters and Men.

A Master-Builders' Association for Malton has been formed. Mr. Anthony Lyon, of Norton, has been asked to become the president, and Mr. Horsley has been elected hon. secretary.

Tees-side Joiners' Dispute settled.—After lasting several weeks the dispute between the Tees-side and Hartlepool Master Builders and the Tees-side District of Operative Joiners has been settled. First of all the men asked that their wages should be advanced from 9d. to 10d. per hour, but this the masters declined, offering ½d. The men refused this, and since negotiations have been repeatedly opened with the view of coming to a settlement. Eventually the masters offered an advance of ½d. per hour, conditionally upon the rules of working being altered, and that those in force in the Sunderland district be agreed to. A settlement on this basis has been agreed upon.

Keystones.

It is proposed to place in Looe Church an oak organ screen specially designed by the architect of the church to cost about £65 to commemorate the ministry of Rev. A. Kemble.

Architectural Association Day School.—Mr. Arthur T. Bolton, A.R.I.B.A., has been appointed Master of the Architectural Association Day School which will be opened at 56, Great Marlborough Street, W., in October next.

A New Partnership.—Mr. G. G. Pye, M.S.A., architect and surveyor, of 12, Paternoster Row, E.C., has taken Mr. F. V. Forrest, an architect late in practice at Hounslow, into partnership. The firm will in future be known as Pye & Forrest.

A Memorial Oak Pulpit to the late Lady Protheroe Smith has been placed in St. Paul's Church, Truro, from designs by Mr. Fellowes Prynne, of Plymouth, and matches well the screen erected by Canon Gardiner to the memory of his wife.

The Birkenhead Town Hall caught fire last week. Although the main building stands intact the upper ornamental portion of the tower has been partially destroyed; the fire having cut down the tower by about 30ft. The left front of the hall in which the fire originated was utterly wrecked.

Kenchester Church.—The rector of Kenchester, Herefordshire, states that his ancient church is in danger of collapse and is in a general state of dilapidation. Kenchester is said to be the earliest city in this country built of stone, and it had a large pretorium adorned with Doric colums. It was the Magna Castra of Julius Cæsar, and from its ruins the present church was built about the time of the Conquest. The font was formed from a section of one of the Doric pillars of the pretorium.

A Plan of Glasgow and the International Exhibition there has just been published by Messrs. W. & A. K. Johnston, Ltd., of London, Edinburgh and Glasgow, price 6d. It is extremely well got up, and will be found most useful for all visitors to Glasgow. It contains a large size map of the city on one side and on the back a small ground-plan of the exhibition, with numerous particulars and information with regard to the exhibition, places of interest, cab fares, &c.

The Hotel Cecil.—In the improvement of the Hotel Cecil by the erection of the north block, besides giving the hotel an imposing frontage on to the Strand and about 100 more bedrooms, the company acquires a row of shops in the street, a first floor of large offices, and a second floor of bachelor chambers, all of which will no doubt be let as soon as they are ready for occupation. When the facade is finished the lofty archway will be higher even than that of Burlington House. It was in order that this archway should be in the centre that a small wing of the block has had—temporarily, at any rate—to be left out of the general scheme of decoration. The six upper floors of the block are to be used by the hotel, so that between 900 and 1,000 guests can be received instead of 800.

The Bradford Board of Guardians at a recent meeting considered the question of appointing Mr. Fred Holland as architect and civil engineer for the workhouse for four years. Mr. Halford moved as an amendment the appointment of an architect be referred back. He said that he did so because he understood that the post had not been advertised, and he urged that such an appointment ought not to be made without open competition. The chairman said that Mr. Holland had been employed in connection with the works which had already been carried out at the workhouse, and had drawn the block plans for the new buildings, and it was natural and proper that he should be selected to carry out the work. There was a good deal of work in prospect, and consequently it seemed to the committee that there would be an actual saving if Mr. Holland were appointed at a salary for the next four years. After some further discussion the amendment was negatived and a notice given that at the next meeting a motion would be made for the appointment of Mr. Holland.

Little Waldingfield Church.—In this article in our last issue, the name of Mr. E. M. Hick was spelt wrongly.

Mr. Dan Gibson informs us that he was in no way responsible for the design for the houses at Windermere by Mr. Thomas H. Mawson, illustrated in one of our centre plates last week.

A New Roman Catholic Church of St. Joseph, at Skerton, near Lancaster, has been built from designs of Messrs. Pugin & Pugin, London and Liverpool. One great feature of the church is its tracery windows.

Roath Wesleyan Church is to be renovated, and tenders are being invited for the work. It is proposed to reglaze the windows with lead light glazing, and decorate the interior, and to substitute electric lighting for gas. Messrs. Habershon, Fawckner & Greaves, of 41, High Street, Newport, are the architects.

The Abersychan English Baptist Church is being added to and altered. The chapel is being enlarged, and new schools and class-rooms are being added. Mr. Charles Shopland, of Maindee, Newport, Mon., is the builder, and the architects are Messrs. Habershon, Fawckner & Greaves, of 41, High Street, Newport.

A Parish Room is to be erected at St. James, Clapton, on a piece of vacant ground on the south-west side of the church, capable of holding about 400 persons, with smaller rooms attached, to be used for parochial purposes. The estimated cost of the building is about £1,700. A faculty was granted by the Consistory Court of London last week.

A New Welsh Presbyterian Church, at Builth, is proposed to be erected on the site of the Alpha Church, one of the first in the Connexion built, and which has been added to twice during its existence. The new church will be designed in the decorated period Gothic, and will afford a seating capacity of 600. The architects are Messrs. Habershon, Fawckner & Greaves, of 41, High Street, Newport.

A New Fire Brigade Station at Dublin is being erected in Dorset Street. It has a frontage of 68ft. and contains a working department and house accommodation for an officer and six married men and their families. The working department consists of an engine-house, to contain a horsed escape and hose carriage combined, an ambulance carriage, with stalls for four horses; on the first floor a large dormitory over the engine-house, with bathroom and lavatory. Stable and engine-house have quick-opening doors. The total cost of the building when complete will be about £7,500, and Irish materials have as far as possible been used.

New Buildings for the General Accident Assurance Corporation, Limited, were formally opened at Perth recently. The buildings will cost £25,000 or £26,000. The building occupies the site of the old post office. The ground floor of the offices is almost entirely taken up by the general office, where there is seating accommodation for 100 clerks. On this floor there are also assistant manager's room, telephone room, post office, &c. The first floor contains a second large apartment, with accommodation for about fifty clerks. There are also rooms for the heads of the departments, boardroom, anteroom and the general manager's office. On the second floor are extra clerks' rooms, keeper's house, clerks' luncheon room, kitchen and other accommodation, while the attic floor is used for storage.

Mr. Pearson Bellamy, an architect, has died at his residence in Tentercroft Street, Lincoln, in his eightieth year. The deceased gentleman was born at Louth, and was articled to the late Mr. Nicholson at Lincoln, and he subsequently gained much useful experience as an assistant in Manchester and Liverpool. Mr. Bellamy afterwards commenced partnership with Mr. Hardy, which had a long existence. The deceased gentleman was well-known as an architect in connection with town halls, corn-exchanges and cemeteries. One of his chief buildings was the Ipswich Town Hall, which has been much admired. His principal cemeteries were those in Leicester and Loughborough, while the Corn Exchanges at Hull, Lincoln, Grimsby and Retford stand out as memorials of his skill in that direction.

The St. Andrew's Schools at Wigan are now being extended at an estimated cost of £1,400.

The French Architect Pichat, it is announced in a Bohemian newspaper, has been commissioned by an order of monks appertaining to the Grande Chartreuse to superintend the construction of a vast convent with great industrial dependences.

Presidential Busts.—It is not generally known that it has become a tradition for the Presidents of the French Republic to give a copy of his bust to each Minister who serves under him. The busts are manufactured at Sèvres, and when Ministerial changes are frequent the famous factory is kept busy.

A New Mission Church at Lynn dedicated to St. Michael and All Angels has been erected at a cost of £1,500. The building is built of red bricks with stone dressings, and will accommodate nearly 400 worshippers. Attached to it is an infants' school for 173 children which has cost about £900, and the total expenditure has been about £2,500.

A French Monument.—Owing to the prolonged illness of the architect who was commissioned to design the pedestal of the monument to M. Jules Simon, the inauguration will not take place before March of next year. M. Denys Peuch has finished the statue, which is in white marble, and it will be erected in Place de la Madeleine.

The City Imperial Volunteers are now receiving the medal which has been struck for the Corporation of the City of London to commemorate the services of the regiment at the front. One side of the medal shows an Imperial Volunteer receiving the City's freedom, while heralds on either side of him sound a call to arms, which is answered by marching figures in the distance. Above the central figure is a scroll with the legend, "Pro Patria, Regina, ét Urbe." On the other side a hill symbolising the British Empire, and surmounted with a staff flying the Union Jack and the C.I.V. flag, stands out against the rays of a blazing sun. At the base of the hill are young oak trees, symbolical of the new British South African Colonies. The medal was designed by Mr. G. J. Frampton, A.R.A.

New Wesleyan Chapel at Stapenhill.—The estimate of Messrs. Thos. Lowe & Sons at £2,240 for the erection of a new chapel and school buildings in Ferry Street, has been accepted, and work will be commenced immediately. The chapel, which is designed in the Early English style, provides accommodation for 400 adults, and consists of a central aisle and two transepts, with entrance vestibules. The north transept is designed to accommodate the organ. The school will contain 300 children, and in connection therewith are cloak rooms and lavatories. At the back of these buildings are provided vestry, kitchen, and heating chamber, &c. The work will be executed in red brickwork and white stone dressings, the main feature of the chapel font being a large four-light tracery window. The whole of the roof timbers inside will be of pitchpine and will be exposed, being stained and varnished. The architect of the work is Mr. Thomas Jenkins, of 35, High Street, Burton-on-Trent.

St. Mary's Church, Black Torrington.—A meeting of Black Torrington parishioners took place recently to consider questions relating to the restoration of St. Mary's Church, Black Torrington. Rev. J. J. Gardiner presided. The chairman stated that £519 had been received and promised, and also that the chancel would be restored by himself at a cost of from £400 to £500. The Rev. Medley Fulford was elected as the consulting architect, and L. H. Reichel, architect, of Beara Court, promised his services gratis as second architect. Mr. Reichel then briefly described the work to be done: (*a*) roof to be taken off; (*b*) walls to be made upright and strengthened by buttresses; (*c*) roof to be covered with English oak boarding, then with deal boarding, then with felting, and finally with best quality Broseley tiles; (*d*) concrete floor and new seating; (*e*) the whole building to be made damp-proof, and additional spouting to be placed around it. A discussion as to whether tiles or slates should be used then took place, and it was decided, with one dissentient, that tiles of the best quality be used.

Mr. S. D. le Roux, architect, Salisbury, has received instructions from the Standard Bank to prepare plans for the new banking premises at Beira.

The Memorial to the late Dean Boyle of Salisbury will take the form of a mural tablet with medallion portrait and stained glass windows in the lady chapel of Salisbury Cathedral.

Housing at Wellington.—A Local Government Board inquiry was held recently into an application by the Wellington Urban District Council to borrow £1,200 for land, and £3,000 for the purpose of building workmen's dwelling upon it.

A New Church at Oystermouth is to be erected by Messrs. Howell & Son, Cardiff, at a contract price of £4,758. The architect is Mr. Bruce Vaughan, Cardiff. The site of the proposed church commands a fine view of the Bristol Channel. The total cost will be nearly £6,000.

A Pulpit in the Parish Church of Longford, Derbyshire, erected two years ago, has just been completed by the addition of several statuettes carved by a lady. The figures include those of St. Chad of Lichfield, St. Aidan and the Venerable Bede, and distinctly enhance the appearance of the pulpit. The carving has been executed by Mrs. Alfred Hobhouse.

The Leeds Insanitary Area.—Last week the Select Committee of the House of Commons considered the Bill of the Leeds City Corporation, which seeks the confirmation of an Order, already granted by the Local Government Board, under the Housing of the Working Classes Act, 1890, for the improvement of the district of Quarry Hill, which is an alleged insanitary area. The Order was confirmed, with the exception of Wray's Yard.

A New Hotel on the East Coast has just been erected for the Coast Development Company at Southwold, which is situated about 12 miles south of Lowestoft. The hotel consists of a main block, nearly 150ft. in length and of six storeys in height, with an annexe extending nearly the whole length of the building. The main block facing the sea contains the principal public rooms, the lounge, dining-room, reading-room, drawing-room, and visitors' rooms. The interior is lighted throughout by electric light. The grounds consist of about 2 acres. The marine parade in front of the hotel is now being extended and laid out by the company in conjunction with the Corporation of Southwold, and on the completion of this the shore end of the pier will be finished.

Grimsby's Almshouses.—A little over seven years ago one of the most extensive schemes of almshouses in Grimsby was commenced, a scheme which should provide for the housing of about 200 aged and infirm, or widows and their children. The scheme is now nearing completion. Thirty-two almshouses have been already erected and paid for, and they are now occupied. Six more of the larger class of house are now being built, and it is intended to build ten smaller houses next year. The two classes are a large six-roomed house in two storeys for widows and their families, and a smaller two-roomed house of one storey for the aged couples. The small houses cost £75 each, and the larger ones about £130 each. At present there are twenty small houses and twelve large ones. Six large houses are to be put up this year, and ten small ones next year, which will make the number up to forty-eight.

L.C.C. Central School of Arts and Crafts.—The annual exhibition of students' work at this School, 316, Regent Street, W., was opened to the public free last Monday, and will be open throughout the week from 10 to 8.30 daily. During the fifth session, now closed, more than 700 individual students have been in attendance, mostly journeymen or apprentices in artistic trades. The work to be exhibited comprises bookbinding, stained glass, enamelling silversmiths,' goldsmiths' and jewellers' work, chasing, engraving, moulding and casting in metal, wood-carving and gilding, writing and illumination, embroidery, lithography, woodcuts in colour, architectural design, furniture design, cabinet work and wood-inlaying, drawing, modelling, and designs for various processes. It will be remembered that a site for the new building was recently allotted by the London County Council for this very successful school which has quite outgrown the present temporary premises.

New Business Premises are in course of erection at Newport, Mon., for Messrs. Davies & Co. and Z. P. Handford, at a cost of £16,000. The facade, which is 114ft. in length and five storeys in height, is of freestone, and flanked with two large domes. It is proposed to have the shop front in brass. Lifts, worked by gas engines, will be provided to raise the stock from the basement to the several floors. Electric lighting will be used throughout. The kitchen department will be on the top floor, which will be fitted with the most economical system of cooking, &c. The contractors are Messrs. E. C. Jordan, Newport, Mon., for masonry, plastering, and ironwork, and G. Martin, Newport, Mon., for joinery and ironmongery. The architects are Habershon, Fawckner & Groves, 41, High Street, Newport, Mon.

New Companies.

May & Padmore, Ltd.

Registered July 1st to acquire the business carried on at Leopold Street, Stanhope Street, and St. George's Place, Birmingham, and elsewhere, as May & Padmore, and to carry on the business of brassfounders, engineers, ironfounders, joiners, cabinetmakers, carpenters, builders, metal workers, manufacturers of brass, iron and metal goods, &c. Capital £30,000 in £5 shares. The first directors are W. J. May, N. C. Reading, A. Blackwell and W. F. N. May. Registered office: 123, Leopold Street, Birmingham.

Artificers' Guild, Ltd.

Registered July 2nd to acquire the business of a metal-worker carried on by N. E. Dawson at Chiswick, and to carry on the business of metal-workers, designers and makers of presentation caskets, memorial tablets, ornaments, furniture, and utensils, &c. Capital £6,000 in £1 shares. The first directors are N. E. Dawson, E. N. Hitchcock-Spencer and R. Rigby. Registered office: Wrought Metal Worshops, Oil Mill Lane, Hammersmith.

C. H. Taylor & Son, Ltd.

Registered July 4 to acquire the business carried on at Cyclops and Alexandra Foundries, Kirkstall Road, Leeds, as C. H. Taylor & Son, to carry on the business of ironfounders, engineers, bridge builders, boiler-makers, metal-workers, metallurgists, &c. Capital £10,000 in £1 shares (5,000 preference). The first directors are W. G. Taylor, W. H. Billington and T. H. Newsome. Registered office: Cyclops Foundry, 22, Sale Street, Leeds.

Thomas Clough & Sons, Ltd.

Registered July 6th to acquire the business carried on at Howley Park, Morley, West Ardsley and Calverley, Yorkshire and elsewhere, by Thomas Clough, as Thomas Clough & Sons, and to carry on the business of stone quarriers, builders, dealers in marble, granite, stone, sand, gravel, clay, marl, brick-earth, bricks, tiles, pavings, kerbs, pipes, earthenware, &c. Capital £20,000 in £50 shares. Registered office: Cardigan Quarry, Morley, Yorkshire.

G. Stocker & Co., Ltd.

Registered July 6th to continue the business carried on by G. H. Stocker, and to carry on the business of gypsum miners, manufacturers of Keene's and Parian cement, floor plaster, plaster-of-Paris, terra alba, mineral white, gypsum and plaster stone, &c., farmers, cattle breeders and dealers in live stock. Capital £2,000 in £1 shares. The first directors are G. H. Stocker and A. Barlow. Registered office: Gotham, Notts.

J. Romans & Co., Ltd.

Registered July 5th to acquire the goodwill of the business carried on at Llanthony Road, the Docks, Gloucester, as J. Romans & Co., and to carry on the business of timber growers, merchants, benders and sawyers, sawmill proprietors, timber surveyors, carpenters, joiners, cabinet-makers, packing-case manufacturers, wood-carvers, turners, &c. Capital £15,000 in £10 shares. The first directors are C. E. Brown, G. Merrylees, A. F. Hobbs and J. Romans. Qualification, £200. Remuneration as fixed by the company.

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

ALDERSHOT.—For the erection of certain buildings and shaft in connection with their electric lighting station, situate at the Parish Clerk's Land, Aldershot, for the Aldershot Urban District Council. Mr. Nelson F. Dennis, A.M.I.C.E., surveyor:—

Shaft.

Bateman & Son	£1,112	Martin, Wells & Co.	£989
G. Kemp, Aldershot	1,025	Mussellwrite & Son	898
R. H. B. Neal	998	Spear & King*	795

Buildings.

W. Garland	£3,329	Spear & King	£2,850
Martin, Wells & Co.	2,931	Mussellwrite & Son	2,723

An Architectural Causerie.

Models. THE House of Lords distinguished itself last week in carrying against the Government a motion requiring the preparation and public exhibition of models of the proposed new public offices in Whitehall and Parliament Street. The House of Commons has made an unenviable reputation for ignoring all artistic questions, and the House of Lords has been our only reliance, the Earl of Wemyss commendably paying especial attention to architectural matters. His latest advocacy of models is a good one, and these ought certainly to have been prepared with such important works as the new Government offices. Professor Aitchison's letter, published on p. 366 of our issue for June 12th and referred to by Lord Wemyss, had, as the Earl of Pembroke pointed out, especial reference to the appointment of two architects, but that was not all—his reference to the preparing of models was most important, for by no drawings can the general design and layout be shown in the full conception of the architect as to the completed aspect. Of course during the erection of the building multitudinous points arise which must be decided, and often altered from the original design, by one who is aware of or can fully perceive the intention of the architect and what is the only proper course, and in this respect a second architect should certainly be appointed. But in any case there should be a model or models prepared, and although late in the day models of the proposed offices will be most useful. We have on previous occasions referred to the great advantages that may be obtained by making rough models in designing any building; they can of course only be suggestive even when the surroundings are also modelled and lighted carefully, and must always be judged with due attention to scale.

Artists' Mediums. AS a pen draughtsman—and particularly as a facial draughtsman—the well-known American artist, Mr. Charles Dana Gibson, occupies one of the highest positions, and it is therefore instructive to hear what he has to say on the relative values of drawing mediums. He prefers pen and ink to any other medium, because it tests to the utmost the draughtsman's powers. All other methods, he declares, are demoralising, since they enable the artist to slur over difficulties of drawing. With "line" one must study hard and think out a subject before starting on it, for if this be not done the finished picture will be full of faults that cannot be hidden. When he grows old, Mr. Gibson says, he will resort to wash, charcoal, &c., for his own amusement. Painting, too, is one of the pleasures he is reserving for the days when his hand will be less facile and his brain less active. This is rather derogatory to all other mediums than pen and ink, and it will doubtless be denied in some quarters; still the fact remains that pen draughtsmanship is exceedingly difficult, and there are few who really excel in it—only men like Abbey, Pennell, Crane, Parsons, Fortuny, Vierge, Menzel. The advance of the art in recent years has been marvellous, so much so that it has been styled by some as the only really living art. Its exponents have forced its being recognised as seriously as painting or any other art work, and from serving as a plaything for the old masters it is grown to be a potent factor in modern illustration. Pen work, however, has its limitations, and by reason of the fact that it is now possible to reproduce tone and colour work with ease and rapidity artists and illustrators are more extensively employing these mediums. Only those who have had experience know how difficult it is to represent tone in pure line, yet that it is possible to do so with the greatest success one needs only to study some of Mr. E. A. Abbey's beautiful work (some excellent specimens are now to be seen at South Kensington). Though the numerous publications of this and a previous day have been the nursery and home of modern illustration the hurry appurtenant to them has caused the quality of the work to depreciate in some respects, being less careful and less finished than that of the older men such as Millais and Boyd Houghton, and this danger needs to be continually guarded against by the artist. Writing on this subject we would take the opportunity to offer a few hints to those who make architectural drawings for reproduction. Wash work may be dismissed briefly with the remark that it should be in good contrast and solid in appearance. Line work needs considerable more surveillance. For the uninitiated it may be mentioned that the original must be *altogether* in line; shadow must not be produced by washing over, but by thickening the lines or multiplying them. We often receive drawings of houses in pen and ink with the walls washed over here and there, or the roof tinted, or the background covered with a tone. Such drawings are unsuitable for making line blocks. Much has been said and written on this subject, and it is not our intention to go over ground which is already familiar. We, would, however like to warn students against the fastidious nonsense which has prompted some to say that it is essential to draw on this paper with this ink and this pen. Any fairly smooth paper is satisfactory; any ink which is reasonably black; and any pen which marks well. So long as the draughtsman remembers that every line reproduces of the same value (gradation being effected by varying thickness and not by fainter ink), that lines close together somewhat in the course of reproduction, that fine cross-hatching for this reason is to be avoided, and that thin isolated lines tend to become broken in printing, he will not go far wrong. Recollecting these things, he can work with a free hand.

SOUTH PORCH TO LOWER CHURCH, GLASGOW CATHEDRAL. MEASURED AND DRAWN BY R. M. McKISSOCK.

IMPRESSIONS OF GLASGOW CATHEDRAL.

By J. JEFFREY WADDELL.

(Concluded from p. 456 of No. CCCXXXVI.)

ONE of the most beautiful pieces of work in the cathedral is the rood screen. It greatly resembles that of the collegiate church of Lincluden; but while in the Glasgow example the sculptured cornice is as rich, it has also the additional beauty of a fine traceried parapet with beautifully designed tabernacle work supported by sculptured corbels representing the seven ages of man, and by two ecclesiastics—probably portraits—at the ends. The line of the arch is much finer than that of the Lincluden screen—it more nearly resembles the fourteenth century doorway at St. Bride's, Bothwell—and by omitting the capitals and so carrying the rich mouldings uninterruptedly from base to base, the architect, who according to Mr. P. Macgregor Chalmers was John Morvo, has accentuated this beautiful line. But while the screen is still very fine, it has suffered greatly from the loss of its eight statues and carved corbels which adorned the panels on each side of the doorway. The addition of these would balance the heavy rich parapet, add interest to the design and complete it as an architectural composition. As it is, with its two altars—the only two now remaining in the cathedral—and its flight of steps for a base, it appears, viewed from the lower level of the nave, one of the most complete and satisfactory pieces of mediæval design in Scotland. Unfortunately the view from the choir is altogether spoiled by the modern woodwork the details of which, while they are appropriate enough when executed in stone on the other side, are distinctly out of place in wood.

The two altars which remain one on either side of the entrance to the central aisle of the choir are very interesting. They are chiefly so because of the panelling with sculptured figures—supposed to be the apostles—bearing scrolls which adorn the fronts, and because on the south end of the altar, called The Altar of the Blessed Mary of Pity, Archbishop Blacader's arms are to be seen. It will be observed that the cross has been carefully removed by the Reformers and that no wanton damage has otherwise been done to the sculptured work. On the north side of the other altar the only cross in the cathedral remains, having probably been overlooked.

The shallowness of the transepts is said by some to be a French feature; but it appears to me that common sense as much as anything else caused the designers to be content with the present shallow but useful form. To have extended them further would not have added to their usefulness, but would have greatly added to the cost of the building, which was at the time the transepts were built a very weighty consideration indeed.

In strange contrast to the plainness of the nave is the rich foliage and sculpture of the choir. The capitals are very fine, but unfortunately have been very much restored. On entering the choir the first thing that strikes one is the peculiar character of the east end. The triforium is not as usual carried round the end, but is stopped, and instead the four lights—not the usual three or five—are brought down to the level of the triforium string course. This has, viewed from the interior, a very good effect, but from without the effect, as already stated, is not good. The square east end appears to be resting upon the roof of the double aisles. The gable is carried by three pillars. The centre one is rather curious, the small shafts which would obstruct the view of the eastern aisles being terminated not far below the capitals by carved corbels. In the spandrel immediately above this pillar there are three niches which formerly contained statues.

The triforium arcade is of the usual character, but is interesting for the way in which the harsh line formed by the cutting of the bell of the capital is covered and converted into quite a thing of beauty by the addition of a small leaf.

The eastern aisle and chapels are remarkably rich in their ornamentation and elegant in design. Here the "dog-tooth" is employed most effectively round the inside of the arch in the north chapel. There is also a piscina here, evidently to supply the adjoining altars. The peculiarity about it is that it does not reach the ground as a drain but appears as a gargoyle on the outside.

At the other end of the aisle is the doorway to the sacristy, a square vaulted compartment with a central pillar. This pillar is curiously carved in the hollow of the base, and it has been intended to further carve the vertical hollows of the shaft, but they are still unfinished.

One of the most interesting portions of the cathedral is that variously known as the aisle of Car-Fergus, Blacader's Crypt and the Dripping Aisle. The first is undoubtedly most correct;

for have we not in the vaulting of the roof a rudely-sculptured car bearing a figure and surrounded with a scroll on which are inscribed the words THIS · IS · YE · ILE · OF · CAR · FERGUS? It is called Blacader's Aisle after its restorer. But the fact that this aisle bears so many names appears to indicate that there is some doubt in the public mind about its builder and use.

Although almost ruined by misuse and neglect, the vaulted roof is one of the finest examples of this date remaining. The mouldings, carved bosses and capitals are very rich and varied. On the capital of the middle pier of the south wall the letter M occurs under the royal crown. This is no doubt meant to typify that union of which William Dunbar, the friend of Archbishop Blacader, sung so sweetly in the *Thrissil and the Rose*—that union of which so many happy things were expected but which ended so disastrously for Scotland on the field of Flodden.

As has already been said, the chief beauty of Glasgow Cathedral is its under-church; but unfortunately it cannot be at all well seen. The lighting is at present so bad that we are forced to conclude that the windows were not originally meant to contain coloured glass such as at present obscures the design and beauties of the building. They render the church so dark that one naturally turns to the windows as the only thing to be seen, and apart altogether from the magnificent carving and sculpture which is thus hidden from view the greater part of the glass is unworthy to occupy its present position and should certainly be removed if not destroyed. The best authorities inform us that the present windows if filled with uncoloured glass would amply illuminate even the darkest corners, and a simple proof of this is seen in that most of the light at present received comes not from the windows but from the doors.

The plan of the under-church is very interesting. It has been arranged round the tomb of S. Kentigern and the high altar. The piers at first sight seem to be very irregularly disposed, but if the plan be drawn out they arrange themselves symmetrically round the two chief centres. To further emphasise these points the vaulting is in each case more elaborate. This is especially the case in the portion under the high altar. It is profusely rich in ribs and sculptured bosses; and advantage has been taken by the architect to increase the height of the crown as it is under the raised steps of the high altar of the cathedral.

Traces of brilliant colour are still to be seen in the hollows of the ribs, and interesting lettering has also been discovered painted on the vaulting.

Immediately east of the high altar the church floor falls about 4ft. 6in., and the east end is divided into four chapels by side walls used as credence tables and piscinæ. The floor has not originally been intended to be so low as it is at present; for as they are now the credence tables and piscinæ are too high for use. This also explains the meaning of the at present useless steps at the door of the chapter-house.

The chapter-house is entered from one of the four altar-chapels, so that the particular saint to whom that altar was dedicated—S. Nicholas —cannot have been much esteemed in ancient Glasgow. The centre of the three divisions between the altars has had its central pillar removed and one arch formed beneath which rests the effigy of Bishop Robert Wishart, who was buried here in 1317. The effigy has, however, been made too large for its position, and the feet have accordingly been cut away. The face is also greatly damaged.

The door of the chapter-house is one of the finest pieces of work in the cathedral. It is exceedingly ornate, being enriched not only with carved capitals but with a band of sculpture and foliage extending round the arch.

These little sculptures are interpreted by Mr. Chalmers as illustrating the heights to which man can rise and the depths to which he may fall.

At the foot of the south steps leading to the nave there still remains, built into the present building, a fragment of the older Transitional Church. One single column is about all that now remains to guide the architect and the antiquary in their search after truth, but on that evidence a great number of theories have been raised; but let it suffice to say that it is now admitted to be the corner of a smaller church which probably terminated in a semicircular apse round S. Mungo's tomb.

Much has been done since the restoration of the cathedral to decipher the history of its various periods, but much remains still to be done and many interesting discoveries will no doubt be made in days that are yet to come.

(We are indebted to Mr. A. G. Henderson for the photographs illustrating this article.)

Infectious Diseases Hospital at Colwyn Bay.—A Local Government Board enquiry was held recently at Colwyn Bay into an application by the Urban District Council for leave to borrow £5,120 for the purposes of an infectious diseases hospital.

ON ARTS AND CRAFTS IN IRELAND.

BY AN IRISH PRIEST.

AT the recent meeting of the Maynooth College Union the following address was given by the Rev. J. O'Donovan, of Loughrea :—

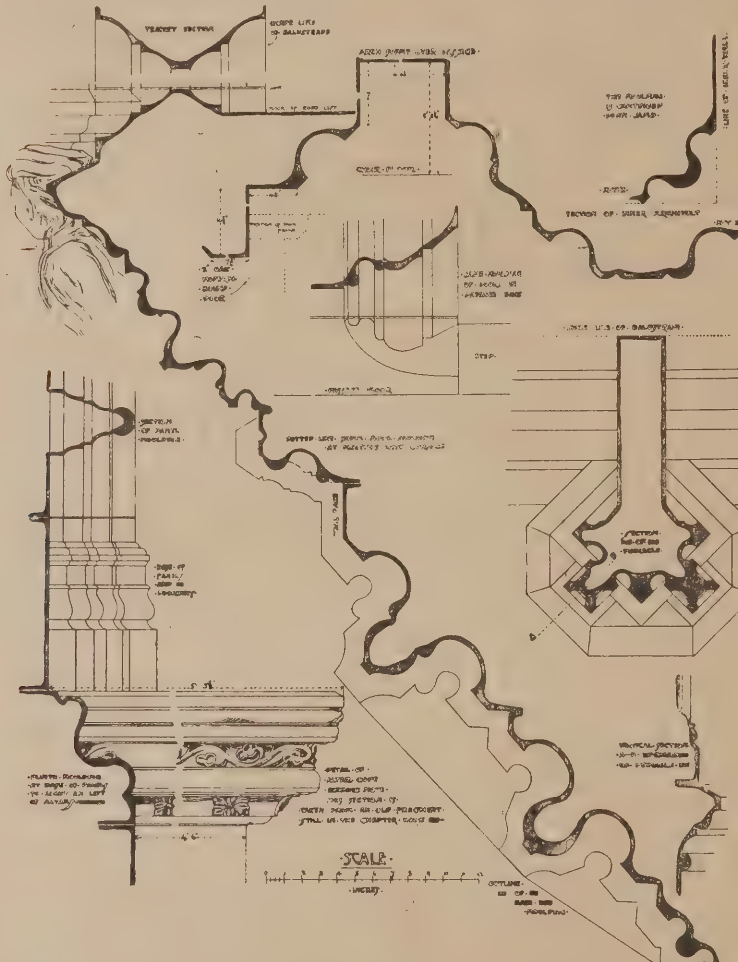
The assertion that a revival of industries is necessary for the prosperity of Ireland, and even for its national existence, has in recent years become somewhat of a commonplace. We have all come to realise that the agricultural industry alone, although it is and will be for many years the staple industry of Ireland, cannot, however, satisfy all our economic needs. When we shall have gained a stable tenure of land and an equitable distribution of it there will still remain the problem of the disposal of a surplus population. The choice will lie between emigration—with its wreck of national life and national wealth—or an industrial revival on a large scale. Nor is this question affecting the future only. Who among us, who has a heart to feel, has not been stirred to the depths by the thought of that quarter of a million of the strength and intellect of Ireland that within ten years have left Ireland, sorrowing, because there was no work at home for their hands to do? Consumers are largely to blame. We are a poor lot here in Ireland in many respects, if we only have the grace to admit it. We abuse England and things English roundly with our tongues, but we have a hankering for English goods and English taste and the stamp of English approval. When we speak of encouraging Irish manufacture we mean, therefore, more than the mere immediate use of Irish things ; we mean, by the strength of our demand, to force idle Irish capital to become a national wealth producer. Now, where does the priest come in? Pretty well everywhere. He is still the valued friend and adviser of the people. He ought to lose no opportunity of impressing on the people the economic aspect of the emigration question. He ought to bring his own influence and the influence of his parishioners to bear on capitalists to invest their money in Irish enterprises. He ought—but here I speak with the diffidence of absolute ignorance—if he is a capitalist in a small way himself to give an example to his followers. And now I come to what is the main object of this paper, and to which what I have hitherto said may serve as an introduction.

SOUTH PORCH TO LOWER CHURCH, GLASGOW CATHEDRAL.
PHOTOGRAPH BY A. G. HENDERSON.

One of the largest consumers of goods in Ireland is the Catholic Church. Hundreds of thousands of pounds are spent annually on churches and church-decoration. Within the memory of most of you millions have been spent for the purposes of the Church. To those interested in Ireland the question has naturally often arisen, Has all this money been spent as far as possible in Ireland, and if not, is there any possibility of securing that all church work should be done in Ireland in future? Before answering these questions I shall have to offer some explanation of my method of treating them. The advocacy of Irish manufacture in church work differs from other branches of the subject in this—that it deals necessarily with questions of art, and where art is concerned we must deal with the question from the art point of view as well as from the commercial and industrial. What I mean is this—if we find that decoration of Irish churches is as a rule not done in Ireland, before we advocate a change the burthen will be laid on us of showing that the work can be done not only industrially as well in Ireland as abroad, but also that it can be done as well, or better, artistically. Taking the shell of churches, they are generally built of Irish stone, roofed with Welsh slate, without in very many instances any effort whatever being made to secure Irish slate. I am not concerned in this paper, which must have a limit somewhere, with the style of our churches, though, in passing, I may remark that it is generally execrable. Architecture in Ireland seems to have fallen from the place it held in mediæval times as the mistress of all the arts. All over the country Gothic churches, false in detail and bad from every artistic point of view, have sprung up during the last fifty years. They are a monument to the zeal and piety of the people, but they are also a monument to the want of taste of modern architects. Beyond the mere walls of our churches and the unskilled labour employed throughout, it must be admitted that 80 or 90 per cent. of the remainder of church work—woodwork, carving in stone and wood, stained glass, painting, &c.—is all foreign work. When we consider that the churches of Ireland are built to the glory of God by the hard-earned money of the poor there must be very strong reasons indeed to justify anyone engaged in church-building in spending the money of an impoverished people for the enrichment of foreign nations to the detriment of art and trade in Ireland. Tradesmen have complained, not once but often, that church money has been spent in England and elsewhere that, if spent in Ireland, would have kept alive trades now languishing from dearth of work. Now, there is to my mind no reason why any church work falling under the head of the ordinary trades should not be done at home. We have Irish carpenters and Irish smiths just as good as in any other country. The great field of argument, however, centres around church art work. It is in this field that the foreigner reigns supreme in Ireland. It is at decorative work that many strong supporters of Irish manufacturers draw the line and say "Here we must stop." Ireland can produce no art ; we must, at least for generations to come, stick to the foreigner. We must go on getting our statues from Florence and Geneva and Munich, our stained glass from Munich, from London and Birmingham, our woodwork from Belgium, our paintings anywhere expect in Ireland. "You know those foreigners are all artists," say the admirers of foreign art in this country ; "the Dublin men can't touch them." Now, I have no hesitation in saying this is all ignorant twaddle. We want a little plain speaking here in Ireland. Every year this unfortunate country, which everything seems to conspire against, is being flooded with bad sculpture and bad painting, and worse stained glass, all, forsooth, because it is foreign and therefore must be good! Of course, there are many in this audience who will deny this. Many will say "This is very true of much of the church-decoration in Ireland, but it is not true of my church. My windows are very beautiful and have been much admired." In order to meet these objectors it is, therefore, better to examine somewhat in detail the different classes of church-decoration. Stained glass is one of the most familiar forms of decoration in our churches. There is scarcely a church in Ireland that has not one or more stained glass windows. In some of the large churches the cost of those windows runs up £3,000 or £4,000. It may seem a rather sweeping statement to make, but it is a statement upheld by every expert authority on art that generally—indeed, in almost all cases—this glass is, from an art standpoint, beneath contempt. It is as a rule gaudy in colour, badly drawn, vulgar in design, and where perspective is attempted, false in perspective. It is, moreover, bad glass. There are many varieties of glass known by the very indefinite name of stained glass. There is pot-metal, which alone was used in the best period of stained glass. In this glass the colour runs through and through the texture of the glass, the colour and the glass being fused together in the pot. Then there is enamelled glass, in which the colour is enamelled on the glass in soft pigment. When stained glass manufacturers advertise they always profess to supply a window, as the advertisement puts it, "best pot-metal antique." When the window is put up it is not infrequently very poor enamelled stuff. A trained eye sees the difference at a glance ; an untrained eye sees the difference after the glass has been put up twenty or thirty years, or very much less in many cases. The real pot-metal is only mellowed by time ; its colours grow richer and more jewel-like. But years deal hardly with enamelled glass, especially with the modern stuff. The enamelling begins to wear off ; faces become patchy, clothes tattered ; it becomes pitted all over in the blacks and browns ; finally, the unfortunate owners would be glad if some thief came in the night and removed the eyesore. Even in churches where a fairly good quality of glass is used the result is equally disastrous. There is a craze for pictured windows, large and elaborate subjects that tell stories. This is a complete misunderstanding of the limitations of stained glass. In the thirteenth century, when the finest glass was produced, there were no elaborate pictures ; the effects were produced by careful leading and a most delicate choice of differently coloured glass. If figures were necessary they were outlined in leads, the feature and other details being worked in with the smallest possible use of brown pigment. The artist craftsmen of these times knew exactly what could be done in glass and what could not. They knew that the first quality of a window is to give light, and next, if it is to be coloured, its function is to give coloured light of the finest kind. For that reason the thirteenth-century artists always aimed at colour and translucency. Now the modern windows sin in almost every instance against this primary law. The function of the modern window seems to be to shut out light, or where it is let in to pass it through thick dirty brown or other paint with which the glass is thickly plastered. To understand fully what I want to convey it is necessary to have seen some good glass of the best period and compare it with the modern. The best examples are to be seen at Chartres Cathedral outside Paris. There are also a few fine examples which somehow escaped the vandalism of Puritanism in some of the English cathedrals—in York Minster, in the east window, in Salisbury, Lincoln, Westminster and others. These windows, when the sunlight passes through them, are like mosaics of different coloured jewels, they never look gaudy because of the extreme purity of their tones. Sunlight through a modern window is robbed of all its beauty, and strikes the eye as a dirty drab. Apart from quality and colour, the modern stained glass window is bad and vulgar in design. I shall not speak now of incorrect drawing, which is to be found in many of the stained glass windows in Ireland. The human figures are certainly not of any race that inhabits this earth in any known period of history. But even given correct drawing, the effects of light and shade are always wrong ; they are impossible with light always falling on the picture from behind. Attempts are made at presenting religious pictures to incite our devotion. The effect is usually a number of conventional dummies, with embroidered clothes and an expression drawn from milliners' showcards. This may sound irreverent. It sounds so to me; but desperate diseases require desperate remedies. I feel intensely having the highest ideals of our religion, the saints that we revere, the Man-God that we love and worship, vulgarised by the ignorance and incompetency of the modern stained glass maker. Another important branch of church-decoration is sculpture. There used to be a fine art known as sculpture. To judge by the Irish churches it is a lost art. Here again the foreigner holds the field. Go into our churches and you will find that the more pretentious of the statues come from Italy and Munich. If you venture to say you don't like the work the good priests looks you all over with a smile of superior pity, and reduces you to your proper level by the clinching remark, "Why, this statue was made at Carrara." Of course there are marble quarries at Carrara and stone-cutters of very great technical skill, but art, with an idea behind it, especially on religious art—no! Take a statue of St. Joseph, admitting that it is modelled correctly, which it very often is not, does it convey any religious idea to the mind? Only for the label it might just as well have stood for Marcus Aurelius or any other character that you like to think of. Church-painting is at just as low an ebb. All our church-painting, with such few exceptions as are hardly worth noticing, comes from abroad. Rome, Germany, Belgium, France, are the principal markets. We may dismiss this branch of church art in a few words. The paintings are either attempts at religious art not above the level of daubs, or fairly good pictures—not religion. What I mean by the latter is this—for some time past the country has been flooded by good and bad copies, generally made in Germany, of paintings entitled Madonnas, Magdalens, &c. The originals were painted by men who had no religious belief and are frankly naturalistic in treatment. Yet those pictures, often the grossest portrayal of human passion, are hung up in convents and other religious buildings, even in churches, to inspire the reverence and devotion of the faithful. There are other branches of church decoration—brass, gold, and silver work and woodwork, that I shall only allude to. They are generally made in Birmingham or in Belgium. Now, how do we stand? We have first an immense consumption of decorative work that show no sign of decreasing. We have most of this produced abroad, and done almost as badly—considered artistically—as one could possibly conceive. This work, if it could be done in Ireland, would be an immense industrial gain, and would provide work for thousands of hands. But it has behind it far higher possibilities. It may make Ireland a great centre of art production. Ireland once was, as you all know, remarkable for its art products. "The barbarians by the Western Sea," as a Greek writer called our fathers, knew the exquisite art of enamelling on various metals when it was unknown to the Greeks and Romans. The country that produced the Tara brooch and the cross of Cong and the Ardagh chalice had surely a highly developed art sense. In architecture our fathers did work of wonderful beauty. The Romanesque ornament at Cong, at Dysart O'Dea, the whole design of that imperishable memorial to Irish genius on the Rock of Cashel—Cormac's chapel—indicate what Irish art might have come to had it not been arrested by foreign influence. The revival, if there is to be a revival, will rest with the Church. The Catholic Church has at all times been the centre of art production. Shall it be so in Ireland? We have hitherto allied ourselves with the Philistines in art, and have followed the lead of incompetent architects and pushful commercial travellers from Birmingham and Munich, who make periodic calls on the patronage of the reverend clergy. Shall we make a new start? We are little to blame for the past. Our Church was forced to live for centuries without any of the helps of art. When the penal laws were dropped, before an art sense had time to develop, the priests of Ireland placed their confidence in men who were supposed to know, but who, as the result has proved, are but ignorant, and, I shall add, impudent pretenders. Personally I am confident that if the priests are willing, they can be in their own special field of work—the Church—the great agents of the industrial and art revival. The future of it is largely in their hands. I shall go further and say that if they can do it they ought to do it. It is not a matter of choice, it is a matter of obligation. It is not a matter of opinion, it is a religious and national duty. This country is seething over with a new life. There is a revival in thought, in self-respect, in real nationality. People are slowly realising that the Irish people ought to be Irish, that there is such a thing as a distinctive national individuality expressing itself in language, in literature and in art. We, fathers, hold the art of the country at our call. Shall we go on as we have done in the past—I say it without fear of contradiction from any competent art critic in Europe—filling our churches with foreign rubbish; or shall we make an attempt to make our churches the expression of the Irish ideal in art; shall we try to make our churches worthy of the faith and piety of the Irish people, worthy of our own devotion to sacred and national aspirations, worthy of the religion we love, of which real art alone should be the handmaiden? Some of my listeners who may not wish to scalp me for any other reason will probably say: "All very fine, but how is it to be done? We have no art in Ireland; I have got thousands of pounds' worth of so-called Irish art in my church, and it is so bad that I would gladly make a present of it to anyone who would cart it off." They may have got thousands of pounds' worth of church-decoration done in Ireland in their churches, but they have no Irish art. With the very few exceptions that I have before referred to a real artist never entered an Irish church. It is true that church-decoration done in Ireland is perhaps as good or as bad as the foreign work that we are so enamoured of. But I do not recommend such work. After all it is not absolutely necessary to decorate a church. No national decay would justify bad art. Bad art is bad art, whether it is produced in Ireland or in Germany. It is time the country is rid of it. Plain churches with white glass windows are not offensive; badly painted churches with senseless knobby carving and gaudy picture glass are. The first step is to put a stop to all orders for bad work, foreign or native. The second is to agree to develop Irish art if it be at all possible. For this purpose I suggest that a society be formed, to be called, say, "the Irish Art Society," open to priests and laymen at a nominal subscription; that this society be directed by a committee consisting of bishops, priests and laymen interested in church decoration, as well as real artists capable of advising on expert questions. This society, representative as it would be of the whole consumptive side of church decoration in Ireland, would be in a position to bring its powerful influence to bear on Irish producers of church work, to compel and enable them to do work of a high artistic level. We have in Ireland artists who will answer to the call. In stained glass manufacture the outlook is hopeful. I do not intend to find much fault with Irish stained-glass makers in the past; they did bad work, but from the point of view of art not worse than the firms in England or Munich. They fought against tremendous odds. They had to contend with the prevalent belief that Irish work was so inferior to the wretched Munich refuse that it could be done at any price. As the unfortunate Irish maker had to live he was forced to turn out work mechanically, perhaps, inferior to the German glass, but still the best he could produce at the money. Fortunately this movement in favour of church art synchronises with the action of a public department that makes me full of hope for the future of stained glass in Ireland. The Department of Agriculture and Technical Instruction, in furtherance of the enlightened policy which has guided its action since its start, has, I am aware, made arrangements to bring to Dublin as a teacher in the school of art the best available stained-glass artist craftsman to be had. In the course of it is to be hoped that a school of real artists in glass workmanship will spring up in Ireland. In the meantime the services of Mr. Child, who was the chief helper of Christopher Wall in the revolutionary return to art stained-glass production, will be available in his spare time—which will be considerable—for the stained-glass firms in Ireland, either to supply designs or superintend their work or both. If the stained-glass firms are wise they will take advantage of the opportunity, for it will be a means, apart from art considerations, of establishing a very large industry in Ireland. In sculpture and painting the prospect is, if anything, brighter. It was one of the curious anomalies of the way in which church work was hitherto done that while we have all along a certain number of painters and sculptors in Ireland, no church work was ever given them to do. In other words, the only real field of art consumption in Ireland was shut to the artist. A start has been made in the production of really artistic church sculpture. I have heard that some good work has just been done in Letterkenny Cathedral, and Dr. Healy, whom the subject forces me to mention, has engaged Mr. John Hughes, a sculptor of whom any country might be proud, to do the modelling and carving for his new cathedral at Loughrea. Mr. Hughes has the highest reputation among artists for the quality of his work. He has now gathered about him

BLACADER'S CRYPT, LOOKING NORTH. PHOTOGRAPH BY A. G. HENDERSON.

a small school animated by his own lofty art ideals. It is a pity, with men like these to do the work, that statues, dull and expressionless as the marble from which they are made, should still be imported into Ireland. There are also a number of excellent carvers in Ireland, who for bread and butter had to do much of the inferior work that floods our churches, and who in the wake of an intelligent movement may be drawn to produce art. A visit to the Royal Hibernian Academy will convince anybody that even the worst academicians are able to paint better than the best of the so-called artistes from abroad, with whose work we are all familiar, while several of the artists have produced paintings eminently suited to church decoration, such as Miss Purser's work in Sir Patrick Dun's Hospital. What is wanted is really some means of contact between the consumer and the producer, and this the proposed Art Society will establish. I have not touched on woodcarving or brass or silverwork or enamelling, which at present are practically all foreign produced, though I believe it would be quite possible to establish these industries in Ireland. The Art Society could easily influence the department charged with technical instruction, which seems only too anxious to develop Irish art, to establish schools for the teaching of these art industries. To these facts, as a further strengthening of hope in the future, I must mention the revolutionary change there has been recently accomplished in educational systems in Ireland. The National Board, owing largely to the heroic efforts of one or two men whose names I need not mention, has arrived at some conception of what real education is. It has for the first time recognised that children have minds and hands and eyes. It has, too, in a hesitating and uncertain but now sufficiently decided way at last acknowledged that Irish children are to be taught on Irish lines and directed to Irish ideals. In the future, when children have been made accustomed to pencil, which is now in every hand, we may hope that the old art sense, deadened for centuries by false ideals in education and art, will spring up anew to perfect the art of early Ireland, an art which never decayed, which was merely arrested by outside forces, but which, we may reasonably hope has awaited our day to receive its fuller life. That the possibility of bringing about an art revival is not a visionary project is proved by what has happened in Belgium. Forty years ago Belgium church art was at a lower level than ours. To-day there is a living ecclesiastical art in Belgium, owing to the exertions of a few enthusiastic workers, such as Baron Bethune, of Ghent, the architect, E. H. King, of Bruges, and others, seconded by the enlightened aid of the Belgian Government. The first school founded at Ghent had only ten pupils; to-day the same school has 600 students, while other flourishing schools exist at Brussels, Tournay and Liege. There all the arts are developed according to distinctive types founded on the wonderful mediæval Flemish art. These art schools of the Guild of St. Luke are every year turning out numbers of artistic craftsmen who produce for Belgium and elsewhere the highest form of industrial and church art. I have spoken at perhaps too great length on the art side of the possible industrial movement in church work. I had to do so to prevent myself from being misunderstood. I have spoken from the conviction that Irish priests have the power to make Ireland an art centre worthy of the best traditions of ancient Irish art. I have spoken in hope of making Ireland the centre of a very widespread industry; of keeping some, at least, of those thousands of the best of our race now yearly leaving us at home.—("Irish Builder.")



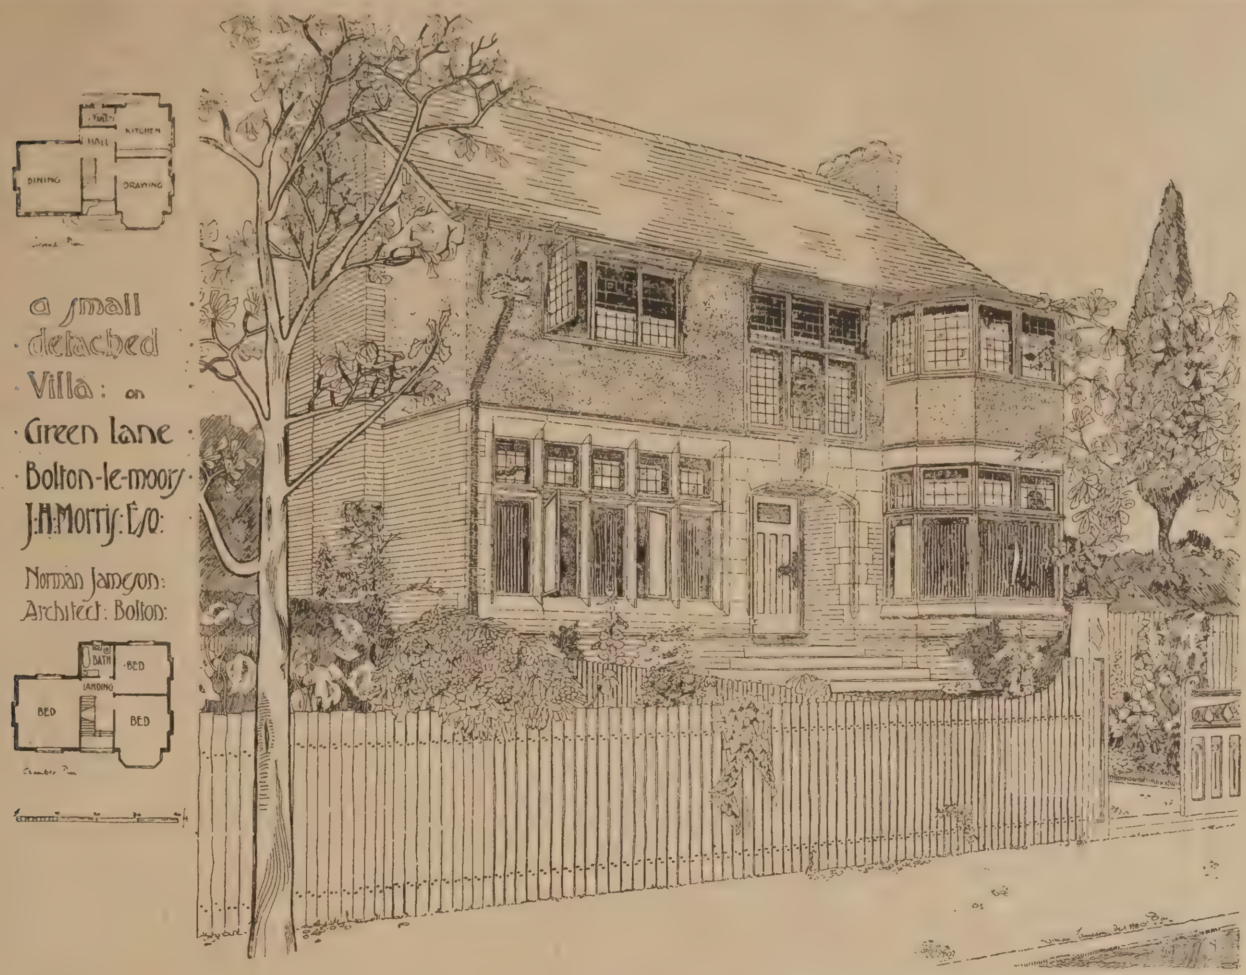
DETAILS OF ROOD SCREEN, GLASGOW CATHEDRAL. MEASURED AND DRAWN BY A. WAGSTAFF.

Villa at Bolton-le-Moors.—The small detached villa by Mr. Norman Jameson, architect, "The Albany," Bolton-le-Moors, is to be built of Ruabon bricks, with bright York stone dressings, Derbyshire spar rough-cast, and a covering of green Buttermere slate. Inside it will be finished with stained canary wood and art metalwork.

THE NEW PUBLIC OFFICES.

Models Insisted upon by the House of Lords.

ON Tuesday last week in the House of Lords, the Earl of Wemyss called attention to the proposed public buildings at Whitehall and Parliament Street, and moved a resolution expressing the opinion that models of the buildings should be made and publicly exhibited, as recommended by Professor Aitchison, late president of the Royal Institute of British Architects, and by the present president and council of the institute. He quoted a memorial signed two years ago by 140 peers in favour of the exhibition of models and the taking of precautions to ensure the erection of a War Office building worthy of the site. If there were any difficulty owing to contracts having been taken, it was not, he contended, beyond the power of adjustment. The Earl of Pembroke thought the noble lord would realise that if two years ago the Government felt it out of their power to accede to a similar motion, it was much more difficult now to make any alteration in the buildings, as in the course of two years an enormous amount of work had been done. The Earl of Wemyss said all that had been done was to clear and excavate the ground and to spread over the basis a sheet of concrete. Not a single brick had been laid. The Earl of Pembroke said he had not understood the noble lord to suggest that the Government plan should be dropped and something else substituted. He was the more surprised at this as they knew that the noble lord had got a baby of his own, and he had expected him to produce it from under his coat at any moment. He had rather gathered, with a feeling of thankfulness, that the noble lord had realised at last that the Government had decided the question of these buildings. The foundations in the case of the War Office had been laid in. The Earl of Wemyss said they had not. The Earl of Pembroke said the noble lord drew a distinction between the actual foundations being laid and the ground being covered with concrete, and apparently thought that the latter work had been done so well that it was ready to receive any building. But the Government had no other proposal before them, and the plans and elevation adopted had been generally approved. The reference in Professor Aitchison's letter to a model of the buildings was only incidental, the object of his letter being to urge the importance of the appointment of two architects for such public buildings, lest the work should be interrupted by death. The noble lord, who had as good knowledge of architectural matters as any one in that House, had warned them that unless they took great care there might be a repetition of the new Admiralty building. He confessed he shared the noble lord's dislike to the exterior facade of the new Admiralty buildings, but the Government, in considering the new buildings for the War Office, were particularly careful to avoid the system under which the Admiralty buildings were built. Those buildings were the painful result of a Select Committee of the House of Commons, and that result, he thought, had proved conclusively that a Select Committee of the House of Commons was probably one of the worst judges of matters of this sort. He supposed there was no subject in which there was more room for difference of taste than architecture, with the exception of ladies' dress. The noble lord was a great authority on architecture, and had done a great deal in that line himself, and he was afraid he could not dissociate the noble lord from his own talent. But even he would not say, he supposed, that work which he had approved, and which was satisfactory to many, was not open to criticism. They would never get everybody to agree on such subjects. He remembered an incident that occurred to himself when a very young man. In discussing the question of a public building with an architect, who, he believed, was at the time very eminent, he very rashly said, "Why don't you take a copy of some well-known building of acknowledged merit, and so avoid criticism?" To this the architect replied, "To do that would be to leave no examples of Victorian Imperial architecture." He was young then, and, with little thought, said, "Do you speak seriously and say that posterity will suffer



for the absence of such examples?" He feared the artist was annoyed, and the conversation did not continue further. It was wrong to make such a sweeping condemnation, and he had since learned to value a large amount of good work produced during the Victorian era. His noble friend was an admirer of Inigo Jones, and he shared that admiration; but it must be recognised that the work of Inigo Jones had to be adapted to modern requirements, and for these requirements a modern architect must be engaged. The eminent architects, now unfortunately taken from us, who drew up the plans for the contemplated building commenced by satisfying internal requirements for a public office and then prepared a facade worthy of such a structure. The plans and elevations would be faithfully followed, and those who were responsible for the building did not ask for models. The plans had received general approval, and he saw no reason for going to the expense of £600 for a model. His noble friend had referred to a memorial to which many of their lordships attached their signatures, but experience should show, he would not say of what little value were such documents, but how dangerous it was to rely upon them. If this was so on ordinary occasions, how much more so in this case, when the extraordinary persuasive influence of his noble friend was exercised upon noble lords inclined to give their signatures out of the respect and affection entertained for the canvasser. The Government could not accede to the motion of his noble friend, and could see no good purpose that would be served by preparing the model.

Lord Tweedmouth thought if the Department were perfectly satisfied with the plans prepared there should be no objection to preparing the model. The expenditure of £600 would be but a drop in the ocean of the entire cost, and certainly there could be no better way of satisfying public opinion. He was inclined to support the motion. Lord Stanmore supported the motion and pointed out the mistakes that critics without technical knowledge were prone to make when forming opinions from plans and elevations instead of from models. He agreed that before great public buildings were erected models should previously be prepared.

The Marquis of Lansdowne said the discussion had raised two distinct questions—first, whether as a general rule it was desirable they should have models; and, secondly, whether that procedure would be appropriate to the buildings in construction opposite the Horse Guards. He would not dogmatise, but he had some doubts whether a model always gave a perfectly clear impression of the effect which a building when erected would produce. Unless it were a model on a colossal scale, it would probably fail altogether to do so. It should also be borne in mind that unless the model included the whole neighbourhood it would give an inadequate impression of the appearance of the buildings when completed. He remembered citing, in regard to these particular buildings, the colossal edifices known as Whitehall Court, immediately to the rear of the site of the New War Office buildings, for the construction of which the Government were not responsible and which had the effect of dwarfing any smaller buildings placed in their proximity. In regard to procedure by model in the case of these buildings, the House probably would not support the motion of Lord Wemyss. Nothing could be more unfortunate than that the long delay that had already taken place should be added to by re-opening once more the whole question of the designs of those buildings. Those designs were adopted, upon the recommendation of the Institute of British Architects, after three leading members of the profession had been employed. He believed those plans met with general approval. If the matter were re-opened, they had no security that these buildings would be completed in the near future. He spoke with knowledge of the immense inconvenience to which the War Office had been put by having to transact its business in eleven buildings scattered over different parts of London, and he earnestly trusted that further delay would not be involved. He hoped they would adhere to the designs which, after a great deal of consideration, had been adopted of the buildings referred to, which were creditable to the architect and would form a great addition to the architectural beauty of that part of London. The motion was then carried, forty-one voting for it and twenty against, majority twenty.

THE LONDON COUNTY COUNCIL

AT the meeting last week, in answer to questions on the report of the Highways Committee, Mr. Benn said that the Council had no power to prevent the New River Company from breaking up the Embankment. He would lay before his committee the question of obtaining powers to compel the companies to use the old subways instead of breaking up the streets. A long discussion took place on a recommendation of the Housing of the Working Classes Committee to send three of their members as delegates from the Council to attend the proposed conference in Glasgow in September next on the question of cheap dwellings, and that the out-of-pocket expenses of the delegates attending should be paid by the Council. Mr. McKinnon Wood moved an amendment to leave out of the recommendation all reference to the payment of expenses. In the course of the debate on the amendment several members spoke against any payment being made to members of the Council when sent on such missions as this, pointing out the danger involved in breaking the rigid principle to which the Council had up to the present adhered. Other members asserted that it was unfair to set up any monetary barrier which might prevent some councillors simply for pecuniary reasons from doing good work for the ratepayers, and urged that in the matter of sending deputations the Council should follow the example of many of the great provincial corporations. On a division the amendment was carried by 45 votes to 41. The recommendation as amended was then adopted. In answer to Mr. Burns, M.P., Lord Monkswell (chairman of the Parks Committee) stated that, with regard to the question of the preservation of the view from Richmond Hill the vendor of the property had met him in the most friendly spirit. He would have several proposals to put forward at the conference to be held at Spring Gardens on Friday, which would be attended by delegates from the councils of London, Middlesex and Surrey, the Richmond Corporation, the Twickenham Urban District Council, and various open space societies. He very much hoped they would be able to come to some satisfactory conclusion.

Views & Reviews.

Rough Pricing.

This book is intended as an aid to architects, surveyors, engineers and others in ascertaining the rough approximate cost of any class of building or general work. The plan of the author's "Price Book for Approximate Estimates," which met with favour, has been extended in the present work. The whole of the subject-matter has been arranged alphabetically, with numerous cross-references in order to save time. At the end in an appendix is a list showing the actual cost of a few representative buildings and works. Of course this book gives only a very rough and ready means of "getting somewhere near" the real cost of the building, but we will not condemn it because of this—it has a considerable value to those for whom it is intended, and will be found most useful when consulting with clients or for giving them an idea of what the work is likely to cost or of what can be done for a certain price. The book undoubtedly fills a gap in the line of vade mecums. The majority of architects and engineers are proverbially ignorant upon the subject of prices, being concerned but little with actual building, and it is to these the book will be most useful. For the pricing of detailed bills of quantities the book is not of the slighest use, however, as the items are lumped together in such a comprehensive manner that they cannót be picked out separately. The book is only intended to give the means of estimating by rough quantities, per foot cube, per square, or per unit of accommodation. The author accurately states that "one of the most fruitful causes of dissatisfaction and unpleasantness between architect and client consists of an unreliable and misleading estimate of cost. It is, therefore, absolutely necessary to devote a considerable amount of care and attention to the preparation of both detailed and approximate estimates, so as to insure satisfactory results." We agree with Mr. Coleman in this, and we would go further and say that no architect, engineer, surveyor or other should call for tenders until he has made or had made a careful and fairly complete detailed estimate and is assured that the client is fully prepared for the worst. To obtain prices from builders and then not go on with the work or cut it down considerably is not right, as they are thus put to unnecessary expense and trouble through the architect's own incompetence or want of taking pains. We suggest to Mr. Coleman that he would be doing considerable service if he were to prepare another small book for the preparation of detailed estimates, giving the work in trades and accurately specifying the work the prices are given for, with a good index giving each item. This question of stating accurately what degree or kind of work he is giving prices for needs attending to in this present book. To illustrate what we mean we will quote item No. 481: "Reclamation of Land. As from tidal estuaries, foreshores and sea encroachments. Cost varies considerably according to locality, extent of land to be reclaimed, nature of embankments or sea-walls required, &c. £20 or £30 per acre." What does the £20 stand for and the £30; what is the extent of land to be reclaimed; what the nature of embankments, what is the locality, &c.? The actual costs of executed works in the appendix are the most useful, being the most reliable in the book, but altogether, as we have said before, it supplies a distinct want. The binding, type and get-up of the book is admirable, as with all of Messrs. Spon's note-books.

"A Price-Book for Architects and Engineers." By T. E. Coleman, F.S.I. London: E. & F. N. Spon, Ltd., 125, Strand, W.C. Price 5s.

A Builders' Year-Book.

This year-book for master-builders belonging to the Lancashire, Cheshire and North Wales Building Trades Employers' Federation has just been published for the first time. The book should meet with considerable success, as it gives a large amount of most useful information in a handy form. The names and addresses of members of the various master-builders' associations in connection with the federation, and their officers are given, with the rules. Forms of contract and sub-contracts approved by the federation are also given. Then there is general information for builders, tables, &c., and at the end a diary from July, 1901, to July, 1902. It will be seen that the price of 1s. is a small one for such a useful and comprehensive book.

"The Building Trades Employers' Federations and Master-Builders' Year-Book and Diary, 1901-2." Compiled and published by Robert Hall, Builders' Quantity Surveyor, Frederick Street, Bury. Price 1s. nett.

WYMONDHAM CHURCH.

WYMONDHAM CHURCH is to be restored. The vicar has explained that the lead is proposed to be removed from the whole roof of the church, and re-cast on the spot, so that the old metal would be properly utilised again. Every inch of the old woodwork of the beautiful roof which can be preserved will be retained, and such parts as were too far gone will be carefully copied. The great western tower will be completed externally as nearly as possible in accordance with what the vicar states was evidently intended when it was built, an interesting example of which was furnished in the tower of Redenhall Church, which was built about the same period. The eastern tower would not be interfered with, except that it will be protected so far as can be done without altering its present appearance. The western window of the north aisle will be opened, preserving every vestige of the presént mullions and tracery that can be made use of, and supplying decayed parts where necessary with accurately fitted work of similar pattern. With regard to the interior, the present gallery, an unsightly and unecclesiastical erection, will be removed; the great western arch, now almost hidden up, will be thrown quite open from top to bottom, the organ being brought some feet lower and re-erected on a new screen of three arches to be placed somewhat to the west of that arch, in a position already indicated by the springers which remain. The ceiling or roof over the organ will be carried up to the height of the arch in accordance with the original design, which is evident from the fan-shaped springers, and will be of oak and groined. The font will either be placed in front of the organ screen or in the north aisle, near the entrance from the porch. This alteration will add no less than 60ft. in length to the seating accommodation of the nave. The present vestry at the west end of the south aisle, formerly fitted up as an archdeacon's court, and which is an encroachment, will be entirely removed and the south aisle correspondingly enlarged. In the north aisle the small entrance door at the east end will be closed, and a side altar, which will be available for weekday and early services, will be provided, the seating accommodation, however, being made available for the general worshippers at other times. The present seating throughout the church, pews as well as the old-fashioned and awkward square erections commonly called "loose boxes," with their great waste of space, will be entirely removed, and proper wooden benches substituted, with the result of adding greatly to the seating capacity. The floor of the nave and aisles will be lowered about a foot, to its original level as shown by the bases of the Norman columns, which remain untouched. The surface will be thoroughly concreted, and then laid with York stone. The space at the east end of the south aisle formerly used as vestries for the parish clergy and the monks will be used as a choir vestry, having entrances therefrom into the choir, as well as into the south aisle, and will be built on the old foundations. The clergy vestry will be placed in the base of the old eastern tower in such a manner as to be scarcely observable from the outside. The doors from the sanctuary, which have been closed up ever since 1410, will be reopened and iron-framed doors inserted. The floor of the choir will be laid with slabs of black and white marble, and will contain the clergy and choir stalls, the latter affording accommodation on either side for seven men and eleven boys, with seats in the arches for four lady choristers. The sanctuary will be raised to its original level as shown by the position of the so-called Abbot's monument. The choir organ will be placed on the south side of the choir, where also will be the console, which will enable the organist, while sitting with the choir, to control both that instrument and the great organ at the west end, which will be connected, as is usual with modern organs. The pulpit will be brought forward one bay on the south side of the nave, the lectern being placed on the north side of the nave near the clergy seats. The sanctuary will have a lofty reredos of marble above, and the wall above it will be either diapered or painted in fresco. The site of the old church of St. Margaret, through which there is at present an entrance to the north aisle, will not be interfered with except to put it in decent order. The chandelier will be removed from its present position, in order to ensure the preservation of such a valuable relic, until the restoration is completed, when it will be placed in some position not yet decided on. The organ will be practically rebuilt, although the pipes and outer case will be retained. It was constructed in 1793. It is expected that the costs of these necessary improvements and additions will amount to at least £10,000.

Engineering Notes.

The second edition of Geipel and Kilgour's "Pocket Book of Electrical Engineering Formulæ" has just been issued by "The Electrician" Publishing Company, London, price 7s. 6d. nett. The authors, who both occupy a prominent position in the electrical industry, and are in close touch with the latest practice in all matters relating to the applications of electricity to industrial purposes, have carefully revised and added to the matter which forms the chief contents of the book. Electric traction, the transmission of electric power, and the many other subjects which since the first publication of the Pocket Book have come prominently to the front, have been given special attention, with the result that the book contains over 850 pages. The use of a thin hard paper and a compact binding has enabled the publisher to reduce the bulk of the work, which is, notwithstanding the mass of matter crowded between the covers, not too large for the pocket.

The New Millbay Railway Station at Plymouth is nearing completion. The whole site has been remodelled. The local Great Western Railway staffs have moved into their new offices, which are situated on the first floor of the station building. The main entrance to the offices is opposite the Duke of Cornwall Hotel, and at the top of a short flight of stairs long corridors branch off on either side. The divisional superintendent has an office on the immediate left, and his assistant is provided with a room on the right. Adjoining both offices are large rooms, furnished and well lighted, for members of the staffs. At the end of one of the corridors another passage runs at almost right angles. Here offices are provided for the district goods manager and his assistant. All the offices are roomy and well furnished and ventilated, and each staff is provided with excellent lavatory accommodation. Ample platform accommodation is provided at the station. Four platforms run into the station, No. 1 being 300ft. long, Nos. 2 and 3 500ft., and No. 4 is to be extended another 100ft. to give it a total length of 600ft. Probably the exact extent of the whole area covered by the new station will not be appreciated until the existing booking office is taken away and all the new ground floor offices are opened up to view. Immediately outside the booking offices a glass roof awning is now in course of erection, and is intended for the convenience of passengers arriving and leaving in wet weather. The covering is 110ft. long, with an average width of 50ft. The first and second-class booking-office has a separate entrance, and close by the third-class booking-office there will be a special entrance for luggage. The offices surrounding what is known as the circulating platform include those of the stationmaster, telegraph, parcels, cash, and porters. The waiting-room and lavatory accommodation is much superior to that usually provided, and the artificial paving on the platforms gives the spacious station a clean appearance. The new station is entirely of dressed limestone.

Queen Victoria Memorial.—Mr. Akers-Douglas stated in the House of Commons in reply to a question that the executive committee has selected a design, and that it will be submitted to the King and to the general committee this week.

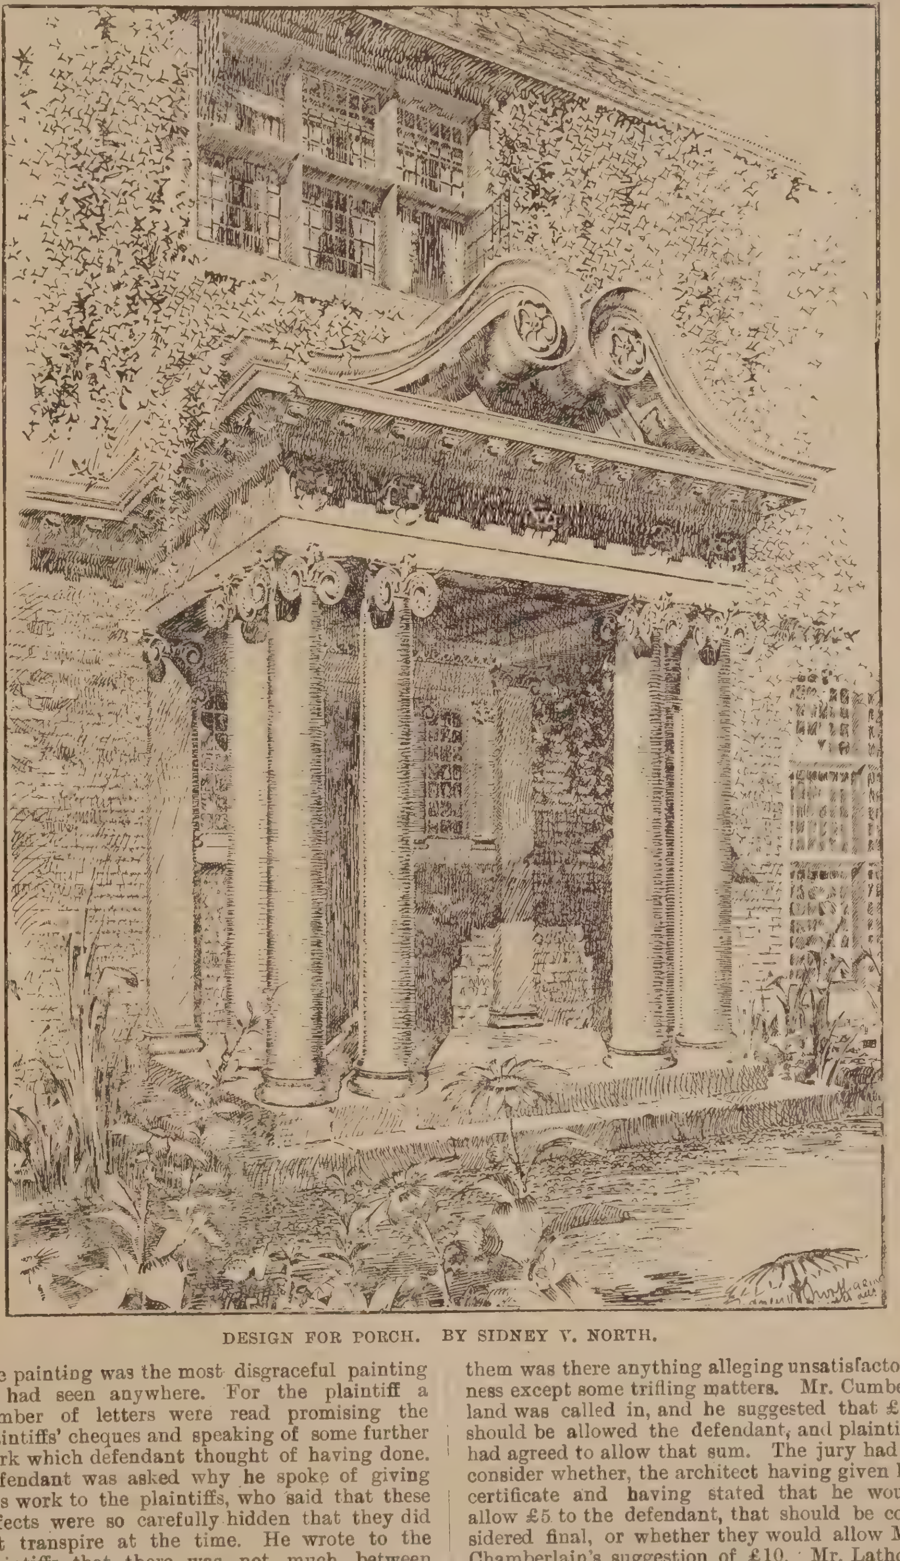
Law Cases.

Suing for Paving Stones.—Before his Honour Judge Gwilym Williams at Ystrad last week David Williams, saddler, Treherbert, sued Messrs. Edward Davies & Sons, builders, Treherbert, for £18 16s. 7d., which he alleged was due for paving stones, &c., from a Cymmer quarry. There was a direct conflict of evidence, and his Honour in giving judgment made some very strong remarks. He said that Mr. Williams's evidence was not in any way supported, and the probabilities of the case were against him.

A Builder's Claim.—Joseph Ford, builder, of Rosedale, sued James Masterman, farmer, of Hartoft, at the Malton County Court recently for £10 2s., for work done at his house and farm buildings. Mr. Kitching, of Pickering, was for plaintiff, and Mr. John Estill, of Malton, for the defendant, who paid £8 5s. 2d. into court, as sufficient for what work was done and for costs. Plaintiff deposed that he and his brother were employed for forty-four days at the farm, and he had charged 4s. 6d. per day, whilst 4s. 6d. worth of material was used. The work done was mainly re-tiling roofs, re-building a small wall and laying three thresholds. Cross-examined by Mr. Estill, plaintiff said he was a farmer before he turned builder, at which latter trade he had been engaged five years. He had charged 4s. 6d. per day, which was the usual charge of the district. He denied that an ordinary practical workman could have done all the work in fourteen days. Mr. Estill called several witnesses (including the agent for the property, Mr. Horsfield, land agent, of Norton, and Mr. Shepherdson, architect, of Driffield) to prove that the amount paid into court was a very liberal allowance for the work done, which ought not to have taken more than a fortnight and which was of an inferior character. His Honour said he thought the amount paid into court was quite sufficient, and he gave a verdict for defendant beyond that sum.

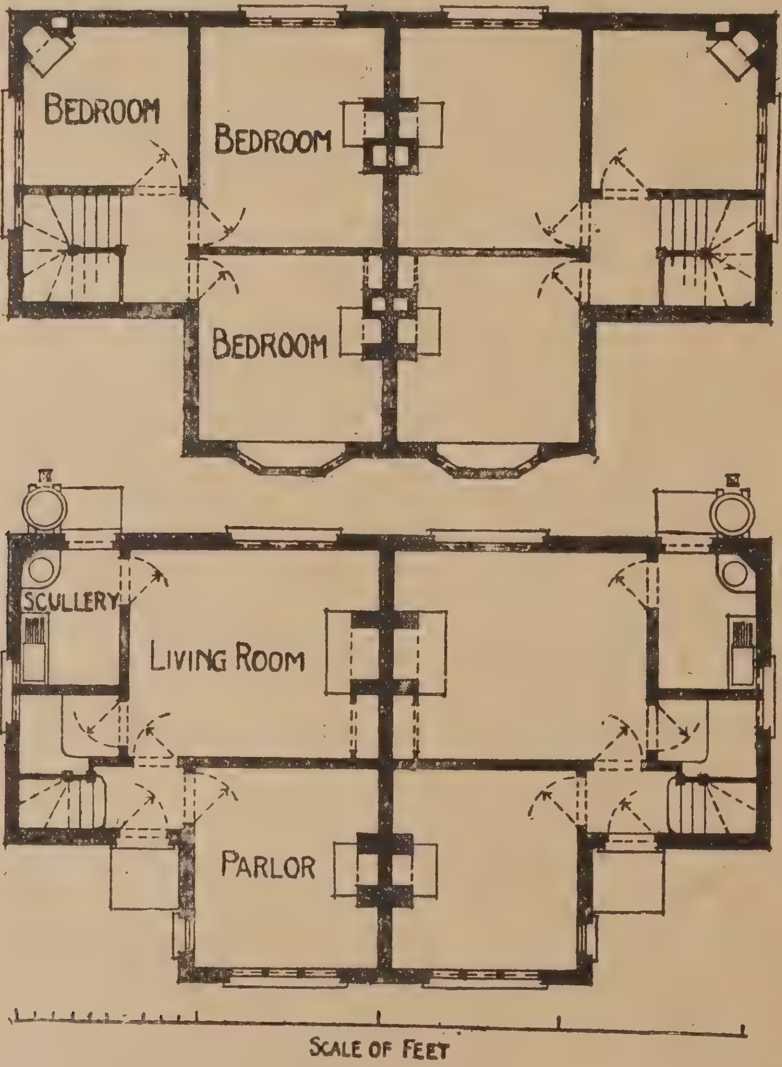
A Dispute with a Builder.—A case in which Mr. Henry Statham, builder, of Brighton and Southwick, sued Mrs. Bannister, wife of Mr. George Bannister, of Southwick, for the balance of the contract price of £600 for the erection of two houses at Southwick, was heard recently before Mr. A. O. Jennings, as special referee, at the County Court House, Brighton. The claim was originally for £165 11s. 9d., and a writ in the High Court was issued. On the hearing in London it was ordered that the defendant should pay £119 8s. 6d. within seven days, and that she should be at liberty to defend the action as to the residue. The residue was for £46 3s. 3d. and a small sum for interest. It appeared that the plaintiff estimated for the erection of two houses at Southwick for Mrs. Bannister at the price of £600, and the contract provided for the payment from time to time of 75 per cent. upon the value of the work done. The works were to be completed on the 25th January last under a penalty of £2 per week for each week after that date that the premises should remain incomplete and unfit for occupation, except for an allowance for inclement weather. The work was not completed by the stipulated time, but the builder contended that the delay was caused through bad weather and through the defendant not making advances as stipulated. Sums amounting to £450 were paid by the defendant on account of the works, and the original claim of £165 11s. 9d. was composed of the balance of £150 and £15 11s. 9d. for extras. The defendant denied that any extras were ordered, and claimed to deduct £28 in respect of fines and £2 11s. 6d. paid to another builder for work left unfinished by the plaintiff. Mr. Statham, giving evidence, stated that some of the extras were required by the district council's surveyor. Mrs. Bannister or her surveyor also sanctioned the work. He stated that the buildings were completed on the 19th February, except the forecourt walls, which had been destroyed by frost. Nevertheless he had not been able to obtain a certificate of completion from the defendant's surveyor, who kept asking for fresh work, including work which was not covered by the contract. Eventually, after consultation, the counsel for the respective parties came to a settlement on the terms that the defendant should consent to judgment against her for £37 and costs.

Claim for Balance of Contract.—At a special County Court held at Luton before His Honour Sir A. G. Marten the action of *Ayre* v. *Lathom* was resumed. This was a claim brought by Messrs. Ayre & Son, builders and contractors, Hockliffe, against Mr. H. W. Lathom, solicitor, Dunstable, for £58 10s. 6d., balance of contract for alterations to the defendant's residence, Princess Street, Dunstable. Mr. Lathom gave evidence on oath in his own defence. He went through a series of items on which he contended that he should be allowed rebates amounting to £58 10s. 6d. Speaking of the painting, defendant said there were places where there was only one coat, and the whole of the rooms he had had to have painted as soon as the contractor left.



DESIGN FOR PORCH. BY SIDNEY V. NORTH.

The painting was the most disgraceful painting he had seen anywhere. For the plaintiff a number of letters were read promising the plaintiffs' cheques and speaking of some further work which defendant thought of having done. Defendant was asked why he spoke of giving this work to the plaintiffs, who said that these defects were so carefully hidden that they did not transpire at the time. He wrote to the plaintiffs that there was not much between them, meaning to say that plaintiff claimed £58, and he thought he was entitled to £51, so that there was not much between them. He had paid a fair sum into court. Defendant drew the plans. He used to practice as a surveyor. He would not swear that the alteration showing the insertion of a bay window was on the original plans; he thought he did it himself. His Honour said the defendant seemed to dispute five items of the work done in which he claimed to have an allowance made and nineteen items in which he claimed that the work was not satisfactorily done. But the jury must remember that the architect's certificates was given by Mr. Kelly on January 13th, 1900, in which he stated that he was satisfied with the work, with the exception of a few trifling items for which he allowed a rebate of £5. Then there were letters written at different times by the defendant showing his satisfaction with the work; such letters were written in January, March, April, July and August, and in none of them was there anything alleging unsatisfactoriness except some trifling matters. Mr. Cumberland was called in, and he suggested that £10 should be allowed the defendant, and plaintiffs had agreed to allow that sum. The jury had to consider whether, the architect having given his certificate and having stated that he would allow £5 to the defendant, that should be considered final, or whether they would allow Mr. Chamberlain's suggestion of £10. Mr. Lathom said it was unfortunate that Mr. Cumberland came to inspect the work when there was no one at home but the servants, but Mr. Cumberland was a gentleman of great experience, and he did not think he would be likely to miss anything which he should have seen. The point was whether defendant's case was exaggerated or whether he really had good cause to say the work had been unsatisfactorily done. The ceilings appeared to have cracked through bad materials having been used, and in the outside piping there was a split which showed it to have been defective. But on the other hand they had to consider whether the terms of the contract were not conclusive, so that any complaint to be made should have been made within the three months therein specified. If a man concluded a contract in the autumn of 1899, he thought it incumbent on a person alleging that the work was unsatisfactorily done to have made such complaint at once so that the matter could have been inquired into at once, and that it ought not to have been left over until the time when defendant made his complaints. He thought the jury should award plaintiffs the sum claimed or any lesser sum which they might agree upon as a just settlement. The jury, after a brief consideration, found a verdict for plaintiffs for £48 10s. 6d., this being the amount claimed less the £10 rebate agreed upon. His Honour gave judgment for the amount stated with costs.



GROUND- AND FIRST-FLOOR PLANS OF LABOURERS' COTTAGES AT MAIDSTONE.
E. HARDING PAYNE, A.R.I.B.A., AND JOHN OWEN, ARCHITECTS.

The Housing Question.—The Metropolitan Tribunal of Appeal sat at the Surveyors' Institution, Westminster, last week for the purpose of hearing an important appeal in connection with the erection of dwellings for the working classes. The appellants were the Metropolitan Association for Improving the Dwellings of the Industrial Classes, and the respondents were the London County Council. Mr. Andrews appeared as counsel for the London County Council, whilst Mr. Gruning, F.R.I.B.A., represented the appellants. It appeared that the appellants proposed to erect some buildings at Stoke Newington. The council refused to sanction the plans on the grounds that there was no guarantee that the houses on either side of the proposed new buildings would be altered in the course of years in such a way as to prevent proper air and light space. Mr. Gruning said the council had no objection to the plans of the buildings, and he thought the appeal should stand. Mr. Andrews, for the London County Council, said the council had no desire to hamper any scheme which aimed at endeavouring to ameliorate the conditions under which the working classes lived. They were bound to object in this case, but if the appellants agreed to certain modifications the council would withdraw opposition. The tribunal upheld the appeal, making an order, however, for certain modifications.

Claim by a Plumber.—A man named Francombe, plumber, Cardiff, sought an action at Cardiff against Thomas Evans, builder, Cathays, Cardiff, for the recovery of £16 for plumbing work carried out at some of the defendant's houses at Ebbw Vale. The defendant contended that the plaintiff had not carried out his contract. Councillor W. H. Allen, Cardiff, who had examined the houses at Ebbw Vale at the request of the defendant, said the plumbing work carried out by the plaintiff was the most disgraceful he had ever seen. In one case the joints were left open, so allowing the sewer gas to escape, and several of the pipes were jointed with putty. Other joints were made with rags. Plaintiff said other plumbers had been employed at the houses, and it was possible some of the joints had been done by them. As the work had to be carried out to the satisfaction of the architect, his Honour adjourned the case in order that the architect might be called to state whether the work satisfied him or not. At the resumed hearing Mr. David Morgan, architect, gave evidence, and his Honour gave judgment for the defendant.

Dispute by Contractors.—C. H. & Joseph Moult, builders, Stapleford, sued Cephas Allen, Stapleford, in the Long Eaton County Court recently to recover £34 19s. 8d., balance of contract for erecting a house. The case was that the contract was entered into between the late Mr. Moult and defendant to complete the erection of a house for £285. Mr. Martin failed, and Mr. Leeman was appointed trustee. Mr. Moult died, leaving his sons to carry on the business and his executors. There was to be £11 allowed for grates. Some material was in Mr. Martin's yard, and it was to be used by Mr. Moult. Mr. Thorpe said there was a balance due of £34 18s. 8d., but a reduction had taken place to £30 9s. At the sale the material was sold. The defence was that no material of any value for building was in the yard, and that no contract existed with respect to it. A question of a bay window also arose. When Mr. Moult died, an arrangement was made for Messrs. Moult to complete the work. His Honour thought the house would be cheaper by paying the claim than the original contract. Mr. C. H. Moult said that no complaint was made about the work. Mr. Thorpe said every effort had been made to settle the matter before going into court. After the defence had been heard his Honour gave judgment for £30 9s.

A Building Line Case.—The case of *London County Council* v. *Ellis* recently came up before Mr. Justice Darling and Mr. Justice Phillimore, in the King's Bench Division. Mr. R. Cunningham Glen moved on behalf of Mr. James Ellis for an order calling upon Mr. d'Eyncourt, the metropolitan police magistrate, to show cause why he should not state a case for the opinion of the King's Bench Division. Two summonses had been issued by the London County Council against Mr. Ellis under the London Building Act, 1894, for erecting a building beyond the general line of buildings. Mr. Ellis had an old building at the place in question, and he proceeded to erect two other buildings, but objection was taken that if he erected them as a separate structure he would be contravening the Act by building beyond the building line. He then made what was really an extension of the old building, but the magistrate found that there were really two buildings, and he ordered the demolition of the new one. If it was an extension of the old building its erection did not contravene the London Building Act. The magistrate held that the point was a frivolous one and he refused to state a case, but counsel submitted that it was not, and that the magistrate should be ordered to do so. Mr. Justice Darling said that there must be no rule. The applicant wus the owner of an old building, and at the place in question there was a building line. He tried to put up some new shops to the right of the old building on a vacant piece of ground, but it was pointed out that if he did so he would get beyond the building line. He discontinued that, and then proceeded by beginning at the old building, and he attached the new building to the old and said that he was laterally extending the old building. The magistrate decided against this ingenious builder, and declined to state a case on the ground that the point that this was only an extension was frivolous. His Lordship thought it frivolous in a legal sense, and it was also frivolous in a dramatic sense; in fact it was comic. Mr. Justice Phillimore concurred. The case was carried into the Court of Appeal last week, before the Master of the Rolls, Lord Justice Vaughan Williams and Lord Justice Stirling. Mr. R. Cunningham Glen moved on behalf of Mr. Ellis for a rule *nisi* for an order calling on Mr. d'Eyncourt, the metropolitan police magistrate, to show cause why he should not state a case for the opinion of the King's Bench Division. The Master of the Rolls: The matter is of great importance to Mr. Ellis because it involves the pulling down of a building which has been erected. For this reason we think that a rule *nisi* should be granted calling upon the magistrate to show cause why he should not state a case for the opinion of the High Court. But we do not say whether the points intended to be raised are or are not frivolous, because we have not the materials before us to enable us to decide that. When the rule comes on for argument it will be open to the other side to show that the points are frivolous.

Builder v. Architect.—The award of the arbitrators has been made in respect of work done in the erection of No. 26, Vernon Road, Edgbaston, by Hiram Wilcox, late of Bradford Street, builder, for Mr. Charles Sharp Smith, architect, of Cannon Street, Birmingham. The work was done under contract on an estimate based on quantities supplied by the architect, who measured up the variations and claimed a balance of £66 0s. 10d. in his own favour, based on a claim for penalty for alleged delay and other matters. The builder's statement on a valuation by his surveyor showed a balance due to him of £258 16s. 8d. The arbitrators awarded £227 as due to Mr. Wilcox. The arbitrators were Messrs. Anthony Rowse and J. Kirkham Dale.

SOME SMALL ENGLISH CHURCHES.

TWO thatched churches, at least, are still standing in England; one at Markby, in a remote part of Lincolnshire, and another at Paston, in Norfolk; but these are by no means the only curiosities among our smaller churches. There is one built of logs at Greensted, only a mile's walk from Chipping Ongar. The little wooden steeple, the porch and brick chancel, the dormer windows of the roof, are of later date, but the nave walls are formed of massive oak logs, roughly trimmed on the outer side, and faced on the inner with boards; formerly their ends were buried in the ground, but as they had become decayed they were replaced some years ago by a base course of brick.

The Smallest Church.

Which is really the smallest church in England has been disputed, but formerly the claims of St. Lawrence, on the Undercliff of the Isle of Wight, seem to have been the strongest, for Lullington, in Sussex, its most formidable rival, was held to be disqualified on the ground of being only the chancel of a once larger edifice. St. Lawrence, however, has been enlarged of late years, for its chancel was lengthened by 10ft., and a new porch and turret were added. Prior to that operation it was 20ft. long and 12ft. broad, with height in proportion. Its neighbour, St. Boniface, at Bonchurch, is also but a tiny church, and both of them are picturesquely situated.

Perivale, near the Brent— a mile or two north of Ealing—is a little church in a little parish, though, as Greater London spreads, it will no doubt fulfil the prophecy that the "little one shall become a thousand." It is a mixture of old and newer work—the former dating from about the fourteenth century. Its tower is faced with weatherboards, and has a pyramidal tiled roof.

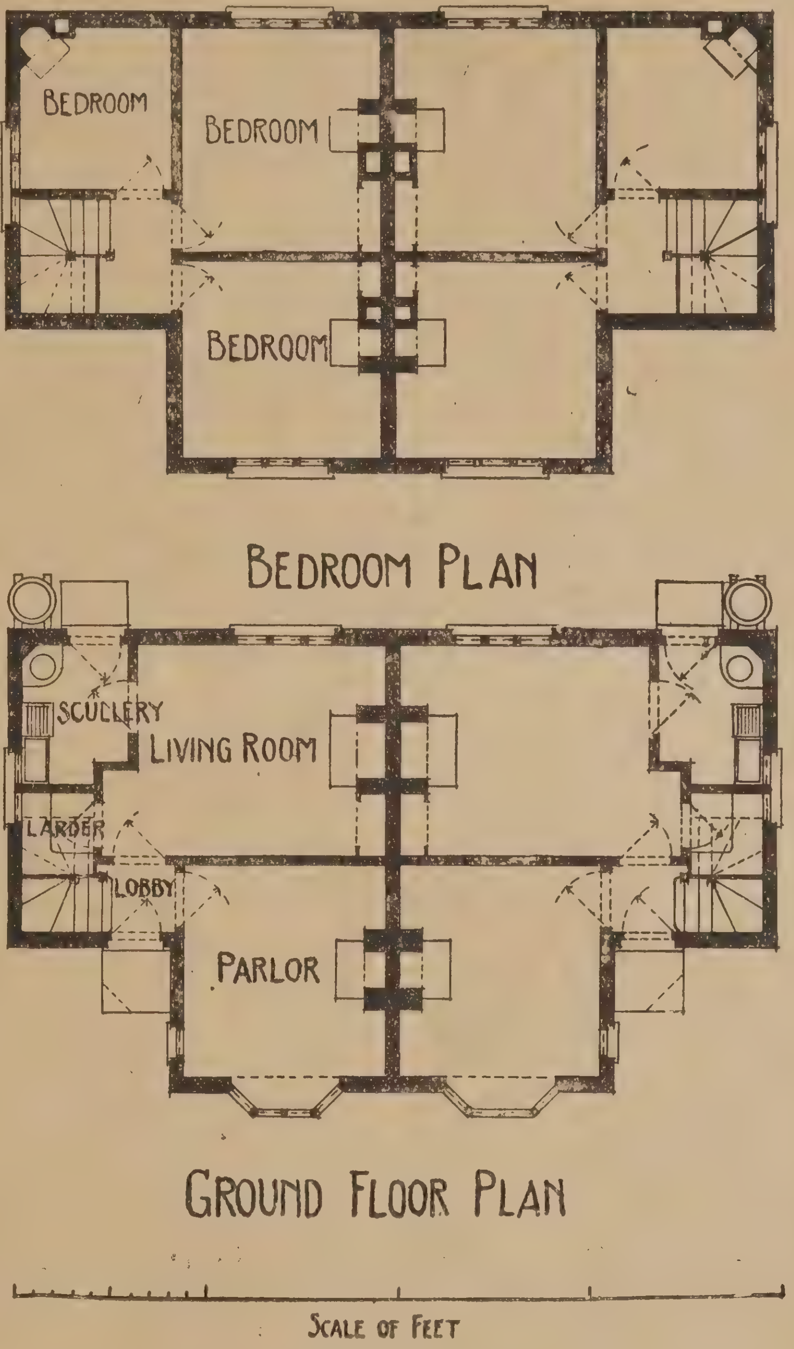
St. Michael's, Verulam,

one of the most interesting churches in England, and still anything but large, was probably once much smaller. It stands at one end of St. Albans town, and on the south side of the yet older Roman Verulam, now indicated only by some mounds and fragments of its walls. Built into those of St. Michael's, which are in part constructed of Roman brick, are small round-headed arches indicating ancient windows, and obviously belonging to the original building. The date of that is uncertain, and the difficulty of determining it is increased by the Roman materials and the rudeness of style. But it is often assigned to the middle of the tenth century, when three churches of which this is probably one, were built by an Abbot of St. Albans.

Probably older, but not quite so small, are St. Mary-in-Castro, at Dover, and St. Martin's, at Canterbury. Experts have differed as to the age of the former, but the materials are certainly Roman, and part at least of the building is assigned on good authority to the same age, while the lower part of the curious tower at the south-west, which appears to have been formerly connected with it, is generally admitted to have been built by the Romans for a lighthouse. Not so much of their handiwork remains at St. Martin's, Canterbury, though fragments can be found in its walls which carry us back to the first days of Latin Christianity in Britain.

The Little Church of Bradford-on-Avon.

One of the smallest and most interesting churches in the country is at Bradford-on-Avon. It was, one may say, discovered about forty years ago, and was afterwards gradually divested of the mean structures with which it had been encased. It consisted originally of a little nave and chancel, with porches north and south, which are, comparatively speaking, large. Of these two, the latter has been destroyed, only the foundations remaining, but the rest of the building is in very good condition. It is a small structure, for the total length is hardly more than 37ft.; but it is lofty in proportion, for the nave is more than 25ft. high. The original windows are both little and few—they must have given only a "dim religious light." The chancel arch is narrow and, in proportion, high. The walls are constructed of rather large and well-squared stones, and ornamented in the upper part externally with a shallow-panelled arcade. As it was erected in the first decade of the eighth century, or about a century after the death of Augustine, we have no more interesting relic of the earliest days of English Christianity.



LABOURERS' COTTAGES AT BIDDENHAM. E. HARDING PAYNE, A.R.I.B.A., AND JOHN OWEN, ARCHITECTS.

Sompting, in Sussex,

on the slope of the chalk downs overlooking Worthing, is anything but large, and is certainly old. The tower was erected some years before the Conquest, and is remarkable for its gables crowned with a pyramidal roof—a pattern very unusual in English churches. This is the oldest part, but there is a good deal of Norman work in the rest of the building. Also old, originally small, and of special interest as the earliest church in England actually dated, is Deerhurst, in Gloucestershire, on the banks of the Severn. The original inscribed stone stating that the church was consecrated on April 11th in the fourteenth year of Edward the Confessor (1056), is now in the Arundelian Collection at Oxford. Here also, as is so often the case, the tower is the best preserved of the old parts, though portions of the south wall of the nave and the chancel aisle are of the same age.

Heysham Church.

Another curious little church stands at Heysham, on a low headland of red sandstone overlooking Morecambe Bay. The greater part is later than the Norman conquest, but the rude chancel arch probably goes back to Saxon times, and some sculptured stones in the churchyard must also be very ancient. But close at hand are the remains of a yet earlier structure, a rudely-built chapel about 8yds. long and less than 3yds. in width, like those which are still not very rare in Ireland, and may be found here and there on our Western shores. Of later though more uniform date, but rather larger, and much more ornate, is the church of Kilpeck, in Herefordshire, which, had it not been restored with more zeal than discretion, would be a very perfect example of a Norman building.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Air-Space in Scotland.

MONMOUTHSHIRE.—J. writes: "What is your opinion as to the legality of a dean of guild court in a county burgh of Scotland rejecting plans for a rebuilding of premises on account of the want of sufficient area space at the back of same? The sketch plans (not reproduced) illustrate the buildings as proposed. The court states that an area 25ft. in depth ought to be provided. This of course would monopolise more than half of the site and render the new building quite unprofitable. The workshop being at present on the site it seems hardly reasonable that they can compel us to knock it down to supply area space."

As I interpret the clause in our Building Regulations (which, by the way, I do not consider a model of correct English that would have satisfied Cobbett) I should say the space required in each is 15ft., being three-fourths of the height of the two living-room floors 10ft. by 9ft., allowing 1ft. additional for intervening floors. Some people might try to bring in the attic also "as the highest habitable room of the building," but that would only produce 22ft. 6in., and be got by what I think an inaccurate construction of the text. CAMPBELL DOUGLAS.

Right of Light.

REIGATE, SURREY.—B. writes: "I have built a house for a client of mine on a plot of ground as per enclosed tracing (not reproduced). Adjoining and overlooking this ground is a stable which has four windows and a door opening on my client's property, and although not used at present may be used in the future. They have been built nearly sixteen years, so if anything is to be done it ought to be done at once, as a question of ancient lights may arise. (Is not the period twenty years?) What I should like to know is, can my client place an obstruction on *his* property against lights and door so as to assert his claim, or can he get an undertaking from adjoining owner admitting my client's claim and paying a nominal rent for the windows &c., so overlooking the property so that a formal notice any time would compel adjoining owner to stop up the windows?"

Most certainly your client may and should place an obstruction on his own property against both lights and door, either in the form of a hoarding or of a permanent wall, which if built of rough material might be ornamental rather than otherwise if creepers were allowed to grow over it. This obstruction must be in continuous existence for a whole year within twenty years of the erection of the stables, and therefore must be put up within nineteen years and a day of such erection. A signed undertaking from the adjoining owner admitting that he claims no right of light to his windows nor of entry to his door over your client's land would serve the purpose equally well, especially if a small rent were paid as is suggested, and as is only fair; but it would be well to have such an undertaking drawn up by a solicitor, and the only way in which to force the adjoining owner to sign this undertaking is to erect the obstruction. G. A. T. M.

Architects' Charges.

BIRMINGHAM.—E. J. C. writes: "What commission can I charge my client, for whom I have prepared two complete sets of drawings, specifications and quantities for his house, and have also obtained tenders for each set? In each case they have exceeded the amount he wishes to spend. I have still to prepare more plans for a smaller house in order to meet with the intended expenditure, for which, of course, I shall have the usual 5 per cent. and 2½ per cent. for taking off quantities."

An architect's charges under these circumstances has often to be calculated as a matter of policy rather than of right. In fact, on the question of right there is opening for dispute, for if the client gave the architect definite instructions that the building was not to cost more than a stipulated sum, and the architect prepared plans without first saying that the sum was insufficient for the purpose for a building which would cost more, no charge at all could be legally substantiated. The architect will have failed to carry out his part of the agreement. On the other hand, if the architect has been careful to guard himself, preferably by letter, saying that the sum named was not in his opinion enough for a house of the accommodation required, but that he was preparing plans as instructed with strict regard to economy but without guarantee as to cost, he would then be entitled to 3 per cent. upon the estimated cost for the preparation of drawings, with plans, elevations, sections, and specification, and for obtaining tenders. For quantities the full sum would be due. As in this instance all this work has been done twice over, it would be twice chargeable. A copy of the R.I.B.A. schedule of charges should be obtained from the secretary R.I.B.A., 9, Conduit Street, W. It costs 7d. post free.

G. A. T. M.

Assessing Fire Losses.

EDINBURGH.—FIRE INSURANCE writes: "(1) Can you supply me with the title of a book giving information on this subject? A property took fire in a village a few miles from a city. Someone telegraphed for the fire brigade from the city, there being no local means of extinguishing the fire. A settlement took place with the insurance company, and now when the proprietor is charged £20 for the services of the brigade the company refuse to pay it. Had the brigade not attended the damage to the insurance company, instead of being only £1,000, might have been several thousands. Is it not to the interest of the insurance companies to pay for and encourage people to assist in extinguishing a fire? Can they be compelled to pay? (2) Do the expenses of the lawyer, clerk of works, architect and surveyor form part of the amount claimable from the company? (3) As the preparation of the claim in detail puts an owner to considerable expense, can he claim this as part of the loss? (4) What is a usual allowance to cover contingencies, as in restoration so many unforeseen points of extra expense occur? (5) As great differences of opinion arise sometimes as to what walls ought to come down, as to renewal of parts partially damaged, and such like, what is the best and most expeditious method of adjusting these?"

(1) I do not know of any book on the subject The companies have formed themselves into a close ring, and by thus doing away with competition are in a position to insist upon the exact letter of each policy being observed. As one result, in the present instance the company can refuse to pay for the services of the fire brigade. The only way to obtain payment is to threaten to insure in future with one of the few non-tariff offices which remain outside the ring, and as this would soon be known in a country district the loss of one policy on such a ground would probably mean the loss of many more; and as all the tariff offices would suffer they would bring pressure upon the one involved in the present dispute. (2) Unless these matters have been specially provided for in the policy the company is not liable. The council of the Royal Institute of British Architects carefully went into this matter a short while ago and approached the insurance companies, but failed to obtain any concession. It is consequently now my own practice to insert a provision for architect's commission, though I have never yet had to add for the clerk of works or solicitor, and doubt whether the latter is insurable. As the charge for quantities, however, is included in the builder's estimate, this becomes payable under the ordinary terms of a policy. (3) No. (4) Fifteen per cent. would not be too high a provision after destruction by fire. (5) A meeting on the site between two surveyors, one representing each party, and an umpire agreed upon by both, under a properly drawn submission to the arbitration of the umpire. If the umpire selected be a complete stranger, so much the better.

G. A. T. M.

Sketching.

SALISBURY.—PUGIN writes: "Is there a preparation by which pencil sketches may preserved? I am preparing sketches for t Pugin studentship, and think that in time th will become indistinct without some kind wash. Also, what size sketch block, general speaking, do you think suitable for this studen ship?"

There are several preparations for fixing cha coal and pencil drawings sold by the artist colourmen. The basis of the majority of the is spirits of wine and resin, and they are spraye on to the back of the drawing. If the drawin are not likely to be exposed to very rough usag a solution of gelatine made with warm wate into which the drawings are to be dipped dow wards and set to dry the other way up, generally effective and inexpensive. With r gard to the size of the block for Pugin studen ship sketches it depends much upon the subjec where detail is to be rendered a larger size bein required than for sketches intended to sho merely the general design and mass of the buil ing, or with its surroundings from a distanc We recommend for full-sized details and profile of mouldings separate sheets of drawing pape as very large blocks are rather expensive. F detailed and general sketches, a block abou 14in. by 10in. would be a useful size.

Sketching Tour round East Coast.

LONDON, W.—H. S. writes: "I propose goin for a fortnight's cycling tour round the Eas coast about as far as Yarmouth. Kindly mentio a route with places of architectural interest where I could sketch and take some measurements."

Both Essex, Suffolk and Norfolk are very ric in old buildings, and we cannot spare space t give a detailed list on any route. The following, however, would be found a good route; i addition to the places we mention, many villag churches and interesting old domestic building will be passed on the way: Barking (the ol nunnery the special interest), Waltham Abbey Ongar, Margaretting (the church has a massiv oak porch and some old stained glass), Beleig Abbey, Colchester, St. Osyth (priory and church) Hadleigh, Ipswich, Woodbridge, Butley Priory Orford (a fine old Norman keep in the castl here), Dunwich (the monastery), and Grea Yarmouth (the parish church the chief interes architecturally).

Measuring Land.

LANCASHIRE.—LAND writes: "How man square yards are contained in 3 roods 3 perches 'customary measure'? Can you give me th full table, 'customary measure'?"

Formerly, by custom, the perch (which forme the unit of measurement generally) varied i different parts of the country, and consequentl the acre varied also. This state of things is no happily dying out, and rarely nowadays doe the surveyor meet the old "customary" measure in England. The old Lancashire lineal perc contained 21ft., and therefore 21ft. + 21ft. = 441 sq. ft. or 49 sq. yds. constituted the area o the square perch. There are, consequently 7,840 imperial square yards in a "Lancashire" or "long" acre (the "Irish" acre is the same) and the area in imperial square yards of the plo mentioned in the question may be thus arrive at:—

3 roods 3 perches = 123 perches.
123 × 49 = 6,027 sq. yds.

If the table asked for be written out fully, i will read:—

"*Lancashire Square Measure.*"

144 sq. in. = 1 sq. ft.
9 sq. ft. = 1 sq. yd.
49 sq. yd. = 1 sq. pole or perch.

$$\left.\begin{array}{r}\text{40 sq. poles}\\ \text{or 1,960 sq. yds.}\end{array}\right\} = \text{1 sq. rood.}$$

$$\left.\begin{array}{r}\text{4 sq. roods}\\ \text{or 7,840 sq. yds.}\end{array}\right\} = \text{1 sq. acre.}$$

If must not, however, be presumed that "customary" measure everywhere means 7,840 sq. yds per acre. This varies according to locality from 2,308¾ for Leicestershire (though I believe thi measure is quite dead, as, though born in tha county, I have never met it) to 10,240 sq. yds in Cheshire. G. S. Bricks and Mortar.

APHORISM FOR THE WEEK.

Mediævalism is as dead as a fern-leaf in a lump of coal . . . ; other developments are shaping in the world, in which Gothic architecture and its associations have no place.—THOMAS HARDY : "Jude the Obscure."

Our Plates. THE cottages at Gould Court, Maidstone, by Messrs. E. Harding Payne, A.R.I.B.A., and John Owen are to be erected for the Right Hon. Earl of Romney. The price for the work, with certain modifications (but including drainage and fencing), is £428. Messrs. Cook, Pearce & Sons, of Maidstone, are the contractors. The plan is given on p. 482.—The cottages at Biddenham, near Bedford, were for the late Mr. E. Rhys Wingfield, and are about to be erected at a cost of £450. The plan is given on p. 483 of this issue.—Mr. C. E. Mallows's drawing of the terrace and summer-house at Dalham Hall, Suffolk, is in this year's Royal Academy Exhibition.

Drawing with Microbes. IN one of his lectures to the students of the Royal Academy Professor Herkomer recommended enamel painting to the artist of middle age who was, perhaps, a trifle weary of working in oils and wanted the inspiration of a new medium. But the "Lancet" offers the painter in search of a new medium something much more inciting than enamel—nothing less than the production of colour on canvas by micro-organisms. Very beautiful colours, we are told, in almost all shades, can be obtained by the cultivation in a suitable environment of chromogenic bacteria. Carefully selected chromogenic organisms need only to be cultivated on the proper parts of the canvas to bring forth a picture "with all the colouring that the colourman's art can produce." Artists are assured that "excellent seascapes could be produced by the selection of organisms producing yellow and blue colours respectively, a blend of colour suitable perhaps also for a moonlight scene, and the purple producing bacteria might be enlisted for the representation of dawn. The "Lancet" gives many useful hints to the worker in the new medium. If, for example, he wants to paint a sunset, there is nothing better than the *micrococcus prodigiosus* for the purpose, while for the representation of a field of corn the *micrococcus auranticus* is all that can be desired. If, however, the cornfield painter is particularly fastidious he can can try the *sarcinae*—those which produce rich yellow colours—in place of the *micrococcus auranticus*. The "Lancet" concludes its article on the new impressionism by suggesting with apparent gravity "that a picture will some day be produced in which the colours portrayed on the canvas will be the products of bacteria provided with a suitable pabulum."

The Late Mr. Yeoville Thomason. MR. HENRY YEOVILLE THOMASON, of 9, Observatory Gardens, Campden Hill, Kensington, died recently. Mr. Thomason was for the greater portion of his life intimately connected with Birmingham and was one of the foremost architects practising there. He was born at Edinburgh in 1826, and after being educated at a private school was articled to the late Mr. Charles Edge, architect of Bennett's Hill, and within a short period after the completion of his articles he became manager of the architectural department in the Birmingham Borough Surveyor's office under the late Mr. Pigott Smith. He, however, soon found greater scope for his talents in private work, and we believe one of his first notable commissions was the designing of the Hebrew Synagogue, Singer's Hill. His next important work was in connection with Francis Road Chapel, Edgbaston, and in this he showed a departure from convention by adopting the Gothic style—a proceeding which, it has been said, was not to the liking of the older generation of Nonconformists of those days, though the example has been frequently copied since. Another building which added to Mr. Thomason's reputation as an architect was the Union Club premises in Colmore Row. The plans for St. Asaph's Church and the restoration of Harborne Church were other undertakings entrusted to him, and he designed the "Birmingham Daily Post" office. His greatest work, however, was the Council House, which, however, is now rapidly becoming too small for the accommodation of the many departments of municipal work. His plans were selected as the result of a competition. When the Art Gallery and Gas Offices came to be added Mr. Thomason again had the planning and supervision of the work, and it was carried out in a manner worthy of the original building. Among the more recent buildings which he designed may be mentioned the Jaffray Suburban Hospital.

Queen Victoria Memorial. AT a meeting of the Council of the Society of Architects held on Thursday, April 25th, 1901, the following resolution was unanimously passed : "That in the opinion of the Council of the Society of Architects (founded 1884) all architects being British subjects should be granted the privilege of showing their loyalty by submitting designs for the National Memorial to her late Majesty Queen Victoria under conditions which should put those resident in distant parts of the Empire as nearly as possible on an equal footing with those living in England, and that a copy of this resolution should be sent to Viscount Esher, with the request that it be laid before his Majesty the King." In reply the following has been received from Lord Esher : "I have now the honour to inform you that, in accordance with the request contained therein, this resolution has been laid before the executive committee appointed by his Majesty the King. I am instructed to say that the committee see no reason to depart from their original decision, taken after careful and due deliberation."

The late Mr. R. Lofthouse. WE regret to announce the death of Mr. Roger Lofthouse, head of the firm of Messrs. R. Lofthouse & Sons, architects, of Albert Road, Middlesbrough, which occurred at his residence, The Croft, Linthorpe, recently. Mr. Lofthouse was a native of Wensleydale, where he was born in 1846, and received his education at a private school there and at Dr. Greaves' Academy in Middlesbrough. After being for some years with a local firm of architects and builders, he commenced business in Middlesbrough as an architect, and during the past quarter of a century gradually built up a large and valuable professional practice in the town and the North Riding. He was a Fellow of the Surveyors' Institute, an ecclesiastical surveyor for the diocese of York, and a valuer under the Finance Act to the Middlesbrough County Council. He was an ex-president of the Cleveland Naturalists' Field Club, of which he was one of the founders, and a member of the Yorkshire Archæological Society. Mr. Lofthouse was at one time a keen artist, and besides painting considerably in oils did a good deal of etching and lithographic work and made a series of drawings for the late Canon Atkinson's "History of Cleveland." In 1895 and 1897 he took his sons, Mr. T. A. Lofthouse and Mr. J. A. Lofthouse, both Associates of the Royal Institute of British Architects, into partnership with him.

Lord Leighton's House. A PUBLIC meeting was held in the Town Hall, Kensington, recently in support of the movement for the permanent maintenance for the borough and the nation of the house and grounds of the late Lord Leighton, with the collection of his drawings and sketches now therein. The Bishop of London moved the first resolution as follows : "That this meeting warmly supports the movement which has been inaugurated having for its object the dedication to the public of the house and grounds of the late Lord Leighton, and the collection of art treasures secured therein, to be a memorial to that great artist, and as a public gallery, museum, and centre of art work for the borough of Kensington." He said the Bishop of London was concerned with all that made for the happiness of Londoners, and therefore it was his duty to support any movement the object of which was to brighten the lives of the people. A long experience among the poorer classes had convinced him that they appreciated beauty of sound and beauty of form. Another reason why he gave his cordial support to the scheme was that the house would be the centre of art teaching for the population of Kensington. Sir William Richmond, R.A., in seconding the motion, said it did not fall to the lot of every generation to commemorate a great artist, a great man also, in so fitting a manner as that in which it was proposed to do in this instance. Leighton was a great artist ; he was also a great man, a man of whom not only his country but foreign nations had a right to be proud. Facile and brilliant, Leighton was never satisfied with his achievements ; his modesty was as conspicuous as his activity was untiring ; the power of taking pains was a gift cultivated in him to perfection. If one word more than another applied to Leighton it was nobility. His was a name which engendered in many enthusiasm in all respects. The intention of the scheme was that the house should be maintained for the nation as a centre of all that was most beautiful and elevating in art, music and letters, and an intellectual possession accessible for the poor as well as for the rich. That intention was in complete harmony with Leighton's whole life. The motion was agreed to. Earl Percy, M.P., moved : "That representations be made to the borough council of Kensington, inviting their co-operation in securing the success of the movement, and suggesting that the council might fitly commemorate their inaugural year of office by accepting the gift of this property and permanently maintaining it under their statutory powers as an institution for the encouragement of the study of literature, science and art in the borough." He said the cost of maintaining Leighton House, if it were taken over, would not amount to more than a farthing rate, in addition to the library rate, once every three years. If the borough council could see its way to carry out the wishes of the meeting, Leighton House in their possession would be not merely a school of art, a museum of priceless curiosities, a concert or a lecture-hall ; it would be a perpetual memorial of one who was a great citizen as well as a great artist, and a perpetual record of the pride and reverence which Kensington felt for one of the best and most distinguished of her sons. Mr. Lionel Cust seconded the motion, which was unanimously agreed to.

The Alfred Millenary Exhibition. A SMALL exhibition is arranged at the British Museum, containing all the antiquarian treasures that the national collection can boast as having a relation to the great English King Alfred. The one precious relic, the Alfred Jewel, that tradition and pious belief hold to have been his, is preserved in the Ashmolean Museum at Oxford, and is here only represented by a careful facsimile. Professor Earle, of Oxford, has recently printed an elaborate monograph on this precious relic. A note of another kind is struck by the finger rings of Ethelwulf, King of Wessex, and of Ethelswitha, Queen of Mercia, the father and sister of Alfred. Fortunately in both of these the craftsman has added the one needful thing, the words "Rex" and "Regina" following the names. Compared with the Alfred Jewel, the charms of these two historical objects are small ; they have no brilliant colouring save that of the rich gold of which they are made, and in design they are simple and modest. Such artistic features as they possess, however, are pleasing, and show such a skill in the gold work and in inlaying of the niello that adorns it as to make it a matter of question whether they, equally with the Alfred Jewel, are not the productions of Roman rather than English smiths. In pure charm of colour, as well as of design, the three enamelled brooches shown beside the rings are far to be preferred to them. It must not be assumed, however, that all the objects in the exhibition were once royal property, nor, indeed, that they are of only one class. A silver spoon and fork found in Wiltshire, with coins of the ninth century, is shown ; while a piece of lead on which the Saxon moneyer Ealdulf has struck a proof of a penny of Alfred forms an appropriate introduction to the series of Saxon coins that have been selected from the cabinets of the coin department.

EXAMINATIONS FOR CLERKS OF WORKS AND BUILDERS' FOREMEN.

MODEL ANSWERS TO THE QUESTIONS SET.

By GEORGE ELLIS, Medallist.

THESE examinations in carpentry and joinery are held annually in June by the Worshipful Company of Carpenters at their hall in London Wall. Certificates of competency signed by the master, and sealed with the company's seal, are awarded, as are also gold, silver and bronze medals to the three best candidates.

The examinations are intended to be suitable for shop and outdoor foremen in carpentry and joinery, and clerks of works and others who have to deal with the construction of buildings. The examination board comprises the following: Professor T. Roger Smith, F.R.I.B.A., Mr. John Slater, B.A., F.R.I.B.A., Mr. John Willson (Warden of the Company), Mr. James Bartlett, M.S.A. (Assistant Lecturer at King's College), Mr. S. Barter (Examiner City and Guilds Institute), Mr. Stanton William Preston; and the following gentlemen are annually invited to join the board: The President of the Royal Institute of British Architects, the President of the Institution of Civil Engineers, the President of the Architectural Association, the President of the Institute of Builders, the President of the Clerk of Works Association, and Sir Philip Magnus, of the City and Guilds Institute. Each candidate must be twenty-one years of age or upwards on the first day fixed for the examination. He must have paid an entrance fee of five shillings, and must have given notice in conformity with the regulations stated herein. He must have passed at least in the ordinary or pass grade of the examination in carpentry and joinery conducted by the City and Guilds of London Institute, or the Science and Art Department's Examination in Building Construction, which examinations the company accepts. Exception may be made in favour of candidates over thirty years of age. The examination is such as to test the practical skill of the candidates as workmen, their know- of materials and their acquaintance with the subject. It will be partly by written answers and drawings of a practical character, partly by work done at the company's workshops in the presence of moderators and partly oral. Candidates who have already gained a second-class certificate and present themselves to obtain a first-class one will be allowed similar marks for the practical work to those they have previously obtained, and need not go through it again. No candidate who has obtained a medal will be allowed to sit for this examination again, and a candidate who has obtained a first-class certificate will only be allowed to sit once more. The subjects for examination comprise the following :—

1. The nature and properties of timber, its decay and preservation.
2. Timber framing.
3. Joiners' work.
4. Shoring.
5. Temporary structures.
6. Centering.
7. Scaffolding, tackle and hoistings.
8. Timberwork in excavations and staging.
9. Describing at sight actual specimens of various sorts of wood, and defects in timbers, which are to be placed before the candidate.

[Full particulars of the examinations may be had on application to the clerk to the company.]

Question 1, Division III. (1893). *Make a detail drawing to scale of $\frac{1}{8}$ full size of the head, meeting rail, transome, sill, and any other parts you please of the casement frame and sash, shown in drawing No. 1 on the lithographed sheet supplied you.* (30 marks.)

For a solution to this question see Figs. 1 and 2, which are respectively broken vertical and horizontal sections through a French casement frame, with inward opening sashes and fanlights. Fig. 2 has been arranged to show on the one side the hanging jamb of a double light frame, and on the other side the striking jamb of a single light frame; whilst the central part shows the meeting stiles of a pair of casements finished with a hook joint and prepared to receive an espagnolette bolt. A hinged metal water bar closes the joint at the bottom of the casement.

Question 5, Division IV. (1896). *The side wall of a house 30ft. long 27ft. high to the eaves has shown serious signs of failing through faulty foundations. Give drawings to $\frac{1}{4}$in. scale, showing the raking shores, needling up, &c., requisite to rebuild the lower part, to a height of 10ft., the top being sound. Two window openings on the first floor, each 3ft. by 5ft. high, equidistant from centre pier, which is 4ft. wide. The wall 18in. thick to ground floor, the rest 14in.; height of stories in clear, ground 10ft.; first floor, 9ft. (no basement). Joists bed in the wall.* (50 marks).

Figs. 3 and 4 are a section and elevation of the wall meeting the required conditions. Three sets of raking shores are required, one against each flank wall and one against the pier. The whole of the under part of the wall having to be taken out and rebuilt, at least five needles with pairs of dead shores will be required to support the upper portion meanwhile. The weight of the floors, &c., is supported by independent strutting, which transfers the load to the lower plates, carrying the inner dead shores. Assuming the rupture of the foundations to be due to a subsidence of the subsoil, it would not be wise to lay the inside plate parallel with the foundation trench; short transverse baulks should be used as shown. The dotted lines in Fig. 4 indicate the interior strutting.

Question 2, Division VIII. (1900). *A warehouse floor is carried on iron girders 12ft. apart centre to centre. Sketch the wooden joisting of one bay, showing the plates, the method of supporting them on the girders, and the notching of the joists over them; also show the trimming for a trap-door 6ft. square in the clear in the middle of the bay. Also sketch the principal joints and connection.* (50 marks).

For solution see Figs. 5, 6, 7, 8. Fig. 6 is a part plan of one bay showing 11in. by 3in. joists notched between 12in. by 6in. R.I. girders, and resting on 4in. by 3in. plates bolted to the girders. The trimmers to the opening are 11in. by 4in.; on one side 6in. by $1\frac{1}{2}$in. floor battens are shown, on the other the naked flooring, with a part in horizontal section at A. The trapdoor is made in two leaves of 6in. by 2in. battens, resting 1in. at each end on the trimmers, and on a 11in. by 3in. movable bar in the middle, the latter being half-notched into the trimming joists for $\frac{1}{2}$in. at each end. Fig. 5 is a section on B B; Fig. 7 an isometric sketch at the centre of the joint between trimmer and trimming joist; Fig. 8 a sketch showing the method of connecting the plates and joists to the girder.

Question 1, Division IX. (1899). *Is baulk timber preferable to plank for general use? and if so, why?* (25 marks.)

Baulk or whole timber is preferable to plank or cut timber for carpentry and all constructive purposes, but not generally for joinery work, because, in the first instance, a maximum of strength with a minimum of scantling is required, and this can only be obtained when the majority of the fibres of the wood run continuously throughout the baulk, as in unsawn timber; in the second instance, appearance and

ueness of section are of more importance than rength, consequently, purpose cut timber is ore suitable.

Question 4, Division IX. (1895). *Does timber rink endways of the grain? If so, name any mbers that you know that do so, giving par- culars of qualities and place of growth.* 35 marks.)

The great majority of timbers do not shrink ppreciably in the direction of the grain, but here are a few exceptions; amongst the more miliar woods may be mentioned English Elm, auri Pine and Basswood. The shrinkage of e first is probably more apparent than real in e direction of the length of the fibres. This ood, being particularly twisted or cross grained, as seldom its fibres running parallel with the rface of a cut plank, and a shortening of the lank would probably be due to the lateral rinkage of some of the crossing fibres. Kauri r Cowrie) pine, a native of New Zealand, is a ugh leathery wood of somewhat loose texture, e tree growing to immense size both in height nd girth. It is a peculiarity of this wood that it rinks but very slightly in width or transversely, hilst its end shrinkage is very persistent; even fter two years of drying a drawer front fitted uite tight one day will fall cut easily the next. he American tulip tree wood, commonly known s basswood, a native of the Middle States of orth America, a spongy, soft but tough wood, also subject to slight shrinkage in the direc- ion of its length.

Question 1, Division I. (1898). *Explain the llowing terms used in connection with strains wood: Compression, tension, transverse strain, eutral axis, fatigue of material, elasticity, ermanent set.* (25 marks.)

"Compressive stress" is the force tending to ush the fibres of wood in the direction of their ngth. "Tensile stress," the force tending to pture them by pulling asunder. "Transverse ress" is a force applied either obliquely or at ght angles to the fibres, and tending to break em across. "A strain" is the change of form roduced by the stress, and would be termed in cordance with the direction of the force; for stance, a transverse strain in a beam would be roduced by overloading it in the middle. The neutral axis" is the imaginary layer near the iddle of a beam carrying a load where the resses change their direction; the fibres in e upper part being strained compressively, d those in the lower part tensionally, there a part where the stresses counteract each other and the effect is nil. This part is termed the neutral axis. "Fatigue of material" is the deterioration or weakening which members of structures suffer under long continued loading or vibration. "Elasticity" is the property which wood has of returning to its original form after being strained. "Permanent set" is a term applied to any alteration in the shape of a member of a structure when it has been strained beyond its elastic limit, and does not return to its original shape after the stress is removed. It is then said to have acquired "a permanent set."

New Patents.

These patents are open to opposition until August 26th.

1900.—**Mosaic, Tile, &c., Paving.**—14,697. G. F. THOMSON, Isebank, Wellingborough. The flooring or paving is constructed in sections consisting of a number of blocks, tiles, &c., mounted on a slab of artificial stone by means of a key.

Artificial Stone.—14,778. A. H. CROIZIER and A. E. THOMINE, 9, Rue Mogador, Paris. Artificial bricks or stones are made by adding clay or loam earth, in its natural state or in a dry pulverulent condition, to fat lime with an addition, or not, of sand, the whole well mixed in appropriate proportions, and then moulded in a hydraulic press, and finally subjected to the combined action of heat and pressure in the midst of steam.

Hoists and Elevators—15,136. C. WUST, Seebach, near Zürich, Switzerland. Instead of the usual method of causing the ropes to move up and down in the well, the ropes are attached to the top and the cage wound up and lowered on the ropes by means of an electric motor attached to the cage.

Concrete Floors.—15,388. M. KOENEN, 129-130, Potsdamerstrasse, Berlin. In a concrete floor having strengthening ribs in which are embedded iron tie rods, these ribs are supported along their whole length on wooden beams; the tie rods are also made to serve as hangers for supporting the wooden beams

1901.—**Windows.**—816. J. M. BYRENS, G. E. DREW and T. R. PEARSON, Bank of British Columbia Building, Columbia Street, New Westminster, British Columbia, Canada. To prevent draughts, keep out wet or dust and prevent the sashes from rattling, a strip having a right-angled side is introduced along that portion of the pulley stiles, the head frame and the side covered by the sash frames, and lies in a rabbeted groove. The invention is also to provide against the window being displaced from its proper position, and allows it to slide up or down in a convenient manner.

Picks, Hammers, &c.—4,318. J. SHONE, 96, New Road, Tuebrook, Liverpool. The working end or point is formed separately from the main body of the hammer or pick, socketed into the other end, and locked or held in so as to enable it to be removed if required.

Manufacture of Portland Cement.—10,297. C. VON FORELL, Giessen, Germany. A process for making Portland cement from blast furnace slag, which consists in the slag being granulated in water, forming a spongy loose mass, being heated to fusing or clinkering point with its natural proportion of lime (about 50 per cent.), or if necessary being brought up to the required proportion by the addition of lime, then the fused product being cooled down and ground.

The following specifications were published on Saturday last, and are open to opposition until September 3rd. A summary of the more important of them will be given next week.

1900.—11,452, BULMER, soldering irons. 11,653, EWING, joints of earthenware or other pipes. 12,124, SPENCE, SPENCE, SPENCE & ROYLEY, treatment of sewage sludge. 12,418, THACKRAY & THACKRAY, road scarifiers. 13,495, LANCASTER (*Perfection Window Hinge Co.*), means for enabling sash windows to be cleaned from the inside. 13,534, LAKE (*Ogden & Ill*), door-checking and closing apparatus. 13,931, BROWN, appliance to control downdraughts and smoke, the like as an exhaust ventilator. 13,947, BIRCH, holders for incandescent gas mantles. 14,253, COPE, means of attaching door knobs to their spindles. 14,738, SAUNDERS, heat radiators. 15,187, BROPHY, cocks or valves. 15,245, EVERARD, portable apparatus for supporting lifting tackle. 15,352, ROUSE, concrete for building, paving and other purposes. 15,390, LILLIE, domestic hearths. 18,350, LAKE (firm of *Fellner & Ziegler*), cement kilns. 22,088, GLUTH, incandescent gas burners.

1901.—1,300, MALTBY & RATCLIFFE, jointing of water, gas and other mains. 3,824, AMES, clay pipes or tubes with internal partitions. 8,859, GERLING, safety appliances for hoists, lifts, &c. 9,397, HELD, spring-hinges. 9,518, KLOTZ & GRUNDMANN, pivot hinges for cupboard doors. 10,725, WISE (*Klinger*), acetylene gas generators. 10,892, Lindqvist, pipe cutters. 10,929, Marsden & Anderson, water-steam or other taps. 10,944, Bobe & Bobe, road scarifiers. 10,946, Perron, rules. 11,057, Price, protractors. 11,060, Müller, seats for closets.

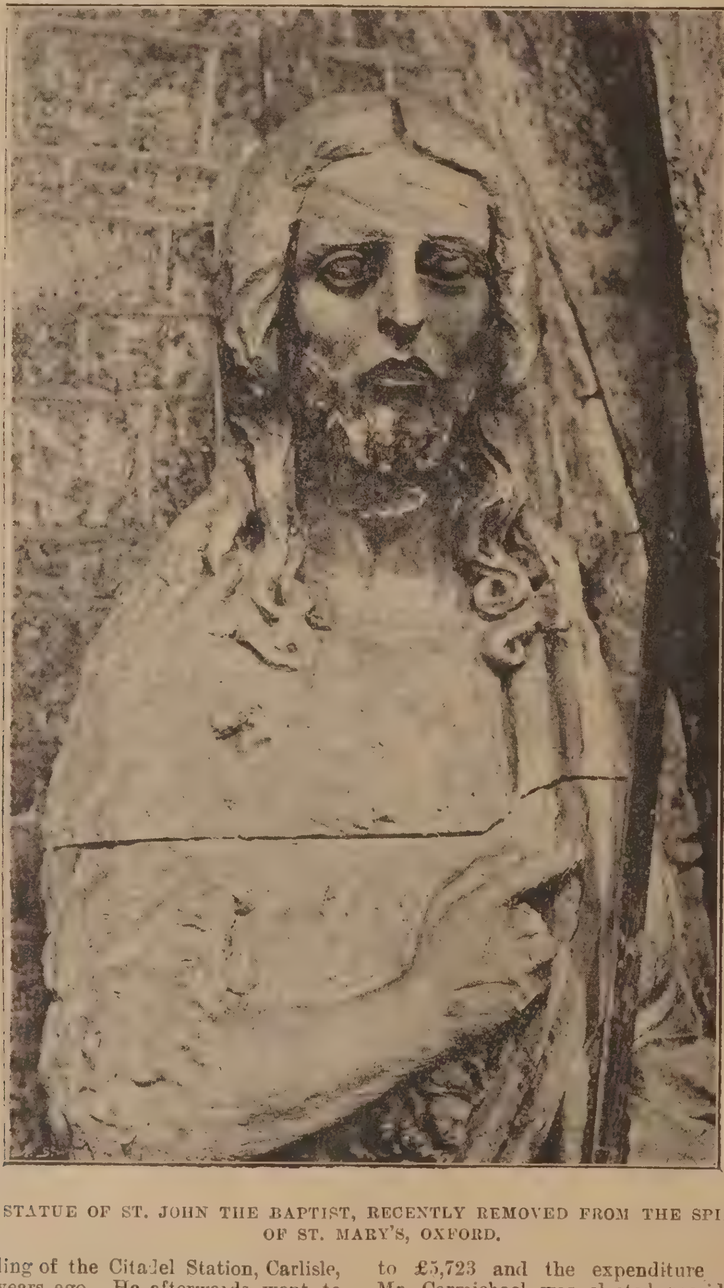
Builders' Notes.

The First Granite ever sent from the United States to Europe will be shipped to Scotland next month from Stonington, Maine. The American quarry companies say they can sell Main granite in Glasgow, Aberdeen or Liverpool at 4s. per foot, whereas Scotch granite costs about 9s.

Mr. John Westmorland, of Southport, owner of the Imperial Hotel, Liverpool, the Grand Hotel, Whitehaven, and the Great Central Hotel, Carlisle, died recently. He was a self-made man. The son of an innkeeper at Brampton, Cumberland, he was born about seventy-five years ago, and became apprenticed to a joiner. He worked at the building of the Citadel Station, Carlisle, over fifty years ago. He afterwards went to Liverpool, where he commenced as a builder, and was fortunate in speculations in property he sold to the railway company. He bought the Imperial Hotel, and some fifteen years ago built the Great Central Hotel at Carlisle. He also purchased the Grand Hotel at Whitehaven, and owned much property at Huyton.

Mr. John Cowley, of Arnold Street, Rugby, died recently at the age of seventy-four years. Mr. Cowley came of a well-known and respected Northamptonshire family many years domiciled at Crick, he being born, however, in the village of Yelvertoft. When a young man Mr. Cowley commenced business as a builder in Rugby. The work on the extensive property of the late Messrs. Benn was almost exclusively done by him; and as a setter of gas retorts and ranges Mr. Cowley possessed a reputation in the neighbourhood.

The Builders' Benevolent Institution held its annual meeting last week under the presidency of Mr. J. T. Bolding. The report stated that, notwithstanding the calls which had been made on the charitable public, the institution had not suffered to such an extent as might have been expected, though it was a matter of regret that there had been a falling-off in the annual subscriptions. It was expected, however, that in the future the number of candidates would be greater owing to the alteration of the rule reducing the age-limit from 60 to 55. The balance-sheet showed that the receipts, including the balance of £833 brought forward, amounted to £5,723 and the expenditure to £1,813. Mr. Carmichael was elected president for the ensuing year.



STATUE OF ST. JOHN THE BAPTIST, RECENTLY REMOVED FROM THE SPIRE OF ST. MARY'S, OXFORD.

The two Statues illustrated on this and the opposite page were unfortunately removed about four years ago from the spire of St. Mary-the-Virgin, Oxford, when the church was restored by Mr. G. T. Jackson, R.A. These old Gothic sculptures are extremely fine examples; and though we regret their removal from their proper position, they have happily been preserved in the old Congregation House.

EXPRESSION IN ARCHITECTURE.

By HENRY RUTGERS MARSHALL.

ALL who are interested in architectural practice, either directly or indirectly, are familiar with a doctrine which has much currency in our day that buildings must express their purpose and their structural qualities in their design if they are to be looked upon as works of architecture. Not a few readers, indeed, who have been influenced perchance by Ruskin's fascinating writings, may have come to look upon this dogma as a recognised cardinal principle of the art of architecture.

But if one has thus accepted this dogma, and in connection therewith has taken the trouble to study with care the work of contemporaneous builders, he can scarcely have avoided the somewhat depressing conclusion that architecture is for us a lost art. Indeed, one may go much further than this; for a student who has followed with critical bent the historical development of what is usually called architecture in the past, and who has at the same time kept this dogma always in mind, must surely have found himself forced to the position, which is apparently held by some of our most prominent architectural critics, that architecture ceased to exist at least 3,000 years B.C., and long before any buildings were constructed of which any examples are now extant.

It is apparent from the words above written that the validity of the dogma above referred to is to be questioned in what follows. Nevertheless the reader must not look for an argument to prove it utterly valueless, rather will he find reason, after all is said, to trust to it in a way, as the architect will find reason to work by it; but this not because the dogma will appear in the end to be true in itself, but because it will be seen to veil a real truth. What this real truth is we will consider briefly at the start, that we may be the better prepared to speak of special examples later on.

We most easily grasp the truth which is back of and veiled by this dogma if we first come to realise that it is only a special adaptation of what has long been held to be a general æsthetic principle. It is but an interpretation of the general dogma of artistic realism in terms of the art of which we speak specially in this article, and to this general dogma of realism we may well direct our attention for a moment, before considering its special architectural adaptation.

This general dogma of realism may be stated thus: "Fine art is the expression of the true essence, of the real nature, of the subject presented by the artist." This is a dogma with which we are all made reasonably familiar by the teachings of the literary realists of the day—of writers like Zola, for instance, and Howells; and it is a dogma that is comparatively easy to uphold so long as we forget, what we should never forget, that literature is only one form of artistic expression co-ordinate with sculpture, painting, music and architecture. But when we are asked to broaden the application of the dogma to all the arts we at once see that it cannot be upheld in its original form; that it must be qualified, or limited or restated if it is to appear in any way applicable to all the fine arts.

It very obviously does not apply to modern music, for instance, without such qualification and re-statement; and if we but think of it, we find that the same is true in all the arts, to no two of which can this principle be applied with exactly the same significance. As we have already noted, the doctrine we are discussing is but a re-statement of this general dogma of realism to make it applicable to architecture, which we are specially considering in this article.

In order to make the supposititious principle thus applicable to the work of the artist-architect it has been assumed by its defenders that the true essence of architecture lies in its constructional and practical worth, and that true architecture, therefore, consists—first, in the expression, in building, of constructional values; and, secondly, in the suggestion, upon the exterior, of the uses which the hidden interior portions of buildings, as wholes, or in their pecial parts, are intended to subserve. But it is easy to show that both of these assumptions are entirely unwarranted.

To consider first the expression of structure. There can be no doubt, of course, that there is great æsthetic value in certain expressions of constructional function in the design of a building; but to claim that the expression of constructional function is *per se* necessarily æsthetic is certainly impossible; for were this true, all scientific engineering would have architectural value, which manifestly is not the case. Think, for instance, of the ugliness of the ordinary cantilever bridge in which constructional function is most clearly expressed. It is evident, in fact, without argument, that works of engineering must thrill us with their beauty if they are to lay claim to the possession of architectural values.

If we consider the second assumption of the architectural realist—the assumption that the suggestion of the interior uses of a building in the design of its exterior is of the essence of good architecture—we find it equally unsatisfactory.

It is true indeed that certain indications in the design of the facades of a building which lead one to appreciate the purposes for which the interior is to be used give satisfaction to the beholder, a satisfaction which often adds much to the æsthetic value of the whole mass; but to hold that the indication upon the exterior of the purposes for which the parts of a building are to be used is necessarily æsthetic is manifestly absurd; for such a principle in an ideal building would require the architect to indicate by appropriate forms or decorations the existence of menial offices which we not only wish to forget but which we actually must necessarily lose sight of if we are to enjoy the beauty of a building as a whole. Suppose, for instance, that we felt ourselves called upon to emphasise the kitchens and sculleries of our large mansions, say by decorating the windows with representations of pots and pans, as we use book-plates sometimes in the decorative leaded glass in our library windows.

It becomes evident, then, that while the uses of a building or of its parts may be expressed in the forms employed in the design, nevertheless this expression must be beautiful if it is to add to the æsthetic character of the structure. It is apparent that we have discovered no "royal road" to the attainment of beauty in architecture when we have grasped the realistic dogma we are now studying.

And if we examine the general dogma of realism of which this architectural dogma is an adaptation we at once see that it itself is utterly inadequate as a guide to the artist in any field; for it is very easy to show that, far from being given up to the expression of truth, all of the arts are deliberately concerned with, and are based upon the adoption of, conventions that are *per se* inherently untrue.

No art attempts what can, by any stretch of terms, be called a complete expression of truthfulness. In all the arts we find the artist working on the basis of conventionalised falsities; and this is true even in those arts which so clearly deal with realities that they are commonly designated as the imitative arts.

For instance, in sculpture—which is perhaps the most clearly imitative of all the arts—we find the artist expressing his genius by presenting to us beauty of form in all cases, whatever else he does, and in most cases he pictures for us living forms. But note that for this purpose he uses lifeless material; and that, in order to emphasise the beauty of form, he deliberately avoids expression of movement and colour; and in this he assumes unreal conventions. And mark how firmly this convention of unreality has been fastened upon us. Lessing, the reader will remember, makes it a canon of the criticism of sculpture that movement must not be portrayed. And as to colour, if anyone will take the trouble to speak of this subject with the greatest of sculptors, and the best informed, and most thoughtful of other artists, he will find how deeply rooted is the objection they have to coloured sculpture. It is true that some of the best sculptors have, from time to time, attempted to use colour in their works, but the colouring has seldom been realistic, and where the sculptor has reached any measure of success in such attempts it has been by adding to his work delicacy and charm rather than that special nobility of beauty which can be impressed upon us by sculpture as by no other art.

The painter goes even further than the sculptor in the direction we are considering by assuming as a necessary convention of his art an added falsity. Form he depicts as does the sculptor, and perspective and even movement, but all "in the flat," upon plane surfaces; and as the sculptor artist in general objects to the use of colour in his work, so the painter artist would look upon the painter who might model up his work before applying his brush as something of a trickster; although, mark you, in this modelling the so-called trickster would, in fact, be assuming less of falsity than the one who works in what we feel to be the legitimate field of the painter's art.

The mural painter has a special convention of his own which demands that the feeling of the flatness of the constructional surface, of its attachment to the wall itself as part and parcel of the building, must never be lost through all his work.

The painter of whom we have been speaking gains his effects by assuming many untruths, and endeavouring to reproduce merely true relations between colour masses; but the painter in monochrome, and the draughtsmen in black and white, assume still another falsity, and deal merely with relations of mass, and values of light, eliminating all colour. Some artists, in fact, have been most successful in expressing these relations of mass and light value by the deliberate use of colour which is impossible to the Nature they are interpreting.

Recall, for instance, the marvellous effects Turner obtained in his water-colours in this way. We may differ in our estimate of Turner if we judge him from his work in all; but no one can deny his great genius who has studied the large number of his water-colours gathered together in the National Gallery.

But beyond the unrealities in the art of painting thus far mentioned, note furthermore that the highest "key"—(if we may use the slang of the studio)—that the highest "key" at our command for use on canvas or wall surface is most untrue to Nature's "key." Furthermore, size and scale are also both deliberately falsified by the painter and draughtsman.

Perhaps the point we have been considering is made by reference to these two arts alone, but it may be well to go further and mention a few of the unreal conventions assumed by artists in other fields.

The dramatist deliberately assumes unreality of entourage, and untruth in all but the main suggestive relations of active expression. In connection with the development of the earliest drama men have discovered that the repeated story, the written word, will, to a great extent, produce the full effect of dramatic action, and they have thus again reduced the truthfulness of expression by describing action instead of acting themselves. The poets have gone still further and have added other conventional unrealities, namely, those of rhyme and rhythm. We have thus in poetry no real expressions of real activity; in their place we have mere verbal symbols which lead us to imagine or recall activities.

Finally, we have the extreme of falsification by the artist-writer, who, like Stevenson at times, or like Carroll in his "Alice in Wonderland," deals with altogether imaginary lives of imaginary people. Yet this art of literature,

STATUE OF A BISHOP, RECENTLY REMOVED FROM THE SPIRE OF ST. MARY'S, OXFORD.
]

which assumes such a wide range of untruth in its technique, is the form of art in which those express themselves who speak loudest to-day in favour of realistic dogma.

Perhaps the strongest corroboration of this argument is furnished by the art of music, as it has developed in modern times; for in music the absence of realism is very marked, while, on the other hand, the musician is dominated by—some, indeed, will say overburdened by—artificial and unreal conventions of many kinds.

And if we turn to architecture, with which we are most concerned in this article, we find the same characteristics emphasised in a very distinct way; these characteristics, however, need not be dwelt upon at length just here, for in the course of what follows they will be referred to very fully.

At the moment it will be well to mark one conclusion to which we are forced. It is impossible to believe that all the assumptions of unrealities above referred to are irrational; we cannot agree that these unrealities are forced upon man, and that the great artist is ever endeavouring to express truth in and through these unrealities that press him down, as must be the case if the realist is correct. Rather, on the contrary, must we agree that these unrealities have been deliberately assumed by man in the course of his æsthetic development; and this becomes clearer when we discover that this assumption of unrealities by the artist is easily explicable.

The first artists were those who tried to produce beautiful objects which they could contemplate whenever they so desired—that, is they had perceived beauty in Nature, had mourned its evanescence and sought in some way to make it permanent. Naturally, they attempted to gain this end at first by imitating the beautiful and admired object. But presently they discovered that they were able to make their work more thoroughly beautiful if they assumed certain unrealities in order to enable them to emphasise certain qualities which were necessary to the beauty for which they were in search. And, as a matter of fact, we find when we come to consider it that unconsciously they have always assumed these unrealities in some measure.

The artist always does his best when he produces by the use of any special material or method effects which cannot be as well or as economically produced by any other technique; and this fact forces the artist who uses any special medium to emphasise the qualities which this medium enables him to present most effectively at the expense of others which cannot be so effectively treated; these latter are thus thrown into the background, to the loss of their reality but to the great gain of æsthetic result.

It is because we accept this principle, though usually unconsciously, that we object as most of us do to coloured sculpture; for mere colour effects can better be produced by the painter than by the sculptor, while beauty of pure form can be better presented in sculpture than upon the painter's canvas. For the same reason critical people have come naturally to object if they find the water colourist using solid opaque colour, as though oil pigment were its medium. They do not object, mark you, because this misuse of material opposes a principle which they have gained by generalisation, for few indeed are the critics of art who know anything about general æsthetic principles: they object because they have adopted a convention of unreality which makes such technique illegitimate, and they have adopted this convention because they have learned that transparent washes of water colour laid upon light reflecting paper enable the artist to produce beauties of relations of light which solid non-transparent oil pigments can never give.

For the same reason again do the musical critics object to "programme music." Why they object they can perhaps not tell you, but it is surely because they appreciate that for the artist who would express himself in this direction literature furnishes a better medium than music does; while the conventions of literature, if applied to music, limit its flow and development in a most unfortunate manner. They realise that reality should be sacrificed if special beauty is attainable by the sacrifice.

It is thus that we can account for the persistence of the conventions of which we have been speaking, and their existence for ever discredits the dogmatism of the realist by showing that thoroughgoing truth is not necessary to the highest forms of beauty, and that the expression of truth and the production of art work are in no sense co-ordinate.

It may be taken for granted then that the current doctrine of realism is not a sound one; and yet some reader may say to himself as he reads: "It is remarkable that this doctrine of the realist is so very persistent if there is so little in it; may there not be, nay surely there must be, some basis for the doctrine if it has kept alive, as it has, ever since Aristotle's philosophic ancestors began the discussion of Æsthetics." This objection, indeed, seems to be well taken; but it is not difficult to explain the reason this discredited doctrine keeps everlastingly bobbing up, and in stating this reason we shall indeed find the truth at the base of this supposititious principle of the realist.

We men and women are persistently bad logicians, and when we find that an argument serves us well on the whole we take it for granted that it is valid. We discover that non-X gives us Y, and from that we very commonly draw the illegitimate conclusion that X will give us the opposite of Y.

We say clear sky, no rain; and then not clear skies; that is, cloudy skies, therefore rain. Now this conclusion is not a valid one, and as a matter of fact we know it does not always rain when it is cloudy; nevertheless for practical purposes the argument serves us very well, for it so often does rain when it is cloudy that most of us go without our umbrellas if it is clear and take them if it is cloudy; and we should consider ourselves incapable of judging from experience if we did not do so.

It is in accordance with this bad logical habit of ours that we take certain experiences which give us a sense of ugliness, and argue that if we could gain opposite experiences we should gain beauty, which is the contrary of ugliness; but this surely is an entirely illegitimate conclusion.

Men note, for instance, that objects in Nature which depart widely from her types are ugly—the monsters of one kind or another; and they, therefore, say "follow Nature's types" or "imitate Nature" and you will produce beauty. But what right have they to make this statement? It is true, indeed, that we shall not produce ugliness if we follow Nature's types; but no arguments from such premises ought to lead us to expect to gain the opposite of ugliness, *i.e.* beauty, by picturing Nature's types. All we can be sure to gain by this means is the absence of ugliness.

Or to take another instance. Certain students of æsthetics have noted that inharmonious relations of colour or form or tone are ugly, and they have argued that if we produce harmony we shall gain beauty; and these theorists have raised the doctrine of harmony to the dignity of a basic principle in æsthetics. But a proper argument will surely lead to no such conclusion. All that we can certainly expect if we avoid discord is a lack of ugliness, not necessarily an acquisition of beauty.

Now it is in this same manner that the realists reason. Having noted that unreality, untruth, are essentially disagreeable and hence ugly, they argue that if we gain the opposite of unreality and untruth, that if we gain impressions of reality and truth, we shall have obtained beauty, which is the opposite of ugliness. Upon this fallacy is their theory based.

But here again we find the invalidity of the conclusion. If we avoid untruth we shall in fact avoid so much of ugliness as was determined by this untruth, but by no means is it a fact that we shall gain an impression of beauty.

The correct doctrine for us to inculcate then is not the realist's dogma, "Strive to express truth," but a much more modest doctrine—"If you would produce beauty begin by avoiding untruth."

And now if we apply what we have been saying to the art of architecture we find that we have in this principle of truth, of sincerity, of veracity, as applied to the art of architecture but a half truth, as, indeed, we have seen that the doctrine of artistic realism in all its modifications expresses but a half truth.

In architecture, as in all the arts, untruth, insincerity, lack of veracity and pretence are in general disturbing, unpleasant and therefore ugly; if a work of architecture, therefore, is to have permanent æsthetic value it must avoid the expression of untruth and pretence.

Now the easiest way for the lazy thinker to manage to avoid this expression of untruth and pretence is to bear in mind, and to some extent to express, the truth. But this mere expression of truth will never make a work of man's hand æsthetic: the æsthetic quality is something which must be superadded.

The aim of every artist should be to produce an object of permanent beauty in whatever material he expresses his conception: this he cannot well do if he shocks the observer in any way whatever, and one of the worst of shocks is that of unreality. If the artist be an architect he cannot succeed in producing the effect of permanent beauty in his buildings if he persistently lies about the construction he adopts, or if he constantly deceives us about the uses of the apartments he erects; but this is due not to the fact that where he succeeds in producing an æsthetic result the truth is expressed, but to the fact that lying and deception are in themselves anti-æsthetic. For mere sincerity and lack of pretence in one's architectural work will not make it artistic; to this negative lack of deceit must be added the positive quality of beauty which brings to the masses of cultivated beholders a permanent feeling of pleasure.

It cannot be denied that the architectural student gains a certain practical value from the emphasis of the dogma of truth: wherein this value lies becomes clearer if we take a familiar analogy from our ethical life. It is more effective to teach the child the importance of speaking the truth than it is to correct him for falsehood. Nevertheless in ethics we practically try to keep in mind general ethical ends, and often quite properly avoid blurting out perfectly certain truths when they are unimportant and inopportune. Correspondingly in æsthetics, it is easier to emphasise its value of truth than the necessity of avoiding insincerity; nevertheless, it is perfectly legitimate and often most advantageous in architecture to avoid emphasising some special structural truth, some uses of parts of buildings, provided this emphasis would involve the production of forms that are distinctly ugly; and this we do quite properly, as we easily see if we constantly bear in mind that the end for each and every artist and for the architect as an artist is the production of a work of beauty.

We have thus far been treating almost altogether of theory, but if the position we have thus taken be correct then the architect in the guidance of his artistic efforts may well make certain practical applications of the principles involved, negative though they be; and the reader as a helpful and appreciative critic may well take them to heart as guiding principles in judging of the architect's efforts to attain beauty in the buildings which he erects. There are just two results of our study which there is space here to bring into prominence, and both of these, the reader will find, bear directly upon the subject we have undertaken to consider in this article.

In the first place, the architect is taught that he should aim to avoid the pretence of constructional effects which evidently cannot exist; but having done this he must equally avoid the expression of constructional effects which are not beautiful. It may be true, if we may take an analogy from a kindred art by way of illustration, that the human frame is made up of bone and muscle, and the artist-sculptor will certainly not model his figure so that it will appear to be apparently unanatomical—unconstructional, so to speak; nevertheless the most perfect reproduction of anatomical detail will not make a statue beautiful, nor should we consider the sculptor to be in any sense an artist who on principle represented his human subjects as exceptionally thin in order to emphasise the position of bone and muscle which make their attitudes possible. Similarly is it true that buildings could not stand did there not exist certain balancing of forces, certain strain on material parts, certain lines of thrust and pressure; but evidently to strip a building of all beauty in order to express this balancing of strain and thrusts and pressures would be manifestly absurd from an artistic standpoint, and this point critics should not fail to bear in mind; for the critic who so emphasises the delight e obtains in the architect's expression of these hysical forces, that he finds in such expression lone the true essence of architecture, is as bnormally warped in his æsthetic development s is the surgeon who finds beauty in a skeleton r in a fine piece of dissection or in a skilful reparation of cancerous tissue.

The architect should aim in all cases to pro- uce a beautiful building; to this end he must void obvious constructional untruth which for ost intelligent men is ugly. So far as in him ies he should also aim to emphasise the con- tructional and practical values of the parts of is structure, and he should do this for the imple reason that such emphasis tends to be ttractive to the intelligent observer. But he hould never emphasise these constructional and ractical values at the expense of a loss of eauty; nor need he strive for this emphasis nless it is possible to gain it in a manner which ill actually add to the permanent æsthetic alue of the building as a whole.

But as the architect should avoid giving the bserver the shock which constructional untruth ntails, so also should he avoid shocks of all orts and kinds, for such shocks always involve ore or less of ugliness.

And here again appears the value of this egative principle of which we are speaking; or not infrequently the architect finds in ractice that by the adoption of some scheme hich involves a minor inconsistency of con- truction he may avoid other shocks of much reater importance; for instance, shocks caused y bad proportion or lack of symmetry.

Suppose the architect has built a large fire- roof hall across the ceiling of which a heavy irder must cross dividing the ceiling into un- ymmetrical parts. Here he has an ugly ceiling. le may remove this ugliness by furring down he ceiling to the bottom of the girder so that e may obtain a perfectly flat ceiling of sym- etrical form. No one will contend that this improper, because in order to avoid leaving n ugly ceiling he has masked the ugly girder, ut this arrangement compels the architect to wer the whole height of his room, and this may e disadvantageous. Now if this girder is ex- osed it must be protected against fire by anging down over it a covering of terra-cotta locks, which are plastered over for further rotection. This leaves the ceiling of a very gly form. There seems no reason why he ould not hang down other sets of terra-cotta ocks which do not cover girders in order to ake the ceiling symmetrical, if he is thus able make a beautiful ceiling instead of an ugly ne. This, indeed, will involve a minor incon- stency of construction, which usually nobody ut the workmen and architect know of, but, on e other hand, it enables him to avoid a very portant shock which would be caused by the ck of symmetry in the ceiling and gives him n opportunity for decorative treatment of this iling which he could not otherwise obtain.

The ideal architect, to be sure, would of course able to avoid all shocks of all kinds; but we or human beings all too often find ourselves lled upon to make a choice of the lesser evil, d surely the architect who is merely human ould not be condemned if he asks us to over- ok some inconsiderable untruth of structure use for the sake of the better æsthetic results may thus obtain. He may well argue that at st we can express but partial truth in any art; e truths which the most thoroughgoing realist wont to emphasise are only some of many ich he chooses to consider, whilst he leaves t of sight many others which but for mere nvention might as well be considered as those ich he aims to express. The sculptor, for stance, in general, as we have seen, assumes onventional falsity of colourlessness which he s us to overlook in order that he may the tter express certain beauties that are inde- ndent of colour. So in architecture there are ny other truths than those of structural ust and strain or of practical use which all istic architects (and even those who labour enuously to express constructional values) ve come to overlook entirely, and this with fect propriety in consideration of the fact t the end in view is the production of beauty: , they overlook the expression of the nature their foundations, of the filling in behind ir finished protective and ornamental stone ings, of the masonry and furrings back of their plastered interior wall surfaces. If, then, in the effort to build beautiful buildings it is permissible for the architect to forget some of many realities, why should he not occasionally ask us to pass over some slight structural disingenuousness provided he is able by such means to produce a nobler type of beauty than were possible if he did not disregard this minor inconsistency?

Architecture more than all the other arts is replete with forced compromises. A symmetrical exterior, for instance, may produce æsthetic results which could not be gained were all the minor lack of symmetries in plan emphasised upon the exterior. The artist must trust to his genius to determine for him how far he can afford to sacrifice one element of beauty in his effort to gain another; and the fact that he is an artist is attested by the fact that the structural truths he fails to express are forgotten by the observer in the beauty of the results attained.

Let us now consider a second application of the theoretical study which we made in the beginning.

We have inherited from a long line of our artist ancestors many architectural forms of great beauty which have arisen in constructional usage, all too often very faulty from our modern scientific standpoint. Thus it happens that inherited architectural forms more or less illogical have been refined and beautified until they have become in themselves æsthetic elements capable of employment for the purpose of adding artistic quality to buildings much as the artist in colour adds to the value of his painting by his technique; and there seems to be no manifest reason why the modern architect should not use such element, as in fact his ancestors always have done, to beautify his work without too great regard for their constructional worth, only provided he does not use them for purposes of intentional deceit.

We may illustrate this by reference to the types of the arch in general use on the exterior of buildings and which are accepted by all of us as beautiful in form.

In the ordinary round arch the pressure line runs in a direction which is not concentric with the curve of the arch. Certain parts of the arch stones are, therefore, constructionally valueless, and if we attempt to work quite logically we should build our arches in a strangely ugly form, keeping the line of thrust in the middle of our arch stones and increasing them in width from top to bottom. We should furthermore give up the emphasis of the keystone, for there is no constructional reason why this should be larger in height than the next stones to it. But think what would be our æsthetic loss if logical criticism compelled us to discard the use of all arch forms which do not comply with the logical constructional thrust lines. Not only the round arch would disappear from our exteriors but all forms of the pointed arch which make the glory of Gothic architecture.

And in this connection it may be well to note that we should to-day be unable to enjoy the beauty of the maze of flying buttresses in the Gothic cathedrals had the mediæval architects understood how to calculate thrusts as accurately as we do and had they expressed these thrusts logically. In the construction of a vaulted roof held in place by a double set of flying buttresses such as is seen in the great cathedrals of France the thrust of the main vaulted roof does not correspond with the form of either of these sets of flying arches but with a line which cuts through the wall between the height of the two. There is evidence that the first builders of the large vaulted roofs put in only one set of flying buttresses, but finding that when they did so the walls were pushed out at another point they then put in the other set of buttresses to counterbalance this newly-discovered pressure. In subsequent structures they then used the double set of buttresses from the start.

The mass of flying buttresses thus built gave the architects of later cathedrals the type which they developed as we know (yet as we have just seen quite illogically) into the beautiful forms which entrance us as we view their finished works.

It is thus that great architects have invariably used forms developed in constructional practice as merely decorative features; and if the beauty of the result is sufficient to arouse our enthusiasm we do not hesitate to condone the slight inconsistency. It is thus that the Romans used the Greece-born order, being content to accept and adopt forms perfected by long use in other relations than those which were appropriate to their civilisation, and while adapting old forms added elements of grandeur and proportion which lead us to overlook altogether the illogical usage. It is thus that the Venetians used old constructional forms as purely decorative elements to add to the beauty of their well-studied compositions; and we forget, and quite properly forget, the inconsistency in the joy we gain from the entrancing groupings in their waterside palaces.

It is, of course, to be conceded, as has been suggested above, that the ideal architect or race of architects would avoid such inconsistencies, but even in the architectural work of the Greeks, which reaches to the highest grade of structural consistency, we find—*e.g.*, in the triglyphs, the modillions, the dentils, of their masonry temples—the use of forms which had been perfected æsthetically in wooden structures, and which were then used decoratively, but from a structural standpoint not truthfully, in stone construction. In the development of the Gothic cathedrals, which many think of as the best examples of an architecture of thoroughly logical construction, we can easily trace the same practice; for example, in the use of many tiers of flying buttresses of which we have spoken above; and again, when we note the blundering steps by which the columns of the basilica, used first as mere columns, were gradually transformed into buttresses where engaged in the walls, or into piers where standing isolated and free.

Our conclusion, then, is this, that the expression of constructional truth in architecture is only one element amongst many which are at the command of the true artist-architect for use in the production of beautiful buildings—a most important element indeed, and one which if skillfully used must add great satisfaction to the trained observer; one also which cannot be disregarded without great risk of ruining the beauty of the building in which the architect is expressing his thought. But, for all that, we are compelled to agree that in many cases this constructional and practical worth may quite properly be subordinated to other elements which are incompatible with it provided the latter without it are capable of producing æsthetic results which with it would be impossible of achievement.

In closing it will be well to make a practical application of these contentions to the reader as a critic; and, first, let us beg him to consider the many difficulties with which the architect has to contend, and let this thought modify the harsh judgments he is wont to make on the results they attain. We do not ask him to condone their failures; nor should he be satisfied with ugliness, nor be content unless the buildings they design are beautiful when finished. But it were well if he always looked for the beauties and not for the faults, and this not for their sakes as much as for his own.

It is so easy for the critic to establish in himself artificial standards which no artist can reach, or in fact ought to try to reach—standards which will prevent him from catching the beauties which the artist intended to present and has succeeded in presenting.

The notion which we have been considering is one of these artificial criteria. If we demand that all structural values, that all uses, shall be expressed to us in a building, and that no forms which have been perfected by past structural usage shall be employed non-structurally and merely as ornament, and if we refuse to acknowledge that a building is architecturally noble unless it meets this demand, then certainly we shall find ourselves forced to hold that no truly architectural building has ever been constructed.

But if we agree to gain delight from all forms of beauty which the architect can present to us in his building (and amongst these we, if we choose, may give pre-eminent place to the expression of structure and usage), if we condemn only ugliness and real failures of taste, then not only shall we aid the artist by higher appreciation of his effort but we shall add to our own delights in studying the architectural works of the past and present, joys which will be utterly unknown to us if we fail of such breadth of appreciation as we should surely strive for.

Keystones.

A Statue of Chevreul, the famous chemist, was erected in Paris recently.

The Monument to Charles Garnier, the architect of the Paris Opera House, will be the first to bear the new City Arms, which incorporate the Cross of the Legion of Honour.

At the University Extension Meeting at Oxford which will open on August 2nd lectures will be given on the housing problem, and the economy of John Ruskin, and the architecture of the period. On August 10th a conference will be held on "The Housing Problem."

A New Bȧptist Chapel at Walsgrave-on-Sour, Warwickshire, has been erected. The population consists almost entirely of agricultural labourers and miners. After their work in the pit, many of the latter spent hours a day removing loads of soil, in preparation for the builder. The women helped by cleaning and scraping the bricks taken from the old building, while all subscribed in money to the funds.

A New Fire Station is being erected for the London County Council, at the junction of Woolstone Road with Perry Vale, Forest Hill. The site was acquired in 1894 for £535. The plans were approved in 1896, but just at that time there was a change in the command of the brigade, and the alterations suggested by Commander Wells caused delay in erecting the station, the estimate for which was £11,900.

A New Hospital for the Treatment of Consumptives, erected by Sir Robert and Lady Pullar, of Tayside, on the western slopes of Kinnoull Hill, Perth, was formally handed over to the Society for the Relief of Incurables and Chronic Disease recently. The total cost of the building has been £8,000. The house, which is sheltered from the north and east winds, faces due south, and commands a very fine view. The grounds extend to over six acres. Accommodation is provided for twenty patients, one wing being set apart for men and the other for women.

Isolation Hospital for Handsworth.—A Local Government Board enquiry was held recently into the application of the South Rotherham, Handsworth, and Kiveton Park Isolation Hospital District Committee to borrow a sum of £16,000 for the purchase of a site and erection of a hospital at Aughton. No opposition was offered to the scheme. The site is contiguous to the Rotherham and Pleasley Road, and there is easy communication by road to all parts of the district. The altitude is 325ft. The number of beds proposed to be provided is thirty-two, and the estimated cost of the building is £14,301, made up as follows: Administrative building, £3,300; laundry, mortuary and stables, £1,966; lodge, £367; scarlet fever block, £2,867; enteric fever block, £1,455; isolation block, £1,267; boundary walls and entrances, £800; roads and laying out grounds, £350; drainage, £210; architect's commission, £629; furnishing wards, £640; furnishing administrative block, £450; total, £14,301. Mr. J. W. Webster, Sheffield, is the architect for the hospital.

A New Wesleyan Church at Erdington, Birmingham, is being erected immediately in front of the existing one, and the structure is to face Station Road, from which the main entrance will lead. The church is to be of Early English Gothic design, carried out in brick with stone dressings. It will consist of a nave, and aisles separated from the nave with granite columns and moulded arches, and will afford seating accommodation for 650 persons. The main entrance will be formed by a stone archway with stone columns; the windows are to have stone mullions and tracery; and the roofs will be covered by red tiles. A five-light traceried stone window will light the chancel. Provision is made in the design for the future addition of a tower and spire, and of transepts when further accommodation becomes necessary. Messrs. Ewen Harper & Brothers, of Corporation Street, Birmingham, are the architects. The work is being carried out by Mr. Isaac Langley, of Tyburn, and is expected to be completed about the end of May next year. The new church is to cost rather more than £3,000.

Ten Workmen's Dwellings at Esher are to be erected for the Esher and the Dittons Urban District Council at a cost of £2,250 on the Council's land at Lower Green.

Copies of the "Builders' Journal" are wanted of the issue for February 7th, 1900. In return for the favor we offer a copy of the current number of "The Architectural Review." Will readers who have copies of the above date to spare kindly address them to the publisher of the BUILDERS' JOURNAL, Effingham House, Arundel Street, W.C.

Newport Parish Church, Dundee, is to be extended and a manse erected. The present transepts and vestry are to be removed, and the church given an additional bay, enlarged transepts, new chancel, organ chamber, vestry and session-house. An additional entrance to the church is to be placed on the east side. At present the building contains sitting accommodation for 400; the addition will increase that capacity to 600. The character of the additions will be in harmony with the original structure, which was built in 1870. The manse is to be erected on the ground immediately to the west of the church. It will contain dining-room, drawing-room, study and five bedrooms. In both instances the plans have been prepared by Messrs. Johnston & Baxter, Dundee.

The Middlesbrough Corporation Baths, after undergoing extensive alterations, were re-opened last week. The Corporation Baths were established in 1884, when eight slipper baths and a swimming bath were provided, but this provision was soon found to be inadequate for the requirements of the town. An enlargement was decided upon three or four years ago when the plans of the borough engineer, Mr. F. Baker, for twenty-one additional slipper baths, a Russian bath, a needle bath, new offices and dressing rooms, and improved ventilation and heating arrangements were agreed to, and the whole have now been carried out at an estimated cost of £4,500 by Mr. Baker and Messrs. Bastiman & Co., contractors. The electric lighting installation was in the hands of Messrs. T. B. Watson, of Stockton; Messrs. Braithwaite, of Leeds; and Messrs. Richards & Co., of Darlington, being entrusted with the heating and ventilation arrangements, and the plumbing work was carried out by Mr. Lambert, of Middlesborough.

The Hillhouse Free Wesleyan Church and Sunday School, Huddersfield, are being extended on the north side, between the chapel and the end of East View. The scheme provides for a chancel, lecture-room, enlargement of the existing Sunday school, nine additional class rooms, an organ chamber, the introduction of the electric light, &c., at an estimated cost of £2,000. The style of architecture adopted is Italian Renaissance of a plain character to harmonise with the chapel and the adjoining houses. The architect is Mr. B. Stocks, of Huddersfield, and the work is being carried out by the following local contractors: Mason, Mr. J. R. Flynn; joiner, Mr. Kilner Wilson; plumber, Mr. George Hardcastle; slater and plasterer, Mr. W. E. Jowitt; painters, Messrs. Lund and Cardno; heating engineer, Mr. J. W. Thornton; electricians, Messrs. Crossley & Bould.

A New Girls' School for Acton.—The new Haberdasher Aske's Girls' school has been erected in West Acton, one of the most important and up-to-date girls' public schools in the western district. It stands on 2½ acres of ground on the Springfield Park Estate and provides accommodation for 350 pupils. It has an assembly hall 15ft. by 35ft., having a gallery on two sides, and about ten large classrooms, nearly all with wide outlooks on to the country. They are fitted up with separate desks, heated by hot-water pipes and well ventilated. There is also an art-room, a needlework-room, lecture theatre fitted up with a stove, &c., for cookery demonstrations; a chemical laboratory, four music cubicles and music-hall, dining-room, a mistresses'-room and headmistress's-room, cloak-rooms and other offices. There is also a large and well-equipped gymnasium, a playground of over 2 acres, provided with tennis-courts, hockey-ground, and children's gardens, and a covered playground for use in wet weather. The school was designed by Mr. Henry Stock, F.R.I.B.A., and built by Messrs. Patman & Fotheringham.

In the Competition for the New Municipal Buil ings for Hereford forty-six designs have been r ceived. Mr. Thomas Blashill, F.R.I.B.A., ha been appointed assessor to help the committe in their selection. Premiums of £100 each a offered for the three best designs.

Infectious Diseases Hospitals for Radcliffe an District.—A Local Government Board enquir was held recently at Manchester into an appl cation made by the Lancashire County Counc for sanction to the borrowing of £40,000 for th provision by the Radcliffe, Ramsbottom, Whit field and Bury Joint Isolation Hospital Committee of an infectious diseases hospital and small-pox hospital on land at Ainsworth. Th site is about fifty acres in extent. There wi be fifty-six beds in the infectious disease hospital and thirty-two in the small-pox ho pital. Mr. H. Lord, architect, of Mancheste said the estimated cost was £34,164, the amoun allowed for contingencies was £3,416, architect charge (which included clerk of works) £2,42 making a total of £40,000. There would b bedrooms for eleven nurses in the infectiou diseases hospital, and eight bedrooms for nurse in the small pox hospital, with dining-room, &c and offices. There was no opposition to th scheme.

A New Girls' Home has been erected of bric and wood at the Leicester Children's Summe Camp at Mablethorpe. It is situated in hollow among the dunes, or sand hills, tha fringe the shore. Built in two storeys, th home provides accommodation for forty girl besides the attendants. On the ground floor the dining-hall, a well-lighted room, 60ft. b 24ft., the match-boarded walls and ceiling which are painted in light green and red, alt gether a pleasant and cosy room. A wide stai case leads up to the dormitory on the first floo this being a room as large as the dining-hal and containing forty single beds. The matron and attendant's room adjoin the dormitory, an there is an additional bedroom, for the use members of the Ladies' Committee who accom pany the girls. On the ground floor there is well-appointed kitchen, with cooking range, &c and also a large bath-room. The exterior wal are protected with corrugated iron, and the ro has an outer covering of red curved tiles, wit a sloping verandah at the front. The buildin was designed by Mr. Joseph Toone, of Highcro Street, Leicester, who has given his servic gratuitously.

Trade and Craft.

Homan & Rodgers' New Catalogue.

The new catalogue of standards and tables constructional steelwork which has been issue by Messrs. Homan & Rodgers, the well-know iron and steel merchants and construction engineers, of 17, Gracechurch, E.C., is extreme well got up. The catalogue is not of the usu trade kind, but is in handy pocket-book for neatly bound in leather, and partakes more the nature of a note-book of formulæ a tables. Among the large amount of useful i formation we may refer to the method of ca culating the stresses produced by loadi stanchions on one side only, tables for asce taining the deflection of a girder under vario conditions, and a table of useful sections showi the loads they will safely support. T stresses caused by loading stanchions eccent cally are generally neglected by architects a failure results, as this subject is of considerab moment, the elastic deflection of the girde causing the stanchions to deflect materially; can therefore commend this part of the wo highly. The calculation of an eccentrical loaded girder is also shown most clearly. T calculation of the foundations for columns a walls is usually neglected and the meth shown here should prove very useful. The cat logue reflects the greatest credit upon its co pilers, Messrs. Ernest Homan and Leopo Menseh, and all architects and construction engineers should endeavour to obtain a cop If the forthcoming separate catalogue on fi proof construction is as good as this, Mess Homan & Rodgers may congratulate themselv on having produced two of the neatest and m useful in the trade.

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance **FREE.** of **£500.**

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/- **£250** for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/- **£500** for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

Hazardous Risks, Premium, £3/10/- **£1 10s.** per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

An Architectural Causerie.

Queen Victoria Memorial.

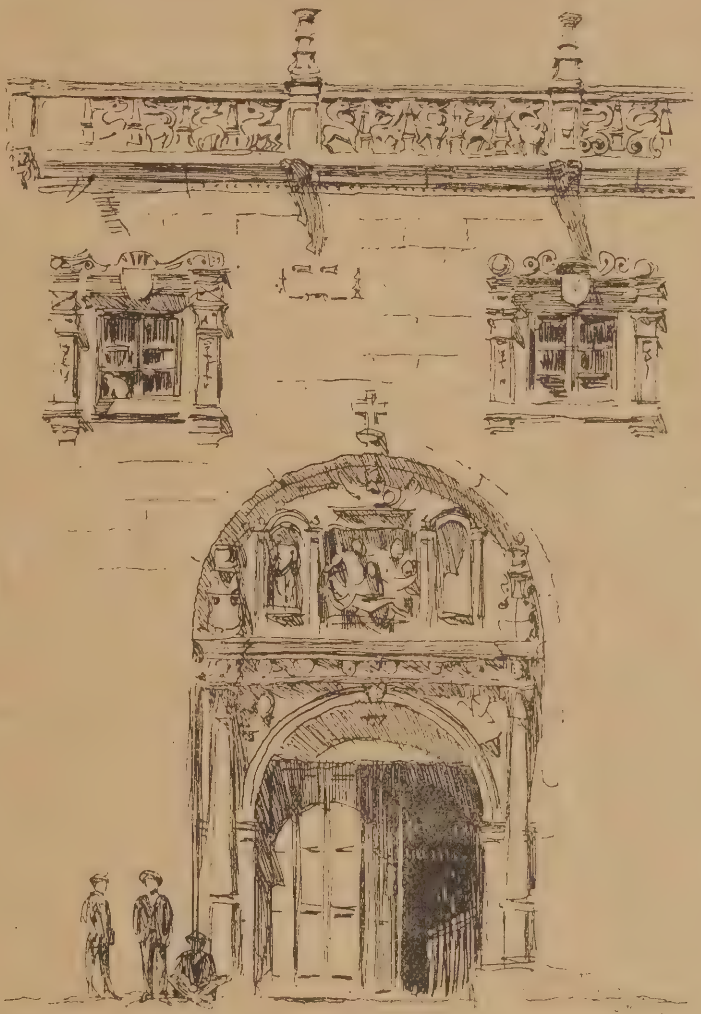
WE are able to publish this week some particulars of the Queen Victoria Memorial as proposed to be erected according to the designs of Mr. Brock and Mr. Aston Webb. From these it is possible to form some idea of the memorial, but as no details are yet settled—both designs being subject to alteration—it is hardly opportune to criticise the scheme. Moreover, before making such a criticism it would be very desirable to see the designs submitted by the remaining four architects. Briefly, the proposal is to replace the railings at present in front of Buckingham Palace by a stone arcade, to bring round the roadway from Constitution Hill to the Mall to a very much wider curve, to throw back the continuance of the Mall to Buckingham Palace Road to the lake, and to build a wall there; and in the "garden" thus enclosed to erect the memorial proper (170ft. by 140ft. by 60ft. high). In addition, the Mall is to be opened out to Charing Cross. It will be noticed that the memorial is to be placed *outside* the stone arcade. This is significant, for it may mean that the Committee think that the commonplace face of the Palace may thus be screened off. But after all this would be a piecemeal method. We have always considered it imperative for the facade to be rebuilt in accord with any memorial adjacent to it. This does not, however, appear to be the view held by the Committee. We respect the official request that no illustrations of the designs should be published at present, but trust that the whole series of designs will soon be exhibited; and also, as soon as the details of the selected design have been finally settled, that these will be made public.

A Spanish Doorway.

THE accompanying illustration of the doorway to the Hospital del Rey at Burgos, from the pen of a masterly architectural draughtsman, is a typical specimen of the Spanish Renaissance. It stands in a courtyard, which itself possesses a most remarkable gateway, and is carried out in stone, the balustrade being pierced and elaborately carved. We would particularly recommend this illustration as a model to those architectural students who endeavour to make their sketches of constructive as well as artistic interest.

An Exhibition of Architectural Photographs.

AT the beginning of the year we had occasion to notice the exhibition of modern illustration organised by the Board of Education in collaboration with the Society of Arts and held in the Indian Section of the Victoria and Albert Museum, Imperial Institute Road. All those excellent drawings are gone, and the walls are now amply covered with about 600 photographs—mainly of architectural interest—which have been gathered together by the same Board. Of these photographs the majority are by the well-known member of Parliament, Sir J. Benjamin Stone, who has long enjoyed the reputation of being an amateur photographer of no mean order. Sir Benjamin has been wandering over the length and breadth of the country with his camera, from the terrace which caused the Premier to pour bitterness on pleasure-loving M.P.s to old-world villages with their quaint personages and customs.



HOSPITAL DEL REY, BURGOS, SPAIN. DRAWN BY A. N. PRENTICE.

There is a photograph of the old Tynwald Court House and House of Keys (now Parr's Bank) at Castletown. Close by on the wall are shown the ball room at Haddon Hall; the "Green Man and Black's Head" Inn at Ashbourne, in Derbyshire, where Boswell stayed in September 1771 and wrote about its ancient signboard; photographs of the Guildhall, the ancient "Falcon Inn" and Shakespeare's schoolroom at Stratford-on-Avon; then the gatehouse of Charlecote (the home of the Lucys) near Stratford, in the garden of which may be seen a curious box-tree ornament in the form of a fleur-de-lis (Shakespeare's flower-de-Luce); next we come to Astley Castle in Warwickshire, once the home of Lady Jane Grey. The old "Lion Hotel" at Dunchurch, where Catesby and the Gunpowder Plot conspirators met after the arrest of Guy Fawkes, is well shown and is worthy of close study—but what abuse to put a telegraph pole at each end of the house! The old rectory at Clifford Chambers, in Gloucestershire, a delightful specimen of English half-timber construction, finds a place in the collection; but perhaps the most interesting feature of the exhibition is the series of photographs (from the National Art Library) of old halls like Wollaton, Arley, Agecroft, Bramhall, &c., &c. Such a series should prove of the greatest interest to all architects and architectural students. It is impracticable for us to enumerate even a tithe of the subjects which are here shown; suffice it to say that their range is catholic and includes the great cathedrals and abbeys, historical houses like "Sparrowe's" at Ipswich, old country churches, and details like the Saxon tympana at Alveston. Moreover, Westminster, the Tower of London and Windsor Castle have received considerable attention, not the least interesting photographs being two taken from Barry's great clock tower, one looking towards Whitehall and the other showing New Scotland Yard and the Embankment. As an architectural photographer Sir Benjamin is perhaps not without deficiencies, and it would perhaps be unfair to consider his work with that of Mr. F. H. Evans; yet he observes all the main requirements and his subjects are of world-wide interest. Altogether the exhibition is a most satisfactory one and we trust that the Board of Education will continue the series which has already proved so eminently successful. The exhibition is open to the public, without charge, every day—on Mondays, Tuesdays and Saturdays from 10 till 10; on Wednesdays, Thursdays and Fridays from 10 till 6; and on Sundays from 2 till dusk.

A Foolish Policy. DOUBTLESS many of our readers observed that last week in the House of Commons Mr. Whitmore asked the First Commissioner of Works whether any definite decision had been come to with regard to the carrying out of the designs of the late Mr. Brydon for the new Government offices in Parliament Street. Mr. Akers-Douglas stated in reply that it has been definitely decided that Mr. Brydon's building should be carried out by the officers of his Department, and that the contracts would be entered into under the supervision of the principal architect and of Sir John Taylor. Thus Mr. Akers-Douglas hopes to effect considerable saving, but this at the expense of the building. In any work of this kind it is the details which give character, and as these remain uncompleted till building operations are in full progress, it follows that in this particular case they cannot be from the hand of the man who designed the building. It was most melancholy and unfortunate that Mr. Brydon should never have lived to see the work completed under his own superintendence, and now that the Government have decided to place matters in the hands of their own officials the case is doubly distressful, for they will never get such a result as that which might have been secured if, on the death of Mr. Brydon, they had given a commission to a leading classical architect. Mr. Akers-Douglas's admission that he hopes to effect a considerable saving exhibits what a short-sighted policy is directing this matter. What a pity that the official mind is so careful of pounds, shillings and pence in matters like this, and so wildly extravagant in other things. It is instructive to read the report, published in another column, of last week's debate in the House of Lords on the subject of a Royal Commission on Art.

THE CHETHAM HOSPITAL, MANCHESTER.

BY F. H. CHEETHAM.

THE history of the growth of Manchester from a fortified enclosure at the junction of two rivers to the present unlovely hive of industry can be read between the covers of a score of books by such as care to turn their pages. To-day few traces of the old town are to be seen except by those who search for them. The two rivers have almost disappeared and have been put to ignoble uses. Where they join one another the Irk has been arched over, and the Irwell bank which used to slope down to the water's edge from the churchyard has been so "improved" in the making of the roadway as to have lost entirely all its original characteristics. Before 1833, when the great changes at Hunt's Bank were commenced, the sloping space between the river and the church was occupied by houses piled tier above tier divided by innumerable alleys and narrow streets. The Old Church itself stands about 40ft. above the Irwell on a kind of platform. A little to the north, at the angle of the junction of the two rivers, is the Chetham Hospital. The two buildings have been intimately connected, as we shall see, but are so no longer. To-day the Old Church is the Cathedral of the diocese of Manchester, and is known to everyone who has visited the city. The Chetham Hospital, now a blue-coat school, hidden from the street as it is by unlovely modern buildings, is little known to strangers, and even among those who are acquainted with the fact of its existence few have ever crossed its threshold. Yet the building is of the greatest interest, and is as well worthy of a visit as many far better known architectural remains in other parts of the country. Its proximity to Victoria and Exchange stations makes it very easy of access to visitors who may have but a short time to spend in Manchester.

A good deal has been written about the Chetham Hospital, but the old stones still hold a secret; for as to the exact date of the present building, as to what parts were first built, and as to when subsequent additions were erected, we can only surmise and admit that there is much room for difference of opinion.

Very briefly the history of the building may be thus told. The site is that of the ancient Barons' Hall, which occupied a defensive position at the junction of the two rivers. The barony of Manchester was founded sometime after the Norman Conquest. The Greslets were its first possessors, and on the death of the last of the line, about 1313, the manor passed to the La Warres. Thomas de la Warre, who was not only baron but also parish priest of Manchester, handed over the care of the parish and its church to a collegiate body in 1421, and gave up his old baronial hall as a residence for its members. Whether any portion of the original Barons' Hall remains in the present building we do not know. It is probable that the place was entirely rebuilt to suit the requirements of the college, for we are told that La Warre before his death in 1426 had spent something like £3,000 on the new building. The style of its architecture corresponds with that of the earliest portions of the church, which were built immediately subsequent to its being collegiated.

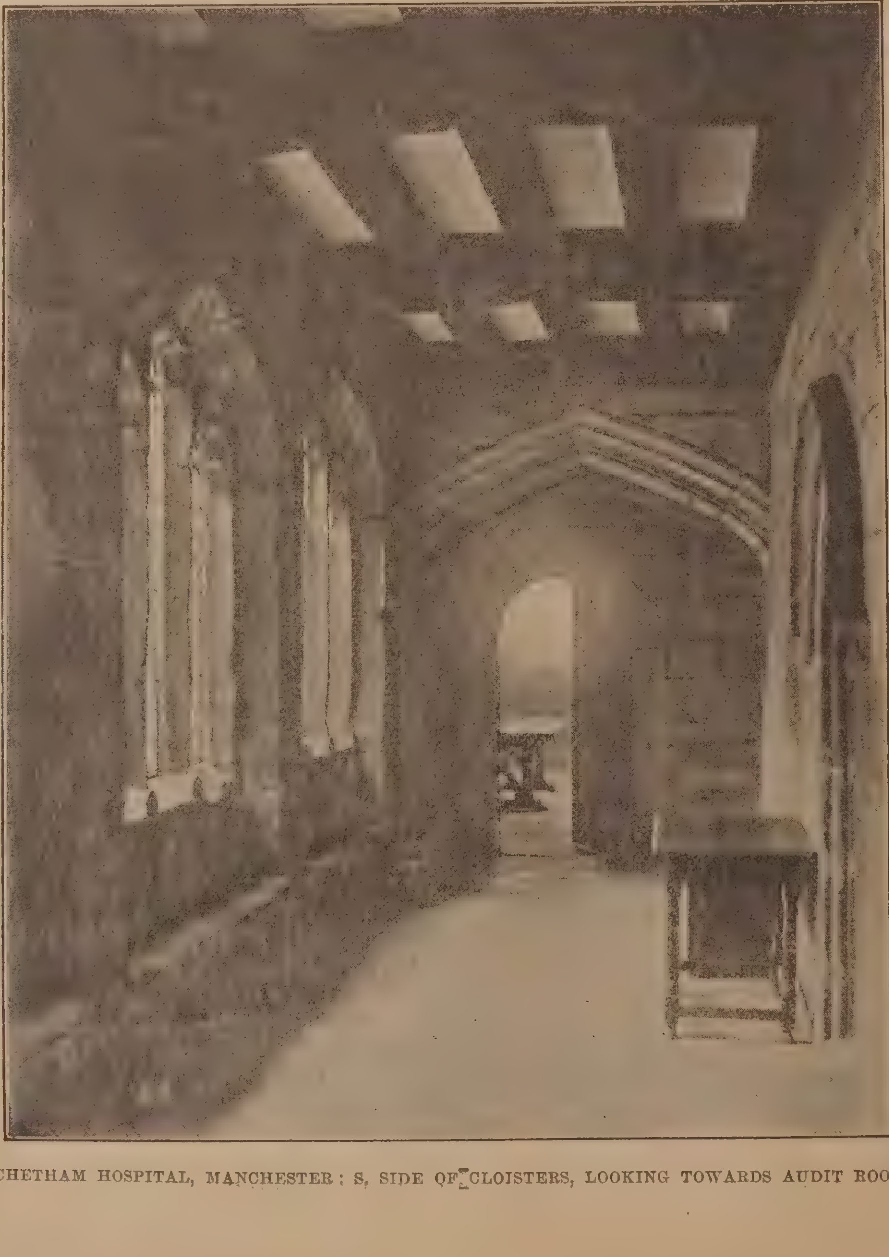
In 1547 the collegiate body was dissolved and the building passed into the hands of the Earls of Derby, in whose possession it remained till the time of the Commonwealth. During the time of their ownership several members of the Stanley family are said to have temporarily lived there. The Derby estates were sequestered at the time of the Civil War, and with them the college at Manchester. The buildings fell into a dilapidated state and were put to all kinds of uses. In this sad condition they fell under the eye of Humphrey Chetham, a Manchester merchant, who conceived the purpose of purchasing them for use as a charity school. He was a philanthropist who had for some years maintained a number of poor boys at his own expense. Applying to the Committee of Sequestration he was met with terms such as he could not accept, and the matter fell through. Chetham died in 1653, but the year following his executors made terms with the committee and bought the college for £500. The boys were transferred there two years later, and there their successors are at the present day. Chetham also left funds for a library, and the Chetham Library is located in the same building, though the two benefactions are kept distinct.

The building has therefore passed through three principal phases of existence—first, as the residence of the collegiate body; second, as the house of the Stanleys, Earls of Derby; and, third, as a school and library.

No doubt the building as it stands to-day was substantially erected in the collegiate days, though probably not all at one time. But it has undergone a good deal of alteration and repair at various times since, which has changed many of its original characteristics, though without taking in any way from its great interest. On the whole, however, it has undergone less change than most buildings of a similar date that remain with us.

The buildings were in such a wretched state after the Civil War that a complete restoration as well as many alterations must have been necessary to fit them for their new purpose by Chetham's executors. There is, however, no record of any alterations of importance during this period. Indeed, here, as in so many places, the stones have to tell their own story, and that is not always easy to read. Many of the documents relating to the earlier history of the college are known to have perished in the Great Fire of London.

The building is L-shaped on plan, with the longer frontage facing north towards the Irk, and the shorter, or west side, facing the Irwell. The west front is now completely hidden from view from the street by shops and a hotel. The north side may, however, be still seen from Walker's Croft. It requires some imagination



CHETHAM HOSPITAL, MANCHESTER: S. SIDE OF CLOISTERS, LOOKING TOWARDS AUDIT ROOM.

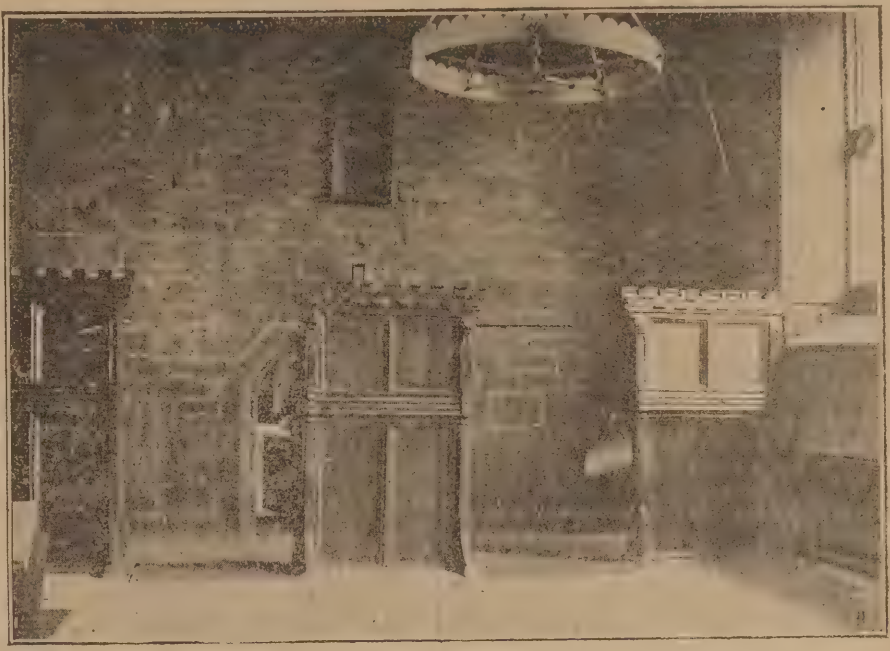
to see it as it would appear originally before the Irk was arched over. Ascending the steps at the end of Walker's Croft you get a glimpse of the river disappearing under the walls of the grammar school building, and you can realise to some extent the height of the old college walls above the stream. There is a drawing by Girton, dated 1797, which shows the college from the north-west angle as it appeared at that time, an engraving of which is among the illustrations of Proctor's "Memorials of Bygone Manchester." In Mr. Henry Taylor's "Old Halls in Lancashire and Cheshire" there is a bird's-eye view of the building from the north "which has been carefully compiled from labouriously made measurements, and from various old drawing and pictures." Mr. Taylor's book contains an admirable architectural description of the Chetham Hospital, and should be read by all who would thoroughly understand the building. There is a copy of the book in the Chetham Library, and seated in the quaint old apartment which is now the reading-room you can see and conjure up from the printed page the history of the centuries long past.

The entrance to the hospital is through a gateway at the corner of Fennel Street immediately north-west of the cathedral. Passing through the door you find yourself in the school playground. On the left is the school-house erected by Mr. Waterhouse in 1878. In front are the old college buildings, which you can enter either by the porch at the internal angle or by the doorway near the library staircase. The library is free to all, but if you want to see the building a fee of 6d. is charged. You are shown over by one of the boys, and if you happen to visit the hospital soon after twelve o'clock you will see the lads at dinner in the great hall. When you have seen the building and perhaps spent an hour or so in the reading-room you feel the old-world influence of the place so strong upon you that it is with something of a shock that you mingle once more with the hurrying crowds in the busy streets of the cotton city. It is difficult to conceive this peaceful restfulness of an age not ours set down, or rather preserved for us, in the very heart of Manchester.

The chief feature of the Chetham Hospital is the cloister court. Round this on three sides were the fellows' rooms, and on the fourth side is the great hall. At the back of the great hall is an apartment now called the audit-room, probably in the old days the private room of the warden. The hall itself is 43ft. long by 24ft. wide, and is lighted on its north side by three large windows. The floor is raised at one end, forming a daïs, and this is surmounted by a fine curved canopy. At the opposite end are the screens, which are solid and massive, and behind these, as usual, are the doorways to the pantry and buttery. The kitchen is, however, hardly where you would expect to find it, access to it being through a porch at the end of the screens. This gives rise to the question whether the present kitchen is, after all, the original one, and many theories have been mooted concerning it. On the west, or cloister side, of the great hall is a large ingle-nook about 11ft. wide and 12ft. deep. This has recently been entirely rebuilt and the position of the fireplace altered. The hall is 22ft. high to the top of the roof, which is open-timbered and in three bays. The ceiling which once disfigured it has been finally removed.

The peculiarity of the cloister is that it is two storeys high, an arrangement which is exceedingly rare. The cloister runs round the north, south and west sides of the quadrangle, which is a very small one, measuring rather less than 40ft. by 20ft. It is generally supposed that this space was originally much larger and that the cloisters were erected subsequently to the rest of this part of the building for the purpose of affording covered communication between the various rooms and offices of the college. In the upper storey a window is placed in each alternate bay only.

The handsome Jacobean staircase in the corner of the quadrangle was probably built after the college came into the hands of the Chetham trustees as a means of access to the library on the first floor. "The door to the cloister yard must have been in the bay now occupied by this stair, as the only present entrance is through one of the windows which has been opened for the purpose."



SCREENS IN GREAT HALL, CHETHAM HOSPITAL, MANCHESTER.

The library is housed in what used to be the fellows' dormitories, and the reading-room is over the audit-room. The partitions were removed between the dormitories so as to form one long L-shaped room, and the narrow windows were enlarged. The old-world charm of the Chetham Library] must be felt rather than described. It is indeed a place to linger in, a true home for the antiquary and the student of ancient lore. The reading-room, as well as the audit-room, is fitted with handsome oak furniture, and is panelled with dark oak wainscot. It has an open-timbered roof, and the ceiling is elaborately vaulted in plaster.

The line of buildings facing north is about 250ft. in length, and consists in its eastern portion of the kitchen, bakehouse, old brewhouse and the ancient hospitium. The kitchen goes the height of two storeys, with an open-timbered roof. The boys' dormitories are near the ancient gatehouse. This gatehouse was formerly the principal entrance to the college, being approached from Old Millgate, then one of the leading streets of Manchester. The new buildings of the Manchester Grammar School now hem in the gatehouse on each side, completely overshadowing it, and an atrocious wood and glass bridge joining the two detached portions of the school actually passes across the face of the ancient gable.

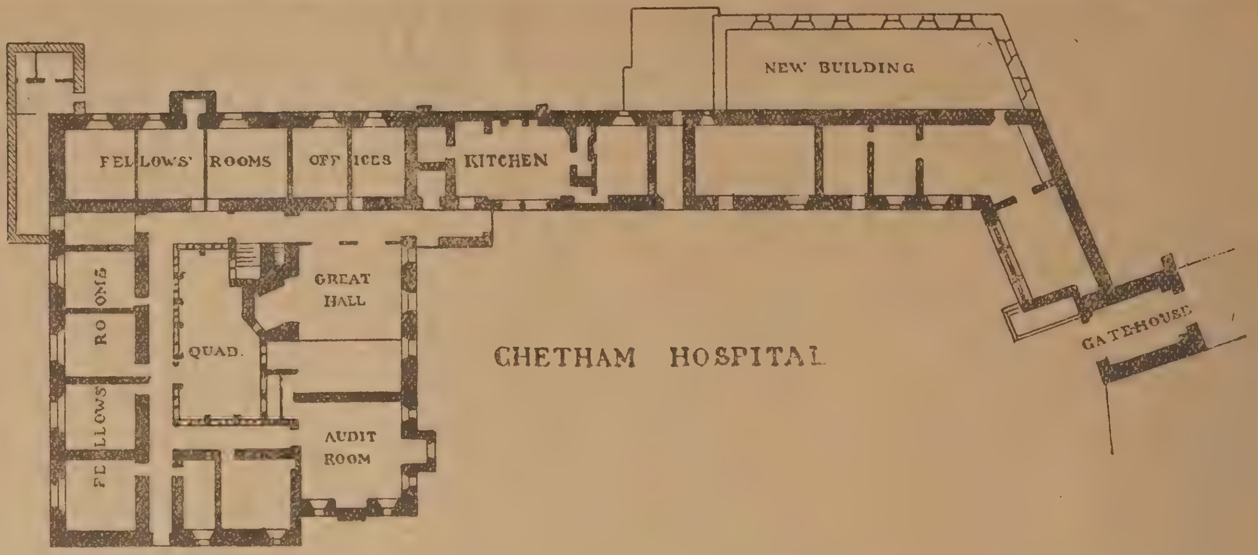
There are indications here and there, more especially in the timber roofs, that portions of the Chetham Hospital belong to a former building, most likely the ancient Barons' Hall. Its massive walls, which are nearly everywhere 3ft. thick, go down a great depth on the western side. They are built with dressed sandstone, and the roofs are covered with stone slabs. There is no wealth of colour. Externally the building can no longer impress, for Manchester has hugged it too tight in her deadly grip. But inside it is different. Unlike many buildings, the Chetham Hospital has gained rather than suffered by restorations. These have been carried out by pious hands, and the inscriptions on our left and right as we enter the building by the library doorway testify to the admirable spirit of nineteenth-century Manchester as well as set forth the nature of the restorations of late years. On the left we read, "Pass not by without bestowing a thought of kindly remembrance upon Oliver Heywood, who of his goodwill did restore the dining hall, reading-room, library, kitchen, dormitories and cloisters between the years 1883-93." On the opposite wall is a tablet recording that Charles James Heywood "completed the work contemplated by Oliver his brother, restoring the ingle-nook, stairs, house, governor's room and other portions of the hospital during the years 1893-5."

A record like this does something to remove from Manchester the stigma fastened on it by Ruskin when he declared that the city was "simply an exponent of a given quantity of national guilt and folly." For those who approach her in a sympathetic spirit Manchester has much to offer of an interest quite other than merely commercial; and if too often the city has "the look of a bad drawing in charcoal which someone has rubbed with his sleeve," that is a quality not belonging to Manchester alone, but which she shares with other and greater cities.

A ROYAL COMMISSION ON ART.

LAST WEEK'S DEBATE IN THE UPPER HOUSE.

LAST week, in the House of Lords, Lord Stanmore moved for the appointment of a Royal Commission similar in character and object to the Fine Art Commission of 1842. The Commission of 1842, his lordship said, owed its origin to the late Prince Consort, who conceived the idea that the building of the new Palace of Westminster might be made instrumental in promoting and improving the fine arts—not only the arts of sculpture and painting, but the fine arts of every kind—in England. Sir Robert Peel, who was then Prime Minister, entered warmly into the project, and the Prince Consort became president of the Commission. The objects of his Royal Highness were three. The first was the promotion and improvement of art generally in England, the second was the supervision and direction of the works of decoration which were to be undertaken in connection with the new Palace of Westminster, and the third, and more in the future, was the conversion of the palace into a sort of supplement to Westminster Abbey, in which there should be pictures of great historial deeds and statues of distinguished men, and that these pictures and statues should be added to from time to time through a long series of generations. The first and second objects met with a fair measure of success during the time the Commission lasted. In December, 1861, the Prince Consort died. His Royal Highness had been the life and soul of the Commission. The Commissioners alleged that they had so completely laid down the course that was to be taken that all that remained to be done was to carry out their programme. Some spasmodic efforts were afterwards made to keep up the work, but from that day to this—for forty years—little of importance had been accomplished. Much that had been done, including some fine pictures, had fallen into decay. He urged that a commission of the same kind as that which sat before, or a committee of some kind, should again be appointed. Of



course, when there was no longer a commission or committee to press the Chancellor of the Exchequer, the latter was only too happy to avoid incurring expenditure. At the time that the Fine Art Commission ceased its labours the next thing which should have engaged attention was the continuance of the decoration of the Royal Gallery, and those of their lordships who had attended the recent trial in that gallery would remember what scope there was for such work. One of the next things that ought to be attended to was St. Stephen's Hall, which had been very much neglected. With regard to his present proposal, he had received a letter from Sir E. J. Poynter expressing the opinion that it could not but be an excellent thing for the encouragement of art of the higher kind. Events had shown that it was impossible to carry on the work desired unless a fixed body were appointed.

Lord Salisbury's Pessimism.

In replying, the Marquis of Salisbury said: I think my noble friend has not considered the peculiar position occupied by the Prince Consort and how far it furnishes the key to the somewhat curious and mysterious history of the artistic efforts of the last sixty years. If it had not been on account of his great influence, of the power he could bring to bear, and of the assistance he could give in all departments of government, I doubt very much whether the Commission would have had the effect which, according to the admission of my noble friend, it has had. He did his best, and he did a great deal. But is the idea of my noble friend practicable that by removing the special machine which, in view of his peculiar position, the Prince invented and worked, we can repeat the same results, or similar results, in a different generation, at a considerable distance of time? I do not believe it. I believe the work of the Commission was the work of the Prince Consort and practically nobody else. My noble friend has dwelt very strongly on the evil results and has carried his investigations so far that he is able to tell us of stains upon various carpets, and he has criticised some wallpaper put up and has declared it to be ugly. I do not know it myself, but of this I am certain—that if the noble lord and his artistic following say it is ugly, we shall find another following ready to say the reverse. But the noble lord thinks things have gone from bad to worse, and he has dwelt on the strange neglect of all First Commissioners of Works who have done nothing to carry on the work of the Commission. But is that an isolated phenomenon? Are you to take it as merely a curious thing to be written in your museum that for forty years the British people and those by whom they were represented took none of those steps in favour of advanced art which my noble friend desires? Surely the more reasonable explanation is that the British people did not care about it. I am afraid that is what my noble friend will find. If some man of the power, position and extraordinary gifts of the Prince Consort were to arise, no doubt many artistic things would be done and many pictures would be commenced; but as soon as the inevitable shortness of human life brought limitation to his efforts, we should again fall into the hopeless difficulties my noble friend speaks of. Some of the observations of my noble friend with respect to things that should be revived and restored, the delicate ironwork which should be wrought, the beautiful carving to be made—these things, however admirable in an artistic dream, are, I am afraid, calculated to cause a cold shudder to the back of a Chancellor of the Exchequer. These things can only be obtained by money. For forty years it has been the opinion of Parliament, as indicated by its action, that the money for these purposes would not be forthcoming—that is to say, that there were other objects preferable to them that claimed expenditure. It seems to me my noble friend has embarked on an enterprise which is certainly hopeless now; and though undoubtedly we can all wish him well in the desire to improve the artistic taste of the country, and especially to improve the building in which we stand, still for everything there is time and opportunity, and I do not think that the present day is the proper opportunity for setting up such a Commission as my noble friend asks for.

Lord Rosebery's Spirited Advocacy.

Lord Rosebery said: I do not rise to support the motion of the noble lord, and I can well understand the reluctance of the noble marquis to entertain it. But I do not altogether sympathise with the reasons the noble marquis has given. The reasons of the noble marquis are, as usual, of a somewhat unexpected character. Another disappointment! He says the Commission would be of a wholly unconstitutional character, and he at once began to draw his familiar warning about the danger of pulling the English Constitution to pieces. Considering that that Commission lasted for eighteen or nineteen years without any violent strain on the Constitution, I am really at a loss to know, unless it be the mere fact of the noble lord's prolonged absence from the country, what constitutes a change in the Constitution that makes the Commission a constitutional peril. Then he said the sum of money the Commission might dispose of would be of an alarming character for the Chancellor of the Exchequer. Well, the old Commission disposed of a fixed sum of £4,000 a year. The noble lord knocked off 50 per cent., and then another 25 per cent., and professed his readiness to undertake the work—for I presume he would be on the Royal Commission if appointed—for the comparatively moderate outlay of £1,000 a year. I think the Government does singularly little for art in this country. On the whole I think that is a good thing. In other States where personal government is more the rule than here, sovereigns are apt to send to the annual exhibitions of art and buy collections of pictures, with which they enrich their palaces and adorn provincial museums. I will not say with what result to the palaces and museums, though I have a strong opinion on the point. I should be sorry to see the noble marquis, followed by a suitable staff, passing through a private view of the Royal Academy, with a marked catalogue in his hand, noting the purchases he intends to make on behalf of the Government. It is no disparagement to his taste to say—I am sure he is convinced of it—that his purchases would be universally criticised by the friends of those whose pictures were not purchased, and that he would create a political situation for himself of a much less enviable kind than that which he new enjoys. What I want to point out is that there would surely be no great difficulty if the National Portrait Gallery were empowered to apply to the Treasury for permission to entrust the execution of a portrait of some great contemporary to some great living artist to enrich the walls of the National Portrait Gallery. If this be not done you have no conceivable chance, except through the patriotism of the individual, and that is not a quantity on which you can always reckon, of obtaining the portraits of great living contemporaries for the national collection. I can hear the objection made to that—"Who is to choose these national portraits?" I would hand over the power to a perfectly impartial and non-political body—the Trustees of the National Portrait Gallery. Without that I think you will have no portraits worthy the name of men living now, because when the portrait of the great man is a success it passes out of your power to obtain it at almost any rate of expenditure.

In the Interests of Architecture.

The Earl of Wemyss said what was wanted in his opinion in this country was a permanent body which should have control over official architectural eccentricities and should put a check on engineering monstrosities, such as they saw in some of their bridges over the Thames. Such a body as he suggested might be composed of the president of the Royal Institute of Architects, the president of the Royal Academy, a professor of architecture, the president of the Institution of Engineers, and a certain number of other persons, including probably the First Commissioner of Works. He thought some body of that kind would be useful, for it would prevent such official eccentricities in the matter of architecture as they had now. He might give a few instances of what he meant. There was Hungerford Bridge straggling across the river spoiling the view of one of the most beautiful structures in the world — Waterloo Bridge. Again, there was that beautiful bridge at Blackfriars, close to which was a hideous railway bridge. If they had a properly constituted artistic body, as he suggested, they would be spared these disfigurements.

Lord Stanmore said he was not quite satisfied with the criticisms of the noble marquis, who had occupied himself in knocking down a house which he had not built. He knew his motion would not be carried on a division, and therefore he would not put their lordships to the trouble of dividing. The motion was negatived without a division.

AN INTERVIEW WITH MR. G. F. WATTS.

A correspondent of "The Daily News" who discussed the matter with Mr. G. F. Watts, R.A., gathered, at the least, such *obiter dicta* as may serve to point a moral and adorn a tale.

Mr. Watts said: "I don't suppose that Lord Salisbury cares an atom about art; he may give an opinion, and there the matter is dismissed. As to his statement with regard to the Commission of 1842, he is undoubtedly right in saying that it was kept alive by the interest and energy of the Prince Consort, and that after the Prince's death its work flickered out. But what then? Lord Salisbury's point, you say, is that the man cannot now be found to renew the work; well, I would suggest, in that case, that every artist of distinction should paint one picture and present it to the nation. For the rest, I don't know that I can suggest anything, except that it would be well if the Government did make some kind of appointment. In France the Government follows a system, but it is confined to historical pictures, which, being only costume pieces, have not the biographical value of portraits. It is this biographical idea which I have attempted to follow in the portraits which I have presented to the National Portrait Gallery; and in that connection I do not think anything could be better than Lord Rosebery's suggestion that the Trustees of the National Portrait Gallery should have the power of applying to the Treasury for permission to entrust the painting of the portrait of a great contemporary to an equally great artist."

The late Sir Frederic Leighton.

This expression of opinion led Mr. Watts into a vain of reminiscent regret. He is, because of the spirit of the times, perhaps, a little pessimistic, and he confesses that in matters artistic he does not exactly believe in anybody. In past days he cherished the hope that Sir Frederic Leighton would be created a peer with the object of fulfilling some such national function in relation to sculpture, painting and architecture as that which was suggested in last week's debate in the House of Lords. Having little faith in committees, for the reason that each man has a different opinion, Mr. Watts believes that Lord Leighton would have been an ideal man for serving the nation in the eclectic sense in matters of art; a man, indeed, whose judgment all could have trusted, and whose high character would have inspired in all other respects the entire confidence of the country.

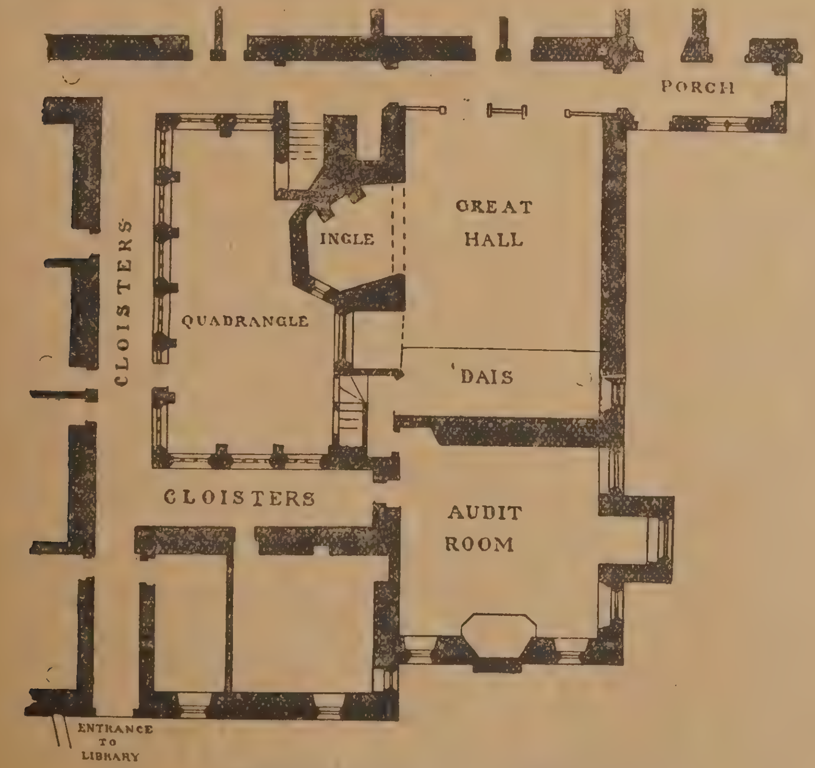
The sum total of Mr. Watts's reflections is that the present generation is not likely to see brought into existence such a Commission on Art as Lord Stanmore suggested. "I don't think you will get enough people to care about it one way or the other," he declared. "Mr. Gladstone might have taken it up, and the late Lord Wantage would have taken a warm interest in it; but for the moment I can think only of Lord Aldenham and Lord Brownlow as likely to be the men for such a movement; both take an interest in art and are quiet capable of forming dispassionate opinions. But in these things we have no patriotism left, and I fear I can offer no practical suggestions if there is no readiness to make a national effort to identify art with the glory and power of the nation."

METAL WORKING AT THE PARIS EXHIBITION.

THE BRITISH JUROR'S REPORT.

A COPY has been sent us of the report by Mr. Bennett H. Brough (secretary of the Iron and Steel Institute) on the exhibits in metal working at the Paris Exhibition of 1900. Mr. Brough (who was the British juror appointed to the International Jury) says: Class 65, *Petite Métallurgie*, dealt for the most part with comparatively small articles universally used, in constant demand, and of special interest in view of their aggregate value, their wide distribution over home and foreign markets, the skill and patience displayed in designing new forms, and the enterprise and expenditure entailed in making changes of plant. Moreover, ample opportunity was afforded British manufacturers of learning useful lessons, for it was impossible for the international jury to give the palm of superiority in this class to the United Kingdom, as was done at the Exhibition of 1851. At that date British hardware of the commoner sort stood unrivalled in its variety, its utility and excellence of workmanship, and in its adaptation to the wants and wishes of every class of purchasers. In 1900, however, France, Germany and the United States successfully competed with Great Britain in these lines. This is notably the case in manufactures which involve tasteful design or ornamentation. Even in the arrangement of the exhibits the lack of taste in the British section was painfully apparent, for with a few notable exceptions the exhibits were not well displayed.

In one branch of the forged iron industry—that of artistic ironwork for architectural purposes—some admirable examples were shown by Starkie Gardner & Co. in the Royal Pavilion. In France this industry is of great antiquity, and some striking seventeenth- and eighteenth-century examples, such as the gates in the Apollo gallery of the Louvre, are familiar to every tourist. Well-selected examples were shown on the retrospective exhibit. The most remarkable forged-iron gate in the Exhibition was that shown by J. Jungfer, in the Hungarian section.



CHETHAM HOSPITAL, MANCHESTER.

The best exhibits of ornamental iron castings were those of A. Durenne, of Paris, of the Kyschtym Ironworks in Russia, which consisted largely of statuettes representing the bronze works of celebrated Russian sculptors and of Deville, Pailliette and Forest of Charleville.

Ironmongery, an industry which in France affords employment to about 90,000 workpeople, was naturally best represented in the French section. The door-plates, handles, locks and fittings of the elegant character traditional in France since the reign of Louis XIV. were conspicuous. There is, however, a tendency to over-ornamentation. Striking novelties in this section were the door-springs shown by Mr. Robert Adams, and the exhibit of the Bostwick Gate and Shutter Co., Ltd. Files made of high-class crucible steel with teeth sharpened by the sand-blast process were shown by J. J. Saville & Co., of Sheffield; tools made from Dannemora steel by Seebohm & Dieckstahl, Ltd., of Sheffield; and hand saws and circular saws by J. Beardshaw & Son, of Sheffield.

Wire ropes, an important branch of manufacture in which British products are pre-eminent, were also included in class 65. The exhibits of George Cradock & Co., of Wakefield, of William Cooke & Co., Ltd., of Sheffield, and of William Smith & Son, of Warrington, well maintained the country's reputation.

Window fastenings were exhibited by a number of Paris firms, and the British articles shown in operation in the Royal Pavilion indicated the ingenuity that has been displayed in simplifying the mechanism.

Many of the locks exhibited were remarkable for ingenuity of principle, and for combinations which seem to render them impregnable. Much progress has been made in this direction on the Continent. The locks shown by Chubb, Needs and other makers are still conspicuous for the merits which public opinion has so long recognised; indeed, there is little fear of Continental locks replacing English ones in Great Britain. No conspicuous success has attended the attempts to introduce the Yale locks with the light keys so popular in America. Moreover, the practice of building operations being under the direction of architects, who stipulate that the fittings must be of certain specified brands, tends to encourage the use of home-made products.

A general review of the contents of class 65 shows that the contributions from France considerably exceed the sum of those from all other countries, and that the character of the contributions seems to indicate that French hardware manufacture has attained a high degree of excellence in workmanship, material, ingenuity and artistic taste. The British contributions, which took the next place in extent, were for the most part thoroughly representative of current practice in various branches of British metallic manufactures. There were, it is true, gaps in the representation of important industries, but of the contributions shown there was little that was not creditable to the country. The United States with forty-four exhibitors, and Germany with only sixteen, afforded little indication of the importance of the hardware industries in those countries.

Extension of Leeds Workhouse.—Proper accommodation is being provided for the large number of tramps who pass through the Leeds Union in the way of new tramp wards. The new buildings, which will cost about £10,000, have been designed by Messrs. T. Winn & Sons, and the principal contractor for the work is Mr. J. T. Wright. The premises are completely separated from the main workhouse buildings, and have an entrance from Gledhow Road. At the entrance are men's and women's shelters, which give access to the respective receiving-rooms and, when necessary, to examination-rooms. Connected with these is an observation-room and an associated-room for the better class of poor women and children. Thirty sleeping cells are provided for the men and twenty stone-breaking cells, and twenty sleeping cells for females, as well as lavatories, bathrooms, &c., and sitting- and living-rooms, and an office for the receiving officer. The buildings will be constructed of brick, with stone dressings, and inside of glazed brick, the floors of the sleeping-cells, &c., being of concrete and the remaining floors of wood-block paving.

QUEEN VICTORIA MEMORIAL.

MR. ASTON WEBB SELECTED.

On Thursday last, at the Foreign Office, a meeting of the general committee of the Queen Victorial Memorial was held for the purpose of considering the recommendations of the executive committee as to the proposed designs. There were present the Earl of Rosebery, Lord George Hamilton, Mr. Balfour, Mr. Chamberlain, Sir Henry Fowler, the Lord Mayor and Viscount Esher (hon. sec.). The following recommendations of the executive committee (Sir E. J. Poynter, P.R.A., Sir L. Alma-Tadema, R.A., Lord Windsor, Viscount Esher, Sir Arthur Ellis, Mr. A. B. Mitford, Mr. Sidney Colvin and Mr. William Emerson, P.R.I.B.A.) were agreed to :—

1. The committee recommend that Mr. Brock's design for the memorial be accepted, subject to such modifications as may be necessitated by the scheme of the memorial as a whole.

2. That Mr. Aston Webb's plan for the general treatment of the space in front of Buckingham Palace be accepted subject to certain necessary changes.

3. The committee further recommend that the consideration of the remainder of the Mall scheme be postponed until the amount of the subscription to the National Memorial has been completed.

In the afternoon, at the invitation of Viscount Esher, a number of representatives of the Press were present at the Foreign Office to examine Mr. Brock's small sketch model of the memorial, and the ground-plan and elevations of Mr. Aston Webb's design for altering the approach to Buckingham Palace. Although certain important changes in detail will be made in Mr. Webb's design, the general idea is settled, and it is undeniably grandiose. The Mall is to be transformed by the simple but very important change, so long desired by every First Commissioner, of cutting an opening into Charing Cross to the north of Drummonds' Bank. The Mall will thus become a great thoroughfare from end to end; a change which, we may hope, will have the practical effect of relieving Pall Mall, and even Piccadilly, of a portion of their traffic. We shall have to pay a price for this convenience, for at least one row of trees must be sacrificed before the proposed two carriage roads, with the great "Processional Road" between them, are complete. Some day, when funds permit, it is intended to place groups of sculpture at two points in the Mall representing (1) Canada and Australia, (2) India and Africa; but the subscriptions to the memorial must be largely increased before this will be possible. What is immediately contemplated is to lay out, immediately in front of the present railings of the Palace, a semicircular space, enclosed by an arcade of stone columns or a grille of wrought iron (the choice has not yet been definitely made), with a wide thoroughfare passing on either side towards Constitution Hill and towards Buckingham Gate. The existing railings having been replaced by something in harmony with the general scheme, the central point will be occupied by the memorial itself, while the remaining space will be laid out as an ornamental garden. The space in front of the Palace has been treated in a broad comprehensive manner by Mr. Webb, who allows for architectural, sculptural and decorative treatment on a generous scale. The first impression the design gives is that of the treatment in front of St. Peter's at Rome, although, of course, it differs very materially. The architect proposes to enlarge the forecourt of the Palace by removing the railings and erecting an arcade about 20ft. further forward. As at present planned, the memorial will be 60ft. high., and will rise from a platform elevated about 8ft. from the ground. The platform itself will be over 100ft. in diameter, and will be flanked by basins into which there will run a copious flow of water. In the centre steps, will lead to the pedestal, the base of a structure of which the effect will be pyramidal, the seated groups below carrying up the eye to the great winged figure of Victory at the summit. Victory, with figures of Constancy and Courage at her feet, stands on the great squared column of Portland stone; and below, facing the Mall, sits the stately figure of the Queen. To the right of the column, looking northwards, is the group representing Justice; to the south, the similar group of Truth; behind is Charity, or Love. Of the ultimate effect of all, these it is of course impossible to speak, for no man can form a final judgment upon so vast an architectural and sculptural group from a small clay sketch measuring, perhaps, 20in. high. But at least one can form an opinion of the ideas meant to be expressed, and of the blocking-out of the design; and, so far as these go, Mr. Brock's plan promises well. The architectural proportions of the memorial, which are artistically quite as important as the sculpture, seem to be admirable, and the whole effect will be greatly helped by the wide platform and its ornaments. This is to be approached by steps guarded by winged lions; a 6ft. wall of bronze will surmount the water on either side, and may perhaps be decorated with friezes illustrating the progress of mankind during the Queen's reign; while in the centre of this wall we shall have on the one side figures representing the Navy and the Army, and, on the other, a similar group to denote Art and Science.

Neither the sculptor, Mr. Brock, nor the architect, Mr. Webb, wishes his scheme to be regarded as in any way complete in detail. The committee also, it will be observed, reserve to themselves the right to make modifications. For that reason Lord Esher made a special request to the representatives of the Press that no sketch of the scheme should be published yet. His lordship further explained that the opening of the Mall into Charing Cross would probably be an accomplished fact within the next year, but that this work would form no part of the memorial scheme. Lord Esher added that something over £130,000 had already been subscribed to the fund, and that the committee had no doubt that a further £50,000 would be raised to enable them to complete the scheme by transforming the Mall.

THE CRACKS IN ST. PAUL'S.

Our readers are doubtless aware of the numerous cracks which have recently been discovered in St. Paul's Cathedral. It now appears that the authorities, realising the critical condition of the edifice, are taking steps to ascertain the precise reason of these cracks, which have been attributed to a number of causes, including the tunnelling of new underground railways. One of the windows in the south transept, and the wall, are in the worst condition. The bars of windows just below the Whispering Gallery are slightly buckled, and underneath are several cracks; while on the corresponding side there are similar fissures, and in addition the cornice beneath has "settled down" at one end. Strong ties have been fixed in the walls on either side, and, as the results of the movements of the building are imperceptible to the naked eye, ties of cement, which stand out about $\frac{1}{4}$in., have been placed across the cracks, so that the slightest movement will cause the cement to break, thus indicating at once the seat of the mischief. These ties of cement are examined at stated intervals, and, if anything wrong appears, steps are taken immediately to put matters right. The walls on the south side contain many cracks, but owing to their slow development it is very difficult to localise them. As showing that the authorities are fully alive to the importance of keeping the cathedral in thorough repair, it may be stated that there are about forty men, representing practically the whole of the building trades, permanently employed in carrying out what may be described as repairing work. These are, of course, in addition to those who are engaged from time to time in executing the larger alterations. The experiment above referred to by way of locating the cause of the cracks is to be followed by further tests.

The Parish Church at High Wycombe, Bucks, is being restored. During recent years the tower, which was erected in the year 1522, has been considerably affected by the weather, and in the course of renovating the external fabric of the historic structure it has been discovered that an expenditure of about £2,000 will be involved to carry out the entire work necessary for the preservation and safety of the tower. The church is a very large one, and is familiarly known as the "Cathedral of Bucks."

THE SEWAGE COMMISSION.

CONCLUSIONS.

Last week the interim report of the Commissioners appointed in 1898 to enquire and report what methods of treating and disposing of sewage may properly be adopted was issued as a Blue-book. The Commissioners arrive at the following conclusions :—

Suitable and Unsuitable Land.

(1) We doubt if any land is entirely useless, but in the case of stiff clay and peat lands the power to purify sewage seems to depend on the depth of the top soil. There are, of course, numerous gradations in the depths of top soil which are met with in nature, and it is not easy to draw the line between lands which contain a sufficient depth to justify their use and lands which do not. We are, however, forced to conclude that peat and stiff clay lands are generally unsuitable for the purification of sewage, that their use for this purpose is always attended with difficulty, and that where the depth of top soil is very small, say 6in. or less, the area of such lands which would be required for efficient purification would in certain cases be so great as to render land treatment impracticable. Further information with regard to this point will be available when our investigation of land treatment is completed.

L.G.B. Rule might be Modified.

(2) After carefully considering, however, the whole of the evidence, together with the results of our own work, we are satisfied that it is practicable to produce by artificial processes alone, either from sewage or from certain mixtures of sewage and trade refuse—such, for example, as are met with at Leeds and Manchester—effluents which will not putrify, which would be classed as good according to ordinary chemical standards, and which might be discharged into a stream without fear of creating a nuisance. We think, therefore, that there are cases in which the Local Government Board would be justified in modifying, under proper safeguards, the present rule as regards the application of sewage to land. No general rule as to what these safeguards should be can be laid down at present, and indeed it will, probably, always be necessary that each case should be considered on its own merits.

The Importance of Protecting the Rivers.

(3) We consider it of the utmost importance that the simplest possible means should be provided for adequately protecting all our rivers, and we are further of opinion that it will be desirable, probably for some time to come, that scientific experiments should be carried on in order to ascertain all the real dangers of pollution, against which they should be protected. In the present state of knowledge, and especially of bacteriology, it is difficult to estimate these dangers with any accuracy, and it seems quite possible that they should be either exaggerated or undervalued according to the predisposition of those who have to deal with them. An authority, guided by medical considerations, might not unnaturally be inclined to insist on a degree of purity which may ultimately prove in certain cases to be uncalled for; while another authority, with its mind fixed upon economy, might shrink from taking essential precautions. It is, perhaps, scarcely for us to say what arrangements should be made, but we are of opinion that the general protection of our rivers is a matter of such grave concern as to demand the creation of a separate Commission, or a new department of the Local Government Board which shall be a Supreme Rivers Authority, dealing with matters relating to rivers and their purification, and which, when appeal is made to them, shall have power to take action in cases where the local authorities have failed to do so.

The report concludes with a reference to the late Sir Richard Thorne, who died at a comparatively early stage of the enquiry. He was a most active member of the Commission, and his advice and help were invaluable.

A New Liberal Club at Neston is being erected in Chester Road.

SURREY ARCHÆOLOGICAL SOCIETY.

VISIT TO WOTTON.

THE Surrey Archæological Society recently visited Wotton. The first stop was made at Wotton Church, where Dr. F. R. Fairbank, F.S.A., read an interesting paper.

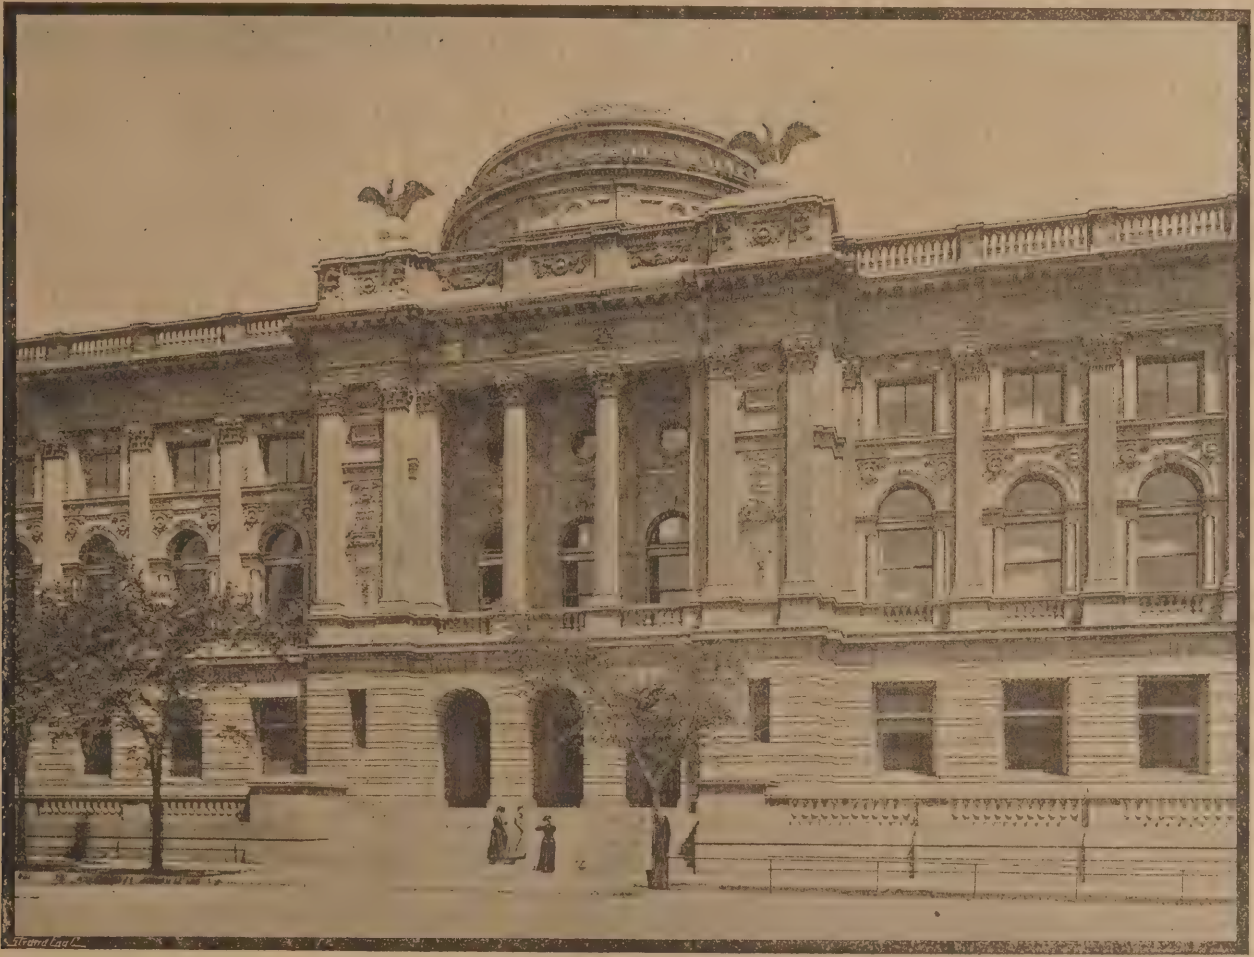
In the Domesday Book, which was the result of the survey made in 1085, the manor of Odestone, or Wotton, is returned as having been held in the time of King Edward the Confessor by one Heraldus, but was then held by Oswald, one of the king's thanes. There is no mention of a church, which is remarkable, as churches are mentioned as existing in most of the neighbouring places, such as Abinger, Shere, Albury, Dorking, Mickleham, Buckland, Betchworth and others. Speaking generally, the non-mention of a church in Domesday is not necessarily a proof that one did not then exist, as no instructions were given to the commissioners to report on the existence of churches. One church only is returned in Cambridgeshire, and none in Lancashire, Cornwall or even Middlesex.

Wotton Church has many points of interest, the tower being the oldest part. It is not square; the width from north to south is greater than the length from east to west. The north, south and east sides appear of the same date, but the west side appears to be later. The eastern arch is exceedingly plain, and the masonry very rough; the stones of which it is built vary in size, some of them being very large, and they are roughly cut. There are no mouldings.

Opinions differ as to the age of this tower. Dr. Fairbank offered the opinion that it is of early Anglo-Norman date and character, or possibly late Saxon. It appears as though originally the eastern wall formed the division between the nave and the chancel, and that the western wall was built afterwards, forming it into a central tower, with chancel and probably apse to the east, a nave to the west, and a doorway to the south. There are now no evidences above ground of this nave. It would be well if some slight examination of the ground were undertaken to endeavour to ascertain its size; this would not be costly, and would not disturb the graves. That was without doubt the form of the church, until, in the thirteenth century, it was re-modelled; the nave was then removed and the western arch of the tower was built up, a small lancet light being inserted in the upper part. The chancel also was removed, and the whole of the new church was built to the east of the tower, much as it now is.

The nave does not present much interest; there is a pair of lancets on the south side, the larger windows are modern insertions, and the walls are much thinner than those of the tower. The large arch across the chancel is modern; on each side of it, in the face of the wall, will be noticed portions of a small arch. Previous to the building of the present arch there was a small one, and indications of others were on each side of it. They are suggestive of an arcade of three arches, which is occasionally found in Norman and Early English churches. There are in the tower three small bells. Two of them are described by Stahlschmidt as of the later part of the fourteenth century; the third bell bears the date 1602. There is no staircase to the tower; this is usual in Norman churches. The font and porch are modern.

After visiting the church the party left for Crossways Farm, which was described by Mr. Ralph Nevill, F.S.A., who pointed out that this building of ornamental brickwork and Bargate stone resembles others of its type in the neighbourhood, and at Godalming and Dorking. It is chiefly interesting because it has been so little altered from its original plan, and not at all for between 200 and 300 years. The house probably dates from 1640; the staircase is part of an older house. The kitchen presents an inglenook fireplace, with an iron fireback showing two heraldic dogs, similar to that in the hall at Wotton.



ENTRANCE PORTICO, PUBLIC LIBRARY, MILWAUKEE, WIS., U.S.A. FERRY & CLAS, ARCHITECTS.

Correspondence.

Expression in Architecture.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.

SIR,—I should like to add a few remarks to Mr. H. R. Marshall's most excellent article in your last issue. He says "the assumption that the suggestion of the interior uses of a building in the design of its exterior is of the essence of good architecture" is one of the tenets of the architectural realist. I hold that all true architects must concur in this, whether realists or not. He then goes on to say that if it is necessary to express in the façade of a building the purpose for which the interior is used, it follows that we must have representations of pots and pans in the windows of sculleries and of bookplates in those of libraries. Again I cannot agree with him. To do such a thing, to my mind, would be on a par with the prevalent practice among church organists of playing very softly those parts of psalms or hymns which relate to sorrow or death, and those referring to joy or thanksgiving loud; or when mention is made of the sea, or thunder or trumpets, to attempt to imitate the same upon the organ. The first two are to a certain extent excusable and necessary for effect, but there is no excuse for the latter, and a true musician is able to express the idea suitably without necessarily resorting to musical realism. Similarly an architect can express in the façade the idea of a scullery or other menial office by a rather simple treatment. The elevation of a concert hall should be dignified, but graceful and expressive of the beauty of music; that of a smoking-room or library should be more of a cosy and domestic character, expressing comfort, and should lack the stateliness necessary to that of, say, a church or town hall.

Yours truly,
R. FINDON.

HEREFORD NEW MUNICIPAL BUILDINGS COMPETITION.

FORTY-SIX sets of designs were submitted in the competition for new municipal buildings at Hereford. The greater portion of the site for these buildings was given by Mrs. Glinn and the Misses Johnson, and other adjoining property has since been acquired by the Corporation at a cost of £2,550. The frontage to St. Owen Street is about 100ft., and the building will occupy the space between the residences of Dr. Turner and Dr. Morris. The area runs back into East Street, but at present the Percival Hall and other buildings are to remain, the present plans being all self-contained without taking down these buildings. The accommodation required is as follows: Large assembly hall to seat 400 persons, fronting St. Owen Street on first floor, with mayor's parlour, reception-room, two committee-rooms, retiring-room, cloakroom for members, council chamber, waiting-room, offices for the four chief officials and staff, the town clerk, the city surveyor, the city accountant, sanitary department, with all necessary basements, strong rooms, laboratory, photo-room for surveyor's use, stores and a spare suite of rooms: in all making about forty-two rooms. The building generally was to consist as follows: Basement plan, ground floor, first floor, caretaker's quarters and kitchens above.

Three premiums were offered of £100, £75 and £50, which were awarded by the assessor (Mr. Thomas Blashill, F.R.I.B.A., late architect to the London County Council) as follows: (1) Messrs. Macintosh & Newman, High Holborn, W.C.; (2) Mr. H. T. Fowler, Barrow-in-Furness; (3) Messrs. Stanger & Stanger, Wolverhampton. The designs of Mr. Henry A. Cheers, Twickenham; Messrs. Brookes, Son & Godsell, Hereford; and Mr. W. J. Morley & Son, Bradford, were reserved.

The Assessor's Report.

In his report to the Mayor and Corporation Mr. Blashill says: "There is a very great general similarity in the designs; this has resulted from the terms of your instructions, which clearly lay down certain leading features that have commended themselves to you as being best suited to your requirements. This has been of great advantage by concentrating the attention of architects upon those features in which individual thought might well be exercised.

"The object of this competition must be to obtain a building which in plan and general arrangements is suitable for its purpose, and which in external appearance will be dignified and appropriate to its character as the centre of civic administration. It may be wished that these two results could more easily be got from the same design. There are elevations amongst these drawings which would very well fulfil the last-named requirement, but which are combined with plans that are plainly inadmissible. Thus in disregard of your instructions or of good planning the assembly hall is in some cases placed at the rear of the building, and the council chamber or the committee-rooms are put in front, where they will be subject to the noise and dust of the street, or even one storey higher than the instructions or good judgment indicate. There are designs which require improvement in some minor points, which can easily be amended, and in such cases I should not think them disqualified if they are otherwise suitable, particularly as to the general arrangements of the departments and the convenience of the more public rooms.

"I will now deal with the three best designs in detail.

"No. 3 is a design which very fully meets the printed instructions and the general requirements of such a building. The official departments are conveniently placed. The mayor's parlour is in very good communication with the council chamber and the assembly hall. The principal staircase with entrance hall should be enlarged in the direction of the internal lighting area and the entrance made wider. But the author is one of the very few who have provided a good secondary staircase and exit from the assembly hall. This will be necessary in any case, and in most of the designs it could not be got without a considerable revision of the competition plan. Good retiring-rooms are provided for the lecturers or performers in the assembly hall, and good hat and cloak rooms, but such accommodation for officers could be improved. The front elevation is fairly characteristic of a public building, but would be improved by modifications that would probably decrease the cost. The author's estimate at 1s. per ft. cube on 357,512ft. is £17,868. I consider that the measurement will be considerably more, but on the other hand I see no reason to think that the cost per ft. cube will be greater than that of the other designs, the authors of which estimate the cost at 10d. or less. For a fair comparison the same price should be used. I consider that this is the design which in its internal arrangements follows out more closely than any other the instructions issued by the council and the real practical requirements of such a building, and I award to it the first premium of £100.

"No. 10 meets in a somewhat less degree the chief requirements. The allotment of the front rooms on ground floor might have to be somewhat varied, and the arrangement of seats in the council chamber requires reconsideration. I think these fittings should be reversed. The general lavatory arrangements seem insufficient. This plan also provides a second exit with staircase from the assembly hall. The front elevation is less satisfactory than that of the first. The author's estimate at 10d. per ft. cube on 432,776ft. is £18,032. I award to this design the second premium of £75.

"No. 7 is in general suitable as to the arrangement of the departments, but there is no second exit with staircase from the assembly hall, and the lavatory arrangements for the lecturers or performers as well as for general use are insufficient. The front elevation shown as an alternative is good. That shown in the large coloured perspective is also good as a design, but would be very costly, and it is too heavy in appearance for such a building. The author's estimate at 10d. a foot on 408,962 cub. ft., with £950 added for heating and ventilation, is £17,990. I award to this design the third premium of £50.

"I do not consider that by the terms of the competition I am to take full responsibility for these estimates. The council has provided a means by which they are to be tested, and under favourable conditions as to cost of labour and materials the money available may not be insufficient for a plainly finished building.

"Finally, I advise you to enter into communication in the first instance with the author of the first premiated design, with a view to his being appointed the architect to this building, if you can be satisfied as to the points to which I have drawn attention and upon general considerations."

The designs of Mr. H. A. Cheers were favoured by the majority of the municipal buildings committee, and they were practically accepted subject to an interview with the architect, which took place last Friday. It should, however, be stated that the decision is not final until the August meeting of the council, when it will come forward for formal sanction. But this practice of disregarding the assessor's award is much to be deprecated.

THE ACCIDENT TO BROOKLYN BRIDGE.

LAST week, without any warning, seventeen of the heavy girders, or steel cable ropes, which sustain the great Brooklyn Suspension Bridge roadway gave way near the Brooklyn end, allowing the roadway to sag considerably. Others threatened to follow suit, and the police at once cleared and closed the bridge. Engineers say that the accident is due to the excessive weight of a long line of heavy trolley cars, which are stalled at that end of the bridge, and they declare that the structure as a whole is not endangered. The broken girders are the long string-like cables which hang down from the main semicircular suspension cables and are the real supports of the passenger and waggon ways.

The Brooklyn Bridge spans the East River between New York and Brooklyn at a point where the river is about as wide as the Thames at Gravesend. It is the largest suspension bridge in the world, its total length being 5,989ft., or about 1⅛ miles, divided into a central span of 1,595ft. and two land spans of 930ft. each. The towers are 276ft. high, and the four cables which take the stress of suspension are 15¾in. in diameter and composed of 5,000 steel wires each. These are anchored to solid masonry structures on shore, each weighing 60,000 tons, and measuring 119ft. long, 132ft. wide and 90ft. high. The roadway of the bridge, which was finished in 1883, is divided into five avenues. The central one is devoted to foot passengers, the two outer ones to vehicles and the two inner ones to tramcars.

New Patents.

These patents are open to opposition until September 3rd.

1900.—**Sewage Sludge.**—12,124. F. M. Spence & D. D. Spence, both of the Manchester Alum Works, Holland Street, Manchester; H. Spence, Audley House, Broad Road, Sale; and M. Royley, 94, Holland Street, Manchester. The precipitated sludge is treated without any slaked lime. It is heated sufficiently to curdle, which causes it to lose its slimy character, thus rendering it much easier to press.

Lifting Tackle.—15,245. J. Everard, 276, High Street, Waltham Cross, Herts. This invention consists of a toggle link, a pair of gripping jaws, and a suspension yoke carrying a hook. The device is intended to be jammed between two joists, or clamped on one joist, for the purpose of raising loads. The greater the weight the closer the jaws grip the joist.

Domestic Hearths.—15,390. H. B. A. Lillie, 34, Gloucester Road, Regent's Park, N.W. The hearth is made hollow and waste heat is deflected into it.

1901.—**Pipe-making Machines.**—3,824. R. Ames, 116, Loughborough Road, West Bridgford, Nottingham. The core is segmental and is attached to the hanging bolt of the clay cylinder. Its outside shapes the inside of the pipe. As many spaces are left between the segments as there are partitions required. If these are not to continue from end to end, stop pieces are provided.

Pivots for Cupboard Doors.—9,518. E. Klotz and A. Grundmann, Ponitz, near Meerane, Saxony. Wood screws with special heads are used. One has a recess and the other a pin corresponding to it. One is screwed into the door and the other into the frame.

The following specifications were published on Saturday last, and are open to opposition until September 10th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—6,019, Moore, street lamps. 11,868, Davies, socket-making machines. 11,913, Fage & Hunt, scaffoldings. 12,071, Colbran, gas fittings. 12,157, Youlten, process for impregnating wood and other fibrous substances. 12,186, Adams, automatic filling and discharging apparatus for sewage purification works. 13,615, Allott & Jones, apparatus for use in copying tracings by artificial light. 14,016, Spence, apparatus for holding doors in a partly open or open position. 14,476, Crouch, window fasteners. 15,030, Bloxam (*Pholox-Glühlicht-Gesellschaft mit beschränkter Haftung*), incandescent gas mantles. 15,432, Gibb, manufacture of Portland cement. 15,446, Mouchel, walls, partitions, slabs, &c. 15,453, Pitsch, fireproof floor or ceiling. 15,561, Oates, street gulleys. 15,720, Bayer, sewage treatment. 15,790, Hannent, means for glazing greenhouses and other structures. 15,853, Bell & Bell, operating mechanism of frictionally-driven cranes. 15,910, Gardner, crushing, grinding and dressing or sifting machine. 15,996, Fickling, means for consuming smoke in the furnaces of steam boilers.

1901.—4,370, Etrich, pavements for tennis and other grounds. 6,588, Roberts & Severn, sash-fasteners. 7,467, Safford, heat-radiators. 8,168, Meldrum, memorial tablets. 8,372, Haddan (*Adams & Westlake Co.*), acetylene generators. 8,691, Boenke, fireproof artificial stone blocks. 9,607, Green, metal roofing. 9,650, Schmidt, contrivances for lighting purposes. 9,830, Quester, construction of armoured walls for safes. 9,919, Stone, wire cables, lightning rods, &c. 10,406, Smith, apparatus for decorating woodwork. 11,128, Rotermundt, sliding doors. 11,152, Hildmann, vices. 11,345, Newton (*New Jersey Wire Cloth Co.*), fireproof construction.

THE GUINNESS TRUST BUILDINGS.

TOWARDS the close of 1889 Sir Edward C. Guinness, now Lord Iveagh, placed in the hands of trustees £250,000 for the purpose of providing, at low rents, healthy and commodious dwellings for the more necessitous class of wage-earners. Of this sum £200,000 was to be expended in London and £50,000 in Dublin. The first trustees were Lord Rowton, who has acted as chairman ever since, Mr. D. R. Plunkett, now Lord Rathmore, and Mr. C. T. Ritchie, the present Home Secretary. Later on, as the operations of the trust increased, Lord Iveagh, Mr. J. Lunard Pattisson, Colonel G. W. Addison, and the Hon. Rupert Guinness were appointed additional trustees. During the twelve years of its existence the Guinness Trust has (independently of its Dublin work) erected eight large groups of dwellings, which will, when the eighth is completely tenanted, house 2,517 families upon eight freehold sites in the most populous districts of London at a total outlay of over £450,000.

The greater part of the eighth group of buildings, situate in Fulham Palace Road, Hammersmith, was opened last week. These buildings, erected from the designs of Messrs. N. S. Joseph, Son & Smithem, may be considered typical of the Guinness dwellings generally, though they are rather more spacious and commodious than those erected in the early days of the trust. The four great blocks of dwellings already built (and there are three smaller ones yet to be added) comprise eight separate buildings, and these blocks are divided by roads and playgrounds of very ample dimensions, the open spaces amounting to an aggregate of nearly an acre.

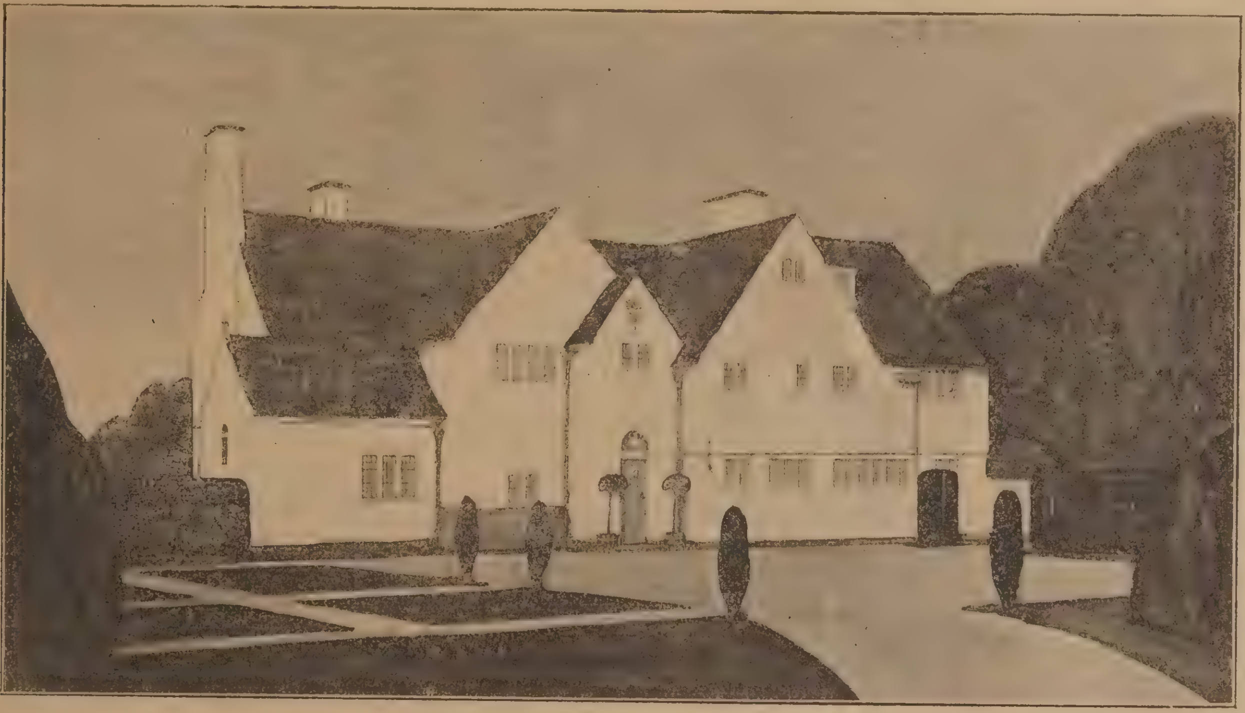
Passing along the broad landings, the visitor soon discovers that there is the usual choice of tenements with either one, two or three rooms each. In the front block there are a few with four rooms for exceptionally large families. The living rooms have a carpet-area of about 150ft.; the bedrooms, where there are two, have each an area of 100ft., and where there is only one bedroom to a tenement its area is 126ft. The rooms are all supplied with fittings. Every window of a Guinness dwelling is fitted with Venetian blinds of the strongest kind. Each living room has a fitment presenting a triple combination of coal bunk, store for cooking utensils, and food cupboard, the latter ventilated into the outer air; and as each living room serves the purpose of a kitchen, it is fitted with a close range of a specially economical kind. The laundries on each landing which are used in common by the tenants of each floor are so apportioned that each housewife has the sole use of a laundry for one day in the week, holding the key for the day, so that her property is safe from the possibility of depredation. Each laundry is fitted with two washing troughs, copper, and drying lines.

In separate buildings, placed in a central position, hot and cold baths are available for the free use of the tenants and their families every evening. In addition to this, each head of a family has the free use of a club room in the evenings and on Sundays. The club room is well heated and lighted by electricity, and is kept supplied with papers, books, and games. The housewife has the use of a drying room in which a high temperature is permanently maintained. But, perhaps, the greatest of the extra boons conferred on the Guinness tenants is the free use of the urn rooms, in which hot water is dispensed at breakfast time and tea time at absolutely boiling point, so enabling the working man to get his hot coffee before he goes to work, and also enabling the housewife to save a good deal of coal in the summer, as she needs no fire for boiling her kettle for the all-important evening meal.

The rents charged are—for a one-room tenement, 3s. 6d. to 3s. 3d. per week, according to position; for a two-room tenement, 4s. 3d. to 5s. 6d.; for a three-room tenement, 5s. to 6s. 3d. Upon the basis of those rents there is, after paying all outgoings, a nett return of 3½ per cent., which, subject to setting aside a reasonable annual sum for a sinking fund, is available for further building operations. These figures are derived from the past experience of the trust as set forth in its published reports.

The report of the trustees for 1900 answers the question whether the right class of tenants find their way into their dwellings. Lord Iveagh originally expressed the desire that none earning more than £1 a week should be accepted as tenants. Owing to the general rise in wages that limit has now been somewhat increased; but the statistics of 1900 show that of the 2,210 families at that time housed in the Guinness dwellings the average weekly earnings of each tenant (including, so far as could be ascertained those of his family) was £1 0s. 1½d. The average weekly rent of each room was 2s. 1½d.

The Hospital of St. John and St. Elizabeth at Grove End Road, St. John's Wood, was opened recently.



THE CHAPLAIN'S HOUSE, ST. MARY'S HOME, WANTAGE. M. H. BAILLIE SCOTT, ARCHITECT.

ARCHITECTURAL EXHIBITS AT THE PARIS EXHIBITION.

Mr. Ernest George's Report.

IN his report on the architectural exhibits at the Paris Exhibition of 1900, Mr. Ernest George (one of the representatives of Great Britain on the International Jury) says:

"It was disappointing to find the contribution of architectural drawings from Great Britain to be small, and to consist for the most part of unimportant works, not fairly representing British art. The list of exhibitors contains but thirty-six names, and in this list several of our leading architects are not to be found, while one or two men have sent drawings hardly supporting their deserved reputation.

"Our exhibited drawings are mostly examples of domestic buildings, and our foreign critics give us higher praise for this branch of work than for our civic or public buildings. Architecture is less erratic and more traditional in France than in England, but when a Frenchman forsakes his classical lines there is commonly less restraint and propriety and less of a pleasant homeliness than in our own country work. The English country house has more comeliness and comfort than the average *maison de campagne*.

"An architectural exhibition will never claim public interest as will exhibitions of the sister arts. The painter and sculptor show their completed works, while the architect's buildings are only explained by diagrams, and it is undesirable that these drawings should become pretty pictures or works of art in themselves.

Great Britain.

"In the group of Great Britain there are mostly line drawing, while in the United States adjoining it is interesting to find architecture represented only by photographs of executed works. These, while making a modest display, seem to us to make the most reliable statement of the present position of architecture in America.

Germany.

"The German architectural exhibits are few, but they represent municipal buildings and churches drawn and coloured to a large scale and handsomely framed, as if the picture, rather than the building, were the ultimate end.

France.

"France presents many works of interest; there is much art in the tinting of the drawings, which are frequently on a grand scale. There are many archæological studies working out the problem of restoring ancient cities or temples, reconstructing them from the fragments still to be found. These show a deep and patient research into ancient art that is hardly practised with us, our training being of a more limited and utilitarian character.

"Our own students have given equally close study to mediæval examples, the Early Renaissance and to subsequent styles, and I venture to think that in our revival or adaptation of the French, the Flemish, or particularly the Dutch types, our own application or reproduction of these is more satisfactory than the prevailing modern work in the countries that gave birth to these styles. I believe that from our best hands the spirit and refinement of the old work is often attained, which in Continental modern work is so frequently missed."

Although the British exhibit, as a whole, did not reflect the highest level to which the arts have attained in this country, it was generally admitted to be the best of the foreign sections. More medals were awarded to the British than to any other foreign section.

Bricks and Mortar.

APHORISM FOR THE WEEK.

He that builds a fair house upon an ill seat committeth himself to prison.—FRANCIS BACON.

Our Plates. THE New Radcliffe Library at Oxford has been built by the Drapers' Company at a cost of over £21,000 and given to the university. The architect was Mr. T. G. Jackson, R.A. It forms a projecting wing of the museum, with which its Renaissance architecture is in strong but not unpleasing contrast. It consists of two upper rooms about 80ft. in length, fitted up as libraries with all accommodation for readers, as well as a basement for the storage of books. There is room, it is calculated, to serve for the accumulations of a century to come.—In the design of the Ryks Museum at Amsterdam, by Dr. J. P. H. Cuypers, the question of adequate lighting was of first importance, and in order to determine which system would be best an experiment was made with a temporary wooden building.

Art in the East End. IN opening an Exhibition of Chinese Art at the Whitechapel Art Gallery last week Mr. Asquith made an allusion to the increase of artistic appreciation among the inhabitants of East London. He recalled his association with the earlier work of the Toynbee Hall Settlement, with the members of which the inception of art exhibitions in the East End originated. The scheme, Mr. Asquith said, met with some discouragement from sceptical critics, but for once the dreamers and idealists won a decisive victory over the practical men, and the exhibitions became an annual feature. During recent years, Mr. Asquith proceeded, a great and widespread decentralisation had taken place in relation to art collections, and exhibits which formerly were aggregated in the great national galleries had now become distributed among the great centres of population. The experiment they were that day initiating was one of a very interesting kind, for it was a most happy ideal that from time to time the trustees of the Whitechapel Art Gallery would concentrate themselves upon an attempt to reproduce some period, country or trade. A very opportune choice had been made in the selection of China as the subject of the present exhibition. Over 200,000 people had visited the gallery since its opening in April last.

The Working Men's College. THE Working Men's College in Great Ormond Street, to the building fund of which several City companies have just made special grants, was in bygone years an object of interest to a great many prominent persons in the world of art. In its earliest days, in the autumn of 1854, Ruskin volunteered to direct a drawing class, which he taught for some time single-handed. Writing to Charles Kingsley a few months afterwards, F. D. Maurice, to whom the college owed its foundation, says that Ruskin was "doing capitally" with the drawing class, but the work soon proved too much for that accomplished amateur. Ruskin thereon looked about for a professional assistant, and found one in the person of a struggling young artist, who was, however, destined to be famous later on. The young artist was no less a person than Dante Gabriel Rossetti, who worked with Ruskin until 1858, when his place was taken by another artist whose peculiar talents had not at that time received proper recognition, Ford Madox Brown. But Rossetti did not altogether sever his connection with the Working Men's College, for he was still teaching there in the evenings at the time of his wife's tragic death in 1862. Rossetti, who two years before had married the beautiful and gifted Miss Siddal, the original of Millais's "Ophelia," took his wife on the evening of the 10th of February to dine at an hotel near Leicester Square in company with Mr. Swinburne. After dinner he escorted her back to their house in Chatham Place, and then went out to his work at the drawing class. Rossetti was late in returning from the Working Men's College, and when he reached home he found the house in darkness. He had "to grope for a light," and called his wife's name in vain. Mrs. Rossetti, who suffered greatly from neuralgia, had taken an overdose of laudanum, and though her husband called in four doctors, among whom, curiously enough, was Mr. John Marshall, afterwards Professor of Anatomy at the Royal Academy, she never regained consciousness, but died in a few hours. Rossetti and Madox Brown were not the only artists who taught at the Working Men's College, for the fortunate students in the evening classes received instruction subsequently from Burne-Jones, Arthur Hughes, Val Prinsep, Stacy Marks, Woolner and Lowes Dickinson.

Edinburgh County Buildings Portico. AT a recent meeting of the council of the Edinburgh Architectural Association—Mr. Henry F. Kerr, A.R.I.B.A., president, in the chair—the immediately impending demolition of the Ionic portico to Parliament Square was under consideration. This portico was designed nearly a century ago by Elliott, and is in great part a transcript of the famous portico of the Erechtheum at Athens. It is undoubtedly a fine work and of commanding scale, and as an example of the Ionic order in its richest development is of great importance. The base and the entablature have original features of individual interest and value. Perhaps the excellence of its design and the beauty of its material and masonry would have been more generally appreciated had it faced another aspect than the east, where the due effect of light and shade from the sunlight can only fully be seen in the early morning. The council of the Association, fully acknowledging the merit of this piece of architecture—one of the very few remaining works of such scale and excellence—unanimously resolved to express its deep regret at the possibility of its being lost to the city of Edinburgh, and its earnest hope that in some way it may yet be saved. Assuming that the portico cannot be retained in its present position, the council is of opinion that within the confines of the municipality a place and a use could be found for it, so that it may continue to be an ornament of the city. The council is strongly of opinion that the destruction of this noble portico would be not only a civic but to a great degree a national loss, and in this age of consideration for all things worthy of repute it would be an irretrievable disgrace if the stones were allowed to be broken up.

Leather for Bookbinding. THE Society of Arts has just issued the report of a committee appointed by it in February, 1900, to investigate the durability of the leathers now used for bookbinding. The sub-committee came to the conclusion that the complaints as to the deterioration of modern leather are quite justifiable. With regard to the conditions under which books are kept, the committee noted the injurious effects of direct sunlight, gas and tobacco smoke, and observed that books kept in cases with closely-fitting doors were generally in the best preservation. As to the suitability of various leathers, the committee reports that of the old leathers (fifteenth and sixteenth century) white pigskin, old brown calf, vellum and red morocco have lasted best. It considers that a pure sumach tannage will provide a good and durable leather, and makes some detailed recommendations as to the binding of books. An extensive series of experiments have been carried out with the view of determining the causes of the decay of bindings. This decay was found to be partly caused by want of ventilation and improper heating and lighting of libraries, and partly by mistakes on the part of leather manufacturers and bookbinders in the earlier stages of leather preparation. The committee condemns the use of tanning materials belonging to the catechol group, and pronounces the practice of embossing leather to imitate a grain and the use of mineral acids to brighten colour extremely injurious. It recommends the use of glass of a slight yellow or olive tint for library windows, so as to exclude as far as possible the more chemically active sunrays.

Northumberland Handicrafts. AN exhibition, which is intended to become an annual event, was opened recently at the Academy of Arts, Newcastle, in connection with the Northumberland Handicrafts Guild. About three hundred articles were shown in the competitive classes, these being made up of woodcarving and embroidery. They were the work of the students in local centres affiliated to the guild and individual exhibitors who might not be associated. Mr. George Frampton, A.R.A., and Mr. Godfrey Blount were the judges, and in making their awards they took the following into consideration: (a) Skill in handicraft reproduction of a copied design; (b) skill in handicraft reproduction of a copied design selected and applied to the decoration of some particular object; (c) original designs applied to the decoration of an object; (d) objects constructed and decorated by the exhibitor from his own designs. A silver shield to be held for one year by the local centre submitting the exhibit which presented the best general quality of work, which had been presented by Mr. Watson-Armstrong, was awarded to Lucker. There were two other sections in the exhibition, one consisting of articles from handicraft schools and kindred agencies in different parts of the country, and the other specimens—old and modern—lent by members of the guild and others, including the Board of Education, South Kensington.

The Late Mr. Hay. THE death occurred recently at West Kirby of Mr. William Hardy Hay, of the firm of Messrs. W. & J. Hay, architects, Liverpool, the deceased gentleman having attained the ripe old age of eighty-seven. Mr. Hay, who retired from business some years ago, had been in failing health for a considerable time, and had been lately confined to his room owing to bronchitis. He was one of the oldest architects in Liverpool, and there are not a few architects in the city who received their training in his office, notably Mr. James Doyle, the late Mr. David Walker and Mr. William Parslow, Dale Street. In addition to a vast amount of ordinary work, Mr. Hay was the architect for a considerable number of churches, especially in Scotland, besides others in Liverpool and in the Birkenhead district, earning a wide reputation as an ecclesiastical architect. Formerly the firm carried on business under the style of J. W. & J. Hay, and was then regarded in the profession as one of the principal, if not the principal, firms for church architecture in the North of England as well as in Scotland. In the early revival of Gothic architecture the firm took a decided lead, making greater strides in this branch than any other firm in the North. Some idea of the magnitude of their work may be gathered from the fact that they have been known to have at one time plans in preparation for no fewer than thirty churches, schools, academies, and the like, which necessitated the employment of a large staff. On the death of Mr. John Hay the style of the firm was altered to that of W. & J. Hay, the only surviving brother now being Mr. James, who, like the deceased, has been out of business for a number of years, being well advanced in years. Whilst Mr. William was eminent as an architect in the Classical style, his two brothers were equally minent in the Gothic style.

Engineering Notes.

The Mono-rail Scheme Sanctioned.—On Friday last a committee of the House of Commons sanctioned the construction of a high-speed railway on the mono-rail principle between Manchester and Liverpool.

The Extensions to the Keighley and Bingley Joint Hospital, Keighley, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

New East-End Railway Stations.—The Stepney Borough Council have received communications from the London County Council stating that that body has received communications from the Whitechapel and Bow Railway asking for the consent of the Council to the erection of new stations in the Mile End Road, one at the junction with Globe Road and the other at the junction of Burdett Road. It is probable that the Stepney Council will give their consent to the plans.

Nottingham's New Embankment was opened on Thursday last. It is about a mile and a quarter long and comprises 24 acres of land. The total width of land occupied by road, verges, slope, &c., varies from 170ft. to 250ft. The roadway is 36ft. wide, and is channelled with granite cubes, the remainder of the carriageway being laid with tar macadam. The whole of the works have been designed and carried out by Mr. Arthur Brown, M.Inst.C.E., the city engineer. Full particulars of the embankment were given in our issue for February 7th, 1900.

London County Council Tramways.—After several days' investigation of the Bill promoted by the London County Council for acquiring new tramways and working those and older lines by electricity, and for the widening of streets, the Select Committee of the House of Lords recently gave decisions. They declined to sanction the proposed line from Camberwell Green to Dulwich, that along Stamford Street across Blackfriars Road, and along Southwark Street, and also the extension of the line in Waterloo Road. They sanctioned the construction of lines from the existing tramway in the Battersea Park Road to Albert Bridge, and that from Lower Tooting along Garratt Lane to Wandsworth, and also an extension from Archway Tavern, Highgate.

The New Pier Pavilion at Dover was opened recently. It consists of a concert-hall, 85ft. by 50ft., with seating accommodation for about 950 persons, and dressing-rooms, refreshment-bars, shop, and pier-master's room are provided in the building. The hall is roofed in one span, with semi-circular steel trusses carried down to the pier girders, and there are no columns to obstruct the view of the platform, which is of ample size for an orchestral chorus. The cost of the scheme, which includes the revising and strengthening of the under-structure of the pier, has been about £6,600. The work was executed in seven months by Messrs. Anthony Fasey & Son, of Leytonstone, from plans by and under the superintendence of Mr. M. Noel Ridley, A.M.I.C.E., and Mr. Robert J. Beale, A.R.I.B.A., joint engineers, of Westminster, whose design was selected in competition.

A New Dock for London.—The Dover Harbour Bill and the Central London Railway (No. 2) Bill recently came before Mr. Hobhouse's Committee of the House of Commons as unopposed measures. Formal proof of the preambles was given, and the clauses adjusted, the Bills being subsequently reported to the House for third reading. The Central London Railway Bill provides for raising of additional capital and the purchase of further land at Shepherd's Bush. Lord Morley's Committee of the House of Lords on Unopposed Bills considered the London and India Docks (New Works) Bill under which sanction is given to the raising of £2,000,000 further capital, with the usual power to borrow a third as much more, with which to construct a large new dock at West Ham to meet the growth in the trade of the port of London. Formal proofs of the preamble having been given, and the clauses adjusted, the Bill, which has already passed the House of Commons, was ordered to be reported to the House for third reading.

A New Electric Railway in Italy forty miles long has just been opened between Milan and Varese. It is built on what is known as the "third rail" system, which is believed to represent a great economy as compared with the overhead wire system usually adopted for electric tramways. The carriages, which resemble Pullman cars, are furnished with four motors connected with the axles of the four sets of wheels, each motor drawing its motive power from a small rail running by the side of the line and communicating with the motor by means of a copper brush at level crossings; the third, or electric rail, along which the current passes, is interrupted, but the two ends are connected underground by means of a cable. At the stations the "third rail" is carefully protected from all possible contact with the travelling public. The distance of forty miles from Milan to Varese is to be regularly covered in fifty minutes, though a much higher speed is easily attainable.

Builders' Notes.

Finsbury Circus Garden was opened last week to the public. Formerly it was private property. The garden is 1¾ acres in extent. The cost of the works is between £400 and £500.

Mr. Fred Noble, builder, of Ongar, died recently. Deceased had carried on an extensive business as a builder for upwards of fifty years, and was in his eighty-fourth year.

A New Hospital for Epilepsy and Paralysis is in course of erection in Maida Vale from the design of Messrs. Young & Hall. The building is to be fireproofed throughout on the Fawcett system. The builders are Messrs. Prestige & Co.

The Smoke Nuisance.—Last week the Westminster Electric Supply Co. were fined £10 for not complying with a notice requiring them to abate a nuisance caused by black smoke from their chimney shaft. Messrs. Mowlem & Burt were similarly fined.

A Fire Prevention Committee for the Continent.—Count Kamarowsky, president of the International Council, which held its congress at Berlin last month, and who is now on a visit in London, was entertained recently by the chairman of the British Fire Prevention Committee at the Carlton Hotel to meet the various chairmen of sub-committees and also the four vice-presidents of the National Fire Brigades Union. The International Council proposes forming a technical research committee on the Continent, with objects not unlike those of the British Fire Prevention Committee, and it was with the view of deciding on the preliminary arrangements that Count Kamarowsky made a careful inspection of the Committee's Testing Station, and several public buildings in which fire-preventive measures have been applied. Facilities were also afforded him to view the stations of the Metropolitan Fire Brigade and the London Salvage Corps.

Scientific but not Architectural.—An agent on behalf of the governors of George Watson's College for Boys in Archibald Place, Edinburgh, recently applied to the Edinburgh Dean of Guild Court for warrant to erect an additional classroom at the college. The Scottish Education Department, he said, desired that there should be further accommodation for the teaching of science, the present classroom not possessing sufficient cubic space. Dean of Guild Ormiston remarked that the suggested alteration was an extraordinary one. The court did not think the governors were improving that beautiful building by putting this roof on it. It was a handsome public building, and he thought the governors should really reconsider the case before rushing to spoil a building which they never could put right again. The agent stated that the department were pressing the Governors to make further accommodation for the teaching of science. The alterations were required by October 1st, and the governors wanted the matter set on foot as soon as possible. They were quite willing to come back to the court at a later stage. The dean observed that the alterations might be for the teaching of science, but certainly not for the teaching of architecture or taste. It might be possible to flatten the roof so as to give it a more classic appearance. Mr. Rose, architect, said the governors were determined there should be no deterioration in the appearance of the building. Warrant was granted.

The Contract for Building the New Church at Oystermouth, near Swansea, has been placed in the hands of Mr. A. J. Howell, contractor, of Galston Place, Cardiff, who will erect it from plans prepared by E. M. Bruce Vaughan, Esq., F.R.I.B.A., of Cardiff.

New Granite Works at Trafford Park, Manchester.—The industries represented in Trafford Park, Manchester, are about to receive a notable addition by the opening of the new granite works of Messrs. Kirkpatrick Brothers. The firm has been established at the Manchester Granite Works, Hyde Road, since 1884, and the steady increase of its business has necessitated the removal. Two acres of ground have been secured close to the Ship Canal Wharf, and a spacious building is rapidly approaching completion which will contain under one roof a full complement of the most modern machinery—including pneumatic hammers—for sawing, turning, carving and polishing granite for architectural, monumental and engineering purposes. A large stock of Aberdeen, Swedish, American, Irish and other granites will be kept, and architects and contractors will be able to see the work fixed in the dry; any additions to or alterations of their plans can then be made at once under their immediate supervision. Further advantages will be that orders will be quickly executed and a considerable saving of carriage effected. The works will be lighted and the machinery driven by electricity. It is probable that Messrs. Kirkpatrick Brothers may also represent several firms in allied trades who wish to take advantage of the opening given by the Ship Canal into the thickly-populated district of which Manchester is the centre.

London County Council.—At last week's meeting the Improvements Committee recommended that the working drawings, specification and estimate of the cost, £29,400, of the paving and other works connected with the widening of Piccadilly between Hyde Park Corner and Walsingham House, by the addition to the public way of the strip of the Green Park, should be referred to the manager of the Works Department with a view to the work being carried out without the intervention of a contractor. Mr. W. H. Dickinson moved that the plans should be amended to provide for the retention of the greater number of the trees at present proposed to be cut down. He suggested that the trees might be left standing in the road. Mr. W. Peel considered the whole of the improvement was unnecessary. Mr. Emden said that the trees would die if left in the middle of a paved roadway. On a division the amendment was negatived. Mr. Sidney Low then moved that words should be added to the recommendation that a report should be made on the suggestion for constructing a subway under Piccadilly at Hyde Park Corner. This was defeated. It was agreed that the Improvements Committee should again confer with the Office of Works with a view to saving more of the trees than now contemplated.—Replying to Mr. Burns, Lord Monkswell said he had received a letter on behalf of the owners offering to sell the Richmond Hill property to the council for £70,000. The conditions attached to the offer were that a deposit of £3,500 should be paid down on the signing of a formal contract, which should be forfeited if the council did not complete the purchase by December 31st next. The owners, on their part, agreed to stop all development work until that date.—The General Purposes Committee recommended that an advertisement be issued inviting applications for the appointment of chief engineer of the council at a salary of £2,000 a year in the place of Sir A. Binnie. The recommendation was adopted —The Improvements Committee recommended that an estimate of £50,000 submitted by the Finance Committee be approved, and that contribution of that amount be made towards the cost of widening the Strand to 80ft. at Nos. 89, 90 and 94 to 104, proposed to be undertaken by the council of the city of Westminster.

The recommendation was adopted.—A report was submitted by the Highways Committee to the effect that the electrical engineer and the tramways manager be authorised to visit America at the expense of the council to inquire into the system of shallow underground tramways and also as to the latest system of tramway traction in America. The matter arose in connection with the suggestion to make a shallow underground tramway from Westminster to Finsbury Pavement via the Strand, Fleet Street and Cheapside. Mr. Benn said that the officers could pay attention to the developments in motor cars in America if they had the opportunity.—Plans were approved for new technical institutions at Poplar and Brixton. The sites for both institutions have been secured. The Brixton institution is intended for the instruction of persons engaged in the building trade.

New Building By-laws at Middlesbrough.—It was reported to the plans committee of the Middlesbrough Corporation recently that a deputation had seen Mr. Grant Lawson, M.P., the Parliamentary secretary of the Local Government Board, with reference to the objections to the new building by-laws for Middlesbrough. Mr. Grant Lawson said that the only point that need be discussed was the question of paving back passages. The by-law required that all back passages not exceeding 12ft. should have 6in. of concrete foundation. Mr. Grant Lawson argued that there was no necessity for it in towns like Middlesbrough, and he gave them to understand that there was no chance if they stood out for a concrete foundation in narrow back streets of the new by-laws being sanctioned by the Local Government Board, and as they wanted them approved and in operation as soon as possible they gave way, and a few days after the new by-laws obtained the consent of the Local Government Board. The changes in the by-laws had since been communicated to all the builders and architects in the town. There has been no alteration of the old by-law save the omission of the 6in. of concrete foundation. All plans sent in before the new by-laws received the approval of the Local Government Board were passed.

Masters and Men.

Bradford Building Trade Dispute becomes Worse.—The dispute in the Bradford building trade still continues, and the spirit is growing more bitter.

The Bricklayers' Strike at the Hartlepools, which has lasted twelve weeks, was settled last week at a meeting of the Teeside Master-Builders' Association and the men. The men asked for a penny per hour advance, and have accepted a halfpenny upon concessions in regard to rules being made on both sides.

A Strike of Masons at Llandudno has occurred. The cause of the dispute involves the difference between "waller" and "banker" masons. The latter deny to the others the right to dress freestone after they have laid the stones in position, and the wallers claim that local custom entitles them to do so. Between 300 and 400 men are on strike, and the masonry work on the new baths and hotel on the pier is in complete abeyance. The contractors, Messrs. Waring & Gillow, had intended to open a part of the hotel on August 20th, but this strike unhinges all arrangements. About 150 men on the Forester's Convalescent Home, which is in course of erection, have also ceased work for the same reason. Negotiations between the men and the master-builders are proceeding.

The Penrhyn Quarry Strike.—It will be remembered that the Penrhyn Quarry was reopened on Monday, June 11th, with nearly 600 men, or rather less than a quarter of the usual number. The output during the first quarry month (four weeks) was over 2,000 tons of slates; and every week some fresh men and boys resume work, about eighty having gone in during the past six weeks. The workmen now employed held their first meeting recently, and unanimously passed the following resolution: "We, the workmen in the Penrhyn Quarry, wish to tender our hearty thanks to Lord Penrhyn for the generous bonus of 5 per cent. given to us this month in addition to the 5 per cent. rise given to us voluntarily by Lord Penrhyn in January, 1896. We also avail ourselves of this opportunity to acknowledge gratefully the constant kindness of his lordship towards us as workmen and neighbours at all times, but especially in time of sickness and distress. Yet more do we wish to place on record our warmest thanks for the relief the funds of our benefit club have had by his lordship's generously taking upon himself the expenses of the hospital and the doctor's salary. Also for the help given in a quiet and unobtrusive way to the sick during their convalescence by sending them to and bearing their expenses in convalescent homes, and for other gifts we know of well enough."

The Yorkshire Slating Trade.—Representatives of the masters and men engaged in the Yorkshire slating industry met recently at the Leeds Builders' Exchange for the purpose of agreeing upon a new set of working rules and, *inter alia*, of deciding upon the standard rate of wages which shall be observed in the trade. The conference was held under the presidency of Mr. Samuel Worsnop, of Leeds, president of the West Riding branch of the National Association of Slate Merchants. The possibility of a strike has been averted. Up to now each town in Yorkshire has had its own working rules, but as the result of yesterday's conference one code will in future operate in the entire county. The advantage of such an arrangement is, of course, obvious. But in suggesting it the operatives, who are affiliated with the Amalgamated Slaters and Tilers' Provident Society, had admittedly an interested motive. First they sought a standard rate of wages—there has been nothing of the kind in Yorkshire before—and asked that it should be 9½d. per hour. The employers could not see their way to go as far as this, but in the end compromised matters by agreeing to pay wages (in town and out) at a rate of 9d. an hour. In some places a halfpenny more has been paid, but there are other towns in which only 8½d. and even 8d. has been paid, so that what is regarded as a happy mean has been struck. This part of the business over, the meeting devoted consideration to the remainder of the working rules, which were discussed on the give and-take principle. At the beginning there was an agreement that when once adopted these should be paramount to the rules of any federation to which the operatives might be affiliated, and that the grievances of other trades should in no way prejudicially affect the spirit of the rules adopted. In this connection the following rule was agreed to: "That no workman or branch of the Operatives' Society shall be allowed to strike or turn out without first obtaining the consent of the executive council of the Amalgamated Slaters and Tilers' Provident Society." This, it is felt, will remove many of the grievances of which employers have complained in the past. Beyond this, the men's representatives have given an undertaking that non-unionists at present employed shall not be interfered with. A satisfactory feature is the provision made for settling all disputes by arbitration. A committee representing both sides is first to go into all questions in dispute, and work is to proceed without stoppage until a decision is come to. Then, should the efforts of the committee fail, the matter is to be referred to the arbitrament of six members of the National Association of Slate Merchants and Slaters and six members appointed by the Operatives' Executive, who meet (in the town affected by the dispute) within fourteen days of the reference to hear the evidence for and against and give a final and binding decision on the grievance. Other rules of minor importance were adopted. One stipulates that the wages of aged or infirm workmen are to be a matter of individual agreement, and another entitles each master to one apprentice. Time-and-half is to be paid for Saturday afternoon work and double time for Sundays and Christmas Days when the workmen are requested by the employers to work. None of the rules adopted can be altered under six months' notice, which must be given during the month of January.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

ANNUAL CONGRESS.

THE fifty-eighth annual congress of the British Archæological Association was held at Newcastle-on-Tyne from July 18th to 24th. On the first day the members were received in the council chamber of the town hall by the mayor and corporation, after which the cathedral, the castle with its Black Gate, the city walls, St. John's Church, the Trinity House and other buildings were visited. On Friday Alnwick was visited, the party driving to Hulne Priory, which was described by Mr. George Patrick, A.R.I.B.A. The fine church at Jarrow was first inspected on Saturday, Monkwearmouth Church and Tynemouth Priory being visited later.

On Monday an excursion was paid to Chesters and various stations on the Roman Wall. Various places of interest were pointed out en route, including the birthplace of Bishop Ridley, Vindolana, the ninth station from the eastern end of the Wall, the Roman station at Housesteads known as Borcovicus, and the camp of Procolitia. Cilurnum, the sixth camp from the east end of the Wall, was also visited. Much time was spent in examining the ruins of a Roman villa, which is thought to have been the residence of the governor at Cilurnum. This is the highest piece of masonry on the line of the Wall, there being in places as many as twenty-three courses of stone standing. At the close of the day's excursion very cordial votes of thanks were passed to Mr. J. P. Gibson and Mr. R. H. Forster for acting as guides.

Holy Island was visited on Tuesday, the drive across the three-mile stretch of sands to the island being much enjoyed by the visitors, who were charmed with the majestic castle at Bamburgh, clearly visible to the south, whilst westward Hedgehope and Cheviot could be seen. The ruins of the Benedictine priory were first inspected, and here an interesting paper was read on the early history of Lindisfarne by the Rev. H. J. Dukinfield Astley, the hon. editorial secretary, who also described the Priory and castle. The vicar of Holy Island (the Rev. D Bryson) kindly showed the visitors over the church, where some Saxon stones were pointed out.

The members paid a visit to Durham on Wednesday. Arriving in the city about 10 o'clock the party was received in the vicinity of the cathedral by the Dean of Durham (Dr. Kitchin), who conducted them over the cathedral and its precincts. The dean read an able paper on the "History of the Cathedral Statutes." In the afternoon a visit was paid to the Castle.

In the evening the concluding meeting was held, when the Rev. H. J. D. Astley read a paper, written by the Rev. C. H. Evelyn-White, on "The Galilee as a place of sanctuary, with a suggestion as to the term 'Galilee.'" Votes of thanks were passed to all who had been instrumental in making the meetings so successful.

Mr. Norman Leech, aged twenty-four, who is at present working as an architect in private practice in London, and is a member of the Society of Architects and a student of the Royal Institution of British Architects, has been appointed a teacher of architecture at the new Norwich Technical Institute. During 1893–6 he was an assistant in an architect's office in South Africa (Mr. Leech was born in South Africa). During the early part of 1897 he visited Italy, Germany and Switzerland for the purpose of study. During 1897 and 1900 he was a student in the architectural division of King's College, London, and during 1897–9 he was also a student in the civil engineering division. At King's College he gained a gold medal in architecture (first place), two silver medals in building construction (both first places), bronze medal in history of architecture (second place), and bronze medal in elementary studio (third class).

Law Cases.

Sequel to a Builder's Bankruptcy.—In the lourt of Appeal on July 22nd the case of *Davis , Gibbs and another* came on for further rgument. The plaintiff, who was the trustee in ankruptcy of a builder named Ham, claimed ,744 balance certified as due by the architect nder a building contract for work and labour done t the "Gibraltar" public-house, St. George's .oad, Southwark. The defence, which was in ie nature of a counter-claim, was that under the greement if the work was not completed by given day a penalty of £10 a week was to be aid by the builder until the work was finished. 'he work was to have been finished in twenty-wo weeks from its commencement in September, 899 (*i.e.*, in February, 1900), whereas the final ertificate of the architect was not given until larch, 1901, so that the delay was more than a 'ear. The Master of the Rolls said the appeal aust be allowed. The defendants' case was that he plaintiff had delayed completing the work so ong that they (the defendants) were entitled to laim damages for the delay, and therefore ntitled to defend under Order XIV. In his pinion, having regard to the fact that the remises were licensed premises and business vas being carried on all the time this rebuilding vas in process, that was a substantial and not a iebulous defence. He thought the defendant hould have leave to defend without being ettered by any condition such as payment into ourt. The order appealed against would there-ore be set aside, and the issue go to trial in the rdinary way. The lords justices concurred.

Respecting Slates.—At the Plymouth County Court recently Messrs. Jefferd & Sons, merchants, laimed £33 11s. 3d. from R. H. Pearce, uilder, St. Ives. Mr. E. R. Ward for plaintiffs xplained that in April last defendant gave an rder to his clients' traveller for 325 dozen of Anger slates for the roof of a chapel which lefendant was erecting at Carbis Bay. On May 25th plaintiffs wrote to defendant that they proposed to send the slates on the following Tuesday unless they heard from him to the ontrary. Receiving no reply, on May 28th plaintiffs sent on the goods. Defendant wrote omplaining that the goods had been sent on without his instructions, and refused to accept them as the architect declined to pass them. Eventually the slates were returned to plaintiffs. The claim was for the value of the slates, £27 17s. 10d.; railway charges, £5 6s. 2d.; and unloading expenses, 7s. 3d. Mr. Percy Pearce submitted that no order was given for the slates. All that was given in April was the promise of an order. Defendant fully intended that plaintiffs should have an order provided the slates were such as would pass the architect. Even if there was a contract, it was on plaintiffs' own showing a conditional one. The slates were only to be sent when defendant was ready for them. Defendant denied giving any order for the slates. At the interview in April he stipulated that a sample of the slates should be sent to him for the architect's inspection. In May he was not ready for the slates. His Honour came to the conclusion that no order had been given and gave judgment for defendant.

The Trade Union Case.—Last week in the House of Lords the case of the *Taff Vale Railway Co.* v. *the Amalgamated Society of Railway Servants* came on for hearing. It was an appeal from an order of the Court of Appeal, and it raised an important question with regard to trade unions and strikes. The respondents are registered under the Trade Union Act, 1871. The society has about 536 branches and 65,000 members, and their funds amount to about a quarter of a million. The case for the appellants, the Taff Vale Railway Co., was that in August, 1900, certain of their servants who were agitating for alterations in their conditions of service and for the reinstatement of a signalman who had been discharged were assisted and encouraged by James Holmes, who was not in their employ. A number of the servants having given a fortnight's notice to terminate their employment, two meetings were held on Sunday, August 19th —one of the executive committee in London, and a mass meeting of the appellants' servants at Pontypridd. The executive committee decided that the action of the men previously to consulting the committee was most condemnatory, and the meeting practically decided on a strike. At midnight on August 19th many of the men ceased work, and the stations and other premises of the railway were watched and beset by pickets of men on strike, organised and paid for by the respondents, and the whole traffic was in effect paralysed. On August 20th Mr. Bell, the general secretary, writing on behalf of the Amalgamated Society to the directors, complained of the treatment of the signalman, and suggested to the company that all negotiations should be through him. The company engaged fresh servants to carry on the work of the railway, but the same organisation for interference was continued by the officials of the respondent society, and the company set out in detail the various alleged illegal acts of which they complained, one being a leaflet circular by Bell, winding up with the question, "Are you willing to be known as a blackleg?" On August 23rd the railway company commenced an action against the defendant society to restrain them from committing these acts, and on the 30th an application for an injunction against Bell and Holmes was made to Mr. Justice Farwell; on the same day the respondents also made an application to him to strike out of the action the name of their society. Mr. Justice Farwell granted an injunction against Bell and Holmes, and reserved judgment as to the respondents' application. On September 5th Mr. Justice Farwell found as a fact that the respondents were responsible for the acts complained of, and granted an injunction against them and dismissed the application of the respondents to be struck out of the action. The respondents appealed against these orders to the Court of Appeal, who allowed the appeal, and the respondent society was struck out of the action and the injunction against it dissolved. The point was whether the action was maintainable against a trade union society like that of the respondents. The Court of Appeal held that it was not maintainable. The appellants now contended that a trade union registered under the Trade Union Acts, 1871 to 1876, was liable to be sued in its registered name in respect of wrongs committed by its executive officers under its direction and at its expense. The Lord Chancellor moved that the appeal should be allowed, that the judgment of the Court of Appeal be reversed and that of Mr. Justice Farwell restored. Lord Macnaghten in the course of his judgment said he was of the same opinion. The other lords concurred, and the appeal was therefore allowed with costs.

Ancient Lights: Interesting Case at York.—At the Yorkshire Assizes on July 24th Mr. Justice Bruce resumed the hearing of an action brought by McLaughlin and others, the trustees of the Irish National League Working Men's Club, against George Moss, builder, of York, and a member of the city council, for compensation for alleged damages. The plaintiffs claimed that their property had been injured by the action of the defendant in pulling down his adjoining building without making due support, thus causing shrinkage of the walls. They also claimed damages in respect of interference with ancient light and air, which they alleged was due to the erection of a new and larger building. Mr. Thomas Winn, architect, of Leeds, stated that he had recently made an examination of the property, and in his opinion the additional weight of the new buildings put up by the defendant had caused a settlement in the ground and a shrinkage on the right-hand passage-wall of the plaintiffs' property. He should estimate that the rental of the property had depreciated to the amount of about £5 per annum, which at twenty years' purchase represented £100. Mr. J. Bromet, architect and surveyor, of Tadcaster and Leeds, gave similar testimony. For the defence it was suggested that there was no damage at all caused either by pulling down or rebuilding. They admitted a certain amount of injury to the lights, but did not consider that such injury was substantial enough to be actionable; but if the judge held the contrary it was submitted that the £20 paid into court was sufficient. The learned counsel further contended that if no damage was caused by the rebuilding the plaintiffs had no cause of action, because the pulling down was completed on March 20th and the plaintiffs had absolutely no interest in the property until March 22nd. A bulging wall referred to was in exactly the same position when the property was bought as it was now. The bulge in his opinion was of very old standing. Messrs. Edward Taylor and Gascoigne Hastings Fowler Jones, architects, also gave it as their opinion that the bulging wall was old. His Lordship in giving judgment said there could be no doubt that the lights were ancient and that there had been obstruction, and obstruction of such a character as to entitle the plaintiffs to maintain their action, but it was difficult to assess the value which the plaintiffs were entitled to recover. One of the windows measured 5ft. by 4ft. 6in., and was obstructed to the extent of 24 degs. At the same time it never had a very good light. It faced east, and would only obtain light in the eastern direction over the wall and roof of the house adjoining. Although the obstruction was appreciable, he did not think it was very important. The other window was 2ft. 6in. by 3ft., and had a northern exposure which had not been interfered with, but there had been an interference to the east, laterally. He thought the plaintiffs were entitled to recover, and fixed the amount at £50, being £30 in excess of the £20 already paid into court by the defendant. In the other part of the case it was for the plaintiffs to prove the damage occasioned by the defendant's act, and he had come to the conclusion that they had failed to do so. On this part of the case, therefore, he gave judgment for the defendant.

PROTECTING THE NATIONAL GALLERY.

THE DISCUSSION IN PARLIAMENT.

IN the House of Commons last week, on the resolution authorising the payment out of the Consolidated Fund of any expenses which might be incurred by the Office of Works for the acquisition of land near the National Gallery, Mr. Healy objected on the ground that nothing was done for the advancement of art in the sister isle. The idea, he said, seemed to be that London was to swallow up everything. At least some equivalent grant ought to be given to Ireland. Mr. Akers-Douglas explained that it was proposed to acquire three or four buildings in Pall Mall in order to secure complete isolation on the western side for the National Gallery to protect it from fire. Lord Balcarres pointed out that the National Gallery of Ireland was already isolated. Mr. Healy: "There is nothing worth burning in it." Lord Balcarres said that on the contrary the National Gallery of Ireland, which was formed by a great expert, the late Mr. Doyle, was one of the most interesting collections of pictures in Europe. The Government had voted £10,000 last year for the extension of the National Gallery of Ireland, £9,000 for the same purpose was on the estimates this year, and a further £3,000 was promised next year. He should have thought these facts were known to the hon. member for North Louth. Mr. Burns appealed to Irish members not to delay the passing of the Bill, the object of which was simply to isolate the National Gallery, which he ventured to say contained the finest collection of pictures in the world. He dwelt on the danger of keeping the National Gallery exposed even for another twenty-four hours to the danger of fire. Mr. Healy contrasted the expenditure lavished on art in England, amounting to £200,000, with the sum of £2,400 in Ireland and upwards of £3,000 in Scotland, and urged that equal measures of precaution and expenditure should be taken in respect of the National Gallery in Ireland. Personally he had no art side. Potatoes and salt were the highest ideal of Irishmen, and they managed to get on fairly well without Murillo. (Laughter.) Mr. O'Mara said that he had visited many of the art galleries in Europe, and he had come to the conclusion that the works of art displayed on the walls of the National Gallery were a lot of rubbish. (Derisive laughter.) After further discussion the resolution was carried by 170 votes to 6.

A Stained-Glass Window in Faversham Parish Church has been erected in memory of the officers and men of East Kent who have fallen in South Africa during the present war.

A SHORT LESSON ON GOTHIC VAULTING.

By JOHN A. MARSHALL.

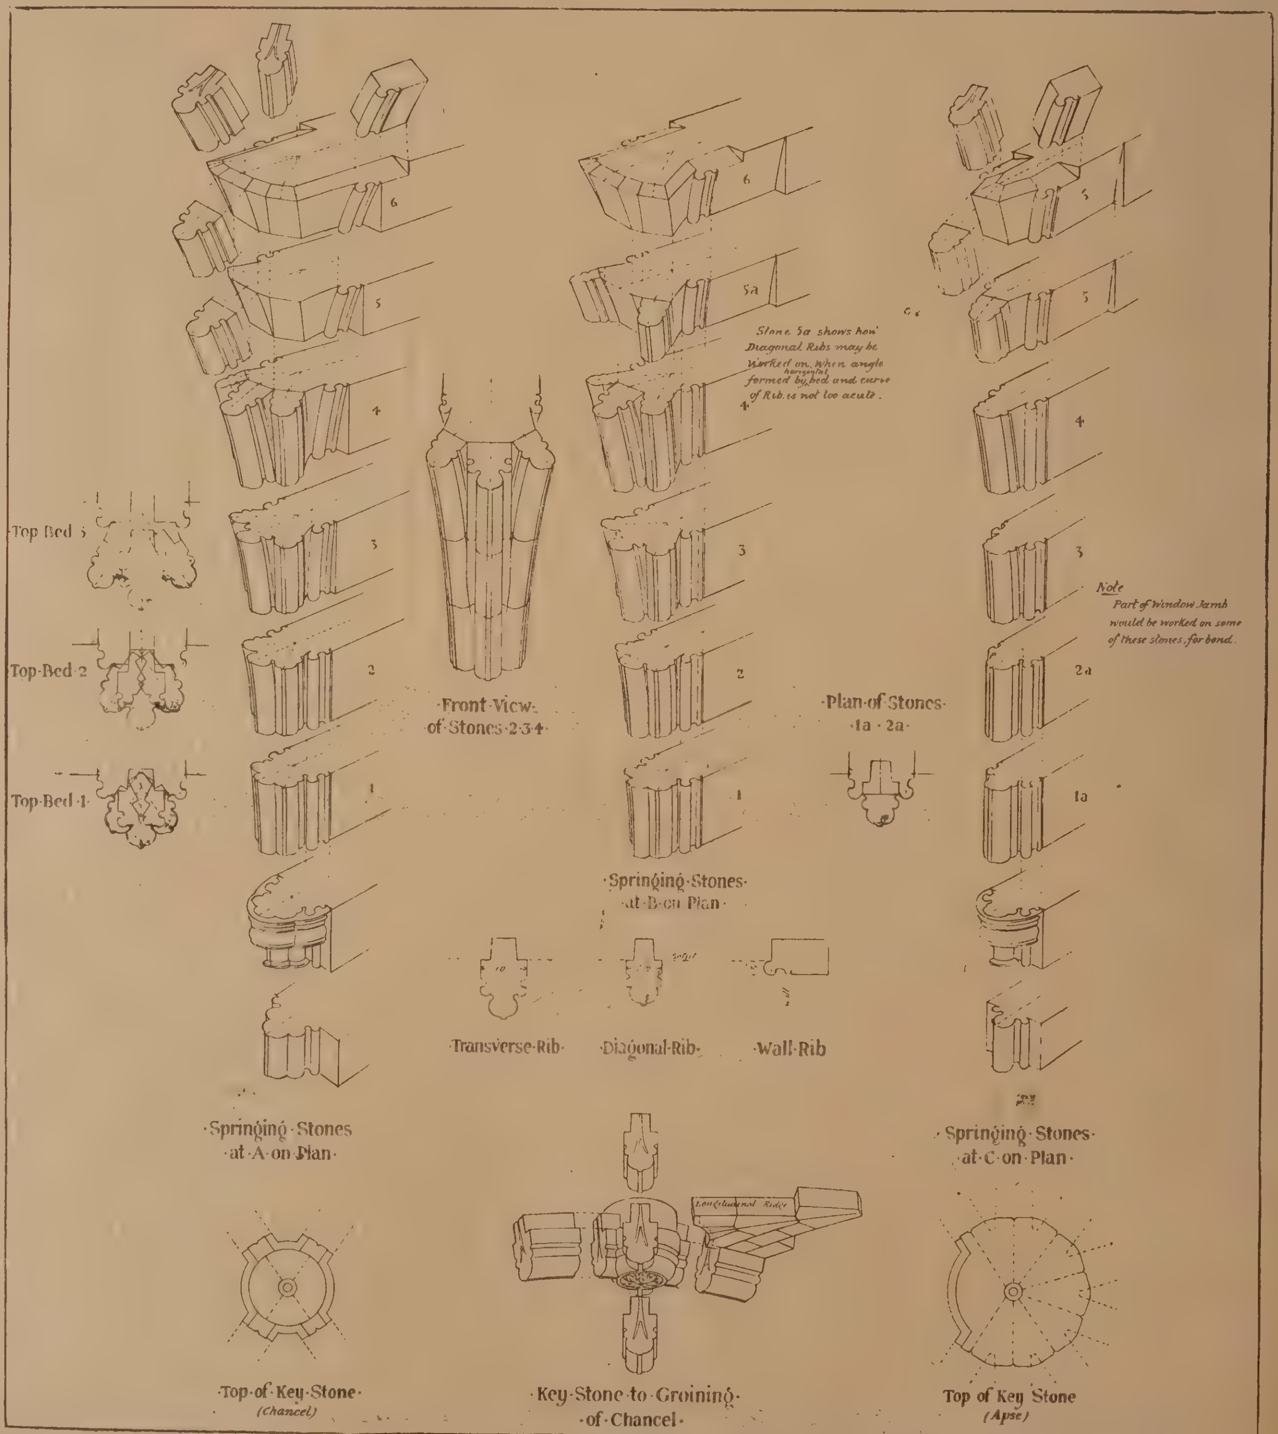
THE study of Gothic vaulting is now, we believe, mainly confined to the speculations of the archæologist; the impetus given by the enthusiastic exponents of the "Gothic revival" has all but died away, and respecting this phase of architecture we are in a position that reminds us of the poet Browning, who, when asked to explain one of his early poems, replied that doubtless it had a meaning once, but he had quite forgotten it. Yet the student of to day cannot afford to ignore the subject of Gothic vaulting altogether, and in view of this we have rescued from oblivion the set of Grissell medal drawings on which the following remarks are based.

From the standpoint of design these drawings, it must be admitted, possess but little merit, and they should be regarded merely as diagrams to illustrate the setting out and the construction of an ordinary Gothic vault. It should also be explained that on the original drawings the ordinates by which some of the curves are developed are distinguished by different colours, but as these colours cannot be reproduced we can only hope that the confusion of lines will not prove too serious.

The space to be vaulted is a chancel 24ft. wide, terminating in a semicircular apse. For the bays in front of the apse the simple "quadripartite" system is adopted, the space being spanned by light stone arched ribs, some taking a transverse direction, others a diagonal, so that they may serve as a permanent centering for the thin filling-in of the vault; the weight and thrust are thus concentrated on a few points. As a commencement for the radiating system of the apse the first narrow bay is arranged on what is known as the "sexpartite" system, or rather a modification of that system—common in France and adopted at Canterbury—wherein the ordinary diagonal ribs are intersected by a transverse rib, which divides the bay into two parts, each with a ridge inclined on plan from the point of intersection to the crown of the windows. One-half only of this arrangement is adopted in our illustration, because the transverse rib just mentioned is placed on the chord of the apse as a starting-point for the radiating ribs.

Having settled the general disposition of the vaulting ribs, their section, and the plan at the springing on the abacus of the cap, it remains to determine their curve. We have commenced by making the diagonal ribs a semicircle, struck from a centre on the level of the caps; this gives two points that regulate the curve for the transverse ribs, viz., the height of the filling-in at the apex and the point where these ribs separate, a little above the springing; this point on the curve is found by transferring it from the plan to the soffit line on the elevation. In striking the curve for the transverse rib it may be a compound curve or struck from one centre only, so long as it passes through the two points mentioned above. Although in this design the curve of the diagonal ribs was settled first, and that of the transverse ribs made dependent on it, yet this order of setting out the work may be reversed if desirable.

The wall rib can seldom be arranged to part from the others at the same level unless the compartment to be vaulted is square, or nearly so, and having no weight to sustain, this rib is generally made subordinate to the others, while

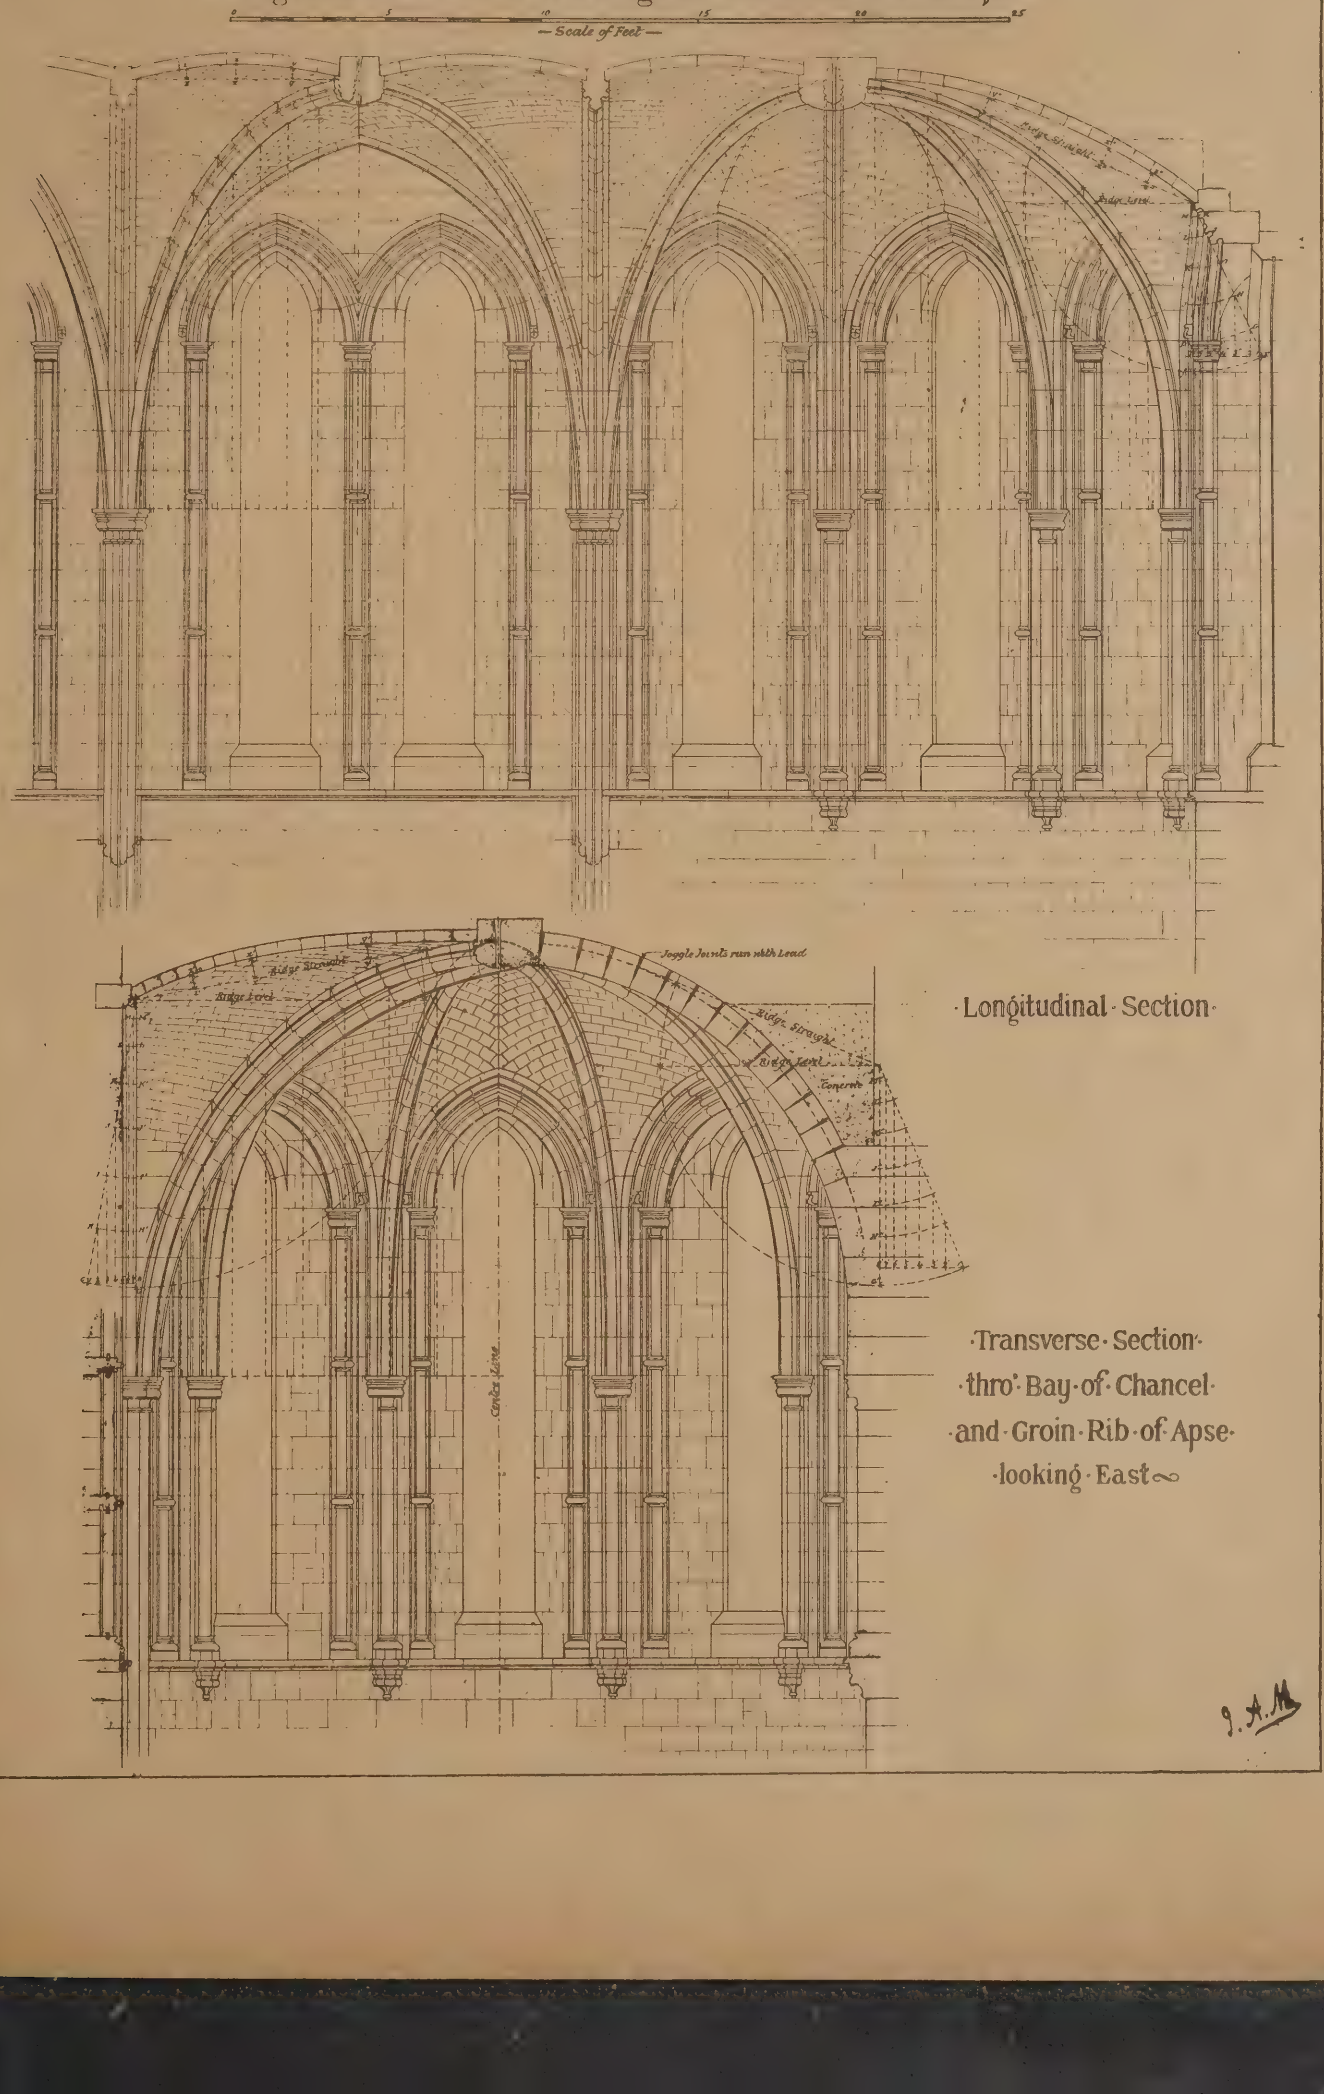


DESIGN FOR THE STONE GROINING OF A SEMICIRCULAR APSE. BY JOHN A. MARSHALL.

the main transverse ribs should be made larger than the rest. The common expedient of stilting the walls ribs to make room for the windows is another factor affecting the point of separation. Up to this point it is usual to build the work in horizontal courses, each course in a single stone, with the beds cutting the mouldings obliquely, instead of being normal to the curve. This method of corbelling practically reduces the span and simplifies the working of the stones, for it will be evident that if the top bed of all the springers is bevelled in front for the mouldings, the underside will have to be hollowed out to fit, thus involving a waste of material and labour. At the level where the ribs become free, or independent of each other, the top bed is of course bevelled to take the voussoirs, which are turned on centering in the usual way.

Keystones, or bosses, are introduced to receive the ribs at the apex; this avoids irregular intersection of the mouldings, and the stability of the vaulting is increased by the pressure of the key at the crown. The top of the boss should

·Design·for·the·Stone·Groining·of·a·Semi-circular·Apse·



project above the filling, and be worked with a level surface on which the radiating centre lines can be inscribed to serve as a guide when the ribs are being turned.

To take the filling it is usual to form rebates on the sides of the ribs. These rebates need not be cut back more than three-quarters of an inch, as it is important not to weaken the ribs, but a slight skewback should be formed in addition to the rebate when the filling is arched or domical, as in the present instance. There is no fixed rule for the direction on plan of the narrow courses of the filling-in, but by placing them at right angles to a line bisecting the angle formed by the ribs the pressure on the ribs is equalised, and, perhaps, the most satisfactory appearance is obtained. It also facilitates the application of a movable hand centre that can be adjusted to suit the varying spans of each course. The domical method of turning the spandrels rendered the use of continuous centering unnecessary, though in England the usual practice was to form the spandrels flat from rib to rib. When the soffit is domical the ridge requires a special centre, because its curve is developed by the intersection of the spandrels at the apex. The ridge stones on which this curve is worked are sometimes made long enough to include two or three courses of the filling, and the notching of the ridge stones for this purpose may then be worked *in situ* to ensure accurate adjustment.

From the level where the ribs separate the pockets are generally filled in up to about one-third of the height with stone chippings or a light kind of concrete. Sometimes the whole of the vaulting was covered with a layer of mortar and rubble, probably poured on hot so that the filling and the ribs become one entire substance—practically concrete. In this connection the following extract from the report accompanying the drawings submitted by Mr. Burges for a church at Constantinople may not be uninteresting: "For the sake of lightness, and in order to diminish the thrust, it is proposed to make the filling-in of the vaulting of a light concrete like that used at Salisbury Cathedral. It is much lighter than any stone, and should a settlement occur does not become detached in small pieces as a brick vault would, but simply cracks. For a similar reason it is carried over the ribs and not rebated on to them. In France, where this system is followed, the author has seen several vaults (the cloisters of Rouen, for instance) where the ribs have fallen, but the filling-in remains quite perfect."

Lastly, cement should never be used in the jointing of Gothic vaulting. It will prevent elasticity and stain the stonework. The rib stones should be dowelled together, either as shown or with slate dowels. For the ribs, only very light framed centering is required, but to keep the voussoirs in position until the completion of the vaulting small pieces of bracketing must be nailed on each side of the centres.

A Busby Competition.—In the recent competition for plans of the proposed new school at Busby, in place of that destroyed by fire, Messrs. W. G. Rowan, I.A., John Watson & Salmond, and H. D. Walton, architects, Glasgow, have been awarded premiums of £25, £20 and £15 respectively by the assessor, Mr. H. E. Clifford, architect, Glasgow.

Camberwell's New Public Building.—A new Passmore Edwards Public Library and St. George's Public Baths and Washhouses is being erected. The land forming the site had been given to the borough by Lord Llangattock. The foundation stone of the baths and washhouses was laid last week by Lady Llangattock, while Mr. Edwards discharged a similar function in respect of the library. The buildings will be of Portland stone and red brick walling, with granite to the baths entrances and roofs of Broseley tiles. Seen in conjunction with St. George's Church close by, next to the canal, the new institutions will form a conspicuous addition to the public buildings of Camberwell. The baths will furnish fifty slipper baths, and the laundry will provide for thirty washers at the same time. Besides the lending library there will be a reference reading-room and a newspaper-room. The building, exclusive of engineering work and the value of the site, will cost £18,000. The architects are Mr. Maurice B. Adams and Mr. W. Oxtoby, the borough engineer.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Unsatisfactory Pupilage.

BIRMINGHAM.—S. C. writes: "About fifteen months ago I articled my son (seventeen) to a firm of architects and surveyors, who covenanted to teach him for a term of three years. At that time there was also another pupil in the office. After about three months I was dissatisfied with the lack of attention which my son received and I complained about it. Six months ago the surveyor partner left the firm, and three months later the other pupil completed his articles and left. My lad was then in the office alone and was often days without any set course of study or work being given to him. I made a further protest and demanded to see what work, if any, the firm had in hand. This was refused to me, and on my threatening to withdraw the lad was told a police summons would be issued if I did so. An office boy was then engaged, but otherwise matters are as before. (1) Can the firm prevent the removal of the lad, or make any claim for damages? (2) Can I sue them in the county court for breach of contract and return of premium (£52 10s.) or a part of it? Does the amount make it one for a jury, or can a verdict be given by a judge? (3) Would the cancelling of the indenture imperil his status as an architectural pupil, and would the period already spent count as part of the three years' course required of a R.I.B.A. pupil?"

The right course to adopt is to consult a local solicitor, to whom the "articles" could be shown, and who would appreciate their exact wording. Basing my reply, however, upon what occurred under somewhat similar circumstances when the pupil was a solicitor's son, I would say: (1) The firm, if proved to have broken contract, could not prevent the pupil's removal nor claim for damage or loss unless they can prove that work is shortly coming into the office upon which his now partially trained help would be valuable. (2) Certainly the whole could not be claimed unless actual damage could be proved, as nearly half the time has been served. This would enable the decision to be given by a judge. (3) Some difficulty might be experienced in getting into another office, but the time already served would certainly be counted. The R.I.B.A. does not insist on any particular period.

G. A. T. M.

Making Measured Drawings at Chester Cathedral.

SALE. — MANCHESTER writes: "I intend visiting Chester Cathedral in order to prepare measured drawings for the Institute examinations, but I am doubtful whether any very good subjects are to be found there. I should be glad if you could name some suitable door, window or arcade. If you think Chester unsuitable, kindly mention some good Gothic examples in the neighbourhood."

Chester Cathedral is not one of the finest in England, but it undoubtedly contains subjects which are suitable for measurement as testimonies of study for the R.I.B.A. examinations. Probably the choir triforium would be the best piece, but special permission from the dean would be necessary, and its measurement might be difficult even with the aid of long measuring rods, tape and plumb-bob. The groining in a passage out of the cloisters is a good specimen of a peculiar form of thirteenth-century vaulting, with an additional rib between the cross springer and the wall and between the cross springer and the pier rib, with longitudinal and cross rib at the point of the arches which does not run to the wall, being stopped by the intermediate rib. There is also an Early English staircase in the refectory (now the grammar school) leading up to a large niche or sort of pulpit for the reader, to measure which special permission from the headmaster would be necessary. The chapter-house is another of Chester's peculiarities, and would be hardly so difficult to measure as some others, being a parallelogram on plan. If the drawing be wanted for the Intermediate examination, it would be best to measure the arch between the choir and the lady chapel as an example of Early English, and one of the nave arches as an example of Decorated work, both being excellent examples; while the west front contains enough Perpendicular detail to satisfy the most exacting.

G. A. T. M.

Right of Adjoining Owner to Close Passage.

WALES.—NEMO writes: "A house (belonging to A.) has on one side a flight of stone steps leading from one road to another. Abutting on these steps are two doorways and a window (ancient light). On the opposite side of the steps is a boundary wall (B.'s) 3ft. from A.'s house. A. now wishes to build up the lower of the two doorways, but also desires to preserve his right of access. He also wishes to fill up an ancient window and raise it above the boundary wall. Can B. prevent him? A. has no other access to his property other than by the steps in question, but he has used this right for more than fifty years without interference, and the public have also used the steps for the last thirty-six years. B.'s boundary wall has no doorway in it. He now claims possession of the steps and threatens to close each end by a door. Has he any right to do so?"

From our correspondent's letter it would appear that both A. and the general public have exercised an undisturbed right of way over the passage formed by these steps for at least thirty-six years, during which period it is presumed that B. has never erected any temporary barrier or other obstruction. At the same time, it is not understood for what purpose a door was erected at one end of the passage unless intended as a barrier against the use of the passage by the public. In the event of B. proceeding to block up this passage by erecting a wall or locked door at one or both ends, then A. should claim a right of way for the occupants of his house (and also his tenants in the adjoining houses if necessary) over the steps into both roads. The best course would be to consult a good local solicitor and act on his advice in instituting legal proceedings against B. The local authority should similarly maintain any claim for public right of way which may have been obtained, if the steps form a convenient and important means of communication between the two roads. As regards the passage door, it may be that the local authority committed an act of trespass in erecting it if B. is in a position to prove that the steps form a portion of his freehold property. If the passage steps are B.'s freehold property—or even if there is any doubt about the question—then A. had better not build up his old doorway if he wishes to retain his present rights of access to the same. A. cannot remove his ancient light to another position, for his prescriptive right of light over B.'s property relates only to the present position and size of the existing window openings. Should A. decide on closing his ancient light and forming another window opening at a higher level, then B. can construct a hoarding on the boundary of his property immediately opposite the new window in order to prevent A. obtaining any right of light from his property. In this case the hoarding might be placed in close proximity to A.'s window, or it may be necessary to place it at a distance of 3ft. away, according as to whether the steps are B.'s property or not.

T. E. C.

Platform for County Hall.

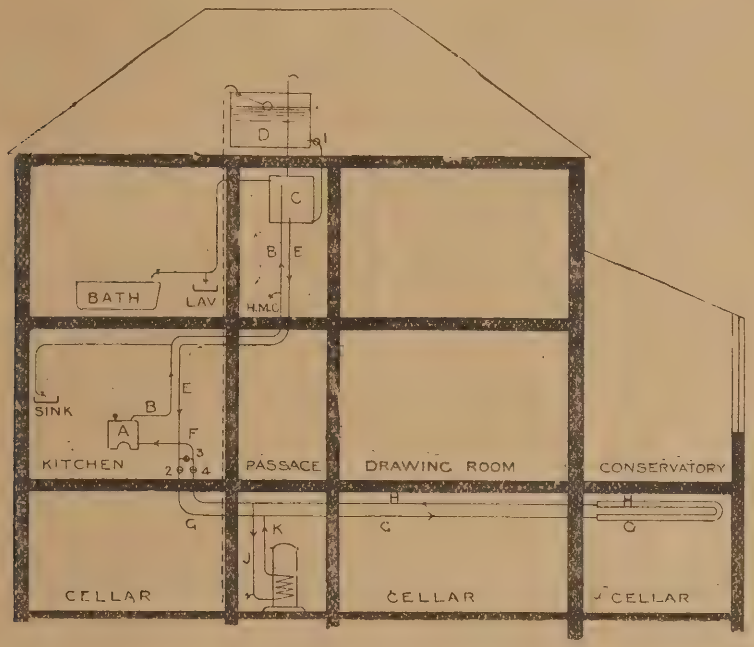
ELGIN.—MAC writes: "What is the proper height for the platform of a county hall in which theatrical performances are given? What is the best slope, the floor of the hall being dead level?"

The platform should slope back so that a person seated in the front row of the audience may see the whole of the platform floor, and the front should be somewhat above the eye level of a person so seated. If the front row of seats be close to the platform the height of the latter in front should not be more than 4ft. 3in.; but if a space for orchestra be provided then it might rise to 4ft. 6in. or 4ft. 8in. with advantage, as otherwise a well for the orchestra will have to be provided in order that the performers' heads may not obstruct the view of the stage, and their moving violin bows be seen, to the irritation of the audience. G. A. T. M.

Rainwater for Domestic Uses.

Maidstone.—Alpha writes: "(1) Which is the cheapest satisfactory method of filtering rainwater for domestic use? (2) What storage should be allowed per head (two w.c.'s, three sinks and one bath) for a country-house entirely dependant on rainwater? (3) Is there any reliable authority to which I can refer?"

(1) For particulars respecting the storage and filtration of rainwater for domestic purposes, see the Builders' Journal of September 26th, 1900, page 157. (2) The average consumption of water in country houses is from 18 to 24 gals. per head per day. The storage capacity to be provided must be governed by local circumstances. In rainy districts a storage capacity of 90 to 100 days' water-supply might be sufficient, whilst in a very dry locality it may be necessary to provide from 150 to 200 days' supply. Under ordinary conditions, a storage capacity of 100 days' supply calculated on a consumption of 20 gals. per head per day will generally prove adequate. (3) Consult No. 4 of "Specification" (published at these offices, price 5s. nett.) for further information on the subject of water-supply, &c. T. E. C.



SYSTEM OF HOT-WATER HEATING.

Co-operative Builders.

Kingston-on-Thames.—W. H. G. writes: "Do you know of any firms of builders who work upon a co-operative or profit-sharing scheme among their employees?"

The Co-operative Builders, Ltd., are well-known and do a large amount of business. The Carpenters' and Joiners' Society in Hull recently started a works department which has been very successful, and the society is being urged to form several others in large towns.

The Cement Combine.

Dublin.—W. C. L. writes: "Kindly name a few cement manufacturers who are not in the amalgamation."

The names of those in the combination will be found on the back cover of our issue for July 18th, 1900. The rest can be obtained from directories.

Books on Architecture and Engineering.

Redruth. — Anxious writes: "(1) What book would you recommend as giving the essential differences between the various styles of architecture (ecclesiastical and domestic), with details of mouldings, &c.? (2) Please also name a book on mechanical engineering. (3) You have also constantly recommended Leaning's book on quantity surveying. Is it preferable to Fletcher's?"

(1) Banister Fletcher's "History of Architecture" (14s.). (2) "Handbook for Mechanical Engineers," by Professor Henry Adams (7s. 6d.). These can be obtained from Mr. B. T. Batsford of 94, High Holborn, W.C. (3) Fletcher's "Quantities" is a very good book; Leaning's is larger and more expensive, but more complete and the most recent on the subject.

Land Registration Acts.

Liverpool.—Registration writes: "Can you give me any information and advice as to the operation of the Land Registration Acts (Lord Westbury's Acts) on the following points? (1) Could the title of a few acres of land be registered in such a manner as to be easily divided into small plots without the expense of investigating the title of each? (2) Has every subsequent mortgage or charge to be registered? (3) I understand the authorities at Somerset House take many months to register a title, and because of this it is of little practical use. What is the usual time it takes to get a certificate of registration if the title is clear and undisputed? (4) What are the objections to having land registered, and why are the Acts so seldom made use of?"

Replying to the heads of enquiry seriatim—(1) When a title is once registered the necessity for investigation ceases to exist, because Government has granted the holder of the certificate an indefeasible title (that is to say, a title good against all comers). There is no trouble in subdividing into small plots; all that has to be done is that vendor and purchaser should execute the "instrument of transfer" (all forms supplied on application to the Land Registry) in the same way as deeds are usually executed, and to send up with it a plan of the plot that it is proposed to transfer. I have many times recently sold plots in this way, and completed the whole transaction within a week. It will be found convenient to use lithographed maps of the estate as originally registered (get them approved by the Land Registry Office once for all) and upon the occasion of each sale simply add the sold plot to one of the lithographs. (2) Every subsequent mortgage or charge must be registered, forms being supplied by the Land Registry Department for that purpose. (3) This work is not done at Somerset House, but at the Land Registry Office in Lincoln's Inn Fields, and certainly my experience has been that the cost of the *first* registration is rather heavy, and the investigation of title very searching: consequently it takes a long time. This must I think needs be so, because if Government is going to grant an absolute indefeasible title it is only right that they should take care that justice is being done. In this connection I may say that an absolute title does not mean that if a claimant should succeed in ousting an owner with registered title that owner should be compensated by Government for his loss—what it does mean is, that *no one can come and claim* to go behind a title when once registered. (4) The cost and trouble of this first registration appear to me to be *the* great drawback; but I think also that one great reason that the Acts are so comparatively seldom made use of is that most people, knowing next to nothing of land transfer, leave everything (very rightly as a rule) to their solicitor, and he caring little for this "new fangled notion" perhaps carries out the business by means of a conveyance in the usual time-honoured way. It would be well for "Registration" (should he decide to avail himself of the Land Transfer Acts) to employ a solicitor who has had experience of this particular work, and I should be happy to refer him to such a man if he so desire. I do not know if it is still procurable, but Messrs. Cassell & Co. published, under the auspices of the "Cobden Club," in 1893, a very good pamphlet on the "Transfer of Land by Registration of Title," by J. R. Colquhoun Dill, price 6d.; but the procedure of land transfer has been simplified in many ways since that date. G. S. M.

Renaissance Buildings in and around Oxford.

London, N.W.—Student R.I.B.A. writes: "What Renaissance buildings in or near Oxford would you recommend to measure for the R.I.B.A. Final Examination?"

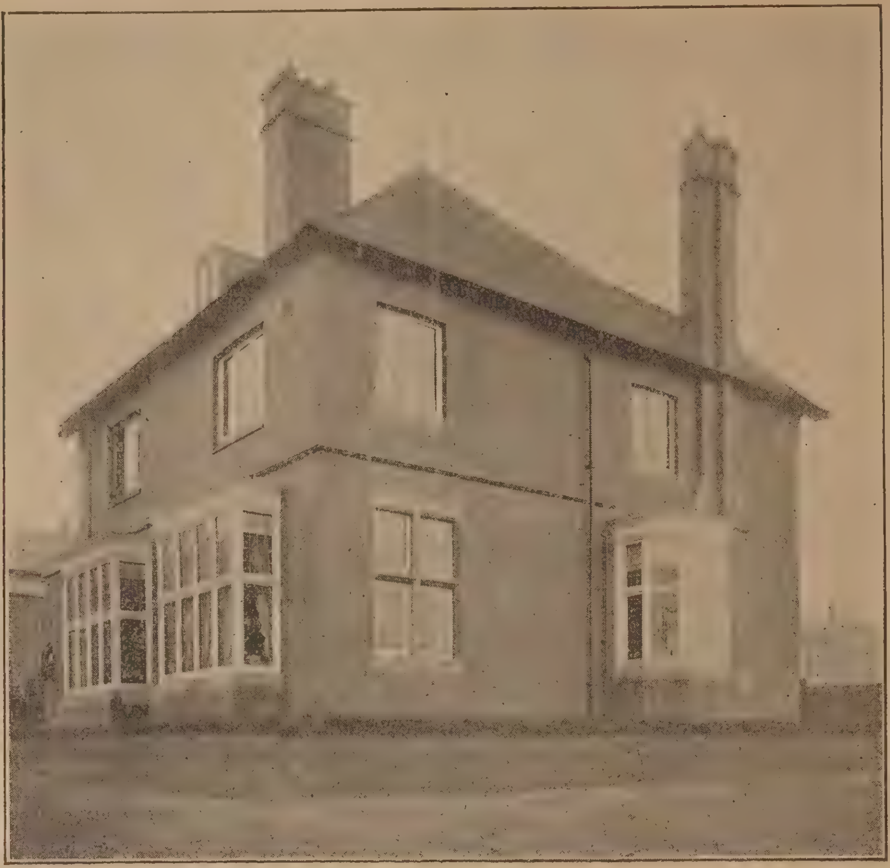
I would suggest Burford Priory, Burford, or the chapel of it. In Oxford, the Ashmolean Library. REGINALD BLOMFIELD.

Level of Heating Apparatus.

London.—T. H. writes: "In the designing of a house which it is proposed to heat by hot-water with radiators the question has arisen whether the boiler must be in a basement or if it can be on the same floor as the rooms to be heated. If the boiler is on the same level, will the result be satisfactory?"

It is decidedly better to have the boiler in the basement, but it is not absolutely necessary; *e.g.*, the writer designed and had fitted up in his own house the following arrangement of hot-water pipes (shown diagrammatically by the accompanying illustration), which has worked satisfactorily for some years. A is a boiler at the back of the kitchen range, with safety valve. B is the flow pipe to the hot-water cistern C, and branched to sink, with a draw-off tap in housemaid's closet. From the top of this cistern a branch leads to the lavatory and bath, and an expansion pipe into the roof. From the bottom is the return pipe E. In the summer the valve 3 being opened, and 2 and 4 closed, the return takes the short circuit to the boiler through the valve 3. In the spring and autumn the valve 3 is closed, and the valves 2 and 4 are opened; the return is then made by way of the pipe G round the conservatory and through H and F to the boiler. In the winter, when more heat is required, the Kinnell's "Acme" boiler in the cellar is set to work to assist the kitchen boiler, the course of the current then being E G and K G to H F and H J; or the valves 3 and 4 are opened, and the valve 2 closed, to give two independent circulations: the valve 4 is left open to allow the expansion of the water in the lower pipes. The cold-water supply is from the cistern D to C, through the valve 1, which is only closed in the event of repairs. In another case with which the writer was concerned the boiler was on the same floor as the radiator for heating a clubroom, and the result was satisfactory. HENRY ADAMS.

A New Masonic Hall at Leeds was opened on Monday last. Mr. J. M. Bottomley is the architect, and Mr. J. T. Wright the chief contractor. Red brick has been used for the frontage. On the first floor is a dining-room capable of accommodating 400 persons; the principal lodge-room is on the second floor.



"CRAIGMONA," HALTON, NEAR LEEDS. ALBERT E. DIXON, ARCHITECT.

STONE AND WOOD AS BUILDING MATERIALS.

In the course of an article on "Constructional Material" which recently appeared in the columns of the "Morning Post" Mr. W. E. Martin says:—

"The limestones furnish ordinary and hydraulic limes, as well as an immense number of building stones, from the Bembridge of the Tertiary rocks to the Coniston limestone of the Upper Cambrian chalk. Purbeck stone, Portland stone, Bath stone, inferior oolite, lias, magnesian limestone, carboniferous limestone, Great Devon limestone and Wenlock limestone—all belong to the series, which represents a lapse of time of probably over three hundred million years. The sandstones have several representatives, from the 'firestone' of the secondary rocks to the flags and massive grits of the pre-Cambrian.

The Durability of a Stone.

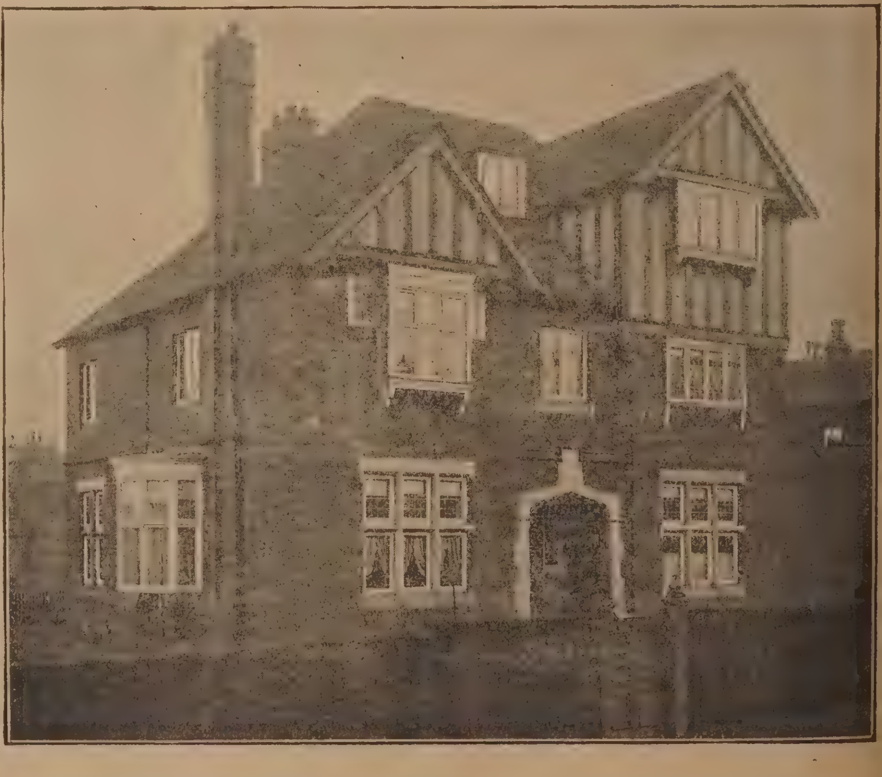
"It is asserted dogmatically by one that the porosity of a stone is a measure of its durability, despite the fact that in the same building, side by side, a stone absorbing water to the extent of three-eighths of a pint to a cubic foot may be seen in rapid decay with another material in good condition which absorbs no less than twelve pints to the foot. Another asserts that specific gravity is a measure of durability, forgetting that even granite weighing 171lb. to the cube foot will sometimes decay more rapidly than a porous limestone (travertine) weighing only 88lb. Again, chemical composition is credited with having much to do with the weather-resisting quality of a stone. But this theory fails, for of the two nearly pure limestones, Bath stone and carboniferous limestone, some beds of the former scarcely last out the completion of the building in which they are used, while the latter, fresh with the mason's tool marks, may be seen in the pre-historic round towers of Ireland. It follows, then, that neither porosity nor weight nor resistance to strain nor chemical composition is alone to be considered in judging the durability of a building stone. A series of experiments conducted by the writer has convinced him that the physical condition in which the component minerals exist in a stone has much to do with its durability, and taken into consideration with the various properties enumerated above it has everything to do with it. The ring of a stone under a chisel struck smartly with a heavy mallet is a good index to its weathering properties, for it tells of the physical condition in which the materials exist in the stone; and an intelligent workman being consequently in an unique position to decide on the goodness or badness of any stone which may pass under his hands, he should be relied on in this matter by whoever takes an interest in erecting a durable building."

Wood Construction.

Speaking of timber, the writer continues: "It may safely be said that less is known of the structure and properties of timber than of any other material which passes through the builder's hands. This ignorance is frequently shared by the architect, who is apparently indifferent as to whether the wood used under his superintendence is likely to last a reasonable time or perish by premature decay. When about the beginning of the sixteenth century the use of oak was gradually being abandoned in this country, hewn pine logs, cut from large trees grown in the provinces bordering on the Baltic, were imported to replace the home-grown timber. This has since completely superseded oak in all our public and private buildings, but when it was first introduced great prejudice existed against its use, for workmen could not be made to understand that a roof of it would answer the purpose nearly as well as oak and be much cheaper. True, now that the tide of public opinion has set the other way no one thinks of using oak, except occasionally in churches, any rubbish shipped from Sweden, Russia or Canada being good enough for the jerry-built structures found in all our towns.

Deterioration.

"To gauge the change in this respect one has only to try to realise what the difference is between a piece of 'heart of oak' and an 'inferior fifth' quality of Swedish deal, a by no means uncommon class of building timber at present. Soon after the removal of the timber duty (in 1866) the country was flooded with foreign sawn scantlings, chiefly planks, deals and battens, which varied in size from 11in. by 4in. to 7in. by 2½in., and these largely displaced the logs hitherto sent, for they saved sawing and were consequently cheaper than the same sizes cut from logs here. This flood of foreign sawn timber continues to increase, while the sizes of scantlings diminish, and the quality of the timber goes from bad to worse. Logs of reasonable size must be cut from well-grown large-size trees, but a 4in. by 2in. rafter can be and is cut from a scaffold pole nearly all sapwood. On many scantlings, including flooring boards, the bark may be seen where the corners are 'waney' and do not hold the full-size specified, which is another growing fault with these imported pieces. In fact, this marked deterioration of foreign sawn timber is so well known that it is rigidly excluded from many important works, and such timbers only allowed which are cut from large logs especially selected as free from sap, shakes and large knots."

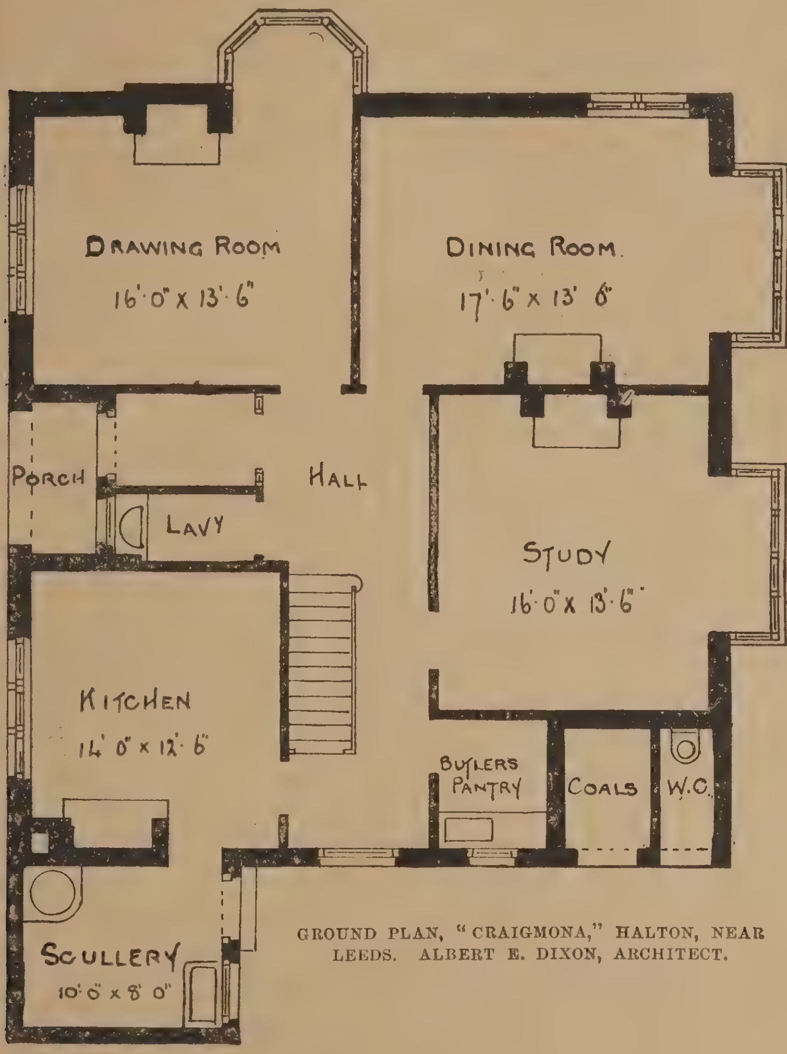


"CRAIGMONA," HALTON, NEAR LEEDS. ALBERT E. DIXON, ARCHITECT.

THE LATE MR. ROBERT FERGUSSON, OF ABERDEEN.

MR. ROBERT FERGUSSON, late of the Aberdeen Granite Works, and long associated vith the old firm of Messrs. Macdonald, Field & Co., died recently in his eighty-third year. Mr. Fergusson was born at Balbrodie, parish of Blair Athole, Perthshire, on May 1st, 1819. In 1841 he came to the Aberdeen Granite Works, then being carried on by Messrs. Macdonald & Leslie. Mr. Fergusson having worked for rather more han a year at polishing, was in June, 1842, engaged to serve four years as apprentice mason, three years as a dresser, and one as a builder, as the rule of the trade then was. On the same day as Mr. Fergusson, the late Baillie Mitchell was indentured as an apprentice, and after having been scarcely two years at the trade hey were sent to Castle Street to dress the pedestal for the granite statue of the Duke of Gordon about to be erected there. This task the young men accomplished in three weeks, this being considered at the time a notable feat. When his four years' apprenticeship were completed he was handed his minute of indenture; and in March or April, 1845, as Mr. Leslie had no building jobs in Aberdeen, the young journeyman was sent to Dunrobin Castle, the firm having secured the contract for the erection of hat fine building. Mr. Leslie was the architect and the work was admirably executed. For about twelve months he was engaged on the building, and thereafter he acted as clerk and imekeeper until the spring of 1849. During the emainder of that season he took part in the rection of the Polmuir railway viaduct. Such was the confidence of the firm in Mr. Fergusson as a careful and skilful workman that his abilities were recognised by his being appointed oreman of the masons towards the end of the ear, the old foreman, Mr. James Don, retaining he charge of the polishing. Mr. Don having died in 1853, Mr. Fergusson was appointed to the oversight of both departments, chiefly under Mr. Macdonald, the original founder of the firm. Mr. Leslie left the firm in 1855, and Mr. Fergusson had practically the sole charge until the death of Mr. Macdonald, senr., in 1860. The knowledge which Mr. Fergusson had acquired of the business stood him in good stead at this critical juncture of affairs. Under Mr. Macdonald's trustees Mr. Fergusson, in conjunction with the late Mr. A. Macdonald, jun., carried on the works for about three years. In March, 1863, Mr. Field joined Mr. Macdonald, Mr. Fergusson was assumed as junior partner for ten years, and the firm became known under the title of Alexander Macdonald, Field & Co. New life was thrown into the constituent parts of the establishment, and during this period the works in Constitution Street were nearly wholly reconstructed and various modern improvements were adopted. During a second term of ten years of the partnership the works were still further extended. Mr. Field retired at the expiry of this second period, namely, in March, 1883, and Mr. Macdonald, jun., and Mr. Fergusson continued to carry on the work until the death of the former at the end of 1894. After the death of Mr. Macdonald, therefore, Mr. Fergusson was the only remaining partner of the firm.

A limited liability company was formed on February 3rd, 1885, and Mr. Fergusson was appointed managing director.



GROUND PLAN, "CRAIGMONA," HALTON, NEAR LEEDS. ALBERT E. DIXON, ARCHITECT.

"Craigmona," Halton, near Leeds, was lately erected for R. Haste Carr, Esq. It is built with red-pressed brick, stone dressings and red tiled roof. The sitting-rooms are so arranged as to obtain a fine view of the surrounding country upon the north and east sides. The south and west have not a good prospect. The architect was Albert E. Dixon. 5, Park Lane, Leeds.

Keystones.

A Bust of Paul Verlaine, by Rodin, is proposed to be erected in the Square des Batignolles.

Public Slipper-Baths at Leeds are proposed to be erected in the West Hunslet Ward at a cost not exceeding £1,500.

New Hospital for Bury.—The foundation stones of a new hospital for the treatment of infectious diseases were laid at Bury recently. The architects for the new hospital, which is to cost about £20,000, are Messrs. Pole & Little, of Gray's Inn Square, London.

Broad Sanctuary.—The Earl of Pembroke in reply to a question in the House of Lords said that the First Commissioner of Works would open to the public and furnish with seats under or around the trees therein, a portion of the enclosure in Broad Sanctuary which lies to the south of Canning's statue, and the branches of the trees would be thinned to render the statue visible.

Lichfield Grammar School. — The foundation stone of a new grammar school at Lichfield was laid last week. The Conduit Lands Trust have given the site of eight acres and made a contribution of £4,500. Special attention has been devoted to perfecting the scientific and technical departments. The whole expenditure is estimated at more than £9,000. The new premises, however, are only part of a larger scheme which will be carried out later should the school succeed. The projected buildings will afford accommodation for 125 boys, with 22 resident scholars, and comprise residences for the headmaster and assistant masters.

The Boadicea Group at Westminster.—Two years ago scaffolding was erected on Westminster Bridge, opposite the Houses of Parliament, for the purpose of erecting the pedestal of the Thornycroft Boadicea group in bronze, the gift of the sculptor to the County Council. The scaffolding remains there still, and for some time has been deserted. Six months ago the grey granite pedestal had been erected, but then, strange to say, workmen commenced to demolish it, and now huge blocks of granite are piled one upon another promiscuously, undisturbed by the sound of mallet or trowel. Clearly something has gone wrong.

Cost of London Board School Buildings.—The works committee of the London School Board, in their annual report just issued, give an abstract of the work done during the year ended March 25th last. The average cost of the sites for 440 schools, the accounts of which had been completed at September 29th last, was £7 2s. 6d. per child. The average cost per head of the buildings and furniture of these schools has been—school buildings (exclusive of sites), £14 9s. 2d., and furniture and fittings (such portion as is chargeable to capital account), 10s. 11d. Tenders have been accepted during the year for eight new schools providing accommodation for 7,430 children and ten enlargements of schools providing additional accommodation for 2,577 children.

The new nave of St. Michael and All Angels, Windmill Hill, Bedminster was dedicated recently. The tower has yet to be carried out. The new nave has involved an expenditure of over £5,000. The new building is of red brick with freestone dressings, and consists of a lofty nave with side aisles not carried to so great a height. Broseley tiles are used, and rising from a central part of the pitch of the roof is an ornamental ventilating shaft, while at the west end is a bell turret. A novel feature in the interior design is the introduction of rather massive square freestone columns to support the archways dividing the nave and side aisles. Windows in the clerestory and elsewhere are of tinted glass, the floor is laid with wooden blocks, and chairs are provided for 573 persons, making the accommodation of the church, with the chancel and side chapel, 625. Vestries for the choir and clergy are built on the north side and the baptistery is in the south-west corner of the church in a small apsidal chamber. The architect for the new work is Mr. John Bevan, St. Stephen's Chambers, Bristol.

A New Church at Quarnford, Derbyshire, is being erected. The building is Gothic in design.

The Calendar of the Glasgow and West of Scotland Technical College has just been published for the session 1901–2.

Change of Address.—Mr. Sam G. Thacker, late of S. J. Thacker & Son, surveyors, 22, Montague Street, Russell Square, has removed to 90, High Holborn, W.C.

A Monument to the Memory of Schumann has just been erected in Zwickau, Saxony. The great musician is represented sitting in pensive mood with his head resting on his left hand.

A Tablet in Maryculter Parish Church, Aberdeen, has been erected to the memory of the late Rev. George Duncan. It was designed by Mr. Macgregor Chalmers, architect, of Glasgow.

New Public Baths at Bradford are proposed to be erected on sites in Morley Street and Drummond Road at a cost of £53,000. A Local Government Board enquiry was held last week.

The Bowling-green of the Famous Old "Bell" of Edmonton has recently been granted by the Cordwainers' Company to the Rev. Lucius Fry, vicar of St. James's, Upper Edmonton, as a site for a parish hall and other rooms, to be used for church and settlement purposes.

"Canada: Its History, Productions and Natural Resources" is the title of a book that has just been published by the Department of Agriculture of Canada in connection with the Glasgow International Exhibition. It is excellently got up and contains several useful maps of Canada.

Competition at Old Trafford.—The awards in the open competition for public baths and managers' residence at Old Trafford, near Manchester, have been made as follows: First premium of thirty guineas to Charles T. Taylor, Oldham, and Arthur Warburton, Warrington, joint architects; secoud premium of twenty guineas to Arthur R. Groome, A.R.I.B.A., 2, St. Peter's Square, Manchester; third premium of ten guineas to Farrar & Woodhouse, Ilkley.

Strand Improvement Scheme: "Gaiety" Plans adopted as a Basis.—Mr. Runtz recently submitted the plans for the new Gaiety Theatre and Restaurant to the Council. Mr. Norman Shaw, R.A., suggested a different structural treatment. He submitted a sketch design to Mr. Runtz, who at once fell in with the idea and redrew his designs to accord with it. This new design, the result of the combined skill of Mr. Shaw and Mr. Runtz, has been approved by the Improvements Committee. Other buildings will be made to fall in with the new Gaiety, which will thus set the keynote for the whole of this vast improvement.

The New Trinity Congregational Church, Leeds, is being erected. The building, which occupies a conspicuous site in Woodhouse Lane, is in substitution of the East Parade Chapel, which was sold to an insurance company for £31,000, and which, being in the centre of the city, became practically disused. The new edifice, which is estimated to cost £25,000, is from a design by Mr. C. F. Danby. It was shown in the Royal Academy this year. About 1,000 people will be accommodated. The memory of three former pastors, the Rev. John Ely, Dr. H. R. Reynolds and Dr. E. R. Cuder, is to be perpetuated by a memorial window at a cost of £300.

A New Mission Hall at Oxford is being erected. The new building will be set back from the road about 24ft. It will have a frontage of 30ft. and will be built of white brick with Bath-stone dressings. The style will be Gothic. The hall will be 60ft. by 24ft. 6in., with a height of 24ft., and is to accommodate 400 people. The walls will be matchboarded to a height of 5ft., the floor will be of wood blocks, and in the roof will be lantern lights. Two aisles up the hall lead to doors which give entrance to the schoolroom. This room will be of the same breadth as the hall, and will be 32ft. long. Behind the schoolroom will be the vestry, a kitchen and other offices. There will be an entrance to the roadway leading to Stanley Road. The building is being erected by Mr. Phipps, builder, of Norrey's Avenue, from plans drawn by Mr. J. C. Gray, of 5, Blackall Road. The total cost will be about £900; £410 has been given and promised.

The Bourse, Paris, is being enlarged by lateral wings, thus making the building cruciform.

The Parish Church of Radley, near Abingdon, is to be structurally repaired at a cost of about £1,000.

A New Wesleyan Church at Walsall Wood is being erected at a cost of over £2,000 from plans by Mr. C. W. D. Joynson, Wednesbury.

A New Parish Hall at Clapton is being erected in connection with the church of St. James the Great.

A Memorial Fountain to the Stewardess of the "Stella," the late Mrs. Mary Anne Rogers, was unveiled on the Western Esplanade at Southampton on Saturday last. The cost was £320.

A New Mission Church for the Parish of St. Mary's, Swansea, was opened recently. It is dedicated to St. Philip, and was formerly a Nonconformist chapel. It held about 300 persons.

A Statue of Pasteur is to be erected in Arbois, his native place. It is the work of Daillion, and represents the great man of science seated in an armchair bareheaded, wearing a frock coat and holding an eye-glass in his right hand.

A New Vicarage House for St. Augustine's, Highgate, is being erected. Between £16,000 and £17,000 has been expended on the portion of St. Augustine's Church already built, and about £10,000 more is required to finish the church and erect a parish-room.

A New Fire Station for East Greenwich is being erected at the junction of Horn Lane and Tunnel Avenue with Lower Woolwich Road, East Greenwich. The cost of the site, which has been acquired from the County Council itself, was £750, and the estimated cost of the building, which is being erected by the works department of the council, is (including £1,000 in regard to the special difficulties of the site) £13,100. It will accommodate in the way of appliances a steamer and a horsed escape, which latter is capable of travelling at the rate of a mile in five minutes and to carry four men. The first storey is to be built in Portland stone and the other two in red bricks. There will be stabling for four horses, watch- and recreation-rooms, and for firemen two sets of three rooms each and one of two rooms.

Assyrian Antiquities.—Another archæological expedition to Sendjirli, in the North of Syria, will be sent by the Berlin Oriental Society about the end of this year, under Professor von Luschan, of the Ethnological Museum. The ruins of the ancient capital of the Kingdom of Shamal, situated near the Kurd village of Sendjirli, were discovered by Drs. Puchsteine and Luschar in 1883, and thoroughly examined by several expeditions from 1888 to 1894 at the expense of the Berlin Oriental Society. The most ancient finds date as far back as about two thousand years before Christ, and consist of some Hittite antiquities, a statue of King Panamma (745 to 727), covered with inscriptions, and an Assyrian stele of Asarhaddon, about the year 670 before Christ. The examination of the tumulus covering the castle gate, which dates back as far as 1,000 before Christ, the castle itself, and the double well not being finished in 1894, the work is to be brought to a conclusion by the present inspection.

A New Sunday School at Huddersfield is being erected in the parish of St. Mark's under the superintendence of Mr. W. Cooper, architect, of 4, Kirkgate Buildings. The building will be in plain Gothic style, and there will be a central hall, with four classrooms and cloakroom in the front block, which will be two storeys high, and two classrooms at the back. The central hall will be 56ft. long, 35ft. wide, and the classrooms will average 12ft. 6in. by 12ft. and will be 9ft. 6in. high. The large hall will accommodate about 350 persons. The premises will be ventilated, lighted and heated on the latest principles. The contractors engaged in the work are as follows: Masons, Messrs. William Mallinson & Sons, Lockwood; joiners, Messrs. Ben Hirst & Sons, Spring Street; slater, Mr. W. E. Jowitt, Fitzwilliam Street; plasterers, Messrs. J. Milnes & Sons Commercial Street; painters, Messrs. Lunn & Cardno, High Street; plumbers, Messrs. George Garton & Sons, Market Place; and electricians, Messrs. Crossley & Bould, Cloth Hall Street.

A Kursaal at Southend was opened last week Its central hall accommodates 5,000 persons.

The death is announced of Mr. Yeoville Thomason, the architect of the Jewish synagogue at Birmingham.

As a Memorial to the late Rev. B. W. Kerr-Pearse, who for thirty-six years was rector of Ascot, new choir stalls have been placed in the chancel.

Mr. Fred Holland has been appointed architect and civil engineer to the Bradford Board of Guardians for a period of four years.

Two Stained-glass Windows have been placed in Holy Trinity Church, Hartlepool, in memory of the late Rev. E. Shaw, M.A., for twenty-nine years vicar of the parish.

The Parish Church of St. Leonards-on-Sea has recently been enriched by the addition of a stained-glass window in memory of Frederick Richards, J.P.

A Stained-Glass Window has been erected in St. Alphege Church, Canterbury, in memory of Alderman William Mount, a former mayor of Canterbury. It is in the north aisle.

Beverley Minster.—A new peal of ten bells has been hung at Beverley Minster. These replace an old peal of eight. Their weight is 166cwt. 8qr. 2lb.

At St. John's Roman Catholic Church at Beverley a new statue of St. John of Beverley was unveiled recently. The statues of St. John of Beverley fixed in the interior, and of the Madonna and Child on the exterior, have been executed by Mr. Robert Smith.

The Rebuilding of the Old Bailey.—Mr. Ross, the city engineer, replying to questions at a recent meeting of the Corporation of London said nothing further had been done in reference to the rebuilding of the Central Criminal Sessions House, and no steps had been taken towards widening Newgate Street to 60ft wide.

Christ's Hospital Bill: Council's Clause Rejected.—In the House of Commons last Friday the Christ's Hospital Bill came back from the Select Committee, to which it was referred, with an additional clause inserted by the Committee giving the London County Council a right of pre-emption for four months after the passing of the Act. On a division the clause was cut out.

St. Mary Woolnoth: Arbitrator's Award.—Mr Vigers has issued his award on the question of compensation claimed from the City and South London Railway by the churchwardens of St Mary Woolnoth, which is being practically acquired by the company for a new station The arbitrator decides that if the church remains on its present site the company must pay £90,628, but if at some future time the site becomes available for building purposes this amount must be increased to £143,548.

Puccini, the Italian composer, has commissioned the well-known artist, Signor Nomellini, to paint the scenery for his new Japanese opera. The precedent is one which might well be followed elsewhere. In this country scene painters, with a few famous exceptions, hardly deserve to rank as artists, and the work they do is often of indifferent quality. If artists of ability were called in, not merely to design scenery, as they are sometimes, but actually to paint it, some of the conventions which hamper the progress of art upon the stage would disappear.

The Cost of the New City Hospital, Edinburgh.—At last week's meeting of the Edinburgh Town Council the city superintendent of works submitted a report as to the probable cost of Colinton Mains Hospital. It set forth that the contracts on estimates accepted under sanction of the town council amounted to £271,621, and that the probable cost of remaining works required for the completion and equipment of the hospital was £62,250—together, £333,861. At an early stage the probable cost was stated at £37 per bed, later the cost was found to be little less than £400 a bed, but finally the figure had reached £556 per bed.

Property and Land Sales.

ROYAL AGRICULTURAL SOCIETY'S SHOW.

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

Hazardous Risks, Premium, £3/10/-

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

THE MANAGER OF THE
BUILDERS' JOURNAL,
EFFINGHAM HOUSE, ARUNDEL ST.,
STRAND, W.C.

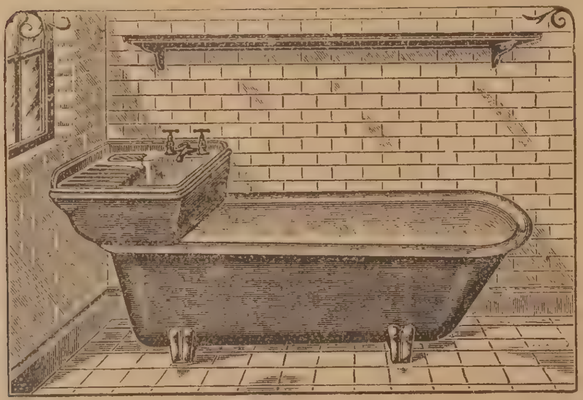
MORRISON & INGRAM'S
. . BATHS. . .



THE PATENT BRAMSTONE COMBINATION BATH & LAVATORY.

The success of the Bramstone combination justifies its introduction, and proves the need for the same.

It is now recognised that no house, however small, should be without bath and lavatory; and since an additional rental is needed of but 2d. per week to yield 5 per cent. on the outlay consequent upon the introduction of the cottage Bramstone Bath, this reform may now be deemed within the reach of all.

It affords economy of space, and a great saving of plumbing is effected.

Only one installation of hot and cold pipes required. It is also made for cold water only. Baths are made 5 ft., 5 ft. 6 in. and 6 ft. long. Prices from £3 11s. 8d. gross.

MAKERS OF ALL KINDS OF BATHS, LAVATORIES, WATER-CLOSETS, URINALS, SINKS, &c., &c.

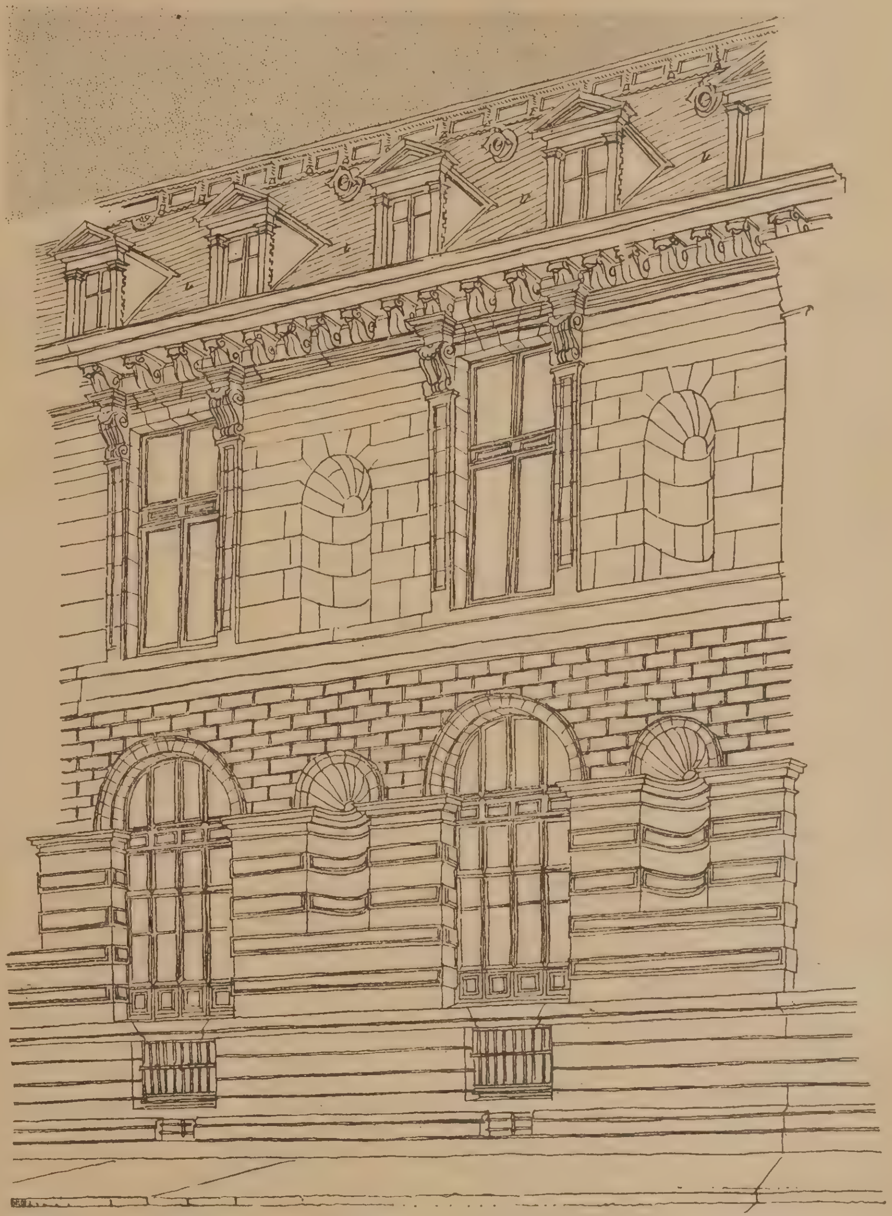
An Architectural Causerie.

The Danger to St. Paul's Cathedral. The rumours current respecting the condition of St. Paul's Cathedral have a great deal more cause for alarm than that which circulated about Westminster Abbey a short time ago, when the fall of a small window shaft of Purbeck marble was sufficient to raise a vision of impending destruction in certain quarters. Mr. Somers Clarke, the architect to the Dean and Chapter, says that St. Paul's is cracked from top to bottom. When, after the Great Fire of 1666, Sir Christopher rebuilt the cathedral, he knew that there was a bed of hard clay about 40ft. below the surface, but was unable to carry his foundations down so far. He therefore put them where the old foundations had been, in a layer of "pot earth," over a bed of sand and shingle above the clay stratum already mentioned. This layer would have been sufficient to withstand for centuries to come the great weight of the superstructure had it not been for the advent of immense drains, and, latterly, of underground railways. But as the result of these excavations and tunnellings the ground has consolidated, resulting in the dislocation of the arches of the nave, choir and transept, and, more important, the subsidence of the west front with its heavy towers and bells. Moreover, the whole of the southern transept has moved, so to speak, towards the Thames. It is true that the movement has only been very slight, but it is sufficient to cause much anxiety to those who have charge of the cathedral. The outer wall of the southern transept, which is between 8ft. and 10ft. thick, and has an outer face of Portland stone with a lining of Oxfordshire stone, is distinctly out of the perpendicular, and in consequence of the strain it has opened from east to west. The north side of the cathedral is, however, perfectly solid. The fabric was first strengthened some hundred years ago by great iron ties put into the cathedral half-way up the walls. The transepts had iron ties securing them to the dome pillars, and they were further strengthened by iron ties placed across their fronts from east to west. The dome was also strengthened by two great iron chains, one placed round its base on the outside and the other a little way up. It is this strengthening up with iron ties which is now being tried in connection with the transept walls. Though the cracks in St. Paul's are disquieting, there is no immediate cause for alarm, for it is the most unlikely thing that the building will collapse. Still, in view of the fact that the borings already made for drains and railways have undoubtedly affected the stability of the building, it is well to exercise every care in the future, especially as it is proposed to construct another underground line close to the south side of the cathedral; and in this connection it is interesting to note that in the case of the Mansion House the horizontal influence of the Central London Railway was found to be effective at a distance of 100ft., and the result was the appearance of a great crack in the walls of the building.



THE LOUVRE, PARIS: FRONT TO THE RUE DE RIVOLI. THE WORK OF PERCIER AND FONTAINE. DRAWN BY H. F. COOKE.

Drawings or Photographs of Buildings? It is needless to dwell on the great changes which have been effected by the development of photography, but its influence on the representation of architecture is noteworthy. In former days drawings of buildings were universal; now the photograph is replacing them to a remarkable extent, and at this juncture it is opportune to note the remark of Mr. Ernest George in his official report on the architectural exhibits at the Paris Exhibition (published in our last issue) to the effect that America was represented only by photographs of executed works; and of these Mr. George said that they made the most reliable statement of the present position of architecture in the United States. A clever draughtsman can do a great deal with a drawing—he can play the trickster with wondrous skill; and though this need not necessarily be so, the tendency lies that way. As a result architects have welcomed photographs as a truthful means of representation. One is glad that it is so and that the practice is becoming all-prevalent. Photographs show the building as it is (excepting the colour, for which we must wait a little while), whereas the drawing often tends to enhance or detract from its appearance. Yet there is another side to the question. Intentionally or otherwise photographs may lies, though perhaps not to the same extent as drawing. There are matters of exaggerated perspective, false contrasts of light and shade, and features made unduly large owing to their proximity to the camera; and these things need to be guarded against. Then there is the much-debated subject as to whether a photograph may be a work of art. For ourselves we should say that in ninety-nine cases out of a hundred it is not, being merely the pictorial representation by light and chemicals of a given subject, combined with a certain amount of skill on the part of the operator. But as a practically truthful method of depicting architecture it is undoubtedly of the greatest value, and in this respect infinitely superior to drawing. Whether we should prefer a perfect photograph of, say, Tintern Abbey, or a drawing of it by a master hand is another matter which we do not propose to enter into now.

THE A.A. EXCURSION TO CIRENCESTER.

WITH SKETCHES BY R. M. BUTLER.

ON Saturday afternoon, July 20th, a good proportion of the excursion party assembled at Paddington and journeyed down to Cirencester by the 3.15 train. Sunday is a day not recognised on the official programme, nevertheless a little outing to some place of interest is usually arranged in the afternoon. Accordingly about a dozen members had a pleasant drive in brilliant weather to Northleach, about 10½ miles distant. There is an interesting parish church here. It boasts some good traceried windows, a fine south porch, a small and rather delicate stone pulpit and an old font. The church is of the Perpendicular period. A feature is the nine-light window in the eastern gable of the nave. The piers of the nave have a pleasant effect, due to the hollowing out of the sides of the octagon and to the mouldings following that contour.

WISHANGER

Monday was entirely a day of churches, and a very pleasant day too. The official programme of the excursion opened with Ampney Crucis—a typical Gloucestershire small parish church, chiefly of Perpendicular date. In the north transept is a large Jacobean tomb. It is more quaint than beautiful, and to whose memory it was dedicated no one knows. There is a Norman chancel arch, and traces of ancient decoration are discernible. On the drive to Fairford, Poulton village and a small church at Maisey Hampton were passed without stopping. Fairford was the next stopping-place. The predominating feature is the central tower, of very rich character. It has a cusped and pierced quatrefoil parapet—pierced battlements are a feature of Gloucestershire churches. Internally the tower has elaborate and very excellent groining and tabernacled work. Fairford is famous for its ancient stained glass. With the exception of King's College Chapel, Cambridge, and Malvern Priory, it has probably the largest collection of old glass in the kingdom. Some of it is very disappointing, notably the western window, which is full of crude colour; but other windows—notably those in the clearstory—are delightful. There are a good chancel screen and choir stalls and brasses.

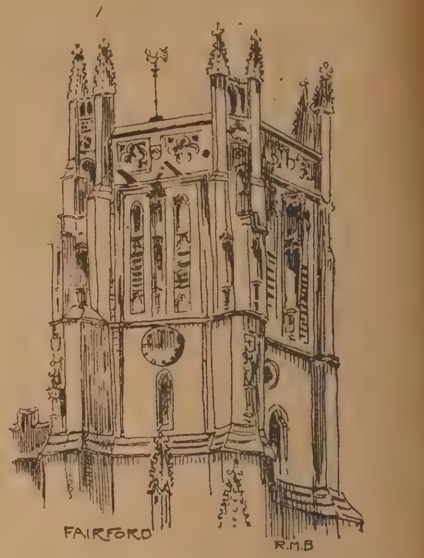
At Kempsford the party was met by the vicar, who pointed out the chief matters of interest and very kindly entertained the members to tea. It was at Kempsford that John of Gaunt wooed and won his wife. There is a finely traceried tower window. The tower is groined internally, and has been decorated by a former curate, the Rev. Mr. St. John. The effect is particularly rich and mellow. There is a tomb to a canon regular whose name and deeds have become lost to history, and there is some good modern glass by Kemp. The present vestry, formerly the south porch, has an exceptionally fine Norman doorway. Some years ago Street added a morning chapel, restored the church generally, and designed a new pulpit and font—all, it must be confessed, in very bad taste and entirely out of keeping with the church.

The church, gatehouse and manor of Down Ampney concluded the day's work. The church spire and battlements are grafted on to an Early English tower. There is a beautiful modern rood screen, designed by Mr. Ponting, of Gloucester. The manor is the property of Lord St. Germains; it formerly belonged in turn to the Craggs, Vilers and Hungerfords. Little of it remains except the hall. The gatehouse is, however, fine.

On Tuesday train was taken to Stroud, where carriages met the party. A long and steep ascent of three miles brought them to Lypiatt Park, the seat of Sir John Dorrington. The house is picturesque, but greatly pulled about by unhappy restorations. An old print of the house in 1624 is extant and shows considerable differences. Writing at the same date, Thomas Stephens speaks of his "faire house of stone at Lypiatt." The Gunpowder Plot is said to have been hatched at Lypiatt (the panelled room of the Conspirators is shown to visitors), and Fawkes is still a common name in the neighbourhood. The gardens are the great beauty of the place: they were well illustrated in "Country Life" some time ago. The view across the valley is most charming. The programme was at this stage altered by the addition of Througham, a most acceptable item, for it proved to be about the most interesting place of the day. Througham Manor, now a farmhouse, is a typical Gloucestershire house. It forms one side of a farmyard, with a picturesque columbarium. The gables form characteristic features of the Gloucestershire manor. Througham is a good example of this. As a rule the work is simple, but very effective, a fairly "quick pitch" to the gable; the rough stone tiles covered with lichen, and the grey walls, form a pretty picture. The boundary walls met with along the roads are usually built of dry masonry. The bulk of the work is of the seventeenth century; Georgian work is comparatively rare, a contrast to last year's tour in Suffolk.

Wishanger Manor is of the usual type, and is now a farm. There is a good entrance porch, with a sundial over it and the arms of the Partridge family. It bears the date 1721.

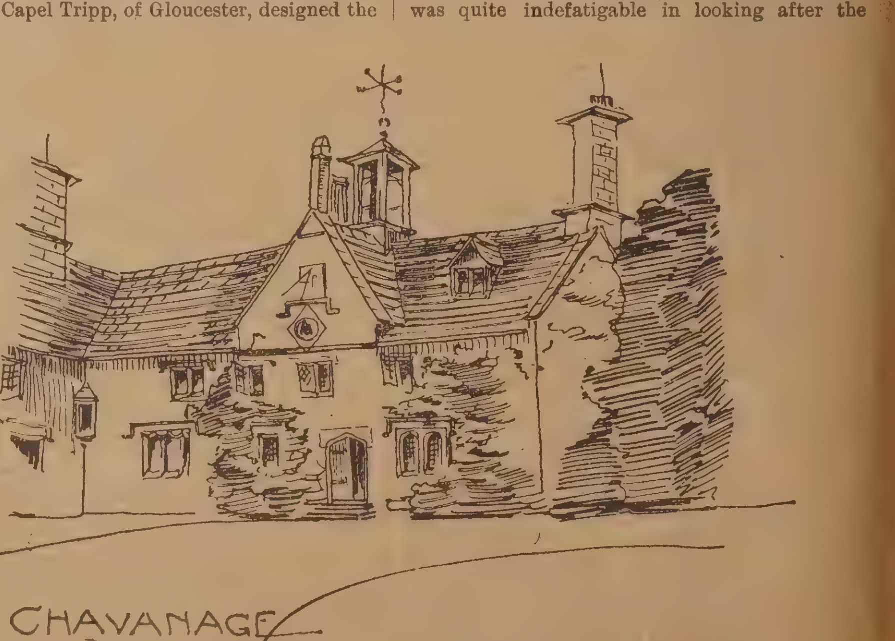
Edgworth has a small but pleasing church, with quaint gargoyles to the tower. The manor of Edgworth is very interesting. The original house dates from 1685, but only about four rooms remain. The present house has just been completed from the designs of Mr. Ernest George, and is a most charming example of his skilled method of work. There is some excellent plasterwork from Mr. George's designs, modelled by Priestly, while the fibrous plasterwork in the bedrooms is by Jacksons, of London. All of the iron and ornamental metalwork was executed by Mr. Starkie Gardner. About twenty years ago Mr. Capel Tripp, of Gloucester, designed the new wing which, prior to Mr. George's advent, formed the chief part of the house. The party was most kindly and hospitably entertained by the owner, Mr. James, who, with his brother, guided the visitors through the delightful woodlands of his park to the summit of a hill where carriages awaited them.



On Wednesday the weather, which hitherto had been bad enough, showed itself at its worst. Doughton Manor, a farm belonging to Captain Arthur Mitchell, was reached in brakes from Tetbury Station in a perfect downpour. It is probably one of the most interesting houses, but unfortunately the elements prohibited outdoor sketching. Many occupied themselves, however, in measuring up the plan and the interesting panelled dining-room. "The Hermitage" is another good house close by. At Doughton the Elizabethan mantel bears the date 1641.

Malmesbury Abbey was next visited. The beautiful church, with its grand Norman nave and noble south porch, were duly admired, as was also the well-known Market Cross; but exigencies of space forbids any detailed description.

Charlton Park, the seat of the Earl of Suffolk, standing in a noble park and approached by a grass drive, is a splendid example of Elizabethan work. The domed entrance hall, chiefly of eighteenth-century work, but not fully completed till about thirty years ago, was formed by covering in the courtyard. The noble owner, Lord Suffolk, is now acting as aide-de-camp to Lord Curzon, the Viceroy in India, but Lady Suffolk very hospitably provided tea for the visitors, while Mr. Bates, the estate steward, was quite indefatigable in looking after the



CHAVANAGE

party and ensuring that they missed nothing which was of interest. Charlton is illustrated in Mr. Gotch's book (the actual plan seems somewhat different to that given by Mr. Gotch), but a good deal of the so-called Elizabethan work is of eighteenth-century date. Of course the main front is genuine and a splendid example of the period.

On Thursday train was taken again to Tetbury, and a short drive brought the party to Beverstone Church and Castle. The rector, Mr. Evans, showed the visitors around. The castle is a picturesque group and boasts some historic traditions. The chancel screen in the church is a curiosity. Sixty years ago it was taken down to make a summer house for the rectory garden. Falling to bits, it was eventually entrusted to the care of Mr. Waller, architect, of Gloucester, to whose skilful treatment is due the present satisfactory restoration. There are some good tombstones of early Georgian date here.

The remains of the ancient moat around the castle may be traced. The chief object of interest is the Berkeley chapel, with a good sedilia and curious angled piscina. Marks of the sword slashes of the defenders are still traceable on the stone joints of the stair. A hole through which prisoners were lowered to the castle dungeon is also shown.

Chavenage House was the chief event of Thursday. The president of the A.A. (Mr. W. H. Seth-Smith) has written a very readable little monograph on Chavenage. This house is picturesque, and a good example of an Elizabethan house of its class. The original house, erected by Edward Stephens, probably dates from 1567 (the date on the label over the porch), and some additions were made by Richard Stephens in 1684. Some unfortunate restorations which have quite spoiled the aspect of certain portions occurred in 1803. There is a decorated two-light window, and the plaque over the doorway appears to have been brought by Richard Stephens from Horsley Priory, which passed by exchange into the possession of Bruton Priory in 1371; after the dissolution of that house, it was granted to Sir Walter Deniss in 1533. The bulk of the house would seem to be of Elizabethan date. The hall has a very fine Elizabethan chimney-piece and minstrels' gallery, the latter apparently made up of odd pieces. There is also some very good tapestry and some charming old glass—mostly Dutch. The coved ceiling of the minstrels' gallery is beautifully panelled, as was in all probability the entire ceiling of the hall.

Upstairs the quaint rambling passages and communicating rooms, panelled and tapestried, give a delightful old-world charm to the house. The arms of the Stephens appear in various positions: *per chevron azure and argent in chief, two falcons rising*, and the crest, *a demi eagle displayed*. The chapel is interesting for a curious little Norman font and an Elizabethan altar table.

Chavenage is associated with many historic personages. Cromwell resided here, as did also General Ireton and Sir Philip Sydney. Later, Queen Anne occupied one of the bedrooms. Chavenage now belongs to Captain Lowsley-Williams, who is at present in South Africa. The members of the Association received a very kindly welcome from Mrs. Lowsley-Williams, who had travelled from Cheltenham specially to meet them and gave them afternoon tea. Before leaving the president took occasion to express to our kindly hostess the thanks of the members and their hopes that Captain Lowsley-Williams might soon return safe and sound from the front, where he has been for almost two years.

On Friday Barnsley Church was visited. It has a very peculiar battered and gabled tower, reminding one somewhat of North Lancashire. A curious old pewter communion service was shown to the party.

Bibury Church has a good roof with cusped windows. On one side of the nave is a Norman arcade of five arches, on the other is a Transitional arcade of five arches. The interior of the church has a rather modern look. The chancel arch is remarkably narrow and the windows curiously irregular.

Bibury Court was perhaps the finest mansion seen on the entire excursion. It is a delightful piece of grouping, a very paradise for the sketching fraternity. The tablet over the entrance bears the date 1622, the date of the main building. The lead water-heads are dated 1759.

·TROUGHAM·MANOR·

A violent thunderstorm held the party for some time prisoners at the "Swan Inn." The next move was to Ablington Manor, the residence of Mr. Gibbs, whose late brother made Ablington quite famous by his book, "Life in a Cotswold Village." The entrance front is really a beautiful picture. The garden front is of comparatively later work (Georgian date). Mr. and Mrs. Gibbs entertained the party to afternoon tea.

In the evening the time-honoured "smoker" (somewhat tame this year) took place, and a comparison of sketches brought the active work of the week to a close.

Saturday, the day of parting, was devoted to Cirencester. The main feature of the ancient town is the splendid church of St. John the Baptist, with its fine tower. Like Fairford and several other churches of the district, this church has a five-light window over the chancel arch.

The old guild hall over the south porch of the church was early in the sixteenth century built at the sole expense of Alice Avening (whose nephew was afterwards Bishop of Durtman.) There is plenty of work to occupy the student for long weeks in this church, but space forbids any details. There are many quaint gabled houses, but few of any great interest. The seat of Earl Bathurst beside the town has a magnificent park—one of the finest in England. His lordship, in command of the Fourth Gloucester Militia, arrived home from St. Helena on July 20th and was accorded a very warm welcome.

EDGEWORTH CHURCH

An hour or so was spent in Tetbury, where there are some good stone houses and a quaint market-house.

The general feeling of all the members was that the week, with the exception of the bad weather, had been a very successful and enjoyable one, the only cause for regret being that so few new men of the younger generation had joined this year, a circumstance for which it appears difficult to find excuse.

TRURO CATHEDRAL.

PROGRESS OF THE BUILDING.

THE architectural conception of the late Mr. J. L. Pearson, R.A., in Truro Cathedral is gradually receiving a more complete presentation. Only a fragment of the full design has for years past been in existence. But a great change is being effected by the building of the nave, and in a very few years that important addition will be completed and the great central tower will be reared. When the work at present arranged for is finished the only conspicuous omission from the design will be the two western towers. Mr. J. H. Dennis has generously provided £15,000 for the central tower, and the opportunity is now available for some other munificent donor or donors to give the £12,000 requisite for the two western towers.

The towers at the west end of the nave have now been carried up 70ft., the height provided for in the last contract. To complete them would mean the addition of 130ft. to the top of the spires. The walls of the nave are up to the same level as the towers, and the roof-timbers for the nave are being prepared. The gable and turrets are up to 74ft., and the statuary for the niches at the top has been ordered. There will also be two medallions on the western gable. A large number of statues will be required for the narthex, or tower of the western porch, and similarly for the southern porch when undertaken. The stone tracery of the great window in the western front has already been fitted. The date stipulated for the completion of the nave was January 31st, 1903, but since that contract was made an additional order has been given for the carrying up of the western towers to the level of the roof of the nave, being a height of 70ft., instead of 32ft. as at first contemplated. If everything goes well the roof of the nave may possibly be finished this year.

Preparations are now being made for beginning the great central tower. This will be carried on independently of the nave, and will necessitate separate scaffolding and hoisting arrangements. The extent of the task may be gauged from the fact that about two thousand tons of stone and other material will have to be hoisted for the erection of the tower. A small portion of the tower already exists beneath the temporary roof, the highest point being nearly 100ft. It is very nearly square, measuring 35ft. from east to west and 36ft. from north to south. The tower at these dimensions has to be carried up another 56ft., and from that height the spire will spring to a complete altitude of 250ft. from the floor of the cathedral. The tower will contain two stages of windows. The smaller lower set will be glazed with tinted cathedral glass, and the upper will be filled in with oak luffers covered with copper. The base of the great spire will be surrounded with four spirelets and four lancet windows, rising from the parapet of the tower. Like the other exterior work, the tower will be built of Mabe granite and Bath stone, the latter being treated with fluate to make it more durable. At the stage of the present matchboard ceiling inside the building the central tower will be groined over. Elaborate precautions are being taken against mishap. Thirty squares of strong boarding are being placed upon the roofs of transept, choir and baptistery for protective purposes. Inside a temporary floor covered with lead will take the place of the wooden ceiling, and a few feet above that there will be placed a strongly-constructed platform to receive the engine and interior scaffolding. Seeing that this is at a height of about 100ft. right over the centre of the building, where congregations assemble, the advisability of these careful precautions is manifest. The work throughout has been executed on the safest lines, and the result has been a complete absence of serious accident. The outside scaffolding will be kept separate from all roofs, and will be supported by great baulks of timber over 50ft. long.

GATE HOUSE DOWN AMPNEY

The open ground to the north of the cathedral is a scene of busy activity, and the former quietude is disturbed by the sound of many chisels and the grind of the mortars. On an average nearly 100 men are employed, principally composed at present of masons and carpenters. The clerk of the works (Mr. E. T. Price) has the oversight of an enormous amount of detail. The plans and sketches are huge in bulk, and altogether nearly 1,200 of them have been prepared for the different departments. The architect (Mr. Pearson) inspects and signs all the plans before they are utilised. Mr. Price has had a very large experience of ecclesiastical building, having superintended the erection of several churches and other buildings for Mr. Pearson. The contractors, Messrs. Willcock, of Wolverhampton, are represented by Mr. Yeatman.

In the course of time the rectory, which is overshadowed by the nave on its north side, will be demolished, and the site will afford some, at any rate, of the surrounding open space necessary to a proper display of the cathedral. The complete plans include on the north side a chapter-house and a large cloister court; but in view of the strain which has been already imposed to obtain the money needed for work in hand, these portions of the building will have to be delegated to the attention of posterity. If only the two western towers could be compassed the present generation would enjoy the satisfaction of completing the really essential portions of Truro Cathedral.

New Church at Goole.—A new brick and stone church, dedicated to St. Paul, has been erected in the North Ward, Goole, at a cost of about £4,000. When completed it will accommodate 730 persons, and will consist of nave and aisles and chancel with north aisle. The architects are Messrs. Brodrick, Lowther & Walker, of Hull and Bridlington; the builders being Messrs. Jackson & Dimberline, of Goole. The terracotta was supplied by Mr. J. C. Edwards, of Ruabon.

TIMBER.

Some Interesting Particulars of the World's Supply.

We have received from the Philadelphia Commercial Museums a report on the lumber trade of the United States, prepared by Mr. O. P. Austin, chief of the Bureau of Statistics, Treasury Department. The principal timbers of commerce in the United States are those known popularly as pine, fir, oak, hickory, hemlock, ash, poplar, maple, cypress, spruce, cedar and walnut. Pine and fir predominate, but oak, the first of hardwoods, still holds its place for variety of serviceableness.

Timber forests constitute the raw materials of the lumber trade. Hence countries where the timber supply has been more or less exhausted, or where timber cutting has been brought under restrictive control of public authorities, must sooner or later cease from contributing to the world's supply of lumber for international trade. Only five European countries now export timber in any considerable quantity. These are Russia, Sweden, Norway, the Danubian provinces and Austria-Hungary. Even the Austro-Hungarian stave trade is gradually being transplanted to the southern Mississippi Valley for want of a timber supply adequate for that trade.

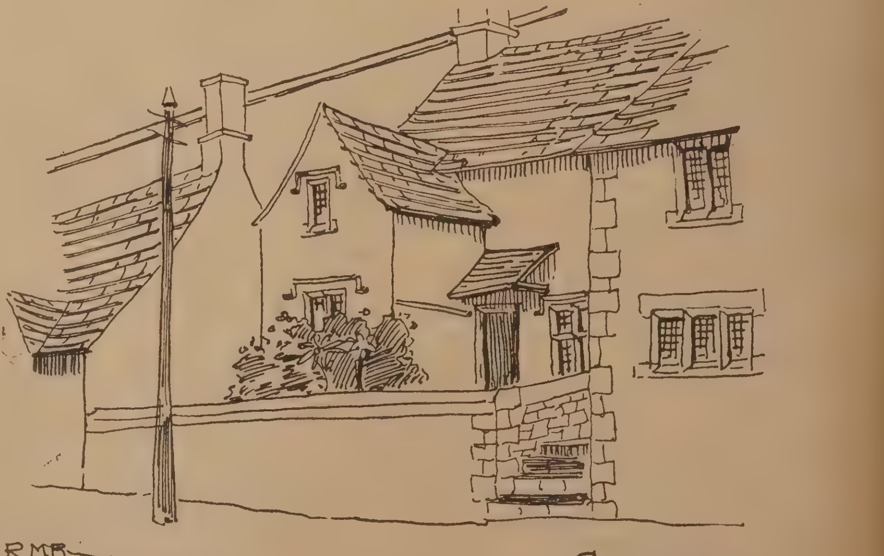
By far the greater portion of the world's timber resources of commerce are now to be found in the New World. Canada and the United States are the greatest exporting countries for the more usual species of timber products, such as pine, fir, oak, maple and spruce. The ornamental woods such as mahogany are derived mainly from the tropical countries of the West Indies, Mexico, Central and South America, though Africa, Hawaii and the Philippine Islands are sources of rising importance in this species of hardwood. New South Wales, the best timbered division of the Australian colonies, has twelve leading species of hardwood trees suitable for export. Nevertheless, the lumber fleets of the Pacific coast of the United States and Canada, whose ships carry lumber to every continent, show that even for the well-wooded islands of Australasia the main source of their foreign lumber supply is still North America.

The demands of modern consumption have greatly enlarged the varieties of useful woods. As older standard varieties became scarcer, newer varieties appeared as substitutes. In not a few cases these substitutes proved to be superior for certain uses to the woods they displaced. As the uses for woods multiplied with modern progress in industry and in standards of living, the distant parts of the earth began to contribute to the demands of Western countries. Thus the jarrah woods (*Eucalyptus marginata*) of Australia came into use as a superior wood for service in contact with soil and water. The karri wood of the same country became known as the world's best wood for paving purposes. The cypress of the South, once wholly neglected as useless, is now a standard shingle wood, and the redwood of California, practically unknown fifty years ago, is now as widely known as the lumber trade of the world.

The Future of the World's Lumber Supply.

It has become the fashion in this age of rapid economic development to make enquiries into the probability of exhausting natural resources such as the mines, the oil fields and the forests at the present rate of exploitation by extractive industries. For twenty years or less there has been considerable apprehension of an impending timber famine. Industries whose dependence upon timber resources is direct have looked upon the disappearance of forests and original timber growths of the country with no slight fear for the future.

A recent volume by A. Mélard, a French official, on the lumber situation in the world's trade, sounds a note of alarm at the astonishing rate at which consumption is proceeding in the leading countries of the world. This is indicated by the small proportion of forested area to total land area and by the vast difference between imports and exports. France, it is estimated, consumes about 20,000,000 cubic metres for firewood and about 6,000,000 metres of lumber, nearly half of which latter requirement has to be imported. England, Germany and Belgium are in a similar position, as in all these countries the industries requiring lumber as materials of development are in a most flourishing condition. For the present these deficiences in lumber supply are made up from Austria-Hungary, from Sweden and Norway, from Finland, from Russia, from Roumania, from Bosnia-Herzegovina and from the United States and Canada. These deficiencies, according to M. Mélard, are made good by the continuous destruction of forests. The world as a whole, especially the



·COTTAGES· ·AT·BIBERY·

European and North American world in the north temperate zone, is rapidly exhausting its capital investment instead of living on its yearly interest in the lumber resources of these nations taken as a whole.

According to this view, the peoples of the north temperate zone, in which most of the existing supply of commercial timber lies, have every reason to face resolutely the question of a future supply. That question can be answered in only two ways. Either the increase in lumber values must reduce the rate of timber exhaustion or the exhaustion of the now available lumber supply must drive these industrial nations to seek new supplies elsewhere. Then, if the uses of lumber are to continue, there will be three sources available—namely, Northern Russia, Argentina and Australasia—for a non-tropical timber supply.

Russia, though not a well-wooded country, has two regions on which Europe will rely more and more for lumber as the American supply is restricted or rises in value. These are in the extreme north and the Ural region, the former of which has 57 per cent. of its area wooded and the latter 45 per cent.

From the sub-Arctic and Ural provinces we must look for the rising of an enormous trade once the difficulties of transportation to Europe by way of the northern rivers and the White Sea are overcome. Four of these provinces, lying in the north-east between the Ural Mountains and the White Sea, largely within the basin of the Dwina river, contain 62 per cent. of the timbered area of Russia proper, excluding the Caucasus and Siberia.

The Want of Transport Facilities.

When we turn to the south temperate zone we find the same backwardness in transportation facilities for marketing lumber. Argentina's forest resources are among the richest in the world, but, unlike those of the United States, they are remote from the ocean, and thus expensively reached, if reached at all.

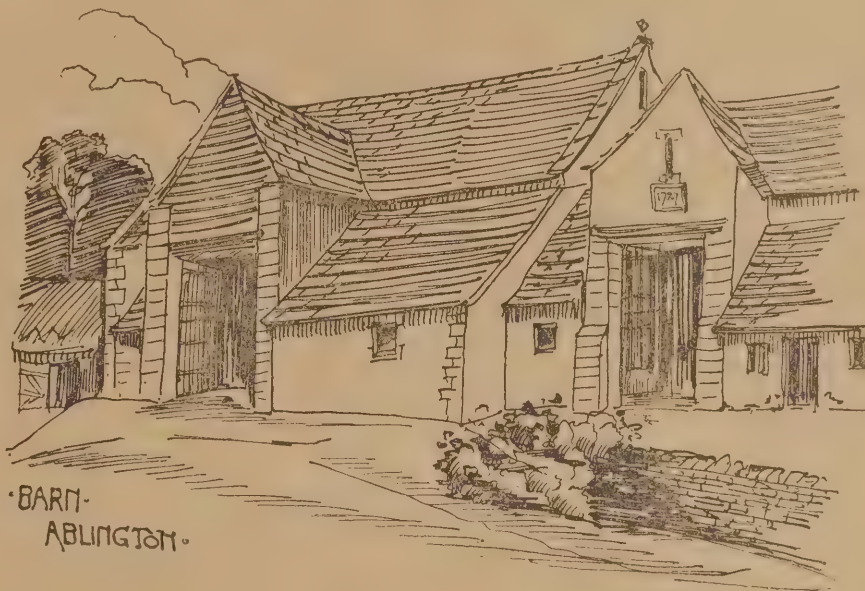
The forests of the interior of Argentina, throughout the north and the north-west, on the eastern mountain slopes and in the valleys of the Uruguay and Perena rivers, are famed for their richness in timber resources. In this country there are fully 500 varieties of woods, with no less than 100 of high utility in commerce. But the richer timbered areas lie remote from the seaboard and away from the centres of consumption. Hence, here, as in Brazil, it is often cheaper to import lumber than to cut it at home. Brazil has a tropical profusion of useful woods. In the province of Amazonas alone there are thirty kinds of building lumber and thirteen kinds available for cabinet uses. But labour is scarce, and the means of transportation are so imperfect that the production goes little beyond the demands of local consumption. Commercial lumber is largely imported, primarily from the United States and secondarily from Sweden, though England and Germany import cabinet woods into Brazil quite extensively. As to Argentina, the exports, mostly to Europe, are of growing importance. Most of this lumber goes to the cabinet-makers of France and Germany. But here, too, there is a reckless disregard of the future. "It is sufficient to say that the damage and destruction under the present system are greater to the country than the profits," declares the Buenos Ayres nation.

Australasia is well supplied with varieties of wood, both hardwoods and pines; and with eastern Siberia and the interior of China the Far East will not be wanting in much. The hardwoods of New South Wales are remarkable for the length of the trunk and for the strength and the durability of the wood. The absence of branches for the greater portion of the height—rarely less than 100ft. being clear—makes these timbers suitable for structural purposes in private and public works. The United Kingdom imports timber to the value of £20,000,000 in round numbers annually; and to this market the Australian trade has been giving special attention, with slow but sure encouragement. A differential tariff in favour of Colonial imports might prove decisive in transferring the main portion of this timber trade to Canada and Australia and away from the United States.

AN INDIAN BRIDGE.

BUILT BY AMERICAN ENGINEERS.

THE far-away corner of the earth known as the Shan State of Thibaw has probably little interest for people at home, should they happen to have heard of its existence; yet, being on the borderland of two vast Empires, and a buffer State between two ancient civilisations, it is not without its own interest both past and present. Lying in the wide belt of hills between Upper Burma and Southern China, the State of Thibaw has always been traversed by the old caravan route from Yunnan to Mandalay. Long before the British took Burma the trade of the Far East filtered through to Mandalay by slow stages up and down the rugged hills and valleys, through thick jungle and over mountain torrents, finally descending the Ghaut, and emerging on to the open plain. Now all this is changed; the iron road winds up the hills and over the plateaux between Mandalay and Thibaw. Soon it will be carried further still, and some day the old route will be superseded for its whole length by the railway.



·BARN·
ABLINGTON·

A very serious obstacle on the road was the Gokteik, and those who have seen the bridge across it which was opened on June 1st can best realise the difficulties faced and overcome by the engineers of the line. The surrounding scenery is very lovely, reminding one of the Canadian Rockies, only without the background of snow mountains. Green ridges and jungle-covered slopes carry the eye up to the high lands lying between the yet higher hills that stretch, blue, peak beyond peak, right away to China. The Gokteik valley winds in and out of these hills, directly athwart the Mandalay-Thibaw road. It is not a simple valley, but one of interesting formation. It slopes from the hills on one side to the foot of precipitous crags, veritable cliffs in parts, on the other, but just where it would touch their feet a deep cañon winds, almost a sheer drop 500ft. down, to the brawling river that follows its course below. Yet is this deep moat no barrier to man, for from the level of the valley to the face of the cliffs there is a natural bridge or causeway of rock, tunnelled at the bottom by the river. When the railway was surveyed and it was planned to bridge the valley and the gorge it was decided to utilise this piece of Nature's engineering, and some of the piers of the steel bridge rest on this natural bridge or causeway.

The steel bridge is more than 2,000ft. long and its deepest pier is 325ft. high. It is a trestle bridge, built by the Pennsylvania Steel Co., U.S.A. It is approached on each side by a gradient of 1 in 40.

A New Wesleyan Church at Stamshaw, Portsmouth, is to be built from designs by Mr. G. E. Smith, of Southsea, at a cost of £4,650.

EAST SUSSEX ASYLUM.

THE NEW HELLINGLY BUILDING.

THE erection at Hellingly of the new lunatic asylum for the administrative county of East Sussex is proceeding apace and in a satisfactory manner. The undertaking—in point of expenditure the most important in which the East Sussex Council has been engaged—represents the practical solution of the difficulties of accommodation involved in the joint use of the Haywards Heath Asylum. The committee was most fortunate in securing the services as architect of Mr. George T. Hine, who is generally recognised as one of the highest authorities on asylum construction. The average number of men employed on the works is about 500. The difficulty is not so much in dearth of labour: workmen are plentiful, but the accommodation is extremely limited. The whole of the foundations have been laid, a separate contract for this work having been executed by Messrs. Wilcock & Co, of Wolverhampton. The contract for the superstructure was secured by Messrs. Howe & Co., of West Hartlepool, and this work is still in an elementary stage. Generally the main building is to be two storeys high, and roughly speaking the first is completed. A few of the smaller buildings such as workshops have been roofed, but the superstructure of the majority of the detached buildings has not yet been commenced. Red Leicester brick from Ashby-de-la-Zouch, with white Bath stone dressings, is being used, and red tiles will be employed for the roofs. A fireproof system of building is adopted. The main building covers about twelve acres, but the whole estate comprises no fewer than 400 acres, the freehold of which has been acquired from the Earl of Chichester. The acute hospital, which will provide accommodation for fifty females and thirty males, will be constructed on different lines from the main asylum, and every opportunity will be afforded the doctors for special and separate treatment of the patients, who will not be under the necessity of suffering the terrible evil of associating with confirmed lunatics.

The main hospital, in which accommodation for 840 patients of all classes will be found, is being built on the echelon principle. There is a wide base at the north, narrowing down to the south, so that the wards and dormitories, which face this direction, will get as much sun as possible, and will consequently be light and cheerful. The main entrance is in the middle of the north base, and immediately on the right and left will be waiting-rooms, committee-rooms and offices. The right wing will be devoted to male patients and the left to female. In the centre will be the surgery, dispensary, kitchens, store-rooms and similar offices; while to the south will be the assistant medical officer's quarters, which will be connected with the main building by a corridor. The asylum is being built to accommodate 1,115 with provision for extension to 1,275, arranged as follows: Acute hospital, 80 patients; main asylum, 840 patients; four detached villas, 120 patients; idiot block, 60, and rooms for 15 quiet female patients to assist in nursing the children. The remaining 160 patients to complete the ultimate number will be provided for in further blocks attached to the main asylum or more villas, whichever is found in experience to be the most desirable. Before the land was purchased the committee made sure that water was to be found on the estate, and boring operations are now in progress. A tower 100ft. high is being erected which will contain three cold-water tanks having a storage of 22,000 gallons. The water will be conveyed all round the building by a 6in. pipe, and a hot-water service will also be available. The asylum will also have its own sewerage works, the outfall being on the lowest point of the estate. The main building is 130ft. above the sea-level, and as the sewage farm is only 65·4 the sewage will be conveyed to the outfall works by gravitation. Here the solids will be destroyed by septic tanks and the clear effluent allowed to pass away.

NATIONAL COMPETITION DRAWINGS.

By S. S. G.

MOST of the National Competition drawings now on view at South Kensington (in a building which requires looking for) reach a fair average of attainment without showing striking excellence. The involved line and exaggerated curve, so distinctive of the later developments of Continental design, are not quite so much in evidence as they were last year, but there is still too great a tendency to imitation of the peculiarities of certain well-known designers and a suggestion of endeavour to work on the lines most likely to prove acceptable to individual examiners, which is scarcely healthy. Twelve gold medals have been awarded, and while some of them have been very easily gained most are well deserved; the silver medals number 127, and the bronze no fewer than 358, besides which 741 national book-prizes have been given, so that the student who is possessed of any talent may almost make sure of some reward—a most comfortable and encouraging state of things for those whose object in studying is the gaining of distinctions. It seems scarcely just that the same award should be made for the pretty but slight design for a printed muslin which takes a gold medal, a repetition of three sprigs of flowers, one of which only is well designed, and small butterflies, delicate and sweet in colour though it be; and the fine sets of measured drawings of the Priory Church, Great Malvern, and of All Saints' Church, Hawton, which also receive gold medals. But these inequalities cannot always be avoided, and the really important thing is that each drawing so premiated should be the best of its class; though it might also be borne in mind that high awards are one means of encouraging effort in directions in which study is thought desirable by the examiners. We are glad for this reason to see a gold medal given for a set of studies of historic ornament as well as for the architectural drawings already mentioned, and wish the examiners could have found it in their hearts to give one to the very fine set of studies of flowers treated for design from Manchester, which are drawn with absolute mastery both of form and manipulation and are pleasant in colour withal, since such studies are of the greatest possible value to the designer, and should therefore be encouraged.

The variety of subject in the architectural measured drawings is commendable, and shows breadth of view in the examiners. The drawings are most of them good and some excellent, and Gothic and Renaissance work is drawn with equal enthusiasm. The gold medal drawings already referred to (there is a second set of Malvern Abbey), the elaborate tower of St. Giles's, Wrexham, and St. Mary's, Warmington (very delicately worked in pale sepia), are Gothic, while Kirby Hall, St. Nicholas, Worcester, the Custom-house, King's Lynn, Nottingham Castle, Westwood House (with a very dainty general sketch), and the staircase of Fyvie Castle give equal prominence to the styles of the Renaissance; and some sheets of tinted drawings from Ely and Cambridge, Worcester and Gloucester, show impartiality in choosing subjects from both styles. Another set shows the market halls of Ledbury, Ross and Chipping Campden; and ironwork, plasterwork and monumental sculpture are also shown in other sheets of capable drawings. The section of architectural design is not so satisfactory. The Scotch designs show massiveness and solidity of treatment, and an artist's country house gives opportunity for picturesque arrangement, but most of the designs are reminiscent of the work of others. A pretentious design for a public gateway to a park relies a good deal upon badly drawn and composed figure panels and groups, which do not redeem it from the commonplace.

The stained glass is better than last year, and one or two sketches of arrangement are good in colour; but almost all are conceived too much from the pictorial standpoint, and silhouette and contrast of colour have not been sufficiently considered, the result of which is that the leads are obtrusive and clumsy, which they are not in a well-designed window. The schemes for decoration are not very good, students generally either making the mistake of over-decorating, and so losing breadth, or in striving after novelty of form or colour falling into the bizarre, which is never restful. There is a design for a day nursery with panelled walls and frieze; both frieze and panels to within 2ft. from the ground are filled with painted subjects, which make the room look as if decorated with the pictures from Christmas numbers (perhaps a virtue in this case). A design for a music room from Nottingham, although conventional in the modern fashion in much of the ornamental detail, is a thoughtful scheme which is pleasant in colour and tastefully arranged. A high panelling surrounds the room, above which is a plastered wall recessed beneath round arches which support a coffered ceiling; the colour is mainly greens and dull blues, with a little red here and there. The mosaic designs are poor, though one set shows considerable feeling for colour. The students appear to think the material suitable for surfaces near the eye. Their masters should have taught them better! The tiles are not of much account, but one is glad to see examples of pressed tiles filled in with coloured glazes, a very effective mode of using the material, as might be seen last year in Paris and now in several showrooms in London. Some of the sgraffito pottery is fairly successful, and here too one is glad to see the actual articles manufactured as well as the drawings for them.

The gesso work is frequently well designed and executed, but applied often to objects which will be much handled, such as bellows and hair brushes, for which the material is manifestly unsuitable. A few examples of carving are interesting, especially a portion of an overmantel well begun and not badly designed (from Worcester) and another from Swansea with cherubs' heads well carved but rather over high in relief. The design of the mantelpiece to which this latter belongs is a most curious mixture of Wren and "L'Art Nouveau." Some of the modelled design is good, especially that for metalwork, but here the tendency to play up to the examiners' presumed preferences is very evident; a clumsiness of general form and a misunderstanding of architectural requirements and of the material intended to be used are also noticeable, and a want of scale between the figures and the ornament or enrichments of mouldings. It would be advantageous for these students to go through a course of architectural study, which would not be amiss even for sculptors of greater reputation. The designs for cast metal resemble *repoussé* too much, and lack the qualities required for the process; and some of the wrought-work, while suitable and not ineffective in detail, is clumsy and even ugly in general form. These remarks apply to both iron and brass work, and the latter is often very ungainly in general outline, showing a good deal of "Art Nouveau" feeling in the detail, which is sometimes moderately successful. The executed objects in enamel show aspiration, but are not very excellent. The process is difficult and requires experience, and though success is not reached, strivings after beauty of colour are evident, especially in the jewellery, some of which is pretty and delicate; this is the most successful section of the metalwork on the whole and much better than such things used to be. Students may be reminded, however, that although the contorted lines characteristic of the latest French and German jewellery are suited to a ductile material such as gold or silver, mannerisms of form become offensive when often repeated.

The embroidery includes a number of articles entirely or partially worked out which show great ingenuity and variety of stitch and effect. It may be presumed that it is this quality which gained the gold medal for a piece of work which is poor in design and badly drawn. A portion of a portière from Salford is as successful as any in colour and richness of effect; and in a screen from Bradford stencil and embroidered lines in high relief with gold lines added are used with great effect, though one may have doubts of its permanency. The designs generally are rather too liney. Many of the stencils are over fussy; a few are good in colour and fairly good in arrangement, but the lines are generally too involved and twisted for satisfactory effect from a distance, which should be a consideration in stencil design. The wall papers are poor. The bizarre is frequent and sometimes becomes the ugly. There are too many spiky forms in many designs, and this makes them confused and sometimes insignificant, though one scarcely expects to find much distinction in the work of students. A few designs for end papers are daintily drawn, and the book decoration is sometimes distinctly talented; but here also the bizarre seems to exert great attraction on the student, and the mannerisms of certain artists find many imitators who do not realise that ugliness is only fascinating when informed by genius, a quality which is incommunicable. There are one or two good stencil cards, but they are not as satisfactory as those shown last year. The book-covers are most of them mannered in a fashion which has been successful of late years in gaining prizes.

The designs for fabric are frequently accompanied by portions of the material in which they have been carried out and with working drawings of a part of the design, showing that they are the work of qualified designers. One could wish for more distinction in the designs—at present they are commonplace or eccentric, according as the designer has aimed at the market demand, or attempted to be original. In the tapestries the lines on which the patterns are set out are too apparent, but the table linen is more successful, though the extravagances of line which are so evident in other sections are also to be seen here. The designs for white work in the embroidery section are often clever, but do not reach the high level of last year, and the same remark may be made about the lace. The printed silks and cottons are dainty in colouring, and some are good in design though too liney, but this defect is much more apparent in the printed muslins, which are also too formal in arrangement. The folds into which these materials will fall when made up would make many of them unintelligible. The designs for carpets follow the ancient lines in several cases with considerable success. Here the Scotch designs are better than the English.

The sections devoted to study of the figure, painting from cast and from life, and advanced modelling, are not so noticeable, and the level of attainment is rather low. Some of the life studies are fairly good, especially the studies of heads. The gold medal drawing shows intelligence in the use of line, and some of the studies of drapery give evidence of care both in drawing and arrangement. The time sketches in pencil are pretty good, and the modelled work about up to the average, while the still life studies are generally too chromo-lithographic. Most of the students do not seem to have realised that the value of such studies is not the reproduction of the objects painted, but the acquirement of power in the manipulation of the brush and the development of the colour sense. One is pleased to see that on the whole in the local personal examinations the candidates have been more successful in the exercises in design than in the other subjects, and this gives one some hope for the future, though the present competition can scarcely be said to show advance upon the level of last year except in the fact that the influence of "L'Art Nouveau" is slightly less marked.

ST. SAVIOUR'S CHURCH, LIVERPOOL.

ST. SAVIOUR'S CHURCH, Huskisson Street, Liverpool, which was destroyed by fire eighteen months ago, was reopened recently. St. Saviour's Church, which was built in 1840, has passed through numerous vicissitudes. It was designed by a Dublin architect, and the estimated outlay at the outset was £12,000.

In the first instance, during 1889, the interior of the building underwent extensive alterations, when the chancel was entirely reconstructed and enlarged. The main walls were painted in various shades of terra-cotta, and this colouring was repeated with pale buff on the galleries and pulpit. Choir stalls were erected of walnut on Classical lines, and the chancel wall was richly coloured. The work throughout was most effective, including pillars, panels, and coloured windows, the latter executed by Mr. W. H. Lonsdale. The improvements at this date included the removal of the old-fashioned high-backed pews, which were substituted by others of a more modern type. These alterations were carried out at considerable cost, which was estimated at about £1,600, and after adding expenditure for repairs to roof, &c., the total amounted to a little over £2,000. The interior of the building was again painted and decorated in 1899, at an outlay of about £400, and a year previous to this £600 had also been expended on external improvements.

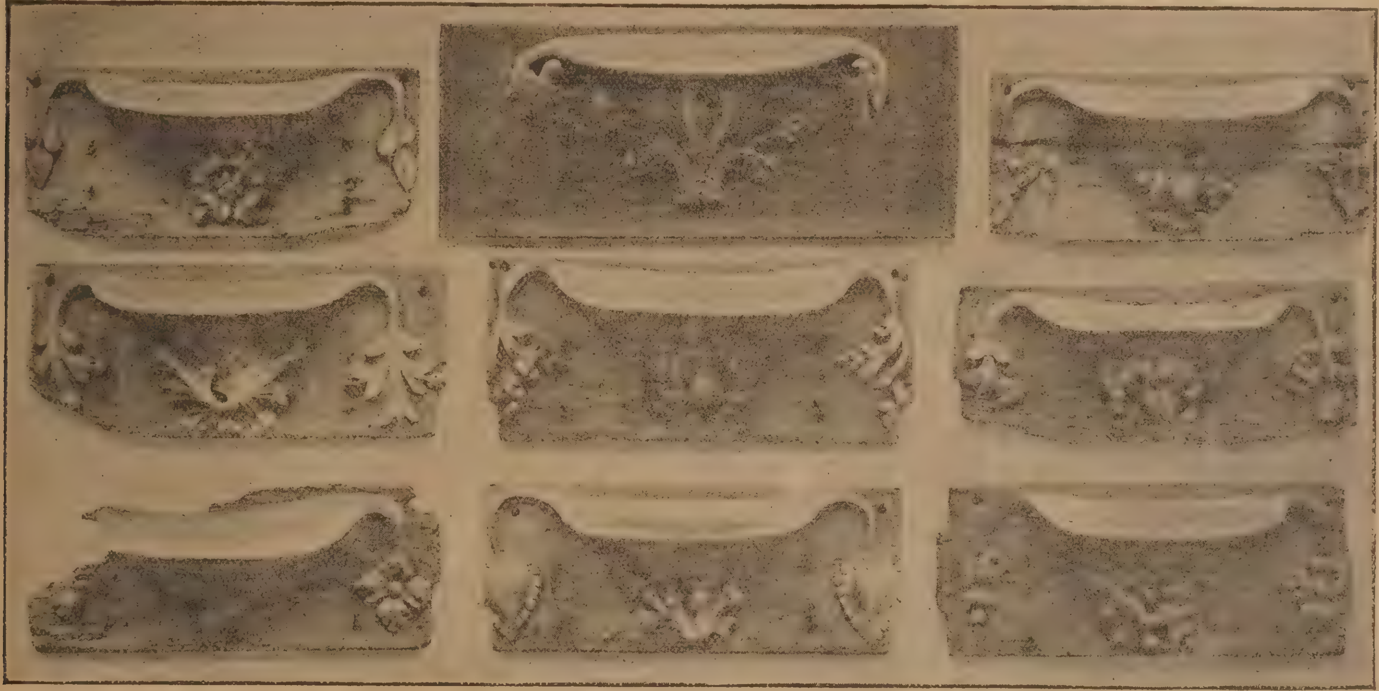
It was at 9.15 on Sunday morning, February 4th, 1900, that the disastrous fire occurred which caused the almost entire destruction of St. Saviour's Church. Starting from a defective flue connected with the heating apparatus, the fire spread until everything combustible was destroyed, including the floor and the roof, the walls and the tower alone remaining standing.

Steps were at once taken to remedy the disaster. A careful examination of the old walls showed that they could be depended on, and it was decided, in order to save time and money, to leave them standing. Considerable changes, however, had to be made. In the old church the chancel was placed at the west end, while the east end was occupied with a series of porches and staircases. In the scheme of restoration, however, this arrangement has been reversed. One side of the tower was removed, the superincumbent weight being carried by steel stanchions and girders, and the rest of the circular Bible porch was converted into an apsidal termination to the chancel. The side porches are changed, one into a spacious organ-chamber, the other into vestries—that for the choir on the ground floor, and that for the clergy upstairs. At the west end corresponding changes were made. Vestries were converted into porches, and the space originally behind the chancel was adapted for use as a baptistry. Thus the axis was reversed, and about 35ft. was added to the length of the church. Another important change has been the addition of a very serviceable basement under the church. Examination revealed a space about 10ft. high under the whole building, which, having no windows, was entirely unused. By removing a foot or so of earth, and raising the floor of the church some 3ft., excavating the ground against the building, and piercing the walls for windows, it has been found possible to provide for the purposes of the parish a mission hall and three good rooms, and thus to supply an institute without requiring a site. In the church itself little will remind anyone of the old building. The galleries have not been replaced, and while the windows under them have been blocked up, those above them have been lengthened. By the substitution of light steel trusses for the immense wood principals of the old building, several feet have been gained in the height of the ceiling, which is curved, and relieved with moulded and enriched beams. Thus the general effect of this edifice is entirely altered. The organ is now being erected in what was the south-east porch by its builders, Messrs. Lewis & Co., of Brixton. The chancel is enclosed by a richly-panelled walnut screen, and the whole of the seating and fittings are made of the same wood of a rich Renaissance design. The floor increases in richness as it approaches the east, the materials being white stone, rock asphalt and Sicilian marble. The east window is to be filled at once with stained glass, the artist being Mr. T. R. Spence, of London. The pulpit is only a temporary one. The whole building, both church and basement, is warmed and ventilated on the Plenum system, fresh air, cold in summer and warmed in winter, being forced in by electric fans, capable of changing the whole of the air, if desired, as often as six times an hour. The architects responsible for the work of restoration are Messrs. Willink & Thicknesse, whose designs and details have been carried out by Messrs. Bullen Brothers & Son, the general contractors for the whole work and the chancel fittings. The nave seating is supplied by Messrs. Haigh & Co., and the heating and ventilation were designed and carried out by Mr. J. A. Wade. These works have cost about £10,000.

New Art Professorship in Rome.—The Italian Government has just created at the Royal University in Rome a professorial chair for the advancement of historical research in connection with mediæval and modern art.

WAKEFIELD'S TECHNICAL AND ART SCHOOL.

THE tenders for the alterations and additions to the Wakefield Technical and Art School, lately taken over by the Corporation, were sent in on July 29th, and assuming that the Local Government Board sanction the borrowing of the £5,500 required by the Corporation for the carrying out of the work, it may be taken for granted that the extensions will be commenced at an early date, and that good progress may be made with the same before the winter months. Mr. Watson is the architect. At the rear of the present building there is to be a new wing, comprising four classrooms on the ground floor, together with a one-storey portion, intended to be used for plumbing and carpentry workshops. This new wing may be reached from the corridor leading from the front main entrance or from behind. Above the classrooms there is to be a chemical laboratory 48ft. by 23ft. and a physical laboratory 22ft. by 33ft., and a lecture hall 22ft. by 24ft., together with a balance-room, a chemical storeroom, &c. This will be reached by a stone staircase, but an iron fire-escape is also to be fitted up behind. The present laboratory and museum is intended to be carried a storey higher, so as to form a large room for elementary art work, 51ft. by 35ft. This additional room will be reached from the present staircase and will, like the new portion, be also provided with an iron fire-escape outside. The floors will be fireproof, covered with wood blocks, and the whole of the school is to be illuminated by electricity.



SOME OLD MISERERE SEATS.

SOME OLD MISERERE SEATS.

THE old miserere seats illustrated on this page were exhibited by Messrs. Harry Hems & Sons, of Exeter, at the recent Exhibition of Works in Wood held at the Carpenters' Hall. One, a specimen of Early English oak carving, is especially interesting. It dates from the time of Bishop Bruere, who was made Bishop of Exeter A.D. 1224, and built the chapter-house and provided stalls for the choir. Of the latter nothing but the fifty miserere remain to-day, and they, as a series, are unique—nothing like them existing in any of our old cathedrals or old parish churches. Messrs. Hems & Sons were enabled to exhibit this specimen by the kind permission of the Dean and Chapter of Exeter. It is as sound and crisp as it was the day it left the carver's deft chisel (nearly 700 years ago), which speaks volumes for the almost everlasting qualities of English oak.

A NEW SOUTHAMPTON BOARD SCHOOL.

A NEW Board school for the Southampton School Board is being erected on a site at the northern end of Foundry Lane, nearly adjacent to the main road through Shirley, being part of the Shirley Freehold Building Estate. It will have three frontages—to Foundry Lane on the east, English Road on the south, and Imperial Road on the west—and will cover an area of 1a. 3r. 23p., the ground being purchased by the School Board for the sum of £1,583. In addition to this there was also purchased a small piece of land with two semi-detached cottages thereon for £586, this forming the south-west corner of the school site. It is intended to utilise these cottages as residences for teachers and caretaker; thus a cottage for the latter is not required now to be built. The main school buildings are divided into two separate oblong blocks, that facing English Road being a two-storey building—for girls on the ground floor and for boys on the first floor. The girls' department contains two schoolrooms, each 60ft. long by 23ft. wide, and four classrooms, each 25ft. by 25ft., connected by a corridor having two separate ranges of lavatories and two hat- and cloak-rooms. The rooms for head teachers' use are placed between the two floors, with staircases leading thereto. To meet the wishes of the Board of Education the arrangement of the four classrooms beforementioned can be converted into the resemblance of a central hall by having sliding partitions and revolving shutter partitions in the place of brick division walls, so when it may be required by moving the partitions these four rooms can be adapted as one room capable of accommodating a large assemblage of children. The boys' department on the upper floor will be approached by two stone staircases, and the general arrangement and planning of the rooms, &c., is similar to that for girls on the ground floor, including the providing of movable partitions to classrooms. The two departments in this building will provide accommodation as settled by the Board of Education for 480 boys and 480 girls. The infants' school, which is a separate block of buildings, is placed at the north end of the site, and the arrangement is one large schoolroom (70ft. by 24ft.) fitted with sliding partitions, six classrooms (23ft. 6in. by 23ft.), a wide corridor that can be used as a marching hall, with narrow corridors as passages to the hat- and cloak-rooms, lavatories and rooms for head teachers, &c. This building will give accommodation for 530 infants. The several rooms will be heated by approved warming grates in open fireplaces, and lighted by Suggs' Taj gas lamps, &c. There are two spacious playgrounds, one for the boys and the other for the joint use of girls and infants. There are also provided covered play-sheds. The property will be enclosed by a brick wall on the north and west sides, and the frontages to Foundry Lane and English Road will have an iron fence, with gate entrances therein to the playgrounds. The exterior elevations of the school buildings are of a very plain character. They will be of red brick, relieved by a little stonework, some coloured brick bands, moulded brick strings, projecting courses to eaves and gables, slated roofs with red ridge tiles, &c. The contractors for carrying out the works are Messrs. Jenkins & Son, of Southampton, at a cost of £17,607. The plans were prepared by Mr. John H. Blizard, architect and surveyor to the School Board, and the whole work is being carried out under his direction, assisted by Mr. S. Jurd, the School Board clerk of works.

Church Restoration.—The Archbishop of Canterbury recently visited Rolvenden to dedicate the first part of the restoration of the interior of St. Mary's Church. The old pews have been removed from the chancel and the front portion of the nave and aisles, and in their place are newly carved pews. The old choir seats have also given way to carved stalls, and the two old chantry chapels have been divided from the chancel and nave by carved screens. The whole of the carving has been done in teak by the vicar, the Rev. H. Percival Smith. The work in connection with the alterations has been carried out by Mr. J. Wickens and Mr. D. Russell.

New Patents.

These patents are open to opposition until September 10th.

1900.—**Scaffold Fastenings.**—11,913. J. Fage, 121, Hertford Road, Kingsland, and J. Hunt, 86, Herbert Street, Hoxton, London, N. According to this invention each fixing may be made in one or two minutes. A metal bracket 2½in. wide by 9in. long is used, being provided with a length of chain which is drawn up tightly by screw bolts.

Door Holders.—14,016. E. P. Spence, Empress Chambers, Southampton Docks. The object of this invention is to enable a door to be held open or partly open. This is accomplished by a spring-actuated rod having a foot of india-rubber that presses on the ground. When it is desired to close the door, the rod with its pad is raised by a handle.

Portland Cement.—15,432. A. Gibb, Hunts Cross, near Liverpool. This invention relates to the production of Portland cement by fusion at a moderate temperature, at the same time preserving the qualities essential to its setting and hardening. Peroxide of iron is used in place of alumina. The necessity for intimate and uniform incorporation of the component materials is obviated and a large reduction in the fuel needed in manufacture is effected.

Concrete Walls and Partitions.—15,446. G. L. Mouchel, 38, Victoria Street, Westminster, S.W. This invention relates to concrete walls having curved metal bars embedded in them to take the main compressive strains set up by lateral or horizontal pressure, and straight bars to take the shearing strains. The wall may be built up of slabs.

Fireproof Floors.—15,453. L. Pitsch, Great Wanzleben, Germany. This invention relates to a fireproof floor with a flat or inclined soffit, the bays being supported at four sides by longitudinal joists and by cross joists; and consisting of grooved bricks embedded in concrete. No tie-bolts are used to counteract the thrust of the ceiling.

1901.—**Tennis and Other Courts.**—4,370. I. Etrich, Oberaltstadt, near Trautenau, Bohemia. A foundation of cinders or slag 4in. thick is first laid down: it is then tarred. Next thin viscous tar is put on in streaks, and on this roofing paper is laid with a lap of 4in. Finally a topping of tar is applied.

Radiators.—7,467. C. E. Safford, 301, Washington Street, Buffalo, U.S.A. The sections are made of flexible sheet metal, and are thus very light.

Decorating Woodwork.—10,406. H. Smith, 176, Edgevale Road, Kew. The wood surface is smoothed and treated with kerosene and varnish. Wetted wallpaper is then applied to it and the design transferred.

The following specifications were published on Saturday last, and are open to opposition until September 17th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—12,380, Lake (*MacCoy*), workmen's time recorders. 12,936, Solon & Tellwright, manufacture of glazed bricks and tiles. 12,964, Baker, conveyor apparatus. 12,993, Sprott, acetylene generators. 13,742, Bauer & Rumpler, feed mechanism for acetylene gas producers. 14,437, Roberts, T-squares. 14,503, Talbot, bricks for metallurgical furnaces. 14,919, Robertson & Robertson, water buckets for fire extinguishing purposes. 15,045, Clay & Ennis, incandescent gas burners. 15,895, Smith & Luke, roller blind pulleys. 16,077, Poetter, gas generators. 16,104, Whittaker, utilising sewage sludge as fuel blocks. 16,193, Brown, sliding window sashes arranged to open inwardly. 16,233, Metz, manufacture of tiles, slabs, panels, &c. 16,270, Haslam, domestic fireplaces. 16,430, Müller, hoisting apparatus for use in the erection and repair of chimneys. 16,665, Charles, lever cramp. 16,728, Harrington, refuse destructors. 17,103, Gibbs, sewer or drain scraper. 17,124, Lucy & Turtle, gauge or protractor for gauging, marking off, &c. 23,222, Thompson (firm of *Samuel Zielenziger*), incandescent gas lamps.

1901.—280, Heberer, pipe-wrenches. 5,597, Davis, chimneys and ventilators. 8,349, Schmidt, radiating tubes. 9,680, Schmidt, grindstones. 10,210, White, maps, plans, charts, &c. 10,256, Lewis, means for connecting together parts of slate mantelpieces. 10,272, Ballinger & Milligan, brackets for supporting gutters or spouting. 10,407, Parker, corner plates, strips or beads for plastered walls. 11,699, Coe, package rolls for facilitating the deposit of metallic leaf upon surfaces to be decorated. 11,765, Kresse, Venetian blinds. 12,014, Parsy, concrete floors.

Surveying and Sanitary Notes.

Blackpool Promenade is to be widened 100ft. The work will be commenced in October.

Duke of Beaufort's Monmouthshire Estates.—A further section of these was sold at Chepstow recently, when forty-four lots of freehold property were disposed of. The total obtained was nearly £15,000.

Cheap Land.—Nearly 13 acres of freehold land, together with a cottage and buildings, situated at Bramston Island, was recently sold at Lincoln for £180. This works out at about 1½d. a yard, while the cottage is practically given free.

A Victorian Memorial.—A public park established to commemorate the Victorian Diamond Jubilee and reign was opened at Tipton, Staffordshire, last week. The park is thirty-two acres in extent, and has cost £10,000, part of which was raised by public subscription. It has given considerable stimulus to building enterprise, and over a thousand dwellings are being erected on its environs.

Twentieth-Century Drainage Systems.—At Eastbourne last week Mr. Isaac Shone, of Westminster, read a paper before the Royal Institute of Public Health on "The House and Town Drainage Systems of the Twentieth Century." Mr. Shone claimed that the drain and sewer ventilation problems, which had hitherto been considered and treated apparently by the highest engineering authorities as if they were and would continue to be insoluble, had been solved by his automatic hydro-pneumatic sectional system of town drainage. He dealt in detail with what he described as a practically perfect system of drainage in connection with all future work. A long discussion took place on the question of the ventilation of sewers.

A Great New Ground Plan of London.—Considerable progress has been made with a great ground plan of London showing the various ownerships. The work has been in hand for more than five years, and deals with the proprietorship of ninety-two square miles of the metropolitan area, representing 5,712 freeholders, and only twenty-six square miles now remain to be mapped out. The committee in charge of the work has met with several refusals to supply particulars, but the information has been obtained automatically from other sources, and now only 150 refusals have yet to be treated. Up to the present the committee has expended £3,705 upon the work, in addition to which there has been a further expenditure of about £135 in preparing an annual map showing the progress of building operations from year to year.

A London Crematorium.—The sanitary committee of the corporation recently requested the City engineer (Mr. D. I. Ross) to prepare sketch drawings of a suitable crematorium with two furnaces for erection at Ilford. The plan provides for a chapel, having an entrance porch and one catafalque. The furnace flue will be arranged in the centre of the tower, which will form a feature in the buildings and will be about 80ft. in height, a small auxiliary furnace at the base of the tower being provided for the more perfect consumption of gases arising from the cremating furnace. The crypt, or columbarium, under the chapel will be fitted up for the reception of the urns. The estimated cost is about £10,500.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Directory of Architects.

SOUTH KENSINGTON.—L. G. A. J. writes: "Is there a directory of architects published similar to the one issued by the 'Engineer'?"

"Specification" (published at these offices, price 5s. nett) gives a list of metropolitan architects. The names and addresses of provincial architects may be obtained from Kelly's "Directory of the Building Trades," and from the R.I.B.A. Kalendar and Society of Architects' "List of Members."

English Houses in Belgium.

LONDON, E.C.—A. B. K. writes: "A friend of mine in Belgium is anxious to build some small houses in the English style, such as we should call semi-detached villa residences, with a good patch of garden to each. Have any plans and elevations of these been published in back numbers of your journal? Of course it would be necessary for him to employ an architect, but the published plans might give him some general idea of the various styles."

We presume our correspondent means that a Belgian architect will be employed, and wants some designs for him to copy. Such an arrangement would, we fear, hardly prove successful, and it would be better either to let the Belgian architect build in his own style or obtain designs from an English architect. Scores of designs for small houses have been published in back numbers of this journal. We might, however, mention as examples the designs by Messrs. Bateman & Bateman in our issues for February 14th and March 14th, 1900; those of Mr. E. Guy Dawber in our issue for April 3rd, 1901; and those of Mr. Arthur T. Bolton in our issue for April 17th, 1901. An illustrated article on "Small Gardens" appeared in our issue for March 13th last.

Registration of Architects.

GREAT MALVERN.—A. T. G. writes: "I send a cutting from a local paper. It would be interesting to know which of the five firms advertising therein would be entitled to register themselves as 'architects' under the provisions of the suggested registration Bill for architects."

The cutting in question relates to persons calling themselves "auctioneers and estate agents, surveyors and architects," &c., who are willing to prepare plans, reports and valuations, and to undertake sales. We have already answered numerous queries relating to the registration of architects (see back numbers of Vol. 12). By section 1, clause 19, of the Bill anyone actually practising architecture prior to January 1st, 1899, or "who has served as apprentice, assistant or practitioner in architecture, all or either, for seven years in the aggregate, after having attained the age of fifteen years prior to the passing of this Act," will be entitled to be registered. If the five firms in question conform to these requirements they could be registered. At the time the roll is first made good and bad must inevitably be included.

Sketching in the French Cathedrals.

BECKENHAM.—C. J. B. writes: "Which is the best way to obtain permission to look over French cathedrals for the purpose of sketching and study? I intend visiting Paris, Amiens, Beauvais, Rheims, Chartres, and perhaps Laon and Noyon. I shall cycle part of the way, and take the train occasionally to save time."

I believe that, technically, the right to grant permission to sketch in the historic buildings of France, including the cathedrals, is vested in the Ministre des Cultes, but personally I have found it sufficient to write locally (in French), using foreign reply post-cards. A courteous reply is invariable, either granting the desired permission or stating how it is to be obtained. Without being absolutely sure, I think the persons to address are "Monseigneur l'Archevéque" at Paris and Rheims, "Monseigneur l'Evêque" at Amiens and Chartres, "Monsieur le Curé de la Cathédrale" at Beauvais and Noyon, and "Monsieur le Curé de l'Eglise de Notre Dame" at Laon. The great church at Laon is under restoration, so that "Mons. l'Architecte de la Restauration" should also be written to, as should also "Mons. le Maire," under whose charge is the museum and the Templars' Church. Laon is a small town containing a good deal of old work, some of it hidden away in courtyards, and should certainly not be missed. It would be advisable before starting to obtain one of the R.I.B.A. travelling cards, as they are sometimes of considerable use, especially in out-of-the-way places.

G. A. T. M.

Rings for Bracing Rods.

LONDON, E.C.—V. W. writes: "In putting round-section wrought-iron diagonal bracings between iron columns, with rings of flat bar wrought-iron at the point where the bracing rods would otherwise cross, how can I calculate the width and thickness of the metal of the ring so as to make it not only of equal strength with the bracing rods but strong enough also to resist deformation? The deformation will of course depend partly on the diameter of the ring, and the strength of the rods must be taken at their effective diameter nett after cutting for screwing on nuts."

Suitable proportions for the junction rings of diagonal bracing in pier work would be as shown by the accompanying sketch, the diameter of the screwed ends being the unit, whether the rods have plus or minus threads.

HENRY ADAMS.

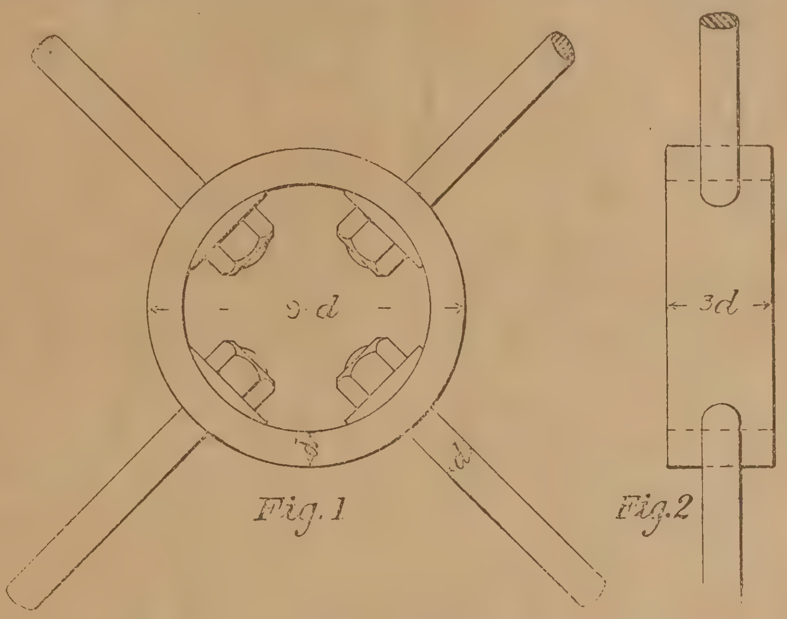


Fig. 1 Fig. 2

RINGS FOR BRACING RODS.

Damp Walls.

SUNDERLAND.—DAMP WALL writes: "We have work in hand which includes the repair of the interior wall of a small chapel which is very damp. Various remedies have been tried without effect. As the chapel is in a seaport town we think that salt sand may have been used and that this is the cause of the trouble. Kindly give your opinion. The wall in question is a hollow 14in. one, in two leaves of 4½in. and a 5in. cavity. It is plastered on the inside, and a flue runs up the centre. Would a couple of windows in the gable form any improvement?"

In all probability the dampness is due to the use of either salt sand or salt water, and if so the wall will have to come down. This would be cheaper in the end than to continue trying ineffectual remedies. If the moisture were on the surface only and due to condensation, that being due to insufficient ventilation, the proposed windows might effect a cure, but this hardly seems to be the case. To sacrifice a little more space and build up another 4½in. leaf inside the wall would be more likely to succeed.

G. A. T. M.

Action of Lime on Iron.

LONDON.—F. C. E. writes: "What is the action of ordinary lime mortar when in contact with structural steelwork (say, when brick in lime mortar is bonded into the steel stanchions of the steel framing now so generally used); and is cement-mortar or fireclay better for the steel? A certain amount of moisture is bound in most cases to find its way through the clothing of brickwork."

The corrosion of iron in its several varieties appears to depend chiefly upon the amount of moisture which reaches it in the presence of air. The comparative liability to oxidation of iron in moist air, according to Mallet, is cast-iron 100, wrought-iron 129, steel 133. Cast-iron rusts with comparative slowness, and the rust is generally in a state of fine division. In the writer's experience mild steel rusts very much like cast-iron, while wrought-iron rusts more rapidly and comes away in large flakes and slabs sometimes exceeding a sq. ft. in area and ¼in. thick. The thickness of a slab of rust does not represent the thickness lost by the original plate, as it is greatly augmented by the oxygen and moisture which have entered into combination with the iron. Chemically the rust is a "hydrated sesquioxide of iron." Lime does not enter into direct combination with iron, but it may be the medium for conveying air and moisture to it; hence iron in contact with damp brickwork in mortar rusts readily, although the Sheffield grinders use lime-water in which to dip their bright articles to prevent them from rusting. Portland cement wash is a protector of iron from rust, and brickwork in cement would permit less moisture to reach structural ironwork than brickwork in mortar, and is therefore to be preferred. In the writer's new pamphlet on designing built-up steel stanchions a quotation from an American work says: "For exterior walls nothing has been found to so perfectly protect the steel embedded in them as first-class hard-burned brick laid in cement-mortar, and this is also the best protection against corrosion."

HENRY ADAMS.

Acquiring a Knowledge of Architectural Detail.

LONDON, W.C.—CONSTANT READER writes: "Having served my articles for three years in a London office and found it of no practical use, would you kindly suggest the most expeditious and best method of acquiring a working knowledge of details? I find the Association expensive."

To acquire a knowledge of architectural detail there is nothing to compare with the conscientious study of old buildings, making measured drawings to scale on the spot. It is necessarily expensive, as it involves a good deal of travelling, unless the student happens to have friends in architecturally good localities; and it takes up a great deal of time. To obtain the greatest possible benefit from such work, two or more students should club together, and they should have an older and more experienced man with them for at least part of the time. If by detail, however, structural detail is referred to, the best course to adopt is to act, for a year or so as clerk of works upon some building which is not of too simple a description—if any architect can be found who would trust so young a student with so responsible a position. Other methods of acquiring the desired knowledge may be more expeditious, but none are better than those above mentioned. G. A. T. M.

Strength of Iron and Steel.

London, W.—Roof writes: "Can you tell me the S.W. and B.W. of wrought-iron (in rods, struts, &c.), say, per square inch sectional area for tensional, compressional and sheering stresses?"

The strength of wrought-iron, mild and cast steel, and cast-iron for structural work is given in tons per sq. in. by the following table:—

	Breaking Strain.	Safe Load.
	Tons.	Tons.
Wrought-Iron:		
Tension - - -	22	5
Compression - -	18	4
Shearing - - -	20	4
Mild Steel:		
Tension - - -	30	7½
Compression - -	25	6
Shearing - - -	25	5
Cast Steel:		
Tension - - -	35	8
Compression - -	50	12
Cast-Iron:		
Tension - - -	7	1½
Compression - -	42	7½
Shearing - - -	14	2½

The tensile strength assumes sound welding and proper proportioning of eyes, &c. The compressive strength assumes that the specimen is so short as to be unable to bend; the actual allowance must be proportioned by Gordon's formula, the figures given being the value of *f* in the formula. The shearing strength assumes that the parts causing the shear stress are so close to each other that no transverse stress by leverage is caused at the same time. An indifferent weld may cause the loss of 25 per cent. of strength, and for this reason 5 tons per sq. in. is the maximum tension that should be put on a wrought-iron rod; some authorities limit it even to 4 tons per sq. in., while others, assuming sound welds, allow as much as 7½ tons per sq. in. for roof-work in wrought-iron.

HENRY ADAMS.

Glaze on Tiles.

London, E.C.—W. R. & Co. write: "One of our correspondents in China, who is a regular subscriber to your journal, has written asking whether we know of any glaze that can be applied dissolved on a cement floor tile—one which is transparent and will stand hot and cold water. Our correspondents are makers of floor tiles of cement and sand which are not glazed, but are either of one or more colours on one plate of about 8in. square, and it appears that for wainscotting or fireplaces these tiles are preferred glazed."

Detailed particulars respecting various recipes for "frits" and glazes suitable for dipping porcelain, ceramic, and other ware will be found in "Workshop Receipts," edited by Ernest Spon and published by E. & F. N. Spon, Ltd., 125, Strand, London, price 5s. T. E. C.

Connections with Town Sewers.

Eccles—O. E. writes: "A. recently purchased the house and land edged red on enclosed plan (not reproduced) and desires to take down the present buildings and erect about twenty cottages on the ground, including the formation of a new street running from east to west from B.'s gateway. There is no connection from A.'s land to the town sewer; the occupant of the house, &c., uses all sewerage upon the land. The council have recently constructed a deep sewer south of this land, but B.'s land intervenes, and he is unwilling to grant an easement to A. The borough engineer demands that being within 100yds. of the town sewer A. must connect his drains therewith, stipulating for a 12in. sewer. Is not the town council responsible to provide a suitable outfall for A. free of cost?"

The town council have apparently done all that may reasonably be expected as regards the provision of public sewers. A. should endeavour to come to terms with B. so that he may connect with the public sewer. Perhaps A. might purchase a strip of land from B., and thus solve the difficulty. T. E. C.

Masters and Men.

The Builders' Labourers' Strike at West Hartlepool.—On July 29th the West Hartlepool magistrates were occupied the whole afternoon in hearing cases of alleged intimidation of workmen, the outcome of the builders' labourers' strike, which has now lasted twelve or thirteen weeks. John Duffy, Anthony Hanlon and Matthew Scanlon were committed for trial.

Masons' Strike at Llandudno.—A strike of masons engaged at the Grand Hotel, the Forester's Convalescent Home, and other places at Llandudno has resulted in a total stoppage of work. The "banker" masons object to their work being undertaken by "wallers." The quarrel has nothing to do with the master-builders, who look helplessly on this civil war in the rank of their employees. About 250 men are affected.

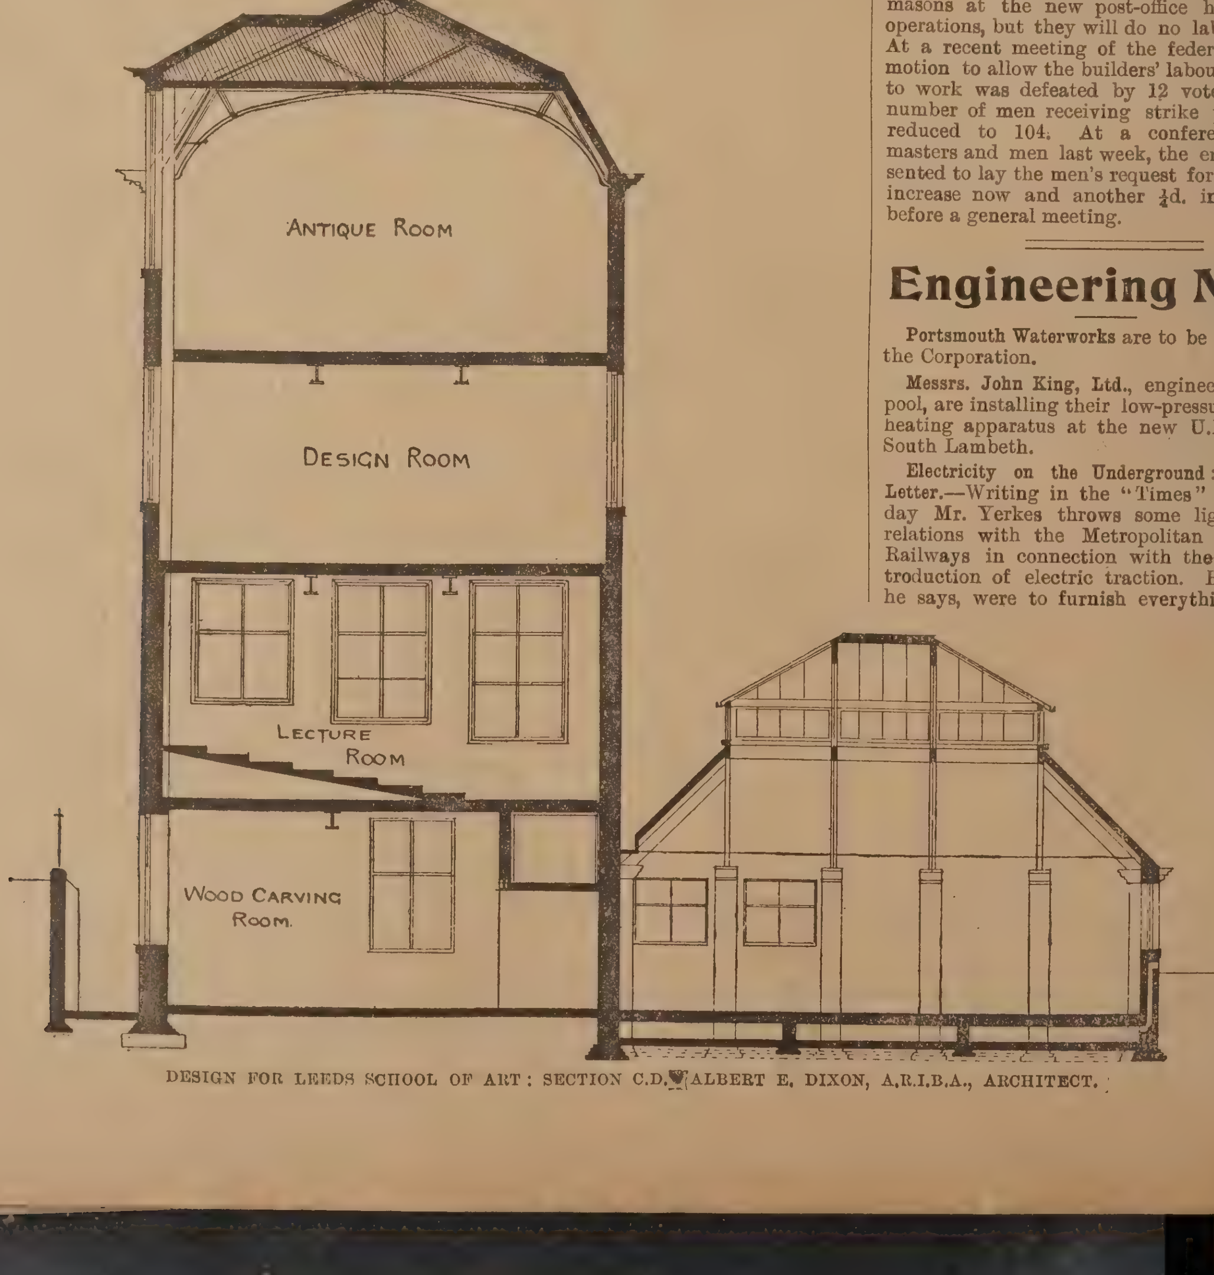
Swansea Builders' Labourers Still Out.—The Swansea builders' labourers have now been out on strike just over three months. Apparently there is little change in the position, except that there is a growing feeling of dissatisfaction among members of the federated trades, notably the joiners, who have been in enforced idleness since the second week of the strike. All, however, are well supported by their unions. The masons at the new post-office have resumed operations, but they will do no labourers' work. At a recent meeting of the federated trades a motion to allow the builders' labourers to return to work was defeated by 12 votes to 6. The number of men receiving strike pay has been reduced to 104. At a conference between masters and men last week, the employers consented to lay the men's request for ¼d. per hour increase now and another ¼d. in six months before a general meeting.

Engineering Notes.

Portsmouth Waterworks are to be purchased by the Corporation.

Messrs. John King, Ltd., engineers, of Liverpool, are installing their low-pressure hot water heating apparatus at the new U.M.F. Church, South Lambeth.

Electricity on the Underground: Mr. Yerkes' Letter.—Writing in the "Times" last Wednesday Mr. Yerkes throws some light upon his relations with the Metropolitan and District Railways in connection with the proposed introduction of electric traction. His proposals, he says, were to furnish everything necessary



DESIGN FOR LEEDS SCHOOL OF ART: SECTION C.D. ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

to change and operate their road by electricity, charging the sum of three farthings for each passenger they might carry; also guaranteeing a nett yearly revenue sufficient to pay the whole of its debenture and other fixed charges, and its guaranteed and preference interest. That tender having been rejected, Mr. Yerkes says it is the desire of the managers of the Metropolitan District Electric Traction Company to proceed to carry into effect at the earliest possible moment the electrification of the District Railway.

THE FUTURE OF ARCHITECTURAL CERAMICS.

IT would be childish to seek to hide (says a writer in "La Ceramique") that the employment of ceramics in architecture is making no progress. On the contrary, its application has for years past become less and less.

In the International Exhibitions of 1878 and 1889 ceramics entered in a certain measure into the construction of the buildings, the outcome of which in each instance was an enthusiasm for the polychromatic decoration of buildings, but which, it must be kept in mind, did not extend beyond a somewhat limited circle. This, however, was sufficient to give a rather artificial life to the manufacture of architectural ceramics. In the 1900 Exhibition, apart from the stoneware frieze from Sevres, which was a triumph for our national pottery, ceramics shone by their absence in the Exhibition Palace and were replaced by coloured plaster.

We might easily console ourselves for this absence if ceramics found any compensation in private buildings, but there is no such luck; and, apart from certain green glazed bricks which are at present in vogue, ceramics are more and more neglected by the architect.

In the provinces, with the exception of those districts where the absence of stone compels the use of brick, ceramic ornamentation makes no progress. The consumption of plain or moulded bricks and tiles is continually on the increase, but, apart from a few villas in the Renaissance or Moorish style, the conspicuous use of ceramics does not thrive, and it remains almost everywhere excluded from public buildings.

Do not let us imagine that this stagnation is confined to France. We do not know the exact position of affairs in all civilised countries: there may be a few exceptions, although we have never heard them mentioned; but this one thing is certain, that in the country where the manufacture of modelled bricks has been pushed most—in Germany—there has been for years past a marked falling off in the use of these bricks.

This unfortunate state of affairs has already preoccupied certain individuals who, by reason of their position, are better informed than the general public. It is the result of this preoccupation that has led M. Metz, chairman of the French Ceramic and Lime-burners' Union, to promote a competition amongst architects, giving a rather handsome prize for the best scheme of entirely ceramic construction. By this initiative the chairman of the Union hopes to attract the attention of architects to ceramic decoration.

We trust that the effort of M. Metz and the ceramists associated with him may be crowned with success, but we cannot avoid being a little sceptical. Frankly, it is a mistake to think that the entire blame for the present state of things is due to the architect. Doubtless the official teaching of the art school is decidedly disdainful with respect to ceramics, and it is against that tendency that the competition in question will fight, and fight successfully we hope. But there are other reasons for the present situation. We believe that the discovery and examination of these causes will elucidate the question, and put us, maybe, on the track of other remedies.

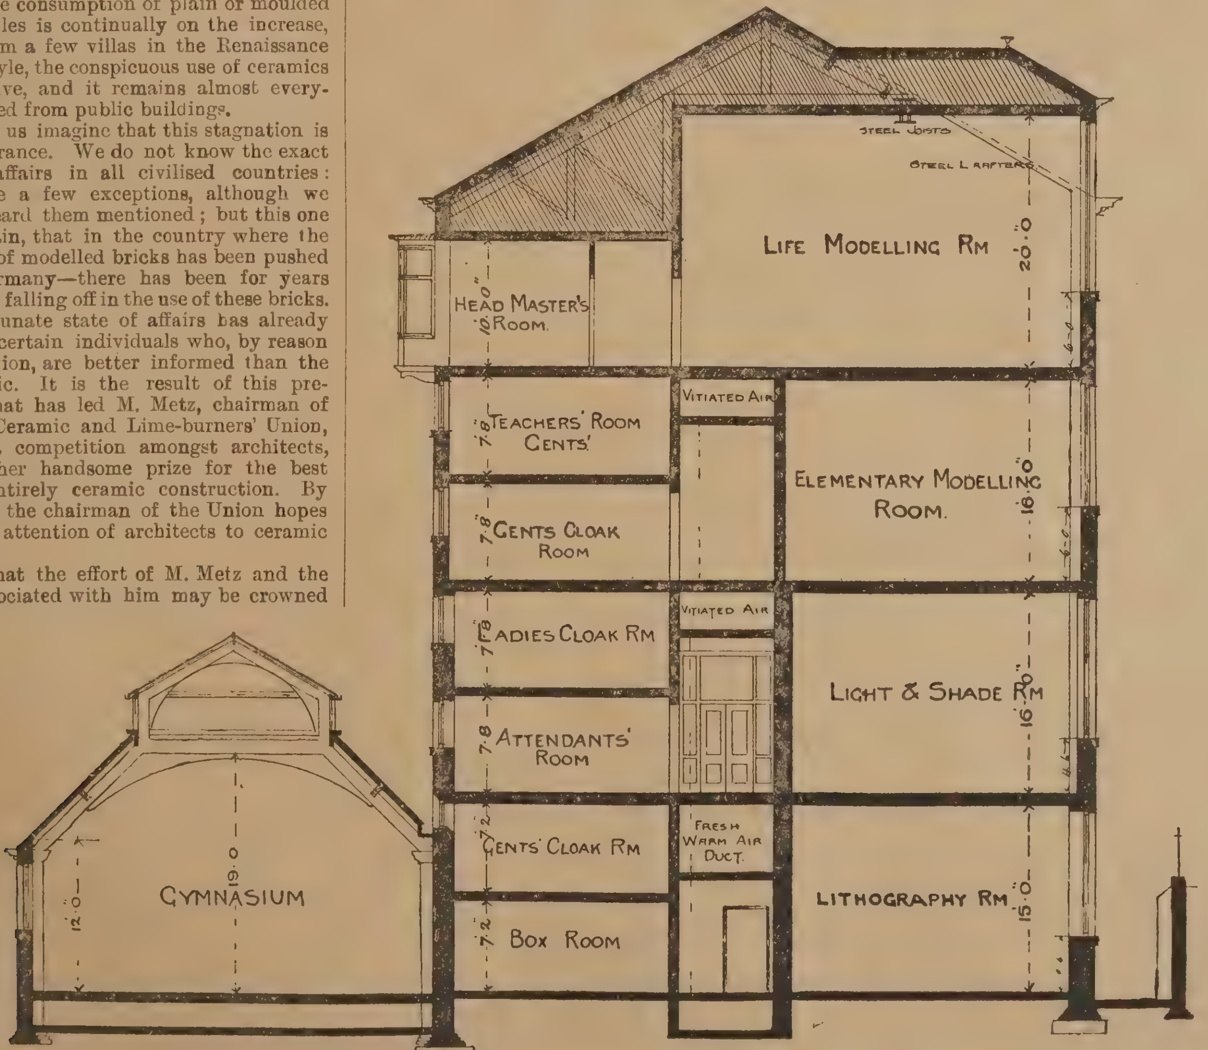
First of all, from the architect's point of view, it is certain that the employment of ceramic decoration offers less facilities than stone or cement fronts. As a matter of fact, before commencing a building it is necessary that all its ornamental details shall be definitely settled, if they are to be carried out in ceramics. On the contrary, with stone, carved on the job, the ornamentation is not commenced till the bulk of the work is finished. The architect's task is simplified, and he finds it possible to judge on the spot the effect of mouldings and ornament, instead of being obliged to decide irrevocably upon them on paper in his office.

It will undoubtedly be very difficult to remove an inconvenience which has already turned many architects against the use of ceramic materials. The clayworkers, in our opinion, started on a wrong track, when they plunged into polychromatic decoration, in adopting startling colours and brilliant enamels. They have been seduced by the architecture of the Moors and the Persians, whose work was destined to be seen in clear sunshine. Furthermore, the taste of the present day inclines to half-tones, and the juxtaposition of slightly differing colours is preferred to violent contrasts. The vitreous glitter of enamels gives a fanciful character which may be suitable for some buildings, but which is disturbing where the style ought to be of a more elevated order. We cannot believe that with the present red, yellow or black terracottas, or the glassy green or blue faïence, we shall ever succeed in bringing about a serious adoption of polychromatic decoration. It therefore behoves clayworkers to themselves seek and find the remedy, and to place in the hands of the architect products more conformable to the artistic aspirations of our times. In this order of ideas, the new Sevres fresco points out one suitable line to take up.

Regarding ornamental bricks more especially, it is certain that their restricted use is due in part to their too deep colour, but we may further observe that many of these bricks are too porous, and their original tint is modified and turned to grey in consequence of the dust which penetrates their pores and which can never again be removed. The two foregoing reproaches do not apply to ornamental bricks of German manufacture, which, after being in favour for twenty years, are now more and more neglected. We think we may seek the reason of this abandonment in another defect of ornamental terra-cotta bricks, the small uniform dimensions of the bricks, and the necessity for a large number of joints.

The small dimensions of terra-cotta employed in building is one of the reasons of its preference over stone in a number of cases, but this advantage often becomes a fault when we are concerned with the facades. The little chequering may suit unimportant buildings, but appears out of scale when it concerns large buildings. It is quite sufficient to see in Germany certain streets entirely constructed in ornamental bricks all of the same size to understand that it is the monotony, the dead uniformity and the desire of seeing plain surfaces more reposeful to the eye which is the cause of the abandonment we speak of.

Such are the principal criticisms we have to pass upon the use of terra-cotta bricks or blocks in matching patterns. It will be noted that they are addressed, at all events, as much to clayworkers as to architects, and that it will only be by the efforts of all concerned that we shall succeed in making ceramic products take their due position amongst decorative and constructive materials.



DESIGN FOR LEEDS SCHOOL OF ART: SECTION A.B. ALBERT E. DIXON, A.R.I.B.A., ARCHITECT.

Bricks and Mortar.

APHORISM FOR THE WEEK.

Better far
Pursue a frivolous trade by serious means,
Than a sublime art frivolously.
MRS. BROWNING.

Our Plates. IN a recent limited competition the design for Leeds School of Art by Mr. Albert E. Dixon, A.R.I.B.A., 5, Park Lane, Leeds, was placed second by the assessor, Mr. Bidlake, of Birmingham. In designing a school of art the lighting of the different classrooms is a very important matter. A north light is considered the best, but if this is not obtainable an east light would be the next best. Special attention has to be given to the life-rooms, the antique, painting, light and shade rooms; all cross-lighting being avoided by the use of very large windows on one side only. The rooms should also be lofty, especially those used for drawing from the antique and the life. Where more than one window is required in these rooms, screens would be necessary to prevent cross-lights. It was proposed to carry out the design in red-pressed brick, with stone and red rubber brick dressings, Westmorland slate roofs, fireproof corridors, &c. Steel joists appear to be a necessity for the window heads. The estimated cost was £9,000, not including the gymnasium. This necessitated elevations of a plain and simple character.

Michael Angelo's House. LITTLE by little, as in all other modern cities, Rome is changing, and precious landmarks are disappearing, in many cases against the will of the inhabitants. At present it is the house of Michael Angelo which is in question. The monument to Victor Emmanuel is now proceeding apace, and with it the consequent widening of the Corso, and in the way of this stands the historic house. The last twenty years—and among the most interesting—of the illustrious artist were spent here, as it was during that period that his charming friendship with the poetess Vittoria Colonna took place; it was here he wrote the sonnets whose inspiration she was, and here that he made his last designs. On a cold day in February, 1561, he died an old man, and was taken to the Church of the SS. Apostoli, not far off, which stands next the Colonna Palace. In the church is still to be seen the statue of Michael Angelo on the tomb where it was intended to lay him. Modern criticism declares that it was not intended for him, but the features certainly answer to what we know, even to the nose broken by Torrigiano, before he went to pursue his heated career in England. The house was for long reverenced for its associations, but was eventually lost sight of, and only unearthed, so to speak, in 1866, to be later marked by a commemorative tablet. It is a pity that so authentic a relic should disappear.

"Art Nouveau" Furniture. A SHORT time ago, Mr. John Belcher, Mr. Reginald Blomfield, Mr. Mervin Macartney and Mr. Edward S. Prior protested in the "Times" against the South Kensington authorities for having introduced into the Museum specimens of the work styled "l'Art Nouveau." "This work," they argue, "is neither right in principle nor does it evince a proper regard for the material employed. As cabinetmaker's work it is badly executed. It represents only a trick of design which, developed from debased forms, has prejudicially affected the designs of furniture and buildings in neighbouring countries. In its present position it is in danger of being looked upon as a recognised model which has received the approval of the authorities for study by students and designers, and the harm it may thus produce on our national art cannot be easily gauged." The writer of the "Art Notes" in the "Morning Leader" does not, however, accept this view. He asks: "Is nothing to be exhibited in the Museum at South Kensington but what may be studied and emulated by students as a model of good taste? Are all works of merely historical interest to be excluded? If so, not a few objects, old and new, will have to be weeded out, along with those 'specimens of the work styled "l'Art Nouveau,"' about which the signatories to the letter are so vastly exercised. But there is another point—namely, is not their letter, in one respect at least, somewhat misleading? The mere outsider knowing nothing of the mysteries of art will run away with the notion that this objectionable innovation is an epidemic of Gallic origin, which, after having gradually insinuated its baneful influence into all the capitals of Europe, is now making its way into this country to infect the art of England. But is not the exact contrary, as a matter of fact, much nearer the truth? . . . .

A Sidelight from Italy. "HAD the signatories to the letter in question been recently at Bologna they might have discovered a school of design which has lately sprung up there, and is flourishing exceedingly, thanks to the liberality of a local patron. The vast Gothic church of San Francesco, long a military magazine, is in the course of being redecorated by this new school, and anyone who will take the trouble of looking at it will see at a glance that their art is only a vigorous Italian phase of 'l'Art Nouveau.' It is true that their wares are submitted to the public under the title of 'l'Arte Emilia'; but at a certain factory where many of their designs are employed I know as a fact that this particular way of designing is frankly called 'stilo Inglese,' and the great source of its inspiration unblushingly confessed to be the 'Studio Magazine.' . . . If, however, we are to probe the epidemic to its origin, we must go back to the early exhibitions of the 'Arts and Crafts,' of which society the four signatories of the letter in question were already members in 1890, if not earlier. At the exhibitions of the 'Arts and Crafts' was first publicly enunciated the grand principle underlying 'l'Art Nouveau,' namely, that all sorts of artistic problems which hitherto had been held to depend on architectonical principles and difficult considerations of form, proportion, propriety, or what not, were really capable of a most easy solution in the simple application of the 'pattern.' . . . . In this grand principle coupled with the formula of the 'swirl and a blob' lie all the mysteries of 'l'Art Nouveau.' . . . ."

"Pattern" Architecture. "A YOUNG designer at Munich, and an exhibitor at the 'Arts and Crafts,' was the first, I believe, to solve the difficult problems of architecture by the application of the 'pattern'; and there is a house at Munich by him whose street-front is one vast 'swirl and a blob.' In course of time the 'pattern' was naturally applied to furniture, with the result that all recognised forms and methods of construction were cast aside as obsolete; and thus were produced those specimens of the work styled 'l'Art Nouveau,' against which the signatories of the letter write to protest. Well, I am bound to agree with them that these specimens are 'neither right in principle, nor do they evince a proper regard for the material employed.' On the other hand, the best Parisian work of the kind possesses an 'esprit' and 'allure' which its English original was far from possessing. Much of the work exhibited at the 'Arts and Crafts' was equally wrong in taste and infinitely duller."

About Lincoln's Inn Fields. OF all the districts affected by the Holborn-Strand improvement, which has moved with giant's strides during the past few months, no one corner is so rich in memories as Lincoln's Inn Fields. Inigo Jones, by royal command, drew out a ground plan for the improvement of the Fields. It has often been stated that he reduced them to the exact proportions of the Great Pyramid, but this is not so, for, as many modern writers have pointed out, the square only contains 12 acres, while the Pyramid occupies 13½ acres. The square finished, Inigo turned his attention to the buildings which were to surround it, but, unfortunately, he only lived to carry out the west side, or, as it was at first called, the Arch Row. The laying-out of the Fields into walks does not seem to have had the immediate result of reducing the number of vagabonds who haunted them, and a new terror in the shape of the enterprising builder appear to have been imported. In Cromwell's time th building epidemic so seriously threatened th Fields that, upon receiving a petition settin forth that "divers persons have prepared ver great store of bricks for erecting buildings o the said square," the Lord Protector ordere that there should be a stay of all further building on the threatened ground. It would be im possible to enumerate here all the great men an women who from time to time have lived i Lincoln's Inn Fields. The famous Duchess o Marlborough, Lord Chancellor Cowper, Lor Chancellor Harcourt, William Pitt and the Ear of Lindsay are but a few. For Robert Bertie Earl of Lindsay, who was general of James I.' army, Inigo Jones designed the fine Ionic hous in the centre of Arch Row. This may still b seen, altered but little from its original appearance; it is now known as Nos. 59 and 60. Th house which adjoins it on the southern side i particularly dear to the heart of every lover o Dickens, for it was the scene of a memorabl event in the novelist's life, and it also figure prominently in "Bleak House." Both thes houses will share the common fate of demolitio when work is begun on the great new street.

Modern British Sculptors. SPEAKING of the Memorial the "Daily Chronicle" says "Mr. Brock is seldom inspired in his work, and he has now to prove whether in his colossal statue of the Queen he can retain the qualities that made the bust in this year' Academy seem so promising. But if Mr. Brock cannot carry through the scheme, there is probably no one but Mr. Gilbert who could. Mr. Onslow Ford's monument for Manchester, shown in the Academy, is anything but a success; Mr. Frampton's, now at Glasgow, has even less of dignity. Among the younger men, to whom could one turn? The young Scotch sculptor who modelled the statue of King Edward VII. —the first raised anywhere in his honour— standing under the dome of the Industrial Hall in the Glasgow Exhibition does not rouse much confidence in untried genius. If the artists do not exist, it makes small difference whether or no there is a minister of fine art or a society for its encouragement to make opportunities for them."

Dr. Peters in Zambesia. FOR the last two years Dr. Carl Peters has been exploring the country between Zambesi and Sabi, and he has been able to ascertain that all the ancient ruins along the eastern border of Mashonaland apparently belong to the same class of civilisation. Along the banks of the Mazoe and Ruenya, on the high plateaux of Inyanga and Melsetter, in Manicaland, and in the neighbourhood of the Sabi river, he has everywhere found the same type of ruins. Over the whole district the cyclopean wall is the typical form of house-building, and in some parts whole cities of these buildings are lying open to the eye of the astonished explorer. During his last expedition he had a chance to get access to some newly-discovered bushmen-paintings, which are in form and in colour of an absolutely Egyptian character. It is also known that etymologists have found in the Hottentot language traces of the ancient Egyptian. These all are very remarkable facts, which seem to contradict the Semitic-Sabæan theory of ancient South African civilisation. Dr. Peters has now brought home with him a female figure 4¾in. long which is undoubtedly Egyptian. He considers it to be about 5,000 years old and a representation of the goddess Isis. It proves direct Egyptian influence in South Africa.

The Sculptor James Vibert is hard at work on a statue to the memory of Eugène Manuel, the poet. When finished it will be erected at Passy, where the author of the "Ouvriers" resided for a long time.

The Fortifications of Paris: Site to be Sold for Building Purposes.—The Paris municipality having been unable to agree with the State for the purchase of the site of the fortifications, the State is now likely to sell it by instalments for building land, the municipality undertaking the expense of roads. Thus vanishes the scheme of a belt of parks round Paris.

A NEW CHURCH AT SPARKBROOK.

THE new church of St. Agatha at Sparkbrook, Birmingham, was dedicated recently. The edifice has been built by the Birmingham Churches' Fund in fulfilment of a scheme having for its prime object the removal of church accommodation from the centre of the city, where it seemed no longer required, into those outlying districts to which of late years people have flocked in ever-increasing numbers. St. Agatha's Church has cost £15,000, and this amount will be paid out of the proceeds of the sale of Christ Church, which was for so many years a well-known landmark in the centre of the city. The original foundation-stone of the old church has been built into the base of the tower of the new structure; and among other things taken to Sparkbrook from New Street are the font and communion table; the single bell, bearing the inscription "John Rudhall, Glocester, Fect. 1813"; and a quantity of the mahogany panelling of the old pews of Christ Church, which has been used in the new baptistery and in the clergy vestry. The church occupies a site adjoining the Board schools in the Stratford Road, and has been erected from the designs of Mr. W. H. Bidlake, and under his superintendence. It is a building of lofty proportions and massive walls, in the Late Decorated Gothic style, with an original interpretation of traditional forms; and accommodation is afforded for more than 1,000 worshippers. The materials employed are buff brick facing within, and red and blue brick without, with Hollington stone and Bath stone dressings. The roofs are covered with grey-green Whitland Abbey slates. Much of the eastern part of the church is hidden by surrounding buildings, but this is compensated for by an imposing west front and lofty tower facing the Stratford Road. The tower is 120ft. high to the top of the parapet, and is surmounted by a flèche rising 40ft. higher. It is constructed to house eventually a peal of eight bells, and the large belfry lights in the upper part of the tower form an important feature in the design. The gilt skeleton dials of a clock adorn the north and south sides of the tower. Below the belfry is the ringing stage, lighted by coupled windows in each face. From the base of the tower projects a semi-octagonal baptistery, over which is the west window, which is in turn surmounted by elaborate sculpture in canopied niches representing Christ in majesty supported by the angels of Justice and Pity and surrounded by angels. On the north and south sides of the tower, and forming with it a symmetrical facade, are lofty porches, whose tympana are filled with sculpture illustrative of the martyrdom of St. Agatha; while the arch mouldings are decorated with cherubs' heads. The interior consists of a nave 120ft. long and 29ft. wide, separated from wide aisles by arcades of Hollington stone arches. Projecting shafts rise between the arches, and, terminating at the cornice level in corbels of leaf sculpture, carry transverse timber arches supporting the timber ceiling, which is partly decorated in colour. The clearstory, and indeed the church generally, is lighted by elaborate traceried windows, nearly every window being of different design. The chancel is also terminated with an elaborate traceried window, which it is hoped may be filled with painted glass. The chancel is separated by arcades from a choir transept, over which is the organ chamber on the north side, and from an ambulatory which communicates with the vestries on the south. The choir seating is of fumigated oak, that of the nave being of sequoia wood. The pulpit, also of fumigated oak set on a stone base, is the gift of Mr. A. M. Chance. The builders were Messrs. John Bowen & Sons.

Christ's Hospital Bill was read a third time in the House of Commons last week.

Permanent Council Chamber and Offices of the Monmouthshire County Council.—The foundation-stone of this building (in Pentonville, Newport) was laid recently. Mr. W. Tanner, the county surveyor, is the architect, and Messrs. D. Richards, Ltd., of Newport, are the builders. The contract price is £8,470.

THE PRACTICE OF STACK BUILDING AND BOILER SETTING.—I.

By JOHN G. DUNN (Instructor in Building Construction).

ALTHOUGH it may be said that this is more a subject for the engineer than for the architect, yet how frequently has the latter (especially in planning factory buildings) to provide a chimney stack and boilers. Stack building might be classed with the French system of bridge building, which demands the co-operation of engineer and architect.

In our public works, factories, &c., the chief requirements are a good supply of steam and the carrying away of all obnoxious gases, and it is therefore essential that they have quick-heating boilers and a good chimney stack.

In our own district we are best acquainted with Tennant's stack at Port Dundas, Glasgow (453ft. high) and the Townsend stack (460ft. high).

Much may be said about forced draughts. Some say the day is not far distant when there will be no need for tall chimneys. So far as my experience goes, we have not yet got a forced-draught system, which can be worked cheaper and do the work of a chimney stack. To solve the problem I think we must take into account the diffusion of the gases as well as the creation of draught, or, in other words, we must either have a tall chimney or else a means of purifying the gases as they leave a short stack, for although we may provide means for burning the smoke we must remember that it is not possible to consume every atom in a piece of the coal commonly used for raising steam in works. Tall stacks are at least needed in such places as chemical works to carry the gases to a reasonable height.

As a rule chimney stacks are built of brickwork. We have examples in stone, but not many, and only when the stones have been cut practically like large bricks and are able to resist the disintegrating powers of the gases have they proved very satisfactory.

Common working stacks (say in steelworks, where there is a stack for each melting furnace or for every pair) are often constructed of steel or iron plates bolted together and the whole held in position by tension rods fixed to surrounding bases. When any of these rods become cut they are apt to cause the stack to overturn, but this danger is much minimised now by fixing the stack bottom with bolts to a very wide base. Stacks of this kind should be lined inside with firebricks.

There are three requisites to a chimney: (1) Efficient draught; (2) stability; and (3) a satisfactory architectural appearance on elevation.

We shall consider chiefly the stability. It is not always easy to retain the perpendicular in these great shafts. One of the chief causes for their going off the plumb is insufficient foundation, or starting to build without ascertaining the nature of the underlying rock stratum, and so causing unequal settlement; with having one-half of the foundation on a compressible soil and the other on an incompressible, or less compressible, soil. In one instance within my knowledge a stalk about 80ft. high had to be erected at a colliery, and, without even examining the foundation, the builder started with regular footings. All went well until the stack was about 50ft. high, and then it was noticed to be leaving the plumb, becoming worse each day. The contractor, who was also the builder, wanted to stop and rebuild, but the company offered to pay for all damages if he would still try to complete the stack. He accepted the risk, and was building the stack hanging on one side and battering the other. The stack was completed and only the tackling needed to be taken down, but when on the next morning they went to clear everything the stack was lying in the adjoining field. On examining the foundation it was found that at a good depth and along one edge of the foundation there was a large drain. While the stack was taking its bearings this side settled more than the other!

In another instance of a stack leaving the perpendicular, the concrete foundation was put in as usual, excepting one part. This was filled in with bricks and mortar (in the absence of inspection) because the cement was finished. Owing to unequal settlement the stack left the plumb when 110ft. high. The soil was of a very sandy nature.

Still another cause of stacks leaving the plumb is the prevalence of the wind in one direction while the stack is in course of erection, or perhaps a fierce gale which arises before the work has actually set, even though the actual building is completed. Another cause is the cutting of portholes at the bottom after the stack has taken its bearings. I have known this to be done without the consequent results being considered at all. Still another cause of stacks leaving the perpendicular is allowing courses of brick to pitch or be built off the level.

There are many ways of bringing stacks, church spires, &c., back to the plumb, the most common (and in my opinion the best) being to saw the horizontal joints on the round on bulging side, thus bringing back the weight; or some of the bricks may be cut out and pinned up again (a very dangerous operation). Too much care cannot be given to the foundations. The same rules apply to these as to other buildings, except that the nature of the foundation should be considered for a greater depth, owing to the very great weight concentrated on a small area. A stack in a mining district should be as far as convenient from the pit shaft in order to avoid the vibrations caused by the winding engines. Even though the foundation is of the best character, I would advocate the use of an artificial conglomerate such as Portland cement-concrete to ensure against crushing at any one point, and also to give a proper level bearing to the stack (rock strata often lie at an angle to the surface level). Much has been, and may be, said about the width of concrete foundations for any given stack. This should always be determined after the nature of the foundation has been ascertained, but a foundation of concrete is not too wide provided it does not exceed the body of the concrete—that is, do not have concrete so wide that, considering its thickness, it will fracture round the line of crush.

A grillage of steel beams on iron tiers may be bedded in the concrete foundation to add to the tensile strength, especially in treacherous soil. The pressure on a concrete foundation shall not exceed 22 cwts. per sq. ft. If the angle of 60 degs. beyond the face of the wall is exceeded the concrete must be thickened accordingly.

This crushing is greatly remedied by footings, which are of the greatest importance. They also act (especially in isolated structures standing on small bases) against the danger of the work being forced out of the perpendicular by the wind. Footings should project at least the thickness of wall beyond the face of the work and be set off in regular offsets of $2\frac{1}{4}$in. and not more than 3in. to avoid fracture of the bricks. Let us take the case of a chimney stack 100ft. high standing on a base 10ft. square and exposed to heavy gales. The compression of the ground to leeward to the extent of 0·025ft. would be sufficient to cause the top of the stack to overhang 6in. If, however, we increase the base to 20ft. square we not only double the leverage with which the foundation resists the force of the wind, but the bearing surface is quadrupled, so that the total resistance is eight times greater than in the first instance. It need scarcely be said that for footings to be efficient they must be securely bonded into the body of the work and be of sufficient strength to resist the violent cross-stress to which they are subjected. The lower the brick the greater the weight there is upon it, and the important matter to observe is that the back joints are as far from the face of the wall as possible. A good arrangement in foundations is to lace a few of the bottom courses together. Another rather special method is to introduce the inverted arch in the interior of the chimney. The plan of a circular shaft is like a kiln crown, that of a square one being ribbed. This is not a very common practice.

The thickness of the work in stacks needs also to be carefully considered. The common rule is to start from the top with 9in., adding

---

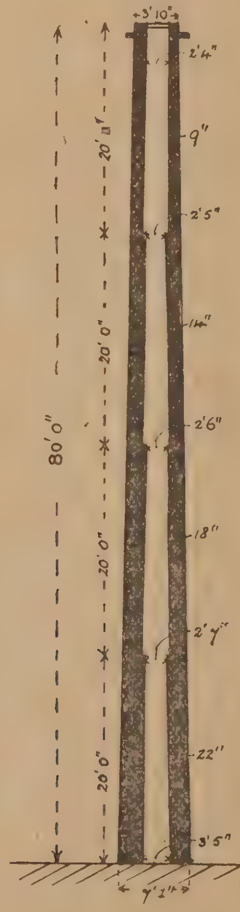
[*] A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

4½in. every 20ft. or 25ft. downwards, the width at the bottom being one-tenth the height for square stacks and one-twelfth for round ones. The common batter from bottom upwards is ¼in. per ft. I have been concerned with many stacks battering 3/16in. per ft., but prefer ¼in. or 1in. in a yard. I think the thickness of the work should never be less than 14in. at the top, especially if the stack exceeds 80ft. This gives a far stronger body of work to bond in a heavy or hanging head, and is not nearly so liable to get racked or rent up.

The amount of batter given to a stack chiefly concerns architectural taste, and although the engineer prefers a plain obelisk, he may secure this internally without affecting the draught to any perceptible extent and yet have a finely proportioned architectural column. A stack should not be ornamented at the expense of its stability, but it is preferable not to leave it entirely plain. This is one good reason for having 14in. work at the top instead of 9in.

Argument still persists as to whether a stack should diminish in sectional area inside, or whether it ought to be parallel (as wide at the top as at the bottom); or, again, whether a chimney should be even wider at the top than at the bottom. It does not fall under our consideration at present to determine what are the proper dimensions, especially as regards the internal area of a chimney-shaft, most suitable for a steam engine of any given horse-power or for burning a given quantity of coal per hour; but here is an example: The area of a chimney in inches for a low pressure steam engine when of more than 10 h.p. should be 112 times the h.p. of the engine divided by the square root of the height of the chimney in feet.

Example: Required the area of a chimney for an engine of 50 h.p., the height of the chimney being 80ft.



$$\frac{112 \times 50}{\sqrt{80}} = \frac{5600}{9} = 622 \text{ sq. in.} (\sqrt{622} = 25\text{in.}) \text{ sq.}$$

$$622 \times 1{\cdot}27 = 78994\ (\sqrt{78994})\ 2\text{ft. } 8\text{in. circular.}$$

This gives 2ft. 1in. for the side of a square stack and 2ft. 4in. for the diameter of a circular stack.

Adopting Tredgold's rule to Mr. Milne's data, it only requires the constant multiplier 112 to be substituted by 280 and the calculation in the above case will then be as follows: $\frac{50 \times 280}{\sqrt{80}} = \frac{14000}{9} = 1555$ sq. in. = 3ft. 3½in. for a square stack.

This just shows how engineers differ, but it will be interesting to notice the following example taken from the common rule—that of only considering the height and having one-tenth the height for a square stack and one-twelfth for a circular one:—

An engineer requires a circular stack of 2ft. 4in. least diameter. We shall begin at the top with 2ft. 4in. internal measurement and with 9in. walls, adding 4½in. every 20ft. downwards.

ft.	in.	
2	4	internal diameter.
0	10	batter.
3	2	
0	9	brick additional
2	5	diameter 20ft. down.
0	10	batter.
3	3	
0	9	brick additional.
2	6	diameter 40ft. down.
0	10	batter.
3	4	
0	9	brick additional.
2	7	diameter 60ft. down.
0	10	batter.
3	5	internal diameter at 80ft. down.

Add thickness of walls to diameter, namely, 3ft. 5in. + 1ft. 10in. + 1ft. 10in. = 7ft. 1in.

As one engineer rightly puts it, a chimney (disregarding cost) is never too large or too powerful provided it has efficient means for checking the draught by properly fitting dampers, or otherwise, whereby the supply of steam can be readily controlled at any moment, so as to work the engine at half its full power and using considerably less than half the power of draught of the chimney, thus having a surplus draught for emergencies. When the chimney is too small it is unable to create a sufficient draught through the furnace. A smoky flame is then produced, instead of a flame with little or no smoke. When the chimney is too small (as often happens) it becomes overworked, an undue pressure is brought to bear upon its sides, and this often leads to the chimney becoming cracked. Too much stress cannot be laid on the turning of the arches over the portholes at the bottom; semicircular or deep segmental arches are the most satisfactory, the centres being lowered a little by means of wedges and then drawn together, so that they may take the ever-increasing weight before the actual setting of the mortar. It is best to have, say, a round chimney on a square base. This allows properly constructed arches to flues to be provided at the bottom: otherwise you have circle on circle arches, which are not very satisfactory.

Much difference of opinion exists regarding the bond of chimneys. In the first place, I would say a round chimney is the best, as you never have so many bats or closers as in a square, octagonal or hexagonal stack. The bond varies as the sectional area of the stack decreases. This is a slight objection to octagonal and hexagonal and also square stacks (especially the first and second) especially if they are not circular inside. Although it is desirable to have as many headers as possible in the interior of a wall to resist direct crushing, yet in the case of chimneys it is possible to have too many headers. Chimney sides extend so short a distance that what is needed is a bond which will keep the sides from falling asunder. I have never yet known a case where the headers in a chimney were snapped and the work split for want of transverse bond; whereas I have seen much cross-splitting due to very little more than want of longitudinal bond (or we may call it half bond). Circular brick should be used for the whole of a circular stack. Hoop iron (tarred) is a great help to a chimney bond. It is placed vertically either in a longitudinal joint one brick deep or between two courses deep, and at vertical intervals of 6ft., 10ft. and 20ft. All stacks should be lined with firebrick from half-way or two-thirds up. Care should be taken to have an air-space between this lining and the outside brickwork. The lining being independent should have ties occasionally into the outer wall. Sometimes special firebrick blocks are used when the air-space exceeds 6in., but where the space is only 2in. or 4in. the common headers can be used quite well at intervals of from 3ft. to 6ft. In small chimneys (60ft. or 80ft. high) the common practice is to line them with 4½in. brickwork having a 2in. to 4in. cavity, but (and especially in large chimneys) I would advocate a 9in. lining and a cavity of not less than 6in. to 9in. When the stack exceeds 150ft. in height there should be a 14in. firebrick lining at the bottom reducing 4½in. every 50ft. Of course gases enter some stacks at a higher temperature than in others. For instance, as a rule a higher temperature (10,000 to 15,000 degs. F.) is given off in a gasworks, necessitating the use of thicker lining. This lining should be bonded in with the main wall at its end so as not to affect the draught. In order to ventilate the cavity and so keep the brickwork comparatively cool, ventilators are fixed in openings through the main wall. As a rule four regulating ventilators are provided at the bottom and the same number about 20ft. or 30ft. up. This causes a draught.

The mortar should be of the best quality; the bricks hard, durable and calculated to resist crushing, great care being taken to have them bedded properly, especially if they have deep frogs, otherwise they will frush at the edges. I think it is a great advantage for the last 20ft. or so to be built with cement mortar, using say, slaked shell lime for sand. This preserves the top against the disintegration of the atmosphere and stands heat well.

(*To be concluded.*)

NEW NURSES' HOME AT THE CLAYTON HOSPITAL, WAKEFIELD.

A NEW nurses' home is being erected at the eastern end of the Clayton Hospital at Wakefield. As the recent erection of a children's wing at the western end completed the hospital in that direction, so the new nurses' home will complete the other end. The newly added wing or nurses' home is being erected in direct communication with the hospital, and the receiving entrance for accidents, &c., instead of being at the end, as formerly, is situate at the front of the new building, which opens into a commodious receiving-room on the ground floor, in which also will be a dining-room, housemaids' pantry and a sitting-room for the accommodation of the staff. The new portion, like the old, is being erected with an eye to the comfort and convenience of a patient, tender-hearted, but much neglected class of servants, and no fewer than nineteen bedrooms are now being fitted up for the nurses' exclusive use, with box and linen rooms, &c., on each floor. The corridor and staircase are fireproof, and the walls of brickwork, pitch faced with Elland Edge stone, are made to match the older portion of the hospital, which since its erection has kept remarkably clean compared with some other buildings in the city. The old entrance has been carefully removed and fitted up again in the same style of architecture, that of Flemish Gothic. The drive in the front will eventually be altered to meet the altered conditions of the buildings. Messrs. Simpson & Richardson, architects, Southgate, are responsible for the design of the new portion, and the masonry work is being carried out by Messrs. W. Kitson & Sons, the carpentry and joinery by Mr. W. Judge, the plumbing by Mr. S. Atkinson, the plastering by Mr. C. Driver, the painting by Mr. T. Naylor, slating by Messrs. Pickles Bros. (Leeds), and the electric light installation and engineering by the Wakefield Electric and Engineering Company. The cost is estimated at a little over £3,000.

COLOGNE CATHEDRAL.

RHINELAND.

FROM the days of the Grand Tour and the old French wars downwards the mouth of the Rhine has formed, in a sense, one of the great river gates to the Continent. It was left to "Childe Harold" to glorify the upper Rhine reaches and set a fashion to a touring world; to Clarkson Stanfield, David Prout and their school to adorn in exquisite steel line never equalled the then romantic and almost remote beauties of Byron's "Pilgrimage." Later, as fashion changed, and facilities increased for visiting the uttermost ends of the earth, Rhineland ceased to be popular. To-day it is scarcely thought of as a touring ground. Yet one has only to read a little pamphlet on the little-known side valleys of the Rhine by Mr. Percy Lindley (30, Fleet Street, E.C.; free) to appreciate these charming by-ways.

Some of the little valleys have long been favourite German holiday haunts. Hence, the inns are sufficient, and, if unpretending, supply all wants of sensible travellers.

The tributary Rhine valleys between Cologne and Coblence, with the Ahr and the Moselle, and the volcanic Eifel district, might well be called the German Ardennes. Some are quite as quickly and cheaply reached, and are as yet unspotted of the "personally conducted" holiday world. Beyond Coblence are the Lahn Valley and Taunus Mountains, and the Nahr Valley, which can be visited *en route* to Metz and the Battle Fields, and to the Vosges—the Blue Alsatian Mountains. Beyond Mayence is the charming Odenwald district, which can be taken from the Lahn and Taunus *en route* to the Neckar Valley and Heidelberg, and thence on to Strassburg and the Vosges. All or part of this Rhineland holiday opens up a prospect of mountains and valleys, woods and rivers, and old German towns and cities, with their antiquities and art treasures, as handy and bright headquarters. And on the homeward track there are Brussels and Antwerp.

The journey is easy. At Liverpool Street you catch the boat train to Harwich. Once there alongside the quay, you walk direct to the train.

Going through direct from the Hook or Rotterdam, Cologne is reached soon after noon. The traveller staying overnight at Rotterdam, Dort or Nymegen can catch this train the following morning. From Dort it is sixty-five miles by rail to Nymegen. You first see the town from the rail, perched up on the high facing banks of the Waal, as this arm of the Rhine is called. From the tree-lined river quays its red roofs and gables rise in broken lines, topped by ancient towers and spires.

One makes for the big church tower which shadows the market-place, which on market days is filled with the vegetable, fruit, meat and poultry stalls, under white awnings or big umbrellas. Framing this old-world scene on one side stands an early seventeenth-century weigh-house and fleshers' hall, a delightful red-brick gabled building with a double flight of steps leading to the entrance on the first storey. On the other side is the church, the Groote Kerk, with its massive brick tower topped by a curious bulbous-shaped spire, crowning the open belfry with its hanging bells. Here near the market-place is the fifteenth-century town hall. Its purple-toned brick façade is decorated with statues of German emperors between tall windows. Entering, you find yourself in the council chamber, a delightful hall with heavy beamed ceiling and grey-black marble floor; at one end a raised daïs and row of carved wooden stalls.

It is a pleasant drive or cycle ride through wooded country to Cleves, and thence the rail runs to Cologne.

From Cologne, Bonn, the pleasant university town is only twenty miles away, and Bonn marks the entrance to the picturesque Rhine Valley. Seven miles beyond are the Seven Mountains, with the "castled crag of Drachenfels" which "Frowns o'er the wide and winding Rhine." It is among the Seven Mountains that the seeker after fresh pastures finds how unhackneyed, almost unfrequented, Rhineland's waysides can be.

In the Valkhof, a little wooded park crowning the green slopes seen from the river, the historic and picturesque interest of Nymegen centres. It is the site of the great castle dating from the time of Charlemagne. Of the noble building where twenty emperors and their suites were lodged; of the vast halls where foreign ambassadors bowed their heads before the Christian successors of pagan Cæsars; of the luxurious chambers where Charlemagne, Louis le Debonnaire, Charles the Bold, slept; of ancient gates through which the paladins made their way to the Holy Land—of all this grandeur there only remain now a couple of small simple vestiges. The other fragment is the ancient baptistery, a small octagonal building, consecrated by Pope Leo III. in 799.

The advice given by Hood's cynic in "Up the Rhine" was "Don't wash or be shaved; go like hairy wild men, play dominoes, smoke, wear a cap, and frock-smock it. But if you speak English, or look like it, then Take care of your pocket—take care of pocket." But things have changed since then.

Those who desire further particulars of a Rhineland tour should obtain the pamphlet by Mr. Lindley, to whom we are indebted for the accompanying illustrations of Cologne and Treves Cathedrals.

THE CATHEDRAL, TREVES.

Law Cases.

Coventry Builder Fined.—At Coventry Police Court recently Spencer Bush, builder, Wren Street, was fined £5 and costs for having erected ten houses in Smith Street without sending in a block-plan of the buildings, as required by the by-laws.

Fined for Using Bad Mortar.—Frederick Gardiner builder, Plumstead, was summoned at Woolwich recently for using mortar in the erection of a building in Grossmount Road, Plumstead, which was not composed in accordance with the by-laws. He was also summoned for non-compliance with a notice of the district surveyor with regard to such irregularity. It was stated that it was the only case in the district where bad mortar had been used. The mortar complained of contained too much earthy matter. The magistrate made an order to comply with the notice to make good all parts built with bad mortar and £5 costs. In the second case a fine of £1 and £2 2s. costs was inflicted.

The Working of Sand-Holes.—The case of *Cockbill* v. *Perry* was heard recently at the Birmingham Summer Assizes. This was an action brought by William Cockbill, haulier, of Walsall, to recover damages for the loss of his son, caused, as was alleged, by the negligence of Benjamin Perry, builders' merchant, of Walsall. The case for the plaintiff was that on February 12th young Cockbill was sent to a sand-hole owned by the defendant to fetch a load of sand. The face of the sand was 15ft. or 20ft. high, and a few feet from the ground was a bench upon which loading carts were accustomed to stand. Whilst the lad was standing upon this bench filling his cart from the loose sand there about thirty loads of sand fell from above, completely submerging him as well as the horse and cart. When dug out fifteen minutes later the youth was dead. It was contended that the sand-hole was improperly worked, inasmuch as a proper angle of repose was not maintained, and the top-soil was allowed to overhang those working at the bottom. The defendant in his evidence said he had worked the sand-hole for ten years under the special rules framed by the Inspector of Mines, who visited the place from time to time. He said that as the sand was of a hard nature it was impossible to work it with such an angle of repose as the plaintiff suggested. In his opinion the fall was caused by the frost. Other witnesses were called with a view of proving that the sand-hole was worked under safe conditions. The jury found for the defendant, and judgment was entered accordingly.

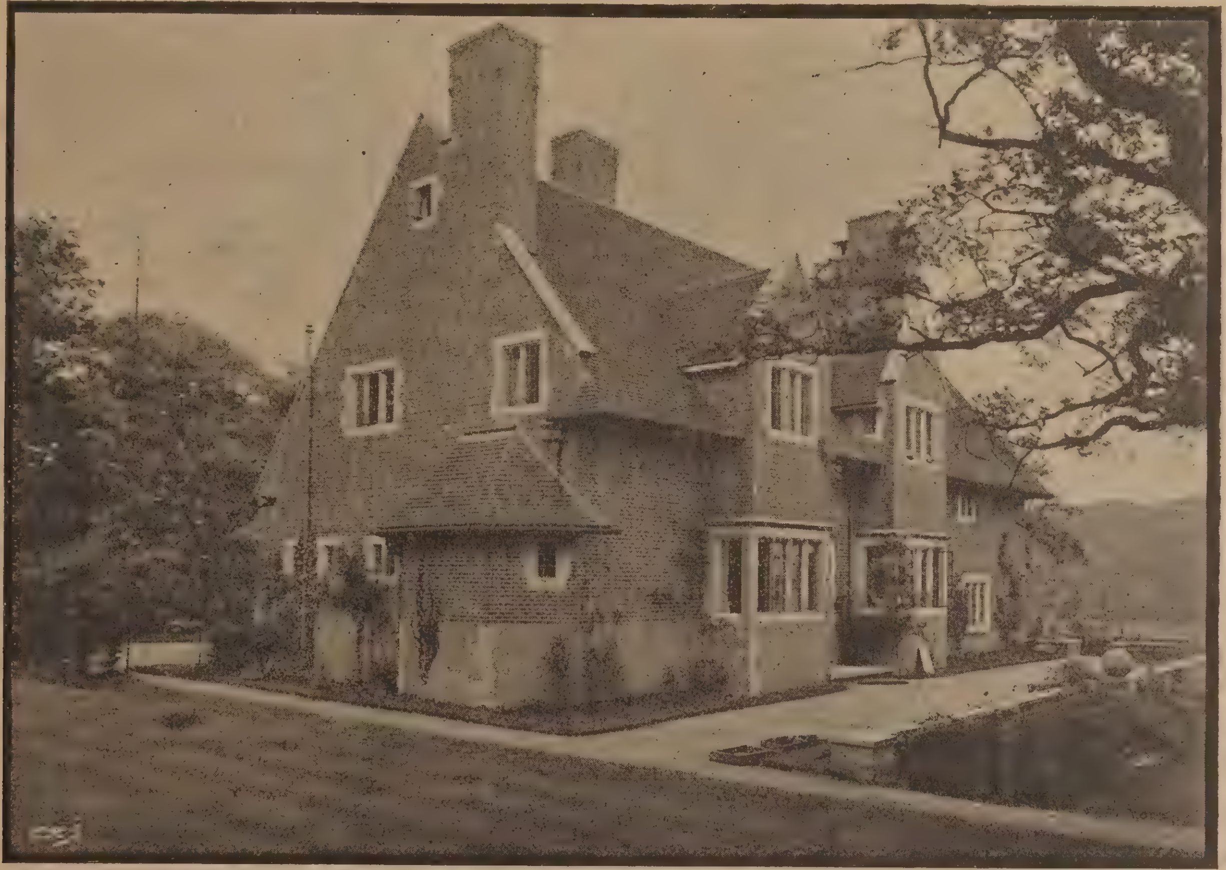
An Audacious Act.—At the Carnarvon Police Court on July 29th a butcher named Jones was summoned for a breach of the Public Health Act. Mr. Trevor Roberts, who prosecuted, said that the defendant submitted to the council plans of a slaughter-house which he proposed to build, but the council rejected the plans. Subsequently the defendant presented plans of a coach-house, and these were approved. The coach-house was erected, and it was found that it was being used by the defendant as a slaughter-house. The bench fined the defendant £5, but the fine would not be enforced if the defendant ceased to use the building as a slaughter-house.

Protection of Factory Employees against Fire.—On July 29th an arbitration was held at the Royal Courts of Justice between the London County Council and the Morgan Crucible Co., Ltd., which involved a question of considerable interest to owners of factories and to the building trade in general as to what is or is not a reasonable requirement on the part of the London County Council, as sanitary authority under the Factory and Workshop Act, 1891, in regard to the provision of a means of escape in the case of fire for persons employed in a factory. The Morgan Crucible Co.'s premises are in Church Street, Battersea, and consist of several blocks of buildings. Early in 1900 the premises were being reconstructed, and after inspection by an architect on behalf of the county council certain requirements were made by that body that alterations should be carried out with a view of providing adequate means of escape for persons employed on the premises. The Morgan Crucible Co. carried out the alterations in accordance with the requisitions made on them, so far as they thought them reasonable or necessary. Blocks A and B of the premises in question were practically one block and communicated with each other. Block A was provided only with an internal open wooden staircase, but at the corner of blocks B and D an external iron staircase was erected. The owners considered that the internal staircase in block A, together with the iron staircase in block B, to which there was access from block A, was amply sufficient as a means of escape from block A in case of fire. The London County Council contended that this was not sufficient, and they required the owners to provide an external iron staircase at the south-east corner of block A in addition to the staircases already provided. The owners declined to accede to this requisition, and the matter was therefore referred to arbitration. The arbitrators were Mr. Thomas Blashill, representing the London County Council, and Mr. Morris Adams, for the Morgan Crucible Co.; and Mr. F. R. Y. Radcliffe, barrister-at-law, was umpire. On the part of the London County Council evidence was given by Mr. W. E. Riley, architect, who surveyed the factory for the Home Office, and Mr. Rowland Plumbe, architect, who inspected the premises at the request of the London County Council. They expressed their opinion that the present means of escape from block A were in sufficient, and an additional staircase was necessary. They believed that in the case of fire the internal staircase in block A would become filled with smoke, and the inmates of the block would be prevented from reaching block B. Mr. Chatfield Clark, surveyor to the Board of Trade, expressed a similar opinion. For the Morgan Crucible Co. Mr. Basil E. Peto, a director of the company, said that when they received in January last year a notice from the London County Council alterations were being made in the premises, and the council's requisitions were complied with, except so far as the erection of a staircase at the south-east corner of block A was concerned. The owners considered that the present outside staircase in block B was amply sufficient. The estimated cost of the staircase proposed to be erected was £600, and it would involve a loss of 9,600 cub. ft. of space, which represented a money loss of £340. The superintendent of the fire brigade at Leicester considered the means of escape from the building ample. The arbitrators reserved their award.

Faulty Drainage Connections.—George Blakeman, builder, was summoned at the Coventry Police Court on July 29th to answer three summonses for breaches of the sanitary by-laws of the city. The town clerk stated that the case related to a house in St. Patrick's Road, which had been recently erected by Mr. Blakeman. In the first place defendant was summoned for erecting a house not in accordance with the plans passed. In the second, the by-law contravened was

HOUSE AT FOUR OAKS, SUTTON COLDFIELD: ENTRANCE FRONT. W. H. BIDLAKE, M.A., ARCHITECT. (*Photo by H. Irving.*)

No. 62, which provided that the drainage system of a house communicating with the sewer should be cut off with a suitable trap at as distant a point from the building as practicable. The third summons was taken out under by-law 64, which required that the drainage pipes of the house should be ventilated by at least two untrapped openings. In the plans finally approved by the Surveyors' Department the house was shown as connected with the main sewer in St. Patrick's Road, with a disconnecting chamber and a fresh-air vent-pipe nearer the house; but the house as built was connected with a rainwater drain, which was not a sewer, and there was no disconnecting trap and no ventilation to the drainage of the house. Evidence was given by the city engineer, Mr. J. E. Swindlehurst, to the effect that the present arrangements of the drainage were the same as in the first plan submitted by Mr. Blakeman, which was objected to. In defence Mr. Blakeman said there had been no substantial alteration in the buildings from the plans approved. With respect to the disconnecting chamber, there was one on the main drain disconnecting the houses with the sewer. There was nothing in the by-laws to prevent him leading the waste from the bath into the drain in front of the houses. The Bench imposed a penalty of £2 and costs in the first case, suggesting that the other two might be withdrawn on payment of costs by the defendant.



HOUSE AT FOUR OAKS, SUTTON COLDFIELD: GARDEN FRONT. W. H. BIDLAKE, M.A., ARCHITECT. (*Photo by H. Irving.*)

A Curious Claim for Damages.—In the King's Bench Division on Wednesday last the case of *Richards* v. *Randall* was heard. This was an action to recover damages for injury done to a studio and its contents through the alleged negligence of the defendants' servants. The plaintiff, Mr. Frank Richards, an artist, occupied a studio at Addison Mansions, Kensington, and last January the defendants, Messrs. Kirk & Randall, contractors, were erecting a large post-office close by, to which was attached a chimney between 70ft. and 80ft. high. For the purpose of constructing the premises the defendants had built a large scaffold. On Sunday, January 27th, whilst a strong gale was blowing, a piece of wood about 2ft. long, which was said to come from the defendants' premises, was blown up against the plaintiff's windows, smashing them and letting in the rain, which did damage to the plaintiff's pictures and the furniture to the extent of £75. This sum the plaintiff now sought to recover. The defence was that it was not shown that the wood that did the damage came from the defendants' premises, and even if it did the storm was an exceptionally severe one which could not have been anticipated or guarded against, and that therefore the defendants were not liable. The jury gave a verdict for the plaintiff for £75, the sum the parties agreed the plaintiff was entitled to if he succeeded in establishing his case.

FIREPROOF AND RUSTPROOF STEEL CONSTRUCTION.

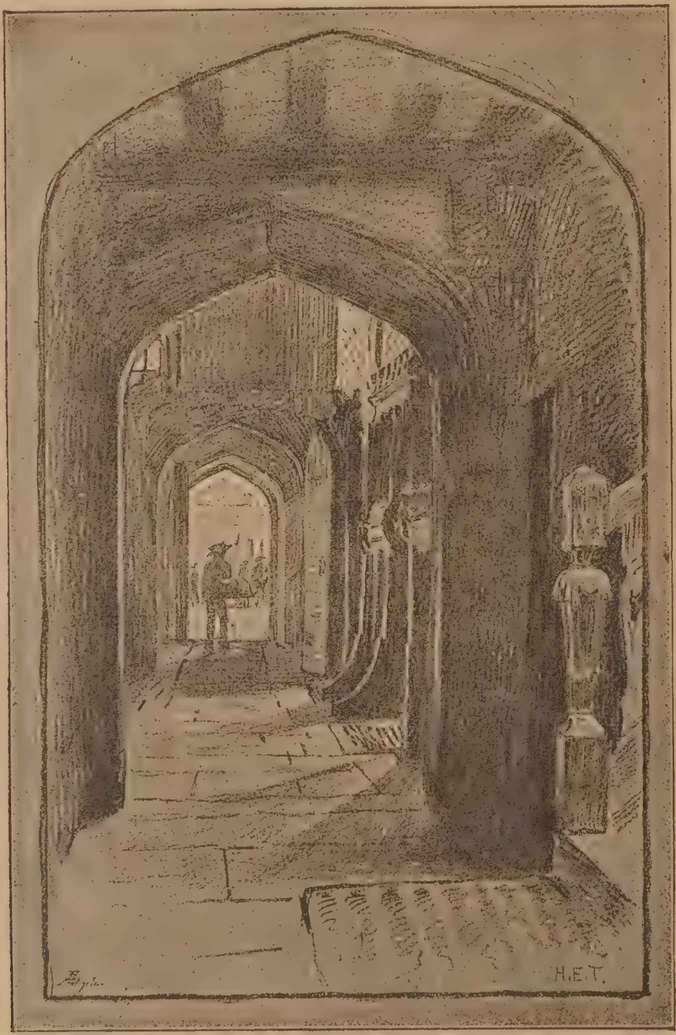
A MAGAZINE called "Insurance Engineering" has recently been published in America, and one of the best articles in it is on the "Fireproof and Rustproof Construction of Steel Buildings," by Mr. Frank B. Abbott. Reviewing it, the "American Architect" says: "Everyone knows that the modern steel-frame construction is exposed to serious dangers. There have been repeated instances where steel or iron frames in buildings, when partially stripped of their masonry covering, have shown uprights particularly deeply corroded after only a few years' standing. In other cases the steel has shown no signs of deterioration, and it is obviously a matter of the highest importance to know what are the conditions which secure immunity. We will not try to give an abstract of Mr. Abbott's paper, but it may be useful to emphasise one of his conclusions, which is that metal intended to be entirely embedded in masonry or concrete, as is usually the case with uprights and often with beams in fire-proof construction, should not be painted. Even the ordinary painting at the mill should be omitted, the mill scale being simply knocked off and every trace of rust removed by cleaning with wire brushes before the metal receives its masonry casing. Where the steel is thus left bare, the cement from the surrounding concrete or from the masonry, if this is grouted where it touches the metal as it always should be, attaches itself to the surface, forming a coating which defies oxidation, while paint slowly disappears, leaving a crevice between the steel and the masonry into which moisture or moisture-laden air, the arch-enemy of iron, can easily penetrate.

"Although this suggestion is not altogether novel, it will, we imagine, be new to most architects. The practice of painting all structural steel is so universal that something more than theoretical considerations will be necessary to change it; but we are inclined to think that experienced members of the profession will be able, if their attention is called to the matter, to furnish extremely valuable evidence in regard to it. We are told, for example, on the authority of Viollet-le-Duc, that iron ties have been taken from the masonry of Notre Dame, in Paris, in which they had been embedded for nearly 700 years, as bright as when they were first put in; while one of our own correspondents, the late Mr. James Freret, of New Orleans, mentioned a case within his knowledge where iron ties in masonry had been completely destroyed in a few years. The masonry of Notre Dame, consisting of limestone laid in lime mortar, would not resist moisture so well as our modern masonry laid in mortar partly hydraulic; and the difference between the two cases would seem to lie rather in the condition of the iron than in that of the masonry around it. In the New Orleans building the iron was undoubtedly painted, according to the modern practice, before it was built into the brickwork, while the iron ties in the Paris building are more likely to have been made by a blacksmith on the spot and utilised immediately; so that it is not improbable that the coat of paint alone may have been the source of the trouble."

House at Four Oaks, Sutton Coldfield.—This house, of which two views are given on this and the opposite page, was designed by Mr. W. H. Bidlake, of Birmingham, for himself, and is an excellent type of the new domestic design, more especially in its grace of form and modelling (if the latter term may be borrowed from another branch of art), suggesting comparison with the domestic buildings of Gloucestershire, which are unsurpassed in this respect.

A NEW AGRICULTURAL COLLEGE.

NEW buildings for the South-Eastern Agricultural College at Wye, Kent, have just been opened. They have been erected from the designs of Mr. T. E. Collcutt. The new work consists in the extension of the quadrangle, begun in 1894, as far as the boundary of the college property, and the addition of a further wing, together with additions and rearrangements in the kitchens and domestic buildings. The refectory has been enlarged by taking in a passage so that the old minstrels' gallery now becomes a gallery in fact as well as in name. The biological laboratory, built in 1894, has hitherto been also used as a subsidiary lecture-room; this is now discontinued, a second laboratory bench being made to run down the middle of the room, so that there is now working space for thirty students. Opening from this laboratory a smaller one has been built for the professor of botany, with working tables, incubators and other appliances for botanical and bacteriological research. A similar laboratory has been built for the special work of the lecturer in zoology and economic entomology. Adjoining these laboratories comes the museum, a large room which is as yet without its proper equipment of cases and tables. The adjoining lecture-room is also new; with the old lecture theatre there is now accommodation for simultaneous lectures to both first and second year men. The drawing office occupies one corner of the new quadrangle. It is 33ft. long and is lighted along its length from the north; it provides working space for twenty-four students. The eastern side of the new quadrangle is completed by the principal's offices and a large common room for the students. The chemical laboratories occupy the ground floor of the new wing, which runs to the eastward of the main block of buildings. The general students' laboratory measures about 45ft. by 30ft., and is lighted from both the longer sides of the room; it is fitted with two double teak-topped benches running longitudinally, the reagent bottles being carried on glass shelves down the middle of the benches. This gives working space for thirty students; other benches in the window recesses are provided for special work. Water and gas is laid on to all the tables, and there are two fume chambers within and one outside the laboratory. Separated from the main laboratory by a glazed partition is the balance-room and the larger of the special laboratories for analytical work and research; adjoining this comes a smaller room reserved for gas analysis, titrations, &c., which require an atmosphere free from acid or alkaline fumes. Lastly, there is a small room for furnaces, a drying chamber and space for ether extractions and other operations involving the use of inflammable liquids. The old building, formerly used as a laboratory, is now taken into the domestic offices. On the first floor of the new buildings additional students' rooms have been built, so that there is now accommodation within the college for fifty students and two members of the staff. These rooms are approached by three staircases, thus dividing the rooms into separate blocks and providing ample exits in case of a fire.



IN THE LOWER CLOISTER, CHETHAM HOSPITAL, MANCHESTER.

Chetham Hospital.—For the accompanying two illustrations we are indebted to the "House" (Messrs. H. Virtue & Co., 13, Henrietta Street, W.C.). We were unable to include them with the illustrated article on this interesting building which appeared in our last issue.

Builders' Notes.

The Will of the late Mr. Thomas Willshaw, builder, of Dunham, near Altrincham, has been proved at £20,294 0s. 7d. gross.

For Structural Alterations to Conway Workhouse the tender of Messrs. D. Jones & Henry Hughes, of Conway and Llandudno, amounting to £3,854, has been accepted.

The Wigan Branch of the Amalgamated Society of Carpenters and Joiners recently held its annual dinner, when sixty persons were present, the chair being occupied by Mr. William Dixon.

Two Big Fires.—A disastrous fire occurred recently on the premises of Messrs. Spear & King, builders and contractors, Crowthorne, Berks. The damage is estimated at more than £3,000. The fire, however, will not interfere with the contracts the firm have in hand.—A fire recently occurred at the premises of Messrs. A. Scott & Son, joiners and builders, Gilmore Place Lane, Edinburgh, causing damage which is estimated at about £1,000; this, however, is covered by insurance.

Colne Builders' Losses.—At the Burnley Bankruptcy Court recently the first public examination took place of Joseph Hawley & Matthew Hawley, carrying on business at Colne and Bromley Cross, near Bolton, as joiners, builders and contractors. The joint statement of affairs showed gross liabilities amounting to £25,530, of which £23,687 was expected to rank for dividend. The assets were estimated to produce £14,411, leaving a deficiency of £12,286. The firm lost £1,780 on the contract for the building of the Colne Town Hall six years ago.

Plumbers' Registration Bill Read a Second Time.—In the House of Lords last week the Plumbers' Registration Bill was read a second time. The object of the Bill, Lord Glenesk explained, was to establish a system under which plumbers could be registered if they so desired. No privilege, however, would be accorded to registered plumbers, but a plumber could not be registered until he was fully qualified by passing an examination under the direction of the Board of Trade. Lord Kenyon said that as the Bill now stood it cast on the Local Government Board the formation of a scheme which that Board did not want to undertake. If the promoters of the Bill would prepare a scheme and make it part of the Bill, then it could be introduced next year in a complete form.

Fair Contract Question at Bradford.—A joint-committee of the Bradford Trades and Labour Council and representatives of building trades' employees recently convened a mass meeting of ratepayers respecting the action of the corporation in regard to the fair contract clause as bearing upon the local dispute in the building trades. A resolution was carried protesting emphatically "against the action of those aldermen and city councillors who voted in favour of permitting master-builders holding their contracts under the fair contracts resolution of the city council in connection with public works to continue building operations with men receiving less wages than the rates agreed upon between the Employers' Association and the men's unions."

Tall Buildings for London: American Enterprise.—Mr. H. S. Black, president of the George A. Fuller Company, builders, of New York and Chicago, has come to England to treat with Lord Revelstoke and others with regard to the erection of a large number of steel-constructed buildings in London. In an interview Mr. Black said: "I am not an advocate of 'sky-scrapers,' and do not favour buildings of more than ten or twelve storeys in height. The tendency in America is towards architectural anarchy, every man building as he chooses without any regard for the symmetry of a skyline. I believe, however, that the erection of moderately high buildings is advantageous. Commercially, of course, the more room one has to rent the more rent there is to collect. From the philosophical point of view, tall well-constructed buildings, modern and beautiful in every detail, with the swiftest elevators and conveniences of minutest description, must be conducive to general progress in the conduct of business."

Messrs. R. Francis & Sons, of Carrara House, Terminus Place, Eastbourne, have secured the contract for the masonry work in connection with the building of the new Granville Hotel which is to be erected in Sea Road, Bexhill, and is to contain 200 rooms.

A Huge Block of Granite.—One of the largest blocks of granite ever hewn in the county has been safely brought into Penryn Railway Station from the quarries of Messrs. John Freeman, Son & Co. It weighs over 37 tons, and is of oblong shape. Under the supervision of Mr. D. B. Donald Mime (the junior engineer), it was suspended from heavy wooden girders between two trucks and carefully secured, two traction engines bringing it down the steep gradients, around the sharp curve, and up to the station without any mishap. The stone is for the memorial to King Alfred the Great, to be erected at Manchester.

L. C. C. Brickmaking. — The L. C. C. wants 16,000,000 bricks for part of its housing schemes. The Norbury estate in South London contained, when the council bought it for housing purposes, a brickmaker's plant in full swing. Tenders were invited for the 16,000,000 bricks, but it is not likely that the council will accept any of them. On the other hand, the cost of making bricks by direct labour at Norbury is estimated at from 22s. to 27s. per 1,000, whereas the cost of purchasing stock bricks in the market and delivering them at Norbury would not be less than 32s. per 1,000. From three practical brickmakers the Housing Committee have selected one as foreman at a wage of £3 3s. per week, in addition to a bonus should he be able to turn out suitable bricks at not more than 25s. per 1,000. It is expected that under favourable circumstances an output of 3,000,000 bricks a year may be forthcoming.

London County Council.—At last weeks' meeting, on the recommendation of the Highways Committee, it was decided to construct 5½ miles of new tramways at a cost of £175,400, exclusive of £87,800 for street widenings. Of these tramways one will be along the Victoria Embankment, from Westminster Bridge to Blackfriars Bridge. A recommendation for the widening of Hampstead Road at the Euston Road end, involving a nett cost of £225,500, was adopted. On the report of the Housing of the Working Classes Committee dealing with a capital vote of £15,000 for the foundations of two blocks of dwellings on the Reid's brewery site, Mr. R. Williams called attention to the fact that the Council was gradually decreasing the floor-space given in working-class dwellings, and he moved as an amendment: "That the recommendation be referred back to the committee with instructions to so amend the plans for this site that not more than 500 persons to the acre be housed thereon." The amendment was defeated. It was resolved that the Council should enter into a formal contract with the property owners of Marble Hill for the acquisition of their land, so that the view from Richmond Hill might be preserved to the public without disfigurement by the erection of buildings. By the payment of £3,500 the Council secures the option of purchase till December 31st, and it is hoped to arrange a scheme for the purchase by all bodies interested of the land for the sum of £70,000. With respect to the proposed widening of Piccadilly between Hyde Park Corner and Walsingham House, the Improvements Committee informed the Council that a conference had been held with the Secretary of his Majesty's Office of Works, and it was believed it would be possible to save eleven of the existing trees. Replying to Captain Swinton, Mr. Davies said of fifty-seven trees affected by the improvement only eight would be actually cut down. The plans for the new Gaiety Theatre were unanimously passed. The Theatres Committee submitted for approval a new code of regulations under the Metropolis Management and Building Acts Amendments Act, 1878, with respect to the requirements for the protection from fire of theatres, &c., in London. A long discussion took place on this recommendation, but ultimately the regulations were approved.

Keystones.

MM. Dalou and Formigé have been commissioned to execute a monument to Gambetta, and they hope to have it finished in two years.

St. Andrews Parish Church Hall is to be built at a cost of £2,500 from designs by Messrs. Gillespie & Scott, of St. Andrews.

Extensions to St. Bartholomew's School, Ewood, Blackburn, are being carried out by Messrs. Cheers & Smith, architects. Mr. John Boland, of Blackburn, is the builder.

The Building of St. Barnabas Church, Portsmouth, has been commenced. The design is by Sir A. Blomfield & Sons. Messrs. W. & R. Light Brothers, of Landport, are the builders.

Hulme Hall, Port Sunlight, has recently been completed from designs by Messrs. William & Segar Owen, of Warrington. It has a floor space of 15,770 sq. ft. and can seat 1,300 persons. It is for use as a restaurant.

A New Wing to North Ormesby Cottage Hospital has just been completed. The architect was Mr. J. Mitchell Bottomley, and the cost has been £4,500, exclusive of fittings and furniture. Mr. King, of North Ormesby, was the contractor.

A New Church at Worsborough Bridge, near Barnsley, has been erected from designs by Messrs. T. H. & F. Healy, of Bradford. The contractors were Messrs. Hammerton, of Worsborough Dale. The east window is filled with stained glass by Messrs. Powell Brothers, of Leeds.

A New Church at East Kirkby, Nottingham, is being built from the designs of Mr. Louis Ambler, F.R.I.B.A. The building will consist of a nave 78ft. long and 27ft. wide internally, with aisles (merely passages 4ft. wide), a chancel 30ft. long and 21ft. wide, vestries for clergy and choir, with heating chamber under, and bell turrets at the west end.

Competition for United Methodist Free Church and Schools, Westcliff-on-Sea.—The design submitted in this (limited) competition by Messrs. George Baines, F.R.I.B.A., & Reginald Palmer Baines, architects, 5, Clement's Inn, Strand, W.C., have been adopted by the committee, and the first portion of the scheme, including the church vestries, &c., is to be proceeded with at once.

Completion of St. Ninian's Cathedral, Perth.—The extensions of St. Ninian's Cathedral, Perth, which have been in progress for the last three years, are now almost completed, and the new buildings were dedicated last week. When plans were required Mr. Butterfield was still alive, but on account of old age had retired from active work. Accordingly Mr. Pearson, who had co-operated in the building of the choir and transepts of Truro Cathedral, was invited to prepare designs. But, before finally revising them, he too died. His place was taken by his son, Mr. Frank L. Pearson. For the remodelling and the furnishing of the chancel the same style of architecture was adopted as that in which the rest of the structure had already been built; but for the additions — the chapter-house, vestries and cloister — recourse was had to "Jacobean Gothic." The work was carried out by Messrs. Fraser & Morton, Perth, who built the nave in 1890. The removal of the high screen and the addition of the aisles, with the beautiful arches which separate them from the choir, entirely do away with the "contracted" effect complained of by Bishop Wordsworth, and add that sense of spaciousness which ought to mark a cathedral. The bishop's throne, canons' and choir stalls, and pulpit are worthy of being the permanent furnishings of a cathedral. The large window opposite the north-west entrance is being filled with stained glass, at a cost of nearly £500, in memory of the soldiers of the Black Watch who have fallen in the South African war.

ENTRANCE TO UPPER CLOISTER, CHETHAM HOSPITAL, MANCHESTER.

The A.A. Library will be closed from August 1st to September 9th.

At Buckingham Palace and Windsor Castle £60,000 is being spent on sanitary improvements and structural alterations.

Another Block of Forty-five Workmen's Houses at Perth is to be erected at an estimated cost of £6,000.

Loughborough Theatre, built of wood and corrugated iron, was destroyed by fire last week.

The death is announced of Mr. Robert Lofthouse, F.S.I., the senior member of the firm of R. Lofthouse & Sons, of Middlesbrough.

Queen Victoria Memorial Designs to be Exhibited Soon.—Lord Esher states that these designs will be exhibited to the public as soon as the necessary arrangements can be made.

St. Paul's Dome to be Inspected.—The great dome of St. Paul's Cathedral is to be carefully inspected inside and out from top to bottom at an early date.

At King's College, Taunton, on Wednesday last the Bishop of Southampton dedicated the new wing which has just been completed. It consists of a large dormitory to hold thirty beds, boys' library and reading-room, chaplain's and masters' rooms.

The Famous Fresco of the Last Supper, by Leonardo da Vinci, in the refectory of the ex-convent of St. Mary, at Milan, has been so damaged by time, damp and neglect that the Italian Government has decided to have it restored.

The Rathbone Statue, Liverpool.—The statue of Mr. William Rathbone, erected by public subscription in St. John's Garden, Liverpool, was recently unveiled. It is of bronze and is surrounded, in accordance with the design of Mr. G. Frampton, R.A., the sculptor, with a stone seat. The total height of the pedestal and statue is 22½ft.

Interesting Discovery.—The construction of the Rue Dante at Paris has completely revolutionised the quarter through which it passes and has destroyed a large number of old houses. In one of these, situate in the Rue Galande, near the Rue Dante, said to have been inhabited by Gabrielle d'Estrées, the mistress of Henry IV. of France, the workmen have discovered a number of old documents relating to the diplomatic relations between France and Turkey, among which was a copy of a letter from Mehemet, pasha of Egypt, dated 1704.

Excavations at Yamboli.—The French Academy of Incriptions and Belle-lettres have granted a subvention of 2,000f. out of the accumulated funds of the Eugène Piot foundation to Mr. A. Degrand, the French Consul at Philippopolis, for the purpose of continuing the work of excavation at Yamboli (Bulgaria) recently commenced by M. Seurre, a member of the French School at Athens, which have given the happiest results with regard to the pre-historic age and the period of the Roman occupation. The Academy make it a condition that the whole, or at least the greater portion, of the objects discovered shall belong to the French Government.

York Minster and the Vibration of Street Traffic.—The Society for the Protection of Ancient Buildings has addressed a letter to the corporation of York in reference to the scheme for improving the thoroughfares of that city in the immediate vicinity of the minster. The society deputed one of their professional members to visit York, and having considered his report, the committee urge the corporation to take into consideration the "serious question of the almost certain damage caused by vibration if heavy traffic is permitted to approach the minster." The committee state that "there can be no doubt as to the harm caused by vibration to an ancient building," and that "so far back as the time when St. Paul's Cathedral was erected this was understood, and Sir Christopher Wren (one of our greatest authorities on construction) wrote most strongly on the subject." The committee express the hope that whatever scheme may be advocated, it will keep in view the general principle that no heavy traffic ought to pass within 40ft. of the minster.

A New Seamen's Institute at Manchester Docks is being built from designs by Mr. Medland Taylor, architect, Messrs. William Southern & Sons, of Salford, being the builders.

Busby Board School is to be rebuilt according to the plans of Messrs. Watson & Salmond, recently accepted in competition. The work will commence immediately.

Tintern Abbey and Village were taken possession of by the Crown on Wednesday last. The modern outbuildings around the abbey will be removed and the monks' graveyard cleared of fruit trees.

The Leeds and Yorkshire Architectural Society made an excursion to Giggleswick on July 27th to inspect the new chapel now being erected at the Grammar School. The donor is Mr. Walter Morrison, and the architect Mr. T. G. Jackson, R.A. Mr. R. Evans is the clerk of the works.

Denork Mansion House, near St. Andrews, has just undergone extensive alterations and additions. Mr. David Henry, of St. Andrews, was the architect, and Mr. William Ness the builder. Electric light has been installed by Messrs. Lowden Brothers & Co., of Dundee.

The Memorial Window to the late Mr. W. E. Gladstone which the members of the Armenian and Cretan Relief Committee are about to erect in the church of St. Ethelwald, Hawarden, is on view in the studio of the artist, Mr. Frampton, 110, Buckingham Palace Road. Its cost is £300.

The New Workhouse Infirmary, Dorking, has been opened. It was designed by Mr. H. Percy Adams, F.R.I.B.A., and was illustrated in our issue for May 8th last. Messrs. Kerridge & Shaw, of Cambridge, were the builders. The total cost of the building was £10,450.

Cambrian Archæological Association.—The fifty-fifth annual meeting opened at Newtown, Montgomeryshire, on Wednesday last. Interest was lent to this the first visit of the Association to Cedewain by the fact that excavations were recently begun on the site of the old Roman city at Caersws.

Antiquities in Western Prussia.—The excavations in the neighbourhood of Dantzic have been continued with very great success. A number of tombs of the pre-Roman period were discovered at Suckschlin containing urns of considerable size. Some of them are covered with fine ornament.

The New Bluecoat Hospital, at Wavertree, Liverpool, to be erected from the designs of Messrs. Briggs & Wolstenholme, and Messrs. F. B. Hobbs & Arnold Thornely, is, like the existing hospital in School Lane, in the late Renaissance style, which has been adopted with a view to continuity of design. It is to be built of red brick with facings of white stone. The total estimated cost is £90,000. This sum, however, includes the sanatorium, a separate building placed on a terrace to the north of the main hospital, and on the east of the playing field, which the sanatorium overlooks.

A New "Hydro" at Church Stretton, Salop, is four storeys high and contains, on the ground floor, entrance hall and lounge, staircase, hall and lift, dining-room 40ft. by 18ft., drawing-room 28ft. by 18ft. (the two latter rooms opening on to the terrace which forms a pleasant lounge and parade), billiard-room 25ft. by 18ft., recreation-room 42ft. by 18ft., and luxurious Turkish baths and dressing and cooling rooms. On the first floor there are seventeen bed and sitting-rooms, four bathrooms, &c.; on the second floor eighteen bedrooms, bath, &c; and on the third floor ten bedrooms. The hotel has been furnished by Messrs. Maple & Co.

The View from Richmond Hill.—The "Daily Chronicle" says: "Richmond Hill has gained a reprieve rather than a free pardon, and its unrivalled view over the Thames Valley is safe only till the end of the year. . . . From all indications we are sure that London, Surrey, Middlesex, to say nothing of Richmond and Twickenham in especial, are determined to save the famous prospect from desecration, and that when the summer vacation is over the apportioning of expenses will be carried out before the option has expired. We have paid that sum for a single picture in the National Gallery and it is not too much to pay for the picture at Richmond."

TO OUR READERS.

We are steadily making progress towards supplying all our regular readers with the Insurance Coupons to which they are entitled free of cost under Scheme No. 1. It is impossible, however, to get directly into touch with each individual reader unless they themselves write us. There are many who have not yet done so, and who are thus depriving themselves of benefit. It is not necessary to write a long letter, a post card will do, giving full name and address and name of newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the OCEAN ACCIDENT AND GUARANTEE CORPORATION, LTD.

Scheme No. 1 is a free Accident Insurance of **£500.**

FREE.

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

The Condition attached to these Schemes is that they only apply to Annual Subscribers, either through Newsagents or direct to this office.

If these schemes interest you, write for full particulars to

West Ham's New Lunatic Asylum.—On Thursday last, the Mayor of West Ham formally opened the Corporation's new lunatic asylum at Chadwell. The building, which is one of the largest of its kind in the country, has cost over £300,000. It extends over 10 acres of land, and some idea of its magnitude can be gathered from the fact that the main corridors are a mile in length. Accommodation is provided for about 800 patients.

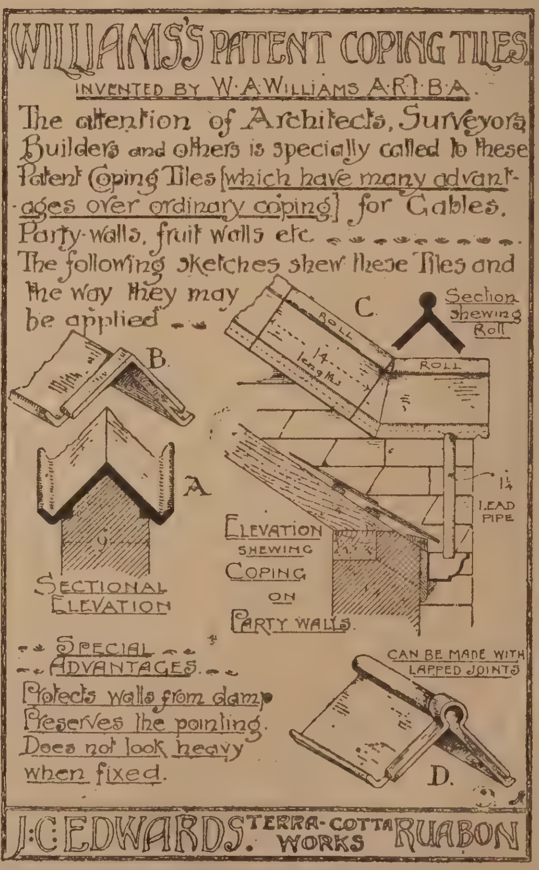
IMPROVED COPING TILE
(PATENTED)
For GABLES, PARTY WALLS, &c.



WILLIAMS'S PATENT COPING TILES
INVENTED BY W·A·WILLIAMS A·R·I·B·A.

The attention of Architects, Surveyors, Builders and others is specially called to these Patent Coping Tiles [which have many advantages over ordinary coping] for Gables, Party-walls, fruit walls etc.

The following sketches shew these Tiles and the way they may be applied

SPECIAL ADVANTAGES.
Protects walls from damp.
Preserves the pointing.
Does not look heavy when fixed.

J·C·EDWARDS. TERRA-COTTA WORKS RUABON

This Coping prevents the water collected by it from running down and soaking into the wall beneath.

The end tile is provided with outlets, from which the water can be conducted to the eaves gutter or elsewhere by a small lead pipe, or the outlet holes can be omitted, the tile throated and set to let the water shoot clear of the building, but the pipe is recommended and the expense is trifling.

It can be used as well on the flat, as raking, for with a little care it can always be laid to a slight fall, the outlets then should not be more than 10 feet apart.

The Tiles are set and jointed in cement, the edges being scratched up rough to form a key, making a permanent and water-tight joint.

It will be seen that with these Copings the walls are protected from dampness, pointing preserved, rooms in roof kept dry, and defective flashings and fillets do not cause so much leakage. No other ordinary Coping answers the same purpose.

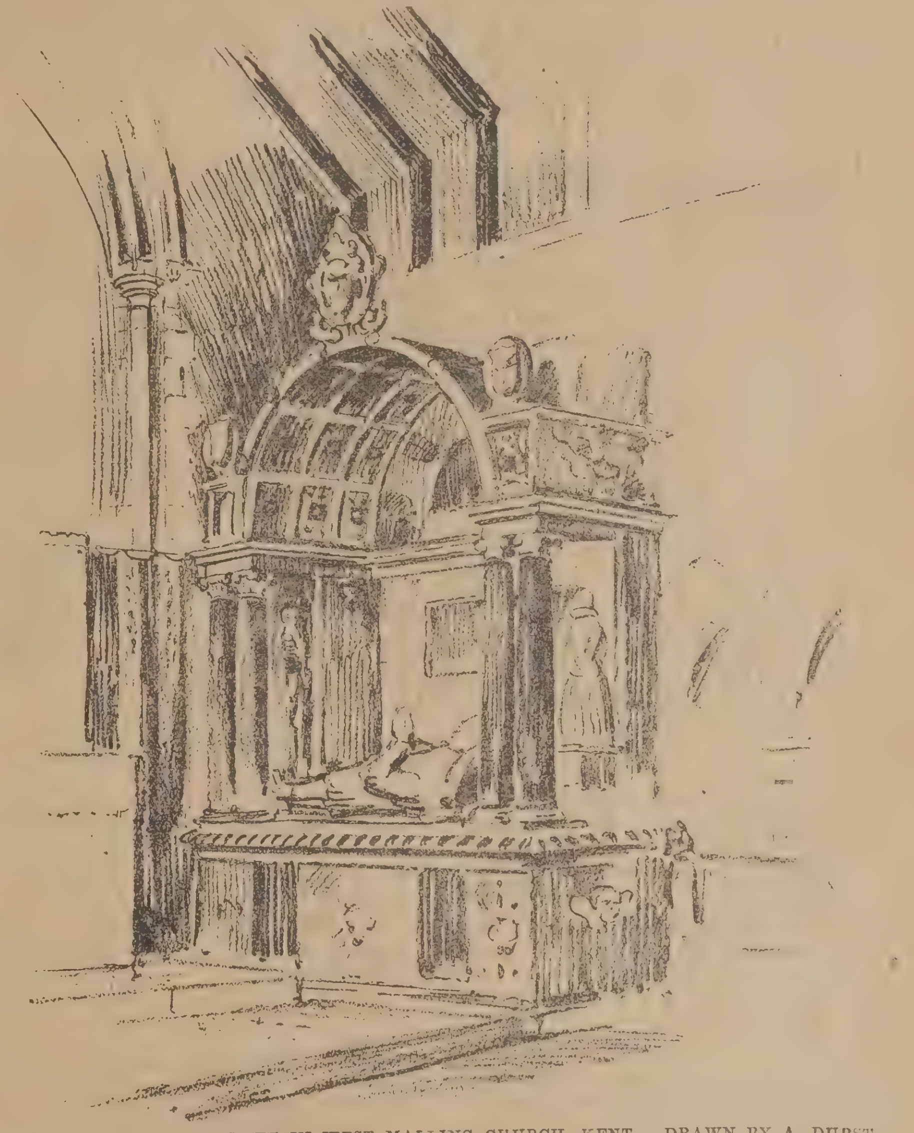
Door and Conservatory Glass. ANYONE with a feeling for colour must have noticed with dismay the atrociously-coloured glass which one sees so often in hall doors and conservatory windows. We refer of course to those panes of intensely red and blue glass, so commonly fixed at the sides of the window panes, which, when the light comes through them, give a ghastly aspect to everything within their range. It will readily be appreciated that violent colours like these cannot properly be used in large sheets or strips, and as this fact is so glaringly apparent by reason of the countless examples furnished by suburban villas and cheap town houses, it is all the more surprising that the practice to which we refer should persist. Intense colour which is near the eye can only be used in small pieces, such as one finds in good stained glass. If it is desired to relieve the white glass in a hall door or a conservatory window, why not insert a lightly-tinted pane of, say, green or pink? It costs less and the effect is pleasing. Would that the offenders might recognise their bad taste in the choice of glass!

Sir Robert Brett's Monument. REFERRING to the drawing on this page by Mr. A. Durst, in the church of West Malling, Kent, in the south-east corner of the chancel, is the monument to Sir Robert Brett, of the county of Somerset, his wife and only son, Henry, who died in 1609, a few years before his parents. The monument is constructed almost entirely of alabaster, except the black marble columns and other marbles used as inlay.

Wanted, a New Thoroughfare. IT is no new and no solitary cry that heads these following words. New ways are in request everywhere for a traffic that increases by leaps and bounds, while our governing bodies in leisurely fashion discuss prejudices and ways and means. There seems to be no possible overtaking of this huge increase, for by the time new thoroughfares are completed, or old ones widened, it has always seemed to be in the last and immovable state of congestion, and the opening of those new, but too-long-considered channels, has merely meant that the business of every-day life can with care be made to proceed. It is only, however, at a snail's pace that the mingled throng of omnibuses, railway lorries, tradesmen's carts, hand-barrows, cabs and private carriages progresses, and by the slow pace only possible helps to prolong the block, and waste time precious to all classes. It is not a new thoroughfare, but a plurality of such that is wanted; but a little experience, conjoined with a little reflection, has convinced the present writer that one such new artery in one quarter of London at least, could readily be brought about, and at small cost in cash, time, and labour. Every Londoner is well acquainted with the great increase in recent years of traffic in the west of the metropolis. There are those of us who can well recollect Knightsbridge, Kensington Gore, and Hammersmith as places comparatively rural; but by this year of grace their crowded condition has become very marked, and that always difficult and dangerous passage—the narrow gut of High Street, Kensington—is chronically blocked. For certainly twelve years past, schemes in which the late Kensington Vestry, the old Metropolitan Board of Works, and the present London County Council have been interested have been drawn up, by which a widening of this altogether inadequate thoroughfare has long been contemplated, and it is understood that a plan is even now pigeon-holed for eventual execution whenever the Council and the Borough of Kensington can agree upon the proportions of their respective contributions to the cost. The thing is necessary, nay, urgent, but it does not suffice to widen a thoroughfare. If possible an alternative one should be provided, and in this case the alternative is readily to hand. This is nothing less than the putting to some real use of the long stretch of Cromwell Road, a road of splendid width, which has never been of more than local convenience, and is much too broad for the traffic that now finds its way along it to what is practically the cul-de-sac of its western end. Cromwell Road, to which a fine entrance leads from Knightsbridge, along the Brompton Road, and so past the South Kensington and Natural History Museums, is surely destined, sooner or later, to be a main thoroughfare. That it should be sooner is devoutly to be wished; but before that consummation can be brought about it is necessary that the district between its western end, at the junction with the Earl's Court Road and Addison Road railway bridge, should be remodelled, and, instead of the mean and altogether inadequate West Cromwell Road continuing in a south-westerly direction to Warwick Road, a new extension be engineered through to Addison Road bridge or Avonmore Road, where the existing Hammersmith Road would be met. Such a suggested thoroughfare would cut across Cromwell Crescent, Warwick Gardens and Warwick Road only, and would relieve High Street, Kensington, of half the intolerable pressure it now suffers. It is true that this would bring more traffic to Brompton Road, which is already well filled, but for three-quarters of the length of that artery there remains on one side a strip of foot-pavement which, occupying the site, as it does, of forecourts and gardens swept away many years since, remains at least twice the width necessary for the comfort and convenience of pedestrians. This might with advantage be thrown into the roadway.

C. G. H.



TOMB OF SIR ROBERT BRETT IN WEST MALLING CHURCH, KENT. DRAWN BY A. DURST.

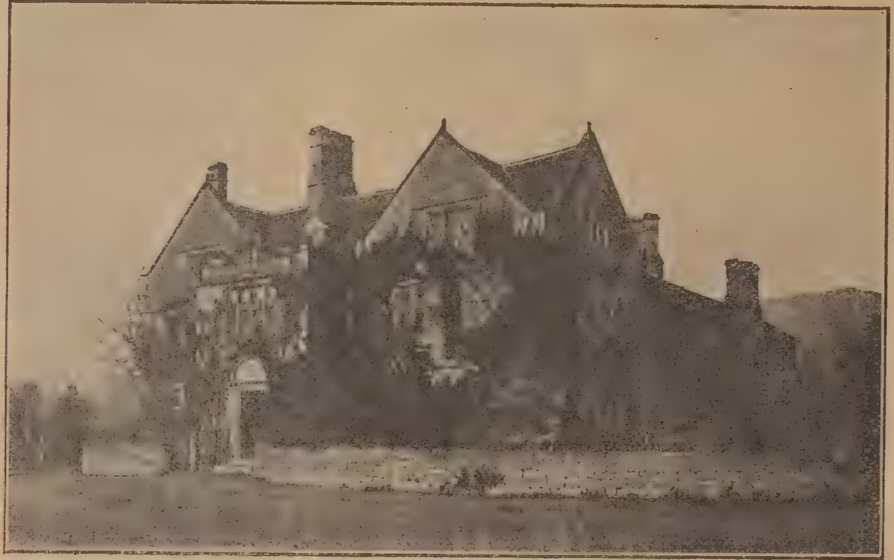
IN THE VICINITY OF HADDON.

BY F. H. CHEETHAM.

WITHIN easy walking distance of Haddon Hall are one or two buildings of more than average interest that architectural students visiting the old manor-house of the Rutlands would do well to see. I refer to places situated within two miles of Haddon itself, a distance which in these days of bicycles is little more than the proverbial "stone's throw" of more remote days.

Haddon itself is usually approached either from Bakewell or Rowsley, between whose railway stations it is nearly equi-distant, and at both these places are examples of old Renaissance houses that find few words of description in any guide-book. Nearly everybody has heard of the Peacock Inn at Rowsley, but comparatively few people know anything of its history. But before we speak of the Peacock, beloved of artists and anglers, let us look first at the old Hall at Bakewell, a building far less known and of whose existence, perhaps, not one in a thousand visitors to the town is aware.

Bakewell itself has been described, and not without reason, as the most pleasantly situated town in Derbyshire, "just the kind of place to which a tourist likes to return for his night's repose." It possesses a church that is well worth seeing, but which, being admirably described in a local sixpenny guide, need not be referred to at length here.



THE PEACOCK INN, ROWSLEY.

The old Hall, however, as far as I know, is not mentioned in any local guide-book. Being a private residence, it cannot of course be visited as a show place, but some reference to it would surely be welcomed by many visitors whose attention would thus be drawn to a most picturesque old English house. It was built in 1686 by one Thomas Bagshawe, a barrister of repute in his day, and for many years legal adviser of the Rutland family, the owners of Haddon. It is the oldest house in Bakewell, and stands on the hillside to the north-east of the church. The late Duchess of Rutland used to describe it as "a miniature Haddon," but the comparison is not at all happy, as the Bakewell house possesses few of the characteristics of the larger mansion. It is one of those quiet English Renaissance houses with gables and balls and balustraded parapets. Their gabled roofs are the characteristic feature of such houses, and these at Haddon are nearly entirely absent. Standing on the side of a steep hill, the square garden in front of the house is built up high from the ground with picturesque effect. Constructed with a warm stone which has weathered a beautiful colour, with its quaint lead heads and its many balled gables, the old Hall is certainly worth finding out when you are in Bakewell. It is rather difficult to discover, however, from written directions, but as you enter the town from the Buxton side, by Mill Street, it lies above you on the right, almost immediately opposite the end of Bath Street, which is the street behind the Town Hall. Indeed, walking along Bath Street with your back to the river you have but to raise your head and there is the old Hall in front of you. But if you are not looking for it you would never think of raising your head.

There is a very good local guide-book called "A Day in the Peak" which gives a full account of Bakewell Church. The church stands on high ground, and the view from the churchyard down the Wye Valley is exceedingly fine. Parts of the structure, the nave and aisles and choir, are old, but the transepts and the tower and spire were built about sixty years ago, and the result is a rather lifeless reproduction of the formerly existing design. The monuments in the Vernon chapel are worthy of notice, and the modern work in the chancel is very good. On the miserere seat of the south stall under the tower the carver has represented a legend that may some day puzzle an enquiring tourist. It is a representation of three somewhat decayed teeth with a cow beneath. The meaning is "Three Acres and a Cow," a phrase much in vogue at the time the carving was executed, but now almost forgotten.

There is an interesting font, the interpretation of the figures on which causes authorities to differ, and an almost unsurpassed collection of ancient sepulchral slabs, most of which were discovered in the foundations at the time of the rebuilding of 1841. They are now in the south porch. Outside the east wall of the south transept stands a fine pre-Norman cross in splendid preservation, but which, owing to the depravity of a tourist some years ago, has lately been surrounded by a heavy cast-iron railing.

There is of course a full account of Bakewell Church in Cox's "Churches of Derbyshire." It possesses the rather unusual feature of two east windows in the chancel.

Just outside Bakewell on the road to Haddon, on the hillside to your right, is a modern house —Burton Closes—built by Augustus Welby Pugin. It has since been added to, however.

The Peacock Inn at Rowsley, our other Renaissance house, does not need any description. It is of the same character as the Hall at Bakewell, but has the additional feature of a large projecting porch, with porch-chamber over. It is earlier in date than the Bakewell house, having been built in 1652, and has more Gothic feeling about it, battlements not having here made way for the balustraded parapet. Over the entrance door on a semicircular stone tympanum are the words—

16 IOHNSTE 52
VENSON

The diagonal lines of the N's are wrongly placed, and the inscription has given rise to some conjecture as to who this John Stevenson was. The guide-books are curiously silent about the history of The Peacock, although they naturally never fail to sing its picturesque charms. Some of them tell us that Stevenson was a former "Boniface" here, which is a purely imaginary statement. The following particulars concerning the inn at Rowsley will therefore, I hope, be of some interest, as being very little known.

John Stevenson, who built the house in 1652, was a member of an old Derbyshire family, who in the reign of Elizabeth were lords of the manor of Elton, close to Rowsley. The building was, therefore, in the first instance a gentleman's residence. It passed from the Stevensons by marriage, and was afterwards occupied by gentlemen farmers as tenants. The last of these tenant-farmers left the house in 1828, when it it was converted into an inn. There is no trace of the building having had any connection with Haddon Hall or the Rutland family, and we may infer that the peacock (the crest of the Rutlands) was not placed in its present position over the porch until the place became an inn. Before 1828 there used to be a garden in front of the house, which now is open to the road, and the present stables and tap room are subsequent additions, the old farm buildings belonging to the residence having been destroyed. The Peacock is a structure of considerable architectural merit and character. The placing of the windows out of the centre line of the gable is what no modern architect would allow himself to do, but it is surprising how little noticeable it is.

Just two miles south-west of Haddon is Youlgreave, a lonely village with a very fine church which is worth a little trouble in getting there to see. The tower, a particularly fine and massive specimen of early fifteenth-century work, is a noticeable object in the country for miles around. The church itself, though it presents a bold and uniform appearance on a general view, will be found to comprise a most interesting complexity of styles from Norman to seventeenth century. In many respects Youlgreave is the most satisfying of the many interesting churches in this part of Derbyshire. The original nave retains its Norman piers and capitals, which on one side support round, on the other pointed, arches. The nave was extended westward in the fifteenth century, but not the aisles, and the tower was added on to this. The effect of this extended nave and tower (which is open to the church) is very fine, especially when viewed from under the tower itself, the floor of which is raised above the level of that of the church. The font is one of the most remarkable in England, and is of twelfth-century date. On one side projects a stoup, or small hollowed receptacle which probably served for holy water, though other explanations of its use are offered: that it was, for instance, for holding the chrism, or holy oil, at baptism.

The church was restored in 1870 by Norman Shaw, and is generally admitted as "a model of what restoration should be." The east chancel window, of five lights, contains some splendid glass by Morris, from the designs of Burne-Jones. The figure of Christ as King fills the centre light, and the others are occupied by the four Evangelists. The beauty of the window, great in itself, seems to be enhanced by its setting, the interior of Youlgreave Church being free from all fussiness, pettiness of detail, or any distracting element whatsoever. It is said that this window was the last work of Messrs. Morris (1876) "before the firm decided to cease from supplying windows for old churches."

The numerous stone bridges in this part of Derbyshire are worthy of some attention, and a collection of measured drawings showing different types would not be without its value. They nearly all have the projecting breakwater between the arches, but in some cases this stops short before the roadway is reached. More often, however, it is carried up to the parapet, forming a triangular recess for foot passengers. The bridge over the Wye at Bakewell is one of the happiest examples of these Derbyshire bridges, and is one of the best known. The bridge at Haddon was built in 1663, and in the steward's accounts at the Hall occurs this entry under date of August 10th of that year: "Paid to John Milner and Charles Hadfield at several times for making the new stone bridge at Haddon, being hired by the great, with what my honourable Lady was pleased to give them in all, £97." "Hired by the great" means to work by measure, as distinguished from work done by day. Rowsley bridge was originally only a packhorse bridge. It was subsequently widened, as may be seen from below by the lateral extensions that were made to the arches.

Apart, therefore, from its natural beauties, the country in the immediate vicinity of Haddon Hall is full of interest; and if the architectural student is a bit of an archæologist as well the district will be a happy hunting ground for him. At any rate, by those who go to measure and sketch at Haddon an extra day may well be spent in visiting some of the old buildings in the neighbourhood.

REPAIRING ST. MARY'S HALL, COVENTRY.

NOT "RESTORATION."

A SHORT time ago the Society for the Protection of Ancient Buildings having learned that certain works of repair were being carried out at St. Mary's Hall, Coventry, expressed a desire for information as to the works in question. The chairman of the Estates and Finance Committee (Alderman Tomson) thereupon intimated to the society that if they would send a representative to Coventry he would be happy to show him the works and explain what was being done. Two representatives, Messrs. Oliver Baker and C. E. Bateman, accordingly visited the hall a short time ago. They make the following report to their committee :—

"In the ancient kitchen, at the south end of the main building, which was probably the original hall of the Guild, a corbel, once one of the roof timbers, having perished, another of white stone has been inserted. This new corbel has been carved to represent a grotesque head with conventional foliage, copied from one in another part of the building. This carving seems to us unfortunate, as, so far as we noticed, the rest of this exceedingly interesting old room is genuine old work, or frankly modern arrangements for cooking, and it would have been better to put in a plain corbel, such as was needed to carry the old post simply as a piece of repair, grotesque heads having no meaning to us of these days, and copies being valueless. The above seems to be the only piece which could be called 'restorative,' the other work now in progress or contemplated being simply undertaken to sustain and uphold those parts of the building which are giving way.

"The little quadrangle, which is entered under a groined archway from the street, has two of its sides bounded by buildings of half-timber work, and in that on the south side the uppermost storey hangs over the lower, and is built of oak framing filled with panelling and enriched externally with cusped arches, above which light tracery is pierced and glazed for windows. The roof of this part is covered with lead, and the timbers are visible in the uppermost room, united with oak boards to form a ceiling with flat top and sloping sides. The whole of this upper storey has fallen forward towards the quadrangle and actually leans against the last of the great buttresses of the hall. It is in other respects in fair condition, considering its age and the slightness of its construction. At either end of the upper chamber are thick walls, and from wall to wall an iron girder has been placed along the bottom of the inside of the wall facing the quadrangle, so as to take the weight and prevent the subsidence increasing. The girder is to be covered by a desk.

BAKEWELL CHURCH FROM THE SOUTH-WEST.

"We learnt in conversation that the advice of architects and archæologists who have expressed opinions on the subject has been against this plan of supporting the building as it is, and in favour of taking down this part of the fabric as a preliminary to its thorough restoration. We, on the other hand, record our firm conviction that such a building as this cannot be taken down without great and irreparable loss to its old character and genuineness as a piece of fourteenth-century architecture. Its original workmanship and its present condition are such that while with care and attention it is capable of enduring for a great many years, much of it would have to be replaced with new work when once taken to pieces. We think the present plan of supporting it with girders an excellent one.

THE PEACOCK INN, ROWSLEY.

"The roof timbers, when examined from within, show a decided tendency to thrust outwards, and it would, in our opinion, be well to put at least two tie-rods across at the wall plates, and going right through the framing, and spiked to the sides of the two principals.

"The lead on this roof is in want of repair, and we are glad to learn that it will be re-cast on the premises and put on again with an inscription recording the facts. Also that inscriptions in excellent character with borders recording three other re-castings of the lead in the seventeenth and eighteenth centuries will be carefully replaced. The substitution of modern rolled lead for cast is most mischievous.

"The woodwork of the present roof being weak with age, it is proposed to place over it a pine one, following its shape, on which to replace the lead—a very good plan, if carefully carried out.

"A certain amount of work has already been done to the lobby on the east side of the quadrangle, and its character seems to have been that of repair. Externally it does not show. The old beams of which the wall is composed have been supported by slender iron columns in the internal angles on each side of the doorway where they are hardly noticeable, and can, if desired, be readily hidden, which is not, however, necessary. The lead roof of this portion also is being repaired by re-casting the lead with new supports on the outside of the present rafters.

"The parapets to the part of the building which contains the kitchen were originally built of thin stone set on edge, and by reason of the very perishable nature of the local sandstone employed they are very weak and decayed on both sides, though the coping stones are in fair condition. There seems to be no alternative to rebuilding these parapets, which are of small extent and only visible from one point at the back. They are simply plain walls rising a few feet from the roof gutters, and should be rebuilt with stone of more durable nature, and the coping stones replaced. Some of the chimney tops require rebuilding; the old bricks should be re-used.

"Altogether the work is, it seems to us, being pursued on very wise lines, with a view simply to the reparation and upholding of the ancient work, and not to setting up copies or restorations of it. The only exception is the single new corbel in the kitchen. This, Alderman Tomson admitted, was unnecessarily large, and it could be reduced and thereby simplified and made plain and unobtrusive; the work done and contemplated would have our cordial approval.

"We are glad to see that electric light has been substituted for gas in the great hall, as the fumes of gas must be exceedingly bad for the priceless tapestry, especially the one made about 1500, to fit the wall at the back of the dais, but it is to be regretted that the simplest possible form of electrolier was not used. The present enormous mass of lacquered brass in the chief room almost prevents one seeing anything else."

ST. PAUL'S.

WHAT MR. SOMERS CLARKE SAYS.

MR. SOMERS CLARKE, the architect to the Dean and Chapter of St. Paul's Cathedral, writes to the "Times" as follows:—

Many reports have been circulated about the security of St. Paul's Cathedral which are not more remarkable for their conflicting nature than for their lack of authority. The public have been alarmed by statements about serious cracks in the fabric. These there are. They, expecting to see daylight shining through the walls, go away disappointed. Then we see comforting reports that there is really no cause for anxiety. The expectations of the one set of people are as unreasonable as the other reports are untrue. Never having seen any representative of the Press, information that has been attributed to me is wholly imaginary. It has been thought well that I should ask permission in your columns to make a statement as to what is the real condition of things, and this I will try to do as briefly as possible.

The Settlement of the Dome Piers and the Western Towers.

Within the first hundred years after the structure of the cathedral was finished the immense weight resting on the foundations of the eight piers which carry the dome and on the foundations of its abutments caused those parts of the structure to sink a little. Most ingeniously spread out as are these foundations so as to cover the largest possible area, the earth beneath them has consolidated rather more than under those parts of the fabric less heavily loaded. The settlement thus caused has broken the eight arches and the windows of the clearstory over them in the nave, the choir, and the north and south transepts, where they abut on the dome piers. In the same way the very great weight of the western towers has caused them to sink. In sinking they have cracked the west front in a vertical direction through the great door, the window above, and the vaulted ceiling of the portico. They have also cracked through the wall of the chapel to the east.

On Settlements in General.

It is very rarely that one finds one of our cathedrals with towers or other heavy features wherein such parts have not been a cause of settlement. Such settlements are not necessarily a cause of serious insecurity, but it is obvious that by them the integrity of the edifice is more or less destroyed. Where the structure was intended to be tied together by continuous masonry the continuity is broken. Arches which should exercise their pressure in a definite direction begin to act in directions unforeseen.

In buildings of pointed architecture such deformations are less serious in result than in those where round arches only are made use of. Pointed arches will undergo the most extraordinary distortions before they finally yield. The moment a round arch is broken or begins to spread the top flattens and its strength is jeopardized.

Iron Ties.

Above a 100 years since the development of the before-mentioned settlements gave cause for anxiety a system of great iron ties was introduced into St. Paul's Cathedral. These are placed so as to tie back to the dome piers the fronts of the north and south transepts; to counteract, in fact, the want of continuity caused by the breaking through of the arches and window already referred to. But another movement was also observed, and ties were introduced to counteract it. The transept fronts were found to be settling away from the main fabric and also themselves to be settling towards the east and west, this being demonstrated by a crack extending vertically through the windows. The damage in the south transept was greater than in the north, and has since developed. This we can tell by observing the size of the joints between the stones, many of which, after the fashion of the time, were run in with lead, now quite loose and not filling the joints.

What Wren Did.

Wren was well aware that the substratum on which the cathedral was to rest left much to be desired. The mediæval builders as a rule troubled themselves very little about foundations. Wren took all precautions that were known or practicable in his time. Examining the site of his new cathedral he found that, passing through the débris of Old London, he came, at a depth of some 15ft. or 16ft. from the surface, to a layer of clay, or "pot earth" as he terms it. This varied from 6ft. to 4ft. in thickness. The pot earth rests on a stratum of sand (not at all solid) mixed with gravel stones, the lower part wet. Below this, and some 35ft. to 40ft. from the surface, lies the London clay. Wren thought it out of the question to carry all his foundations down to the London clay. He rejected piles, foreseeing that wells or other things might more or less drain off the water from over the clay, and knowing that unless piles remain always under the same conditions they must certainly rot. He thought best, by spreading the foundations, to float the cathedral on the bed of "pot earth," and thus he built, never dreaming of the desperate attacks the sandy substratum under the pot earth would have to sustain. Had this substratum been left undisturbed, although there would no doubt have been some movement on the structure on the lines of the chief settlement we now see, there is no reason to apprehend that the movement would have continued.

Of the Trouble caused by Sewers

The very necessary increase of sanitation and of road improvement was probably the first serious attack on the substratum. The ground on which the cathedral stands slopes rapidly towards the south and the west. It is fairly level to the east and north. In all directions sewers were made and at various depths. It was proposed in 1832 to bring a sewer at some 30ft. below the surface through the churchyard on the south and east sides of the cathedral. Immediately the danger to the fabric that this would cause was pointed out, the Corporation of London, which has ever shown the greatest consideration for the cathedral, ordered the works to be stopped. The deep drain in these places has never been made. Unfortunately it was carried up Godliman Street almost into the churchyard, and must have done not a little to drain the substratum, especially near the south-west tower. The level of this sewer is considerably below the bottom of the foundation of the cathedral walls.

And the District Railway.

Some thirty years ago the Metropolitan District Railway was made under Queen Victoria Street, cutting a large gash along the southern slope of the hill on which the cathedral stands. The railway at its nearest point is but 530ft. away—that is, just about the length of the cathedral. The railway is, in fact, a huge trench cutting into the sandy stratum. The disturbance caused by making such a trench was very great. There cannot fail to have been a considerable change in the water-bearing conditions just above the London clay. A cutting once made the water will always follow it. Below the underground railway there has since been pierced the tube for the Waterloo and City Railway. How far this is down in the London clay I do not know.

A Riddled Site.

We find then that the southern slope of the hill on which the cathedral stands is fairly riddled with excavations of one sort and another. There are sewers, the underground railway and a tube at a lower level. The most remote of the railways or tubes is but just 500ft. from the cathedral foundations. Those who have studied earth movements, the result of deep excavations, know that a great deal of dislocation takes place in a line diagonally right and left of the parts excavated. The fact that the underground railway is 500ft. off does not ensure that resultant earth movements do not come much nearer to the cathedral.

Fresh Indications of Settlement.

During the last twenty years fresh indications of settlements have been showing themselves in the walls of the church. The movements are still in progress. Those most to be observed are on the south side. The worst are in the south transept. The way in which these have moved since the ties of 100 years ago were inserted shows that the settlements are due not to the thrusting of arches in the fabric itself but to the subsidence of the mass which at this place consists of a wall from 8ft. to 10ft. thick, 130ft. long, 130ft. high, and weighs between 12,000 and 13,000 tons.

The arch of the window head is so broken that the great keystone carved with a cherub had dropped more than 2in. from its place. Before the repairs just completed it was quite loose, and was merely held by the pinch of some stones at the back and by the ironwork of the window. The wall has, in fact, split vertically through the doorway and window over it, sinking gently in two masses right and left. The coffered window head we see from inside the church is quite out of shape, and the same dislocation in a less degree may be observed over the windows of the clearstory adjoining. The massive iron stanchions intended merely to resist the wind and to give rigidity to the lead glazing are now bent by the weight of the window arches pressing upon them. It would be going into too much technical detail to state in your columns where there are other indications of movement. It is enough to say that they exist on the south side of the church, and we know that some of them have continued to develop during the last three years. They are still developing.

The Future.

If we suppose it possible that the subsoil be left from thenceforward untouched, the settlements are of sufficient importance to make it necessary not only to watch them carefully but to expend considerable sums (out of a very limited income) on their repair. During the last four years the chapter has had to find the money for such works. But now comes the attack by the electric railways. One of these—the Victoria, City and Southern Electric Railway—proposes to come under the churchyard, taking a line between the cathedral and the great warehouses on the south. The centre line of the tube or tunnel would be about 40ft. from the south-west tower and 50ft. to 60ft. from the south transept. Another—the Piccadilly and City Railway—proposes to pass under Carter Lane—that is to say, under the first street immediately south of St. Paul's Churchyard. The centre line of this tunnel is at a distance of 170ft. both from the south-west tower and the south transept. It would be a little nearer to the cathedral than the width of the west front. It would be but 300ft. from the centre of the dome.

The "Tube" and the Cathedral.

We must not forget that the cathedral is already attacked on the north. Here is the tube of the Central London Railway, and this is but 460ft. from the centre of the dome. We know that this tunnel, passing as it does close to Bow Church, has already in the few short years since it was pierced caused the steeple to overhang 1ft. 9in. towards itself. Bow Church tower is a mere toy compared with the enormous weight of St. Paul's. The area of one of the western towers of St. Paul's is just double the area of Bow Church tower.

The Chief Danger to St. Paul's.

But the chief danger to the cathedral lies by no means only in piercing the tubes or in the vibration from passing trains. The tubes may be sunk ever so far down, the vibration may, and no doubt will, be very much reduced, but wherever the tube may be a tremendous hole must be made for the public to get at it. Then, when the bottom is reached there are footways, cross passages and all manner of subsidiary excavations. Who knows what underground streams may not be tapped in making these big shafts or how much superincumbent weight may affect excavations? The Piccadilly and City Railway proposes to place its terminus under the space where Cannon Street is crossed by Queen Victoria Street. The tunnels in which is the terminus must necessarily be of considerable length, and can hardly fail to come within 600ft. of the cathedral. The great hole and excavations to the east are, however, not more dangerous than would be those to the west on the slope of Ludgate Hill, where a station is projected. There is already, on the north, the Post Office station of the Central London Railway. The results of these big excavations and disturbances would very probably not show themselves seriously in the fabric of the cathedral for a good many years; but what is, let us say, fifty years in the life of a great national monument, one of the most magnificent buildings in the world, and which, taken due care of, may last for 1,000 years or more?

Mr. Charles Reilly proposes, as a means of rendering the cathedral secure against any dangers occasioned by underground railways or sewers, that the building should be supported on the bed of blue clay 35ft. below the surface. The cost of the underpinning necessary he estimates at £220,000. He has recently done the same thing to the hall of one of the City Companies, within 50ft. of the Stock Exchange itself, when isolated stone piers weighing 300 tons were safely underpinned to a depth of 50ft. without cracking the plastering in the rooms above.

ASYLUM BUILDING.

THE LUNACY COMMISSIONERS' REPORT.

IN their fifty-fifth report, dealing with the question of the provision of cheaper asylum accommodation, the Commissioners in Lunacy observe that the rapid rise in the cost of asylum construction due to the advance in the price of materials and labour has accentuated the importance of a careful consideration of present methods and future possibilities of asylum provision. What seems to be desirable is the greater differentiation of asylum buildings, in the provision of everything that the hospital system can secure for the recoverable and acutely sick, and of simple inexpensive buildings, either in the form of cottage or otherwise, for those who need a home under supervision and nursing should they be or become sick. In this way it would be possible to limit the waste of expensive machinery, and enable due provision to be made without imposing an intolerable burden upon the public. "It may be that the provision of less expensive buildings for certain classes of patients may assume new forms and developments by virtue of modern methods of manufacture, which have succeeded in producing, bulk for bulk, greatly increased strength of material. By the use of these, perhaps in one-storey buildings, there might possibly be introduced into asylum construction a new element of cheapness without any sacrifice of comfort, safety or convenience. In each of these and in other similar ways it may become possible to diminish the cost of asylums, while leaving them suitable for all their purposes, and by so much to lessen the public burden, which is growing so rapidly and becoming so onerous. But in addition to these we have no doubt that those who represent the local authorities in asylum matters should exercise more careful scrutiny and control over the decorative fittings and finishings of new asylums and of additions to old ones, and, while securing adequate comfort and brightness and cheerfulness of aspect, excise that which is unnecessary, unsuitable or redundant, a process in which they will have our hearty support. While bearing in mind the primary and fundamental objects of asylums, and desiring in no way to suggest any limitation of their proper equipment for the discharge of their legitimate functions, we view with some concern a growing tendency to extravagance in some of the details to which we have referred, and especially in those parts of the buildings which are devoted to official and administrative purposes, and we have thought it desirable to prepare and issue the following circular: 'In view of the rapid increase in the price of labour and materials, and the corresponding cost of asylum construction, we think it necessary to urge the need of such strict economy in the building, finishing, fitting and furnishing of asylums as is compatible with the adequate discharge of the objects which are contemplated in their provision—namely, the cure of those who may recover, and the safety and comfort of those whose prospects may be less hopeful. While it is necessary to provide solid and substantial structures of adequate but not superfluous strength, and cheerful and comfortable accommodation suitable for the classes of persons who are to be housed and treated within them, all extravagant and, therefore, unsuitable decoration both inside and out should be carefully avoided; and we shall regard it as our duty to advise the Secretary of State to refuse his approval of all plans in which there is an obvious departure from this principle.'"

YOULGREAVE CHURCH, DERBYSHIRE, FROM THE SOUTH-EAST.

IMPROVEMENTS AT NORTHAMPTON OPERA HOUSE.

DURING the past few weeks extensive improvements have been effected in the Northampton Opera House. The theatre has been thoroughly cleaned and re-decorated, additional pit exits have been provided, and orchestra stalls have been erected. The chief alteration concerns the stalls. Several of the front rows of seats in the pit were removed, and in their place three rows of orchestra stalls, accommodating sixty-two persons, have been erected. The orchestra accommodation has also been increased and improved. At the rear of the pit two additional exits leading into Swan Street have been made, and an extension of the pit accommodation has been decided upon and will shortly be commenced. The pit seats are now placed in straight rows instead of being curved. The electric lighting has been installed in the pit and in various other parts of the theatre, and the pit has been re-papered in a rich red shade. The fronts of the gallery, dress circle and boxes have been thoroughly cleaned and renovated. The "crush room" has been re-papered, re-carpeted and re-decorated, and various other minor improvements and renovations have been made in other directions. These changes, however, are but an instalment, for Mr. Lockwood is looking forward to being able to still further improve the theatre at an early date. The work has been done by Messrs. A. R. Dean, Ltd., of Birmingham.

THE PRACTICE OF STACK BUILDING AND BOILER SETTING.—II.

BY JOHN G. DUNN (INSTRUCTOR IN BUILDING CONSTRUCTION).

(Concluded from p. 526, No. CCCXXXIX.)

A BINDING of some sort is essential for a stack. Concrete, terra-cotta blocks bound or tied in with hoop-iron, or cast-iron heads may be used.

During a recent storm the wind was blowing at the rate of 64 miles an hour and showing a pressure of 22lb. per sq. ft. at 9.45 p.m. and 29lb. at 12.30 a.m. Suppose the wind to be blowing not steadily but in concentrated gusts upon the surface opposed to it. If one gust causes the structure to oscillate, and just as it has passed through this oscillation and is about to commence another and smaller one, a second gust strikes it, the energy of this will be added to what remains of the energy of the first, and by the continuation of such action the force of the oscillations may be so increased as to cause the structure to overturn, although quite stable enough to resist the steady continuous pressure of the wind. Increasing oscillation is then a more distinct warning than amplitude of oscillation, for as long as the amplitude does not increase we may consider the work safe; when it does increase, however, the fate of the work will depend upon the duration of the storm. If the wind blows against a flat surface at right angles to its course, the whole effective pressure will be the pressure of the wind per sq. ft. multiplied by the area acted upon. This will not, however, be the case with a round surface such as one side of a cylindrical column. Let the wind be assumed to be blowing in the direction of the arrow on the accompanying diagram (Fig. 1) with a force of P pounds per super. ft. At the point R the wind will exert its full force on the surface. But take two parts of the surface having their centres A and B at 45 degs. from R, and examine the effects of the wind blowing on these parts. Its force will be expended partly in normal pressure at right angles to the surface, partly in continuing the motion of its particles, but in a direction at right angles to that pressure. Draw the radii A C and B C at right angles to tangents A D and B E. An equal surface being taken, the wind forces will be equal. Let A F and B G represent these forces. Complete the parallelograms. Those forces pressing towards the centre of the column will be represented by A L and B H. Produce these and make C N and C M respectively equal to A L and B H. Complete parallelogram C M O N. The resultant, C O, which is the resultant pressure of the two forces at A B, is equal to one of them, A F or B G. The force then in the direction of the wind varies from the maximum at R to O at S′ S′, and it may be shown that that total pressure on the column will be the wind-pressure multiplied by the height of the column and by its radius.

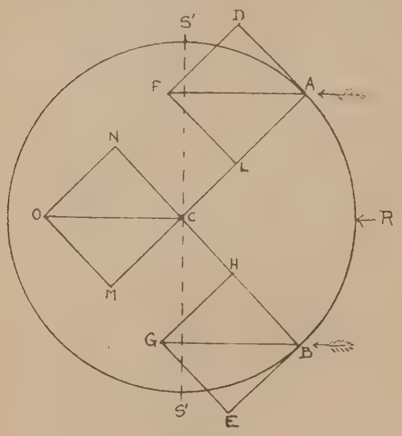


FIG. 1.

In the same manner it may be shown that if the wind blows in the direction of one of the diagonals of a square chimney, the whole pressure upon it will be that due to the wind blowing at right angles to one of its sides multiplied by ·707. For hollow square (see Fig. 2): $\frac{T}{6}$ from F, $\frac{T}{3}$ from middle of joint. For hollow circle (see Fig. 3): $\frac{T}{4}$ from f, $\frac{T}{4}$ from middle of joint.

Formula: $W \times \frac{T}{6} = P \times \frac{H}{2}$ for square, and $W \times \frac{T}{4} = P \times \frac{H}{2}$ for circle.

Other formulæ—
Prof. Hawksley:

$$P = \frac{V^2}{200}$$

V=Velocity in miles per hour.
P=Pressure in lbs. per sq. ft.

Rouse:

$$P = \frac{V^2}{20}$$

V=Speed of wind in ft. per second.
P=Pressure in lbs. per sq. ft.

The pressure in both cases is at right angles to the direction of the wind on every sq. ft.

Lightning conductors are very essential for the protection of stacks. Engineers differ about the best metal for a lightning conductor (that is, taking cost into consideration), but all are agreed that copper has the best conductivity for any given sectional area. The scale runs thus:

	Conductivity.
Copper	100 per cent.
Silver	99 ,,
Gold	80 ,,
Zinc	29 ,,
Platinum	18 ,,
Iron	17 ,,
Lead	8 ,,

This shows that you can use a much lighter section of copper than iron, and as it will be much easier to fix the difference in the cost of the two is not very great. Some persons contend that there should be as many fine points (say of copper, and plated with gold or nickel) as possible at the top, while others prefer a bow or double-bow of, say, galvanised iron across the top of the chimney. A conductor should be flat, not circular, in section, and perfectly stranded (especially if of copper). It should be attached to, but not insulated from, the building which it is intended to protect. There should be as few joints as possible, and where these occur they should be soldered. The conductor should terminate 10ft. or 20ft. from the foundation, and should slope downwards in the ground to a depth of at least 6ft. The end of the rod is soldered on to a 2ft. or 2ft. 6in. sq. copper plate. This is embedded in the earth and covered with 2ft. or 3ft. of coke, so as to form a drain and keep the whole moist. The holdfasts should be of the same material as the conductor. They vary in form.

A good form consists of two holdfasts batted in with lead, with a cover-plate recessed to fit the conductor bolted on the face.

The following are some particulars of the chimney at St. Andrew's Cross Electricity Works: Height, 200ft.; extreme width, 20ft. 4in. at bottom and 11ft. 9in. at top; brickwork, 14in. thick at top, with an additional 4½in. every 30ft. down = 1½—2—2½—3—3½—4—4½. Brick lining of firebrick additional 9in. thick, 50ft. high, with an air-space of 9in. This is built with a batter of ⅛in. per ft. External batter ¼in. = 1ft. or 1 in 48. Octagonal on plan at bottom, with two air conduits on each side, to keep the interior of the brickwork cool. The top of the lining has a few chequered courses into the main wall, this being topped by a double course of fire-tiles. At the bottom the work was built plumb inside for 15ft. high. Finished with a coping of terra-cotta blocks cramped together. The lightning conductor consists of a flat copper band 1¾in. × ¼in., one being run up on each of two sides. These again are each split into two about 20ft. from the top, and have forked terminals.

Another stack 125ft. high has 25ft. of 9in. work, with an additional 4½in. in every 25ft. down: 20ft. of 4½in. firebrick lining and a 4in. cavity (ventilated).

Referring to Tennant's stack, the formula, considering weight of stack to resist storms, is: $W = C\frac{a\,h^2}{b}$, where w = weight; a = average width of shaft; h = height; b = breadth of base; C = constant 56 for a square chimney, 35 for octagon and 28 for round.

London Building Act regarding chimney shafts:—

Unless the Council otherwise permit, every chimney shaft for the furnace of a steam engine, brewery, distillery or manufactory shall be constructed in conformity with the following rules:

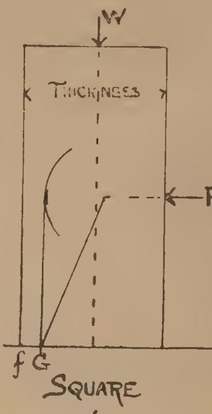

FIG. 2.

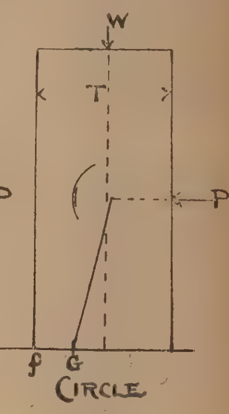

FIG. 3.

(1) Every shaft shall be carried up throughout in brickwork and mortar of the best quality, and if detached shall taper gradually from the base to the top of the shaft at the rate of at least 2½in. in 10ft. of height.

(2) The thickness of brickwork at top of shaft and for 20ft. below the top shall be at least 9in., and shall be increased at least one half-brick for every additional 20ft. measured downwards.

(3) Every cap, cornice, pedestal, plinth, string-course or other variation from plain brickwork shall be provided as additional to the thickness of brickwork required under this Act. And every cap shall be constructed and secured to the satisfaction of the district surveyor.

(4) The foundations of the shaft shall always be made to the satisfaction of the district surveyor on concrete or other sufficient foundation.

(5) The footings shall spread all round the base by regular offsets to a projection equal to the thickness of the enclosing brickwork at the base of the shaft, and the space enclosed by the footings shall be filled in solid as the work progresses.

(6) The width of the base of the shaft if square shall be at least one-tenth of the proposed height of the shaft, or if the same be round or of any other shape then one-twelfth of height.

(7) Any firebricks built inside the lower portion of the shaft shall be provided as additional to and independent of the thickness of brickwork prescribed by these rules, and shall not be bonded therewith.

Boiler Setting.

As a rule, engineers supply working drawings with their boiler, but a few hints regarding the different methods of setting may be helpful to us as architectural craftsmen.

Draught is caused by the difference in weight between one body of air and another, and the intensity depends on the amount of that difference. With steam boilers the chimney is the chamber with the hot gases, and the space outside the furnace is the chamber with the cold gases. Two columns of air of equal height and area and temperature would remain at equilibrium. When, however, the furnace gets heated and the hot gases are driven up the chimney, the gases in it are at a higher temperature than the air in front of the furnace. The rapidity with which they ascend will depend on their difference of temperature. With the same temperature inside the chimney, one twice the height of the other will have twice the difference between the pressures at the foot.

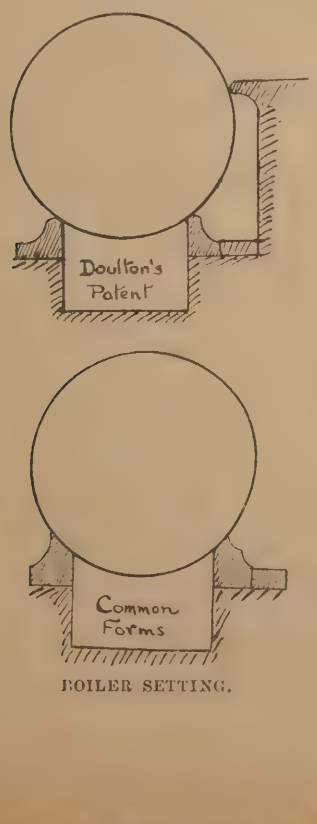
It thus follows that the difference of pressure, and thus the draught of the furnace, is directly proportional to the height of the chimney.

In many cases the waste gases coming along two different passages about the boiler meet together and reach the outside air by a common chimney. If two flues enter the common flue by orifices opposite each other, the influence of their currents on one another will be nil (if they have equal rapidity), because the whole will pass as if they had struck against a plane fixed between them. If, however, the currents be unequal, that which has the greatest rapidity will reduce the speed of the other, and will have the effect of closing the orifice through which both should flow. These streams of air in this respect act on each other like streams of water; under such conditions a diaphragm will have the effect of making the stronger current assist the weaker and cause it to have more draught, thus producing an equalising effect.

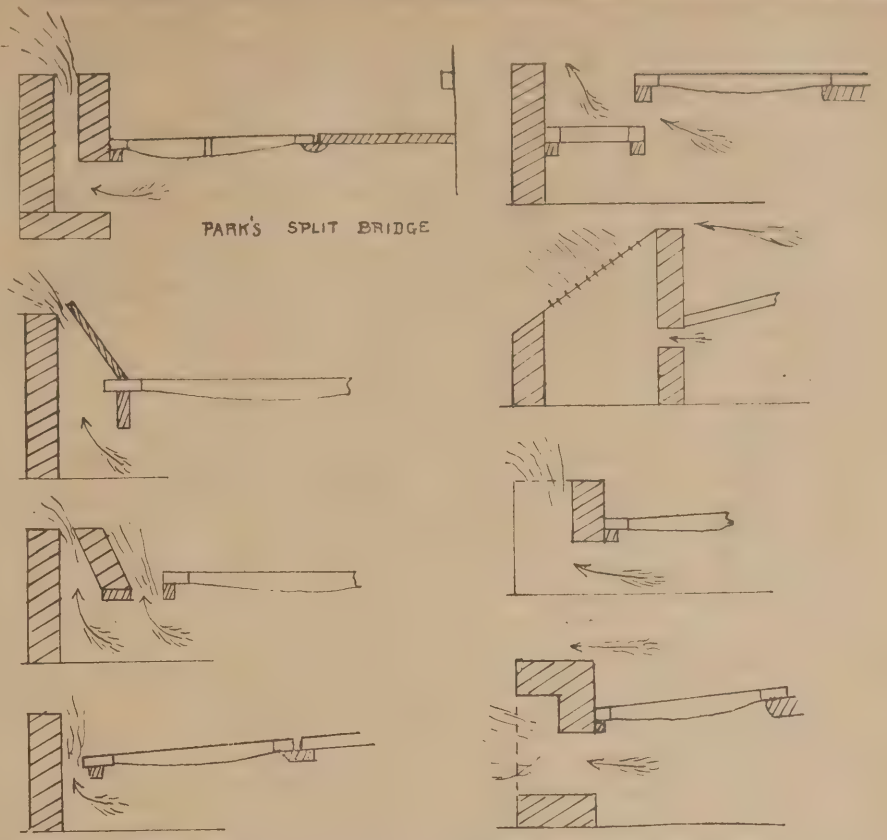
Right angles should be avoided as much as possible, and all necessary angles rounded.

The finer the class of work in boilers and chimneys the less will be the friction.

Examples of Boilers.—Boilers are of very different forms. For land stationary purposes, by far the most largely used in this country are those of the Lancashire (double flue), Cornish (single flue) and Galloway types. Water-tube boilers of the Babcock and Wilcox type (Stirlings, &c.) are, however, being adopted to some extent, especially in connection with electric lighting and other work where the demand for steam is intermittent; and with the existing tendency towards the use of higher steam pressures this form of generator is likely to be much more extensively employed. Cornish boilers are made of 4ft. to 6ft. diameter, and Lancashire from 6ft. to 8ft. 6in The chief objects to be aimed at are: Accessibility of the flues for examination and cleaning; minimum of brickwork in contact with the plates so as to avoid as far as possible concealment of the plates and the harbouring of moisture; deflecting and distributing the gases in such a manner as to obtain the greatest efficiency from them, and at the same time obviating as far as practicable unequal expansion and contraction of the shell without checking the draught. In good practice it is usual to seat the boiler on special fireclay blocks, so that it is supported on a narrow surface on each side, the surface in contact with the plates being from a mere circular ridge up to 3½in. or 4in. wide in the ordinary blocks. The blocks are shaped so as to support the weight without crushing, and to give the greatest amount of room in the side flues and conduct away from the plates any moisture which may run down the sides of the boiler. Special arched fire-tiles are used for the flue covers. The products of combustion on leaving the flues should pass, first under the bottom of the boiler, splitting at the front end and flowing along the side flues to the back and thence to the chimney. By this means the bottom and sides of the boiler are maintained at a more equable temperature than would be the case if the gases passed through the side flues first. If they pass through the side flues first the draught will be downward, thus reducing the heating area; the high side flue is thus causing more harm than good because of its low temperature.



BOILER SETTING.



DIFFERENT FORMS OF BRIDGES FOR THE PREVENTION OF SMOKE. MECHANICAL MIXTURE OF AIR AND GAS CONTINUOUSLY AFFECTED.

The damper if in a flue with too much draught should not be allowed to stand, or rather hang, nearly its depth in the flue, as the gases will not heat more than the depth of the open space along the side flue. The best dampers rotate on a central axis, and thus do not affect the height of the draught. The top of the side flues should not be above the level of the furnace crowns, and the seating blocks and saddle covers should not come in contact with the lines of rivets of longitudinal seams of the shell. The front cross-wall should be clear of the shell angle-iron and recessed (if need be) for an elbow-pipe to the blow-off. All external walls should be built with a batter (rather more than that for the stack) to allow expansion and not show hanging. All parts exposed to heat should be built with firebricks set in fireclay (no sand being used). The other parts may be built with good shell mortar (3 to 1). Great care should be taken to have the bricks alike in thickness, so as to secure good transverse bond; and as the fireclay work does not stand compression well it should be built tight. It is preferable to have the common bricks a little thinner than the firebricks.

No lime should be allowed to touch the plates of the boiler, as it eats away the shell. At the front, where the fireclay would get washed out, I have often used Portland cement (Roman cement is an excellent covering to iron and steel, and so is best for this part to withstand the weather and protect the joint).

Boilers should have a bed of concrete over the area beneath them. This should be protected in the flues by a firebrick paving. The front, to which the boiler should have a slight dip, should be drained not only for blow-off water and boiler-cleaning, but also for surface water.

Different arrangements have been used to prevent the ashes falling in the pit in front of the boilers. The best I know of is a cast-iron cradling piece, which fits the underside of the boiler and has an angle ledge on which to rest the front footing plates.

I could not close this paper without alluding to the economiser and smoke-preventer. An economiser consists of a collection of cast-iron tubes placed directly in the flues, so that the hot gases may play round and give up some of their heat to the feed water which is pumped through these tubes. An arrangement for cleaning the tubes is now fitted up with Green's Economiser (the most popular one), and a saving of from 20 to 30 per cent. of coal is secured by its use.

Various inventions have been tried to prevent smoke; and while I believe the smoke can be lessened, or rather the coal can be burned without smoke, still we must remember what was pointed out in an earlier part of the lecture, that complete combustion can only take place where you have practically perfect fuel, and not with the common forms of coal used for steam raising.

In the apparatus employed at the Blind Asylum there is a spray of water falling on the particles of soot, flue dust, &c., in the flue. A fan is fixed above the flue giving mechanical draught with a small stack.

HOUSING AT MANCHESTER.

THE SUTTON BEQUEST.

A WRITER in the "Manchester Evening Chronicle" suggests that the solution of the housing problem in that city might be greatly assisted by the magnificent bequest of Mr. Sutton, who has left nearly two millions to be devoted to the better housing of the working classes in London and some of the largest provincial towns. This writer says: "That there is a housing problem in the city has been recognised for very many years, although it was not until about 1885 that any serious work was done to cope with the question. Under the Labourers' Dwellings Improvement Act, 1875, and other special Acts since passed to facilitate the improvement of insanitary areas, a number of improvement schemes have been carried out. Action under these Acts was commenced in 1889, when the area bounded by Cornwall Street, George Leigh Street, Bengal Street and Oldham Road was declared an unhealthy area, and was compulsorily purchased by the Corporation at a cost of £97,481. At the same time an area in Pollard Street was bought for £9,546. The Oldham Road scheme is the most important that has been undertaken by the Corporation. The contract price for the whole of the buildings now in existence was about £70,000, but this was greatly exceeded in the actual cost. The plan adopted was to divide the work into two. There is Oldham Road Block No. 1, which is a building of five storeys round a quadrangle, with 285 tenements and accommodation for 848 persons, and Oldham Road Block No. 2, which has accommodation for 425 persons. At Pollard

Street the arrangement is very similar to that in Oldham Road, and the accommodation is for 448 persons. Other schemes which have been taken in hand by the Corporation include those dealing with the Harrison Street area (lodging-house for men, with accommodation for 363 persons); Chester Street area (tenement buildings, two storeys high, with accommodation for 324 persons); and Pott Street area (tenement dwellings, with accommodation for 321 persons). Thus the Corporation since 1891 has wiped out some hundreds of unhealthy dwellings under the special Acts, and has built new houses and tenements for no fewer than 2,729 persons.

"Of course it cannot be pretended that this work, great as it is, really touches more than the fringe of the housing problem. But it has been honest work, whether under the local or the general law, and has evidenced a desire to do something to alleviate the miserable conditions under which many of the poor have to live. Comparatively little has been done in the past few months, but the hope of receiving assistance from the Sutton Trust should serve as a stimulus. If any money is received it will be the first halfpenny which has been used in Manchester for the better housing of the poor other than that provided by the rates. It is badly wanted. With a considerable grant, say, of £100,000, such work might be done in the provision of new dwellings built on now sparsely-occupied land that the Sanitary Committee could continue its crusade under the local Act without further interruption, and thus add considerably to its already good work at a trifling cost. It is too early to speculate as to what policy will actually be pursued by the Sutton trustees. For the moment it is sufficient to show (as I have endeavoured to do) that Manchester has tried to improve the housing of the people, under the peculiarly awkward legal difficulties which exist, and has so far succeeded that any encouragement by way of a grant from the great bequest would be well deserved."

Restoration of Halesowen Church.—As much of the stonework of Halesowen Parish Church has recently decayed very badly, the Church Council have found it necessary to restore the external walls, some of which have been pronounced dangerous. The tender of Messrs. Collins & Godfrey, of Tewkesbury, for £1,025, has been accepted. The whole of the work it is deemed necessary to execute will cost £1,200.

FRIEDRICHSHOF.

OVER the main entrance to the Palace of Friedrichshof, near Cronberg, where the Empress Frederick died, there is written "Friederici Memoriæ," a simple dedication suggested by the architect, Herr Ihne. The building stands free and open to the gaze of all who dwell over the wide Frankfort plain, only sheltered on the north by the pine-clad Taunus range of mountains. Geheimer Hof-Baurath Ihne carefully studied the architecture of the mediæval castles of that part of Germany, and designed a mansion that combined all the typical features of the princely and noble residences of the locality with the improvements introduced by modern science and civilisation. Amongst the many details of interest in the construction may be mentioned the copper rain-boxes that form the headings of the pillars, most of them constructed after a pattern discovered by chance at Windsor by the deceased Empress when on a visit to the late Queen. The bronze knockers on the doors are also a feature of the ornamental decoration outside the edifice, which were collected from all parts of the Continent during a long period of years—most of them from Italy.

Entering the mansion by the main entrance one finds oneself in a spacious and imposing hall, which used to be a favourite gathering-place for the late Empress and her family and guests. She had here her own favourite chair at a table which is situated in front of a fireplace from Brescia, over which, carved in stone, are some appropriate lines from Dante. In the corridor flanking the hall is a music-gallery, and the walls downstairs, on the first storey and on the staircase are hung with valuable French, Italian and Spanish tapestries and interesting portraits and other pictures. The grand staircase leads to the late Empress's private apartments and to the adjoining State rooms. There is also a good deal of interesting wood-carving reflecting old associations with her native land of England, and of old armour on the staircase, and the long corridor above-mentioned is full of cabinets of great value. The suite of reception-rooms, which are entered from the corridor, face the south and form the front of the *schloss.* They consist of the library at the west end, the late Empress's private drawing-room, the large drawing-room, which opens on to a magnificent and spacious terrace commanding an extensive view over the Frankfort plain, from which at night can be seen the lights of the city; the assembly-room, and the large dining-room. The hooded fireplace in the library is interesting, and over the door leading into the late Empress's private drawing-room is a fresco copy of the well known picture shown in Cologne Cathedral. The dining-room has a large fireplace, with a marble bust of the Emperor Frederick standing in the centre of the mantelpiece, and forms the east end of the front suite of rooms. On this floor also are a small billiard-room and a small dining- or breakfast-room in which the royal family take their breakfast and afternoon tea. In the basement are two excellent kitchens—a large one for the family, and a smaller one for the servants. The smoking-room is at the top of the house.

Of the gardens it may be said that everything grows luxuriously at Friedrichshof, the rose-garden being a glorious sight in summer.

GENERAL VIEW OF CHARTRES CATHEDRAL.

CHARTRES CATHEDRAL.

CHARTRES CATHEDRAL, of which we give an illustration on this page, is one of the six "grandes cathedrales" of France (they are, Paris, Amiens, Bourges, Chartres, Laon and Rheims) and still retains intact thirteenth-century stained-glass lights large and small to a number exceeding 170; the harmonious glass of Gothic art at its best before the glass-pictures of the sixteenth century, beautiful in their own way, supplanted it even to its actual destruction. Chartres, of stone figures beyond 4,000, pronounced by the Abbé Bulteau to be "l'expression la plus complète de la pensée chrétienne et artistique du moyen âge." Chartres, of origin so remote that according to tradition so far ago as a century before the Christian era the Druids venerated on its site a wooden effigy with the dedication "Virgini parituræ." Of Chartres indeed all has been said, and it remains now to contemplate it with delight.

Berks Archæological Society.—A number of members of the Berks Archæological Society visited Wantage, Charney, Denchworth, Faringdon, and other places in the district recently. They inspected the old parish church at Faringdon. The president of the society, Mr. C. E. Keyser, pointed out where one style of building ended and another began, giving the approximate dates of each from about 1170. The church was one of the finest specimens of architecture in Berkshire, and the ironwork on one of the doors was not excelled by any in England.

THE RUINS OF BASINGWERK ABBEY.

By HENRY TAYLOR, F.S.A.

ON the occasion of the Chester and North Wales Archæological Society's recent visit to Basingwerk Abbey, Mr. Henry Taylor, F.S.A., read an interesting paper on the historic ruins. The following are extracts :—

During the Middle Ages devotees from all parts of Christendom were in the habit of visiting St. Winefred's Well. That a place of this religious celebrity should be long without its monastic establishment is hardly to be expected. . . . Accordingly we find that a society of monks did exist here previous to the year 1119, for it is said that Richard, the son of Hugh Lupus, Earl of Chester, was attacked by the Welsh on his pilgrimage to the Virgin's Well, and was obliged to take refuge in an abbey in the neighbourhood, but how long it had existed prior to that date we have no means of ascertaining. Nor is it known who the original founder was. It is probable the Cistercian Order was introduced into Basingwerk by Randle, the second Earl of Chester, A.D. 1131. He was one of the greatest benefactors to the abbey.

The following description of the remains as they were in 1846 is given in the first volume of the "Archæologia Cambrensis": "The general style of the remains of this religious house is the Early Pointed, corresponding closely in character to the time of Henry II. or the latter half of the twelfth century ; the masonry work is good and carefully finished, but there are very few traces of ornament remaining, not even any foliations being observable in the windows. The ruins consist of the abbey church, running from west to east, with a little deviation to the south, the refectory, abbot's buildings, barns and grange, and probably a portion of the porter's lodge. The church was cruciform, consisting of a nave, with a single aisle at each side, transepts without aisles, and a chancel, probably also without aisles. Of the edifice nothing is left standing except the southern transept and a few courses of the outer wall of the southern aisle ; nevertheless, from the traces of rubbish, &c., the plan of the church may be made out satisfactorily except for the chancel. . . . As far as can be guessed from the present condition of the church the nave was about 80ft. long by 25ft. wide, the aisles were 10ft. wide, the piers of the nave arches were circular or octagonal, massive, and supporting bold arches very slightly pointed, like those of Buildwas Abbey ; one pier and half an arch are still remaining. The transepts were 20ft. long by 17ft. wide. . . . The chancel could not have been more than 25ft. or 30ft. long, and was probably as wide as the nave. . . . The refectory, entered by a circular-headed door from the cloister, extended southwards from the wall of the southern transept, about 75ft. and 17ft. wide ; it had the dormitory above, and both apartments were lighted by small lancet windows with very wide and bold internal splays. . . ."

There is a legend that part of the roof of Cilcain Church came from Basingwerk and another that the roof of the ancient church of St. Mary-on-the-Hill, at Chester, was brought from the abbey. By taking measurements it may perhaps be possible to ascertain how far both these legends are correct. No doubt the roof of St. Mary's at Chester is Perpendicular work, but then Basingwerk appears to have had alterations and additions made to it about the time of King Henry VII. The late Mr. Loftus Brock, F.S.A., the learned architect of the diocese of Canterbury, in a paper read before the British Archæological Association, said of Basingwerk : "The style of the church is Early English of a good type, and when perfect of an excellent effect. The base of the south wall of the south transept seems somewhat earlier, and may be a portion of the 'small cell' which existed in the time of the Giraldus Cambrensis. It has a small round-headed opening into the sacristy, a chamber, however now quite destroyed, but we trace a round-headed and chamfered doorway which afforded entrance to it from the cloisters, and also a portion of a Perpendicular window, eastward." This latter, like the roof, may have been made in the time of Henry VII.

CARDIFF'S NEW TOWN HALL.

PROGRESS OF THE WORK.

ROUGHLY speaking, the value of the work done on the new town-hall and law courts in Cathays Park, Cardiff, up to the present is £30,000, out of a contract price of something like a quarter of a million.

On the town hall there are employed one manager, five foremen, thirty excavators, twenty-nine bricklayers, fifty-three masons (including the eighteen dressing stone at the yard in Penarth Road), five carpenters, two smiths, two plumbers, two painters, twenty labourers, five scaffolders, fourteen machinists and engine drivers, ten stone labourers and fifteen crane fixers. On the law courts there are three foremen, twenty-six excavators and concrete layers, twenty-eight bricklayers, four masons, eighteen labourers, eight crane fixers and five scaffolders.

The whole of the heavy foundations of the town hall are completed, and the masonry rises to an average of 3ft. or 4ft. above the ground-floor level. In the exterior walls of both the town-hall and the law courts the level for the foundation-stone has been reached—about 6ft. or 8ft. above the road level. The date for the ceremony attending the laying of the stones has not yet been fixed, but preparations are already being made for it.

So far the principal work has been in laying the foundations, and on the general line of the building they are laid to a depth of 9ft. below the ground floor. The ground was everywhere found to be good, and it was only in one part that a difficulty was encountered. This was in the north-west corner, where deep excavations for the boilers took the operations below the level of the sewer. Water came in, and with asphalt and concrete the boiler-rooms had to be converted into something like a submerged tank, and the foundations carried to about 15ft. below the ground floor level. On the eastern side, looking in from the exterior through the fresh-air openings to be left in the Portland stone frontage, half below the ground level, can be seen the circular spaces in the brick walling for the huge fans which are to ventilate the building.

The law courts are not so forward as the town-hall, mainly because the foundation work has been heavier, the walls thicker—especially where the cells are—and inside the four-square of the exterior there is the complicated body of foundations on which the various courts and rooms have to be built, instead of the large light areas that form quadrangles in the town-hall.

The contractors (Messrs. Turner & Sons) have employed the most modern machinery, with the view of saving labour as much as possible and also carrying out the work expeditiously. There are now in use, or shortly will be, eight electric derrick cranes each capable of lifting 5 tons. They are elevated 40ft. above the ground, and although the jibs or arms are 80ft. in length they are so arranged that they can all be worked at the same time for conveying material to any part of the building where it is required. There are in addition two locomotive steam cranes capable of lifting 5 tons, and a number of hand cranes, both fixed and movable. A 10-ton steam gantry which is employed has been specially constructed for the work, and travels at the rate of 200ft. a minute. The bulk of the stone is sawn and dressed on the ground, the remainder being dealt with at Messrs. Turner & Sons' works in Eldon Road, where they have more plant than on the Cathays Park. The electric cranes are, so far as we can ascertain, the first of the kind introduced into building operations. They are driven from one central dynamo, the contractors providing their own power for generating the current. One of the most interesting machines used in preparing the stone is a circular diamond saw, which cost £150. There are also four stone modelling machines. These are only a few of the most important items in the immense plant employed on the ground, the total cost of which is about £12,000. The contractors are confident of completing the work within the period specified, which gives them nearly four years from the present time.

Extensive Building Operations near Heath, Chesterfield.—The Hardwick Colliery Co. intend to erect 400 houses for the employees of the Holmwood pit.

THE WIDENING OF PICCADILLY.

OPINIONS OF TWO PROMINENT MEN.

CONSIDERABLE discussion has been going on in the public press (chiefly in the "Times") with respect to the proposed widening of Piccadilly by taking a strip off the Green Park, a scheme which we protested against when it was first mooted.

Sir Edward Poynter's Objections.

Sir Edward Poynter in a letter to the "Times" makes the following remarks : "Other correspondents have clearly shown, as is indeed obvious, that no widening of the road between Berkeley Street and Hyde Park Corner will have any effect in relieving the obstruction to the traffic where it occurs at Hamilton Place or to the east beyond Berkeley Street as far as Piccadilly Circus, while on the other hand the part of Piccadilly which it is proposed to alter is precisely that part which is wide enough for the traffic to flow quite freely. The scheme is really unintelligible from any point of view, for it will certainly be no improvement to the appearance of Piccadilly to cut off a portion of the Green Park and destroy a number of the fine trees which constitute the beauty of the thoroughfare. . . . I have always considered that these trees give a peculiar charm to that part of Piccadilly ; they are a survival of a time when London was a less hideous Babel than circumstances have now made it, and linger there as a reminder of a past and more tranquil condition of life. . . . It may be objected that it is proposed to enlarge the space in front of Buckingham Palace ; but it has been settled almost unanimously by the public voice that that spot is the most appropriate place for the National Memorial to our late Queen, and if the monument, which must necessarily be of an imposing size, is to be properly seen it must have a certain space around it of a symmetrical character of which it must form the centre, and this, unfortunately, cannot be done without some encroachment on St. James's Park. It is to be regretted, but the omelette cannot be made without some breaking of eggs. The alteration of the Mall is another affair, and may well be postponed until the monument and the new piazza are complete, when it will be seen whether an alteration is a real necessity. The big boulevard mania has been the ruin of many a beautiful and characteristic quarter in fine old foreign towns. A street or a square are not necessarily, as many would appear to think, more beautiful for being of exaggerated size ; on the contrary, they are apt to make vast and tiresome blanks as inconvenient as they are monotonous. Any tendency to this form of megalomania is to be avoided, and, above all, our unique parks, with their truly sylvan scenery, are to be respected."

Sir John Wolfe Barry revives his Subway Scheme.

In connection with the proposed alteration to Piccadilly Sir John Wolfe Barry revives his scheme (suggested two years ago at a meeting of the Society of Arts) for constructing a subway at Hyde Park Corner so that the east and west traffic (vehicular and pedestrian) might pass clear of the north and south traffic.

Eastward of Down Street, Piccadilly rises to Hyde Park Corner to the extent of 12ft. by a gradient of about 1 in 50, and the Knightsbridge Road falls westward from Hyde Park Corner to the extent of 20ft. by a gradient of 1 in 40 towards Wilton Place. "It would thus be easy," says Sir Wolfe Barry, "by utilising for the purpose a narrow strip of the Green Park to construct a sunken road on the south side of Piccadilly descending gently towards the west by a gradient of 1 in 70 to join a covered way which would extend under the wide space opposite the gates of Hyde Park and under the junction of Grosvenor Place. The covered way would be about 340yds. in length, and would bend gently to the north in order to avoid St. George's Hospital and to emerge on the north side of the Knightsbridge Road at a spot slightly to the west of the hospital in the narrow strip of land of Hyde Park between the railings of the park and the road in the park leading to Knightsbridge Barracks. The sunken road would rise from the west end of the covered way by a gradient of 1 in 50 so as to join the

Knightsbridge Road opposite Wilton Place. . . . The sunken road and covered way which I propose would be 70ft. in width, which, seeing that no shops or houses would open on to it, would be ample for all purposes. I may mention as an example that the width of the Tower Bridge is 60ft. The side walls of the sunken road might be treated architecturally by panelling or otherwise, and be surmounted by ornamental stone balustrades, while both the walls and the covered way should be faced with glazed bricks. I am convinced that under proper architectural guidance the whole work might be made very handsome."

New Patents.

These patents are open to opposition until September 17th.

1900.—**T-squares.**—14,437. H. W. ROBERTS, Kingston House, Newmarket. A strip of wood, to act as a knob, is fixed on the blade at the centre of gravity: the object being to make it easier to move the T-square about. A further attachment enables the square to be raised or lowered conveniently.

Utilising Sewage Sludge.—16,104. C. J. WHITTAKER, West Bank, Lytham. The sludge or scum is mixed with coal dust and small coal in the proportion of 50 parts of the sludge to 50 parts of the coal. It is then made into briquettes.

Lever Cramp.—16,665. R. CHARLES, 113, Osborn Road, Sparkhill, Birmingham. This cramp is intended for holding pieces of wood against a bench stop. It consists of a base plate, having spikes on the underside, with a sliding fork actuated by a toothed sector lever. The cramp is hammered down on the bench and the lever moved sufficiently to press the fork tightly against the end of the wood, so securing it for working.

Drain Scrapers.—17,103. W. H. GIBBS, 126, Medway Road, New Brompton, Kent. The scraper consists of a series of sector-like blades mounted spirally on a shaft having a point screwed on its foremost end.

1901.—**Brackets for Guttering.**—10,272. T. BALLINGER, 32, Victoria Street, Wellington, New Zealand, and W. MILLIGAN, Barker Street, Wellington. The bracket is made of two pieces of galvanised iron folded so as to form feet through which screws can be passed, and with a pivoted hook to clasp the bead of the gutter.

Corner Strips for Plastered Walls.—10,407. W. F. PARKER, 1,135, Broadway, New York. A strip of metal is folded so as to be of T section, and is provided at intervals with clips for fastening to the walls. It projects at the corner and is plastered up level.

Gold Leaf.—11,699. W. H. COE, 230, Westminster Street, Providence, Rhode Island, U.S.A. Instead of being flat, the leaf is held on a reel, thus facilitating its deposit.

The following specifications were published on Saturday last, and are open to opposition until September 24th. A summary of the more important of them will be given next week. The names in italics are those of communicators of inventions.

1900.—12,887, WILLOUGHBY & FOX, crematorium furnaces. 14,417, HARRIS, apparatus for softening water. 14,774, PROCKTER (*Russell & Erwin Manufacturing Co.*), door checks. 16,311, WIGHAM & WIGHAM, means for connecting pipes. 16,494, CHATTWOOD, traps of sewers and drain pipes. 16,598, CLARK, acetylene gas generators. 17,709, HEIDEMANN & AXDORFER, gas burners for heating purposes. 19,853, CSÁKY, SÁRKÁNY & CENTIÀN, acetylene gas generator.

1901.—3,827, TURNBULL, machines for making expanded metal. 4,993, COWAN, gas chandeliers. 6,235, CUSTODIS, chimneys. 6,236, CUSTODIS, round chimneys. 6,375, SEAGRAVE, area ladders. 6,542, RÜHLING, apparatus for heating buildings and for preventing water pipes freezing. 9,468, JENKS, incandescent gas burners. 9,470, COUTURE & ROY, locks and latches for doors. 9,811, JONES & MOORE, flushing cisterns. 10,085, WALLACE & HILTON, sash balances. 10,093, WALLACE & HILTON, window sash balances. 10,104, WALLACE & HILTON, window sash racks. 10,948, ALLISON (*Palmer, Palmer & Palmer*), concrete walls for buildings. 12,296, HODKIN, combination of sinkstone, bath and boiler. 12,582, JANIN & JOLLIFFE, levels and plumbs. 12,610, BOULT (*Roquerbe*), building blocks. 12,633, THOMAS, firegrate. 12,636, JOHNSON (*Wellman Seaver Engineering Co.*), cranes.

EXPLORATIONS IN CRETE.

FURTHER WONDERFUL DISCOVERIES.

FROM time to time we have published reports of the progress made by Mr. D. G. Hogarth and Mr. A. T. Evans with the explorations in Crete. Now Mr. Hogarth has additional discoveries to announce. Speaking of the ruins, he says that the ordinary visitor, not a specialist, will prefer the ruin at Phæstos, on the south of the island, the full revelation of which has certainly been the sensation of the past spring. When Professor Halbherr announced in 1900 that he had begun upon a lesser Knossos no one expected that he and his Italian colleagues were to find in the event a palace more uniform, complete and imposing. What they have now laid bare stands alone in Crete as a spectacle. Even those fresh from the Mycenæ walls and the Treasury of Atreus, or even from Egypt and Syria, must admire the broad staircases and majestic courts of Phæstos, all on so intelligible a plan and preserved to a point which excites without overtaxing imagination.

The Palace of Phæstos.

The ruin covers a promontory of rock. Far below the greatest of Cretan plains stretches to Mount Dicte in the blue distance. Ida hangs right over the site, and through a gap in the screen to west show the snows of Sphakia, all three high masses of the Cretan relief being visible from this one point. In so superb a setting it is the more pity Phæstos should be so difficult of attainment. It may, indeed, be reached in an hour from the sea, but it is from the stormy, harbourless Libyan Sea. A steamer that had landed its passengers in the sunrise calm at Dybáki would often be unable to re-embark them at noon. One must ride, therefore, from Candia, making a three days' expedition, which will include also Gortyna; but the days are long and the paths are rough.

This palace of Phæstos is contained in a vast rectangle, obvious at first sight. There has been an earlier structure, but the building now revealed is of one character and period—that of the acme of the Mycenæan age in Crete. The visitor, approaching from the north, sees from a terrace the ruin below distinguished into three main quarters. On his left a broad stairway descends to a spacious paved court, containing an altar, and tiers of stone built up against the rock, evidently to hold an assembly. Flanking this on the east, and raised high above it, is the main building entered by a truly majestic flight of steps, extending the full width of the fine pillared hall at their head. But the entrance from without is from the opposide side, where a second and larger paved court stretches to the brink of the precipice Thence is admittance not only to the pillared vestibule and main hall, but to a double rank of galleries, and a maze of small chambers to southward, which form the third quarter. This great court, round which the walls and doors are admirably preserved, vies with the region on the west, where the two main stairways meet, as the best point of view on the site. To one standing in it the uses of the various blocks about it are manifest. Here were the living and sleeping rooms of men, there of women. Their common hall of assembly occupied half another side; the store galleries for the produce of the plain fill the other half. In the chambers to south they bathed, worshipped and lodged their retainers and their beasts.

Construction and Decoration.

All this is constructed of an excellent limestone, which has retained its sharp and square outlines, while the Knossian gypsums have crumbled and collapsed. The general impression, therefore, is the more convincing. But in details the inferiority of Phæstos is unquestionable. The elaborate frescoes, the sculptured friezes and the delicate plaster relief of Knossos were never here. Phæstos was provincial. It could command good stone and good masons, but not the materials or the men for the more subtle crafts. The noble shell was decorated only in the rudest manner, and its ruin is not comparable to that of Knossos as a museum of art.

Gorynia.

Certain problems raised by these mid-Cretan excavations it was hoped would be resolved by exploration in the east of the island, the reputed home of the Eteocretan aborigines; but what the Eteocretan capital, however, has failed to produce has come in abundance from two unknown sites, Zakro and Gorynia. These, to compare small to great, stand to one another as Phæstos to Knossos. Gorynia is the more complete and comprehensible. Indeed, it is the most perfect example yet discovered of a small "Mycenæan" town, uncontaminated with later remains, and at this moment after the two great palaces it is the "sight" best worth visiting in Crete. It was discovered by the perseverance of the American lady, Miss Harriet Boyd, who has been directing its excavation. Her workmen have now laid bare two narrow and tortuous streets, paved, and here and there ascending by flights of steps, on either hand of which are preserved to a considerable height houses of stone with party-walls of brick. This style of structure, often suspected on Ægean sites, has never been actually found before. The two streets converge towards a large building of fine masonry on the highest point of the knoll in which it is easy to recognise the house of the local chieftain or governor. The contents of these buildings are as interesting as their structure. If almost everything in precious metal has vanished, everything in bronze seems to have remained in the shape of weapons, tools and vessels. These houses, however, and their contents, though the more intelligible from belonging all to one primitive epoch, are for that reason less instructive than the scantier remains which Mr. Hogarth found at Zakro.

Zakro.

The main site has suffered greatly from denudation, but the ruins of the town show it to have been of more massive character than that at Gorynia. The houses have like party-walls of brick, but their outer walls are true "Cyclopean." They are also of great size; one, for example, was found to contain over twenty chambers, and, utterly ruined though it was, it yielded over seventy vases, besides many fragments and objects in silver, bronze and stone.

The most productive structure lies on the crown of the knoll, a fragment of a large group of connected blocks which probably formed the residence of the chief. In one room of this were found two inscribed tablets and a deposit of bronze implements and vases, among which one with decoration of shells and *marine* stars may claim to be the most graceful of "Mycenæan" ceramic products. Here, too, were found the hundreds of impressions of lost signets, lying in a heap as if once contained in a box. The separate types represented number 150, and illustrate in a remarkable way not only late "Mycenæan" glyptic art but also "Mycenæan" religious symbolism. For instance, several bull-headed human figures are noted, associated in two cases with women draped in the typical flounced skirts of the period, pre-Greek Minotaurs and Ariadnes. So well preserved are these impressions that it has been possible to take casts of them for study in England.

Conclusions.

The general result of east Cretan exploration seems likely to establish the fact that the Pan-Ægean civilisation, which it is agreed to call "Mycenæan," was foreign in that part of the island; and that the native civilisation, existing before and coincident with it, was much ruder than (and perhaps of different character to) that of mid-Crete. If this be really the case, an important inference must be drawn—viz., that the Knossian tablets have probably nothing to do with the Præsos inscription; and that the non-Greek language of the latter, if ever interpreted, will supply no key to the most interesting puzzle that Cretan excavation has supplied.

Builders' Notes.

Mr. E. Manning, of Nelson, has been appointed building inspector to the Coventry City Council at a salary of £130 a year, rising by annual increments of £10 to £150 a year.

London School Board and its Workmen.—The School Board for London has accepted the offer of the Accident Insurance Co., Ltd., 10, St. Swithin's Lane, E.C., to insure the Board from all liability for accidental injury to workmen employed on repairs to buildings and at the furniture store.

Building Trade at Kirkcaldy: Promising Outlook.—The Kirkcaldy Dean of Guild Court have passed plans for a large hotel to be erected near the railway station. Plans have also been approved for the erection of a four-storey block in place of the Victoria Hotel in High Street which will be taken down in connection with the tramway scheme. Several other properties in the High Street are to be reconstructed with a view to widening the street. The building trade in the district is very promising.

The Cement Trade.—The cement manufacturers in the Medway district are anticipating a lull in the foreign demand during at least the next six months. This view is being reflected in a weakening of prices, and there seems to be little doubt that stocks are accumulating. The incident is of interest for the sake of the light it throws upon the probable demand for structural ironwork for new projects in the near future. America itself is coming to the end of its contracts for certain descriptions of rolled steel work, with the result that there is an eagerness to pick up business abroad.

A Glasgow Contractor's Bankruptcy.—Alexander Rennie, sole partner of the firm of R. & W. Rennie & Co., builders and contractors, of Glasgow, was recently examined in bankruptcy. He stated that he had commenced his present business in 1896 with a capital of between £800 and £900, chiefly sunk in plant. His liabilities amounted to £4,235, and assuming that certain outstanding debts would be recovered his assets would amount to £2,340. He accounted for his bankruptcy by contract prices not meeting increased prices of material and increased wages. On one contract alone, that of Provan Gas Works, he lost £1,000, and had ultimately to give it up. The examination was closed.

Lead Poisoning: Professor Thorpe's Report.—Professor Thorpe's official report to the Home Office on the lead compounds used in glazing pottery is really a technical argument in favour of the proposed new rules, or rather one of them, to which the manufacturers have lodged an unqualified objection. In 1898 an enquiry into lead poisoning was instituted by the Home Office, and the special rules regulating the trade were amended. In 1899, as the result of extended enquiry, it was proposed by the Home Office that the use of raw lead should be abandoned, and that all lead should in future be "fritted"—that is, fused with other materials before being ground to form glaze—after the lapse of sufficient time to enable manufacturers to accustom themselves to the change. That proposition was accepted by the manufacturers. The new rules now proposed provide that the fritting of lead shall be made compulsory, and, further, that every fritt shall conform to a certain standard of solubility in dilute hydrochloric acid. Mere fritting is no safeguard against lead poisoning, as the lead contained in the fritt may be readily absorbed. It is assumed that this is not the case if the compound is insoluble in dilute hydrochloric acid, which is taken to represent the gastric juice, and it is further inferred that the less soluble the fritt the more harmless it is. The Home Office, therefore, on the advice of Professor Thorpe, has fixed on a maximum standard of solubility to be calculated on a given formula. Professor Thorpe apparently rests his case chiefly on the facts that certain foreign manufacturers produce ware with glazes conforming to the standard, and that some specimens sent him by English manufacturers for examination also conform to it.

Delays by an Aberdeen Contractor.—At the last meeting of Dundee Town Council mention was made of the delay which had taken place in carrying out the contracts in connection with the extension and reconstruction of the gasworks, and Mr. W. M'Crae, the manager, was instructed to report on the matter. Mr. M'Crae has now drawn up his report. With respect to a contract of Mr. William Anderson in connection with the new retort-house and coal stores, it is stated the contract was accepted on October 23rd, 1899, and according to the specification the work should have been completed five months afterwards. On November 3rd, 1899, Mr. Anderson wrote asking for an extension of time, and this was granted as follows: The north half of the retort-house and coal stores to be completed by April 23rd, 1900, and the south half three months later. The north half was not completed until November, 1900, and the south half until May, 1901. During the execution of the contract, work was greatly delayed on account of bad weather, but Mr. M'Crae considers that the chief cause of delay was the want of bricks. These, the manager understands, were not contracted for, nor were they ordered until shortly before they were required. In all, the works were forty-one weeks late in being completed, and there was a penalty clause in the case at the rate of £20 per week. With regard to the work Mr. Anderson undertook in connection with new chimneys, the report states this contract was accepted on April 6th, 1900, and according to the specification each chimney should have been completed within three months from the date on which instructions to proceed with the work were given. On April 17th Mr. Anderson wrote asking for an extension of time. This was granted, the time for the completion of the chimneys being made six months for the north chimney and ten months for the south chimney, both dating from May 1st. Operations were only commenced on July 24th. The first chimney was completed on May 30th last, being twenty-nine weeks behind time, and the south chimney is now only about 60ft. in height. The penalty in each of these cases was at the rate of £20 per week. The Water and Gas Committee, to whom the report was submitted, are of opinion that a claim should be made against Mr. Anderson.

Surveying and Sanitary Notes.

The Name of London's Great New Street.—The London County Council and its committees having risen for the summer vacation, the name of the new street from the Strand to Holborn will not be decided for some time. The Streets Improvement Committee have received innumerable suggestions as to the nomenclature of the thoroughfare, and have whittled them down until about seventy or eighty remain for the further weeding-out process.

The Property Market.—The Tokenhouse Yard Mart only opened for two days after the August holidays, and the business was of a meagre description, the total sales amounting to £15,100. A small residential estate of 36½ acres in Blyth, Notts, known as Barnby Moor House, sold for £8,000, and Clavering Hall Farm, Essex, comprising 506 acres, realised £14 per acre. The site of the celebrated Blanchard's Restaurant in Beak Street, W., upon which £35,000 is to be spent in rebuilding, was withdrawn at £80,000, bids reaching £77,000. The monthly summary shows that in July this year the sales at the mart amounted to £1,028,760, as compared with £873,430 in the corresponding month last year.

Trees in Whitehall and Parliament Street.—Upon the suggestion of Sir John Wolfe Barry, the Works Committee of the Westminster City Council will consider the practicability of planting trees on both sides of Whitehall and Parliament Street from Horse Guards Avenue to Bridge Street. Should this be successful the north side of the improved Strand will receive similar treatment. In this connection it is interesting to notice the complaints which have again been raised of the extreme enthusiasm among planters for the occidental plane; but it is of small use suggesting alternatives without a knowledge of how London soil suits other trees. During this season two species have flourished beyond others—the acacia and the catalpa. Both are exceedingly beautiful in flower as well as in leaf, and grow to a convenient height, while the plane in a comparatively few years will unduly block up almost any London view. There is no reason why the ash or even the walnut should not do equally well.

KING'S COLLEGE, LONDON.

Result of Examinations in Architecture and Building Construction.

THE following is the list of awards in the examinations in architecture and building construction (evening classes) held at King's College, London, under the joint auspices of the College and the Carpenters' Company (the awards are given in order of merit):—

Building Construction.—Silver medal and £3 in books, F. J. Jones; bronze medal and £2 in books, G. H. Briggs; £1 in books and certificate of distinction, G. Thompson; certificates of distinction, P. Luker, J. J. Crowe, P. J. Black, H. F. Berry, W. Fenn, S. H. H. Ixer; certificates of merit, H. A. Alexander, F. Davies, J. N. Horsfield and J. A. Meikle.

Constructional Drawing.—£3 in books and certificate of distinction, W. Nicholls; £2 in books and certificate of distinction, A. J. Meikle; £1 in books and certificate of distinction, E. L. Hampshire; certificates of distinction, A. Gomme, S. H. H. Ixer, A. Bale and H. F. Berry; certificates of merit, J. J. Crowe, A. Bowles, P. J. Black and G. H. Briggs.

Quantities.—£3 in books and certificate of distinction, F. J. Jones; £2 in books and certificate of distinction, F. Davies; £1 in books and certificate of distinction, H. F. Berry; certificates of distinction, P. J. Black and J. N. Horsfield; certificates of merit, F. Hartnoll, H. A. Alexander and E. L. Frost.

Sanitary Construction.—The Sir George Faudell Phillips medal was not awarded.

History of Architecture.—Silver medal and £2 in books, E. L. Hampshire; bronze medal and £1 in books, A. E. Brooker; certificate of distinction and £1 in books, J. A. Meikle; certificates of merit, J. A. Gillett, W. Fenn, G. W. Rogers and H. Byron.

Architectural Sketching Class.—Bronze medal and £1 in books, A. E. Brooker.

Architectural Studio.—Gold medal and £3 in books, E. L. Hampshire; silver medal and £2 in books, A. E. Brooker.

Wood Carving.—First prize, R. Toms; second prize, H. S. Jones; third prize, M. J. Mathers.

Particulars of the two free scholarships for the evening classes offered by the Carpenters' Company will be duly advertised.

The following is the list of the awards in examinations in architecture and building construction (day classes), for which prizes were given by the Carpenters' Company:—

Architectural History (Third Year).—Silver medal and prize of £2 in books, S. C. Ramsey.

Architectural Studio.—Silver medal and £2 in books, S. C. Ramsey; bronze medal and £1 in books, G. W. Rogers; bronze medal and £1 in books, L. K. Wright.

Architecture and Building Construction.—Silver medal and £2 in books (second year), A. H. Bristow; bronze medal and £1 in books (second year), T. H. Vitty; silver medal and £2 in books (first year), F. R. Fairmaner; bronze medal and £1 in books (first year), S. C. Ramsey.

Architectural History.—Professor's prize for best note-books (third year), G. W. Rogers.

Building Construction.—Professor's prizes for best note-books (second year), L. Baldasano-y-Lopez; (first year), J. P. Katigbak and A. Rodriquez (equal).

Building Construction (Second Year).—Certificates of distinction, W. J. Marlow and O. C. Thompson; certificates of merit, A. H. Imber and E. A. Soames (equal), J. Gardner and E. Karam (equal), E. Woodward, R. M. Smith, G. P. Geen and H. Osmond (equal), H. C. Swayne. (First Year): Certificates of distinction, R. V. Gregory and T. J. R. Kiernan; certificates of merit, J. H. P. Bilbrough, G. H. Rutland, G. W. N. Rose and J. P. Katigbak.

Architectural History.—Certificate of merit, G. W. Rogers.

QUEENSLAND TIMBER.

As may be inferred, Queensland, lying within two zones (10 degs. to 29 degs. South) and with over 2,500 miles of coast, possesses a remarkably rich and varied flora. The dense scrubs frequently bordering the rivers contain trees which supply valuable timber, whose stems are often clothed with superb climbers, and the undergrowth is intermixed with ferns exceedingly beautiful and of almost endless variety. Though there are many beautiful cabinet woods, and woods of great value for railway sleepers and all uses in which endurance is required, still only a very few of the timber trees are at present cut for use, and these are a mixed lot sold under the names of "hard" and "soft" woods. The hardwoods are principally supplied by the eucalypts, and denominated ironbark, gum, box, peppermint, stringybark and turpentine. The soft woods are almost entirely derived from the various pines. Hardwoods are generally obtained in open or forest country; soft woods in the scrub lands on the borders of rivers and the rich moist lands often met with on the tops of the ranges; yet this rich scrub soil often produces some of the very best hardwoods, as, for instance, the Johnstone River hardwood, which is considered second to no timber in Australia for strength and durability; also Thozet's box, one of the most valuable eucalypts found in the scrubs bordering the Fitzroy.

Amongst the hardwoods where strength and durability are required those known as ironbark take first rank. Of these there are several kinds, the best being obtained from *eucalyptus siderophloia*, of which there are two kinds of wood, one red and the other a brownish grey, both excellent timbers, though the red is the favourite; the narrow-leaved ironbark, which has a greyish wood, very strong and durable; and the Palmer River ironbark, better known by the lemon-like fragrance of its leaves, from which it received its local name, than as a timber. The wood of this last, though very hard and of a rich red colour, is usually small and pipy.

The trees known as stringybarks supply excellent timber for sawing and splitting. Nearly resembling these in bark are the trees sometimes called turpentine, a very hard, strong, durable timber.

The timber generally known as gum is furnished by those eucalypts which annually shed their barks, as the blue gum, the poplar gum, the grey gum, the spotted gum, the woollybutt and the Moreton Bay ash. The bark of the last two is persistent at the base. There are also several others called gum trees, but those noticed furnish the best timber. The so-called box is a name under which several trees supplying good useful timber are known, as poplar box, gum-topped box, Thozet's box, and also the Brisbane box.

Two trees are designated bloodwood. The common bloodwood is only adapted for using whole, as it often contains cavities in the wood so full of gum as to render it useless for sawing; it is, however, the favourite timber (on account of its durable nature) for house stumps, piles for bridges, and other works where it can be used uncut. The white bloodwood is very similar, but the wood is of a lighter colour and not quite so durable.

The hardwood of the Johnstone River is furnished by a species of *Backhousia, B. Bancroftii*. This is a very tall erect tree, and so far as is yet known the wood is both durable and strong, does not crack or warp, and is easy to work. The broad-leaved or paper-barked tea-tree; the mahogany—Tom Russell's mahogany, as it is sometimes called—and the swamp mahoganies are timbers of a high quality, though the last mentioned is useless except under water, when it is extremely durable. The hardest wood, however, of Australia is that of *Erythrophlœum Laboucherii*, a tree met with in North Queensland, from the Endeavour River to Normanton. The wood of this tree is a rich red in colour, and takes a high polish.

The soft woods in use are the bunya, Moreton Bay or hoop pine, Dundathu pine, the she-pine, and several of the *callitris* under the name of cypress pine.

For cabinet and ornamental purposes the following are in high request: Red cedar (the Moulmein cedar of the English market, yellow wood and others of this genus, silky oak, deep yellow wood, tulip wood, and beech, a tree attaining a great size. The wood of this last is in great request for verandah flooring and deck planking.

Other woods suitable for cabinet work are: *Elæocarpus Bancroftii*, a tree with a firm light sapwood and a quantity of very hard prettily-marked heartwood, though perhaps its true value will be in its proving a substitute for the American *Lignum vitæ* in the manufacture of blocks, pulleys, &c., than as a cabinet wood; several of the *Evodias*, all having a white pliable wood; the satinwood, one of the most beautiful yellow woods known; *Geijera Muelleri*, a common tree in most Queensland scrubs, having a large quantity of beautifully marked dark heart; *Siphonodon australe*, another scrub tree whose wood is nearly white, very much resembling ivory when polished; the bean tree, growing a heartwood somewhat resembling walnut, but apt to warp in seasoning; the Queensland ebony, a rich-coloured hardwood, very suitable for veneering; the scrub sandalwood, the Australian olive, and many species of acacias commonly called myalls or wattles and remarkable for their rose-like fragrance.

Handsome woods are produced by the "dead finish." The Gulf country gutta-percha and the thready barked oak are very prettily marked and conspicuous for their beauty.

NEW GOVERNMENT OFFICES.

We are glad to see that the protest against the action of the Government in regard to the completion of the new public offices in Whitehall is being ventilated. In a letter to the "Times" Mr. Arthur W. Soames, M.P., says: "It will be within the recollection of your readers that the architect, Mr. J. M. Brydon, who had been selected for the work, unfortunately died before his drawings were completed. It now appears that, from motives of false economy, the Government intend to trust the completion of the designs to the Office of Works instead of following the precedent which was set on the death of Mr. G. E. Street before the completion of the Law Courts, when Sir Arthur Blomfield was appointed to superintend the completion of the building. It is true that the First Commissioner of Works proposes to add Mr. Brydon's chief assistant to his staff for this purpose, and I have not a word to say against this gentleman nor against the permanent staff, who no doubt are thoroughly competent for their own special work, but that work is not the erection of vast buildings of national importance. The character of Mr. Brydon's design is such that its effect when completed will depend, far more than it is easy for the public to realise, upon the proportions of the cornices and mouldings and the design of windows, doorways and innumerable other minor parts of the building. Mr. Brydon was unable to complete the drawings for these details, and if, therefore, this important mass of buildings is to be carried out in a manner creditable to the country it is of the utmost importance that an architect of the first ability should be appointed to complete the designs of one who had been selected with much care from among the foremost members of his profession."

Lord Balcarres supports Mr. Soames. He observes that there is no financial difficulty, as ample provision was made by the Treasury for the architect's fees; £26,000 was allotted for the Westminster buildings, "and I understand that of this amount not much more than £10,000 was spent during Mr. Brydon's lifetime. A very large balance therefore remains, and while we all applaud the wisdom of Mr. Akers-Douglas in appointing Mr. Brydon's chief assistant to continue as draughtsman I feel strongly that the money ought not to be intercepted by the Treasury. The site is one of the finest in London, and it would be deplorable if we save a few thousand pounds and thereby imperil the dignity and refinement of our new Government buildings."

Professor Aitchison suggests that Dr. Rowand Anderson should be invited to complete the building. Another view of the case is taken by an "A.R.I.B.A." in a letter to the "Times." He says that if an architect of note is employed to finish the work he would find it irresistible to impress his own personality on the superstructure, and we should not then have the building as it would have been carried out by the late Mr. Brydon himself. Therefore he considers the Government have taken the right course, for the official architects are "not open to the same temptation."

Engineering Notes.

The Isle of Thanet Joint Hospital at Ramsgate is being warmed and ventilated by stoves and grates supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Caterham Asylum Engineering Contract.—For engineer's work in connection with the extension of the Caterham Asylum the contract of Messrs. Macintosh, Brocklehurst & Co., Ltd., Queen Victoria Street, has been accepted by the Metropolitan Asylums Board.

The Electric Lighting of Worksop.—The completion of the work of laying down the cables and the fixing of standards for the lighting by electricity of the main streets of Worksop, and the building of works for the supply of electric energy, was celebrated on August 3rd by the holding of a dinner.

A New Swiss Railway.—The recent opening of the electric line from Fayet St. Gervais to Chamounix inaugurates a new era for this famous Alpine resort. The new line passes through some very fine scenery, and crosses the gorge of the Arve by the imposing Viaduct of Ste. Marie, consisting of eight arches, 165ft. above the torrent. It also brings Chamounix within four hours of Geneva, fourteen hours of Paris and twenty-one hours of London; and it is expected that the line will be continued to Martigny, there joining the great Simplon route to the Italian Lakes and Milan, thus placing Chamounix on one of the great highways between France and Italy.

New Bridge over the Tyne.—At the last meeting of the Northumberland County Council the Bridges and Roads Committee reported that the surveyor had prepared plans for a new masonry bridge to replace the existing suspension bridge over the Tyne at Warden, about one mile west of Hexham. The bridge would connect that part of the county in the fork of the North and South Tyne rivers with the Hexham district. The nearest bridges, five and four miles up the river, were at Haydon and Chollerford. The new bridge, therefore, would be an important one. The width of the proposed bridge was 21ft. The surveyor estimated the cost at £11.500. The Committee recommended that the Council authorise the erection of the bridge, and the Finance Committee recommended that application be made to the Local Government Board for consent to borrow the money. This was agreed to.

Crystal Palace School of Practical Engineering.—There was a good attendance last Thursday at the Crystal Palace School of Practical Engineering on the occasion of the presentation of certificates. Mr. William Shelford, C.M.G., presided. and among those present were Mr. J. W. Wilson (principal), Mr. Maurice Wilson (vice-principal), Mr. C. F. Fuller (mechanical examiner) and Mr. J. G. W. Aldridge (electrical examiner). The chairman, speaking of the specialisation of engineers' work, said that specialisation was good for the community, but was not always desirable or even possible for civil engineers. Mr. Fuller in his report said he considered the work of the students in the mechanical section extremely good. The work in the pattern and fitting shops showed a high percentage of good work, and the same might also be said of the work in the drawing office. The examiner of the civil engineering section (Mr. R. J. Money) reported that the results of his examination showed that the students were well grounded, and that, while receiving a thoroughly practical training, their theoretical education was in no way neglected. In his report on the electrical section Mr. Aldridge remarked that it was an important feature of that section that the students had as lecturer an engineer engaged on practical work. Electricity was becoming a part of every branch of engineering, and he looked forward to the time when no student would consider his course complete without passing through that section.

Bricks and Mortar.

APHORISM FOR THE WEEK.

We laugh when we are told that, among the Ancients, even the Arts were subjected to municipal laws. But we are not always in the right when we laugh . . . The aim of art is pleasure, and pleasure is not indispensable. It may, therefore, fitly be left to the lawgiver to decide what kind of pleasure, and what degree of each kind, he will allow.—LESSING.

Our Plates. THE design for new municipal buildings at Hereford by Mr. Henry A. Cheers, architect, of Twickenham, has been selected. A notice of the competition will be found on p. 500 of our issue for July 31st. We are indebted for our illustration to the "Hereford Times."—The stables at Oakover, Ticehurst, by Mr. Ernest Emerson, have six loose boxes and four stalls, and are now being erected for Mr. Campbell Newington. They are situated on high ground. The stone used is Monk's Park Bath-stone. The half-timber, clock turret and vent turrets are of oak, with domical tops covered with copper. The contractors are Messrs. Strange & Sons, of Tunbridge Wells.—The drawing of the additions to the chancel of St. Bartholomew's Church, Brighton, by Mr. H. Wilson, was exhibited at the Academy of 1898. The design is eminently characteristic of this clever architect.

Mr. Hall Caine and Ruskin. WHEN Mr. Hall Caine, the novelist, left school he was apprenticed to Mr. John Murray, a Liverpool surveyor, who was agent for the Lancashire estates of Robertson Gladstone. Subsequently he acted for a few years as general assistant to a builder, Mr. James Bromley, of Liverpool. It was about this time that he received his first letter from Ruskin in regard to a society newly-formed by Mr. Caine and called "Notes and Queries." Ruskin said: "I have, of course, the deepest interest in your work, and for that reason must keep wholly out of it. I should drive myself mad again in a week if I thought of such things. I am doing botany and geology, and you, who are able for it, must fight with rascals and fools. I will be no more plagued by them."

An Evil Associated with Flats. SPEAKING of the extensive replacement of ordinary dwelling-houses in London by "flats" many storeys high, Dr. John Henry Bridges says in a letter to the "Times": "A very large proportion of flats are built round an enclosed space varying from 10ft. to 30ft. in diameter and from 80ft. to 100ft. in height, forming an unventilated and unventilable shaft. Into this the offices, larders, kitchens, and inferior bedrooms look out, and from it they derive their principal supply of air. At the level of the topmost storey the air may be renewed as the winds pass by; but at lower levels it must remain indefinitely stagnant. The behaviour of bacteria throughout this space I leave to the specialists in this branch of science; but assuredly they will not be dispersed by the natural motion of the atmosphere, nor will they be killed by sunlight. Speaking from a past experience of more than twenty years as a medical inspector in the service of the Local Government Board, I may observe that no such building would be for a moment tolerated by that authority, if proposed for their sanction by any Board of Guardians in the kingdom; and in saying this I do not speak only of Poor Law infirmaries, but of buildings appropriated to healthy inmates. The same thing I should presume from my imperfect knowledge may be said of prisons or of public elementary schools. London has won the reputation, thanks largely to its admirable staff of local medical officers of health, of being one of the healthiest cities in the world. If the present system of building is allowed to go on unchanged, it will assuredly lose that reputation."—Mr. Delissa Joseph, F.R.I.B.A., in reply to the foregoing, says that Dr. Bridges "ignores the fact that since the passing of the London Building Act of 1894 no such areas may be constructed unless approved means for the access of air to the base of such internal courtyards is provided. The suggestion that these areas are at times 100ft. high is also made impossible by the same Act, which limits the height of a building to 80ft. from the street level. The further statement that blocks of flats are 'in a large number of cases constructed in absolute defiance of the best known laws of health' loses sight of the fact that all such buildings are necessarily constructed subject to the Public Health Act of 1891."

Sun Rooms on Town Houses. THE "Hospital" says: "Flat roofs have never attained great popularity in England, although in some workmen's dwellings they are provided. Perhaps the reason has been partly a doubt as to their being permanently weather-tight, partly to the fact that if well made they are heavy to support and expensive to construct; moreover, in the present state of the atmosphere of London, life in the open air is not a constant joy and horticultural pursuits on house-tops are not very attractive. A glass-roofed room or conservatory, however, would be another affair. A glass ridge and furrow roof can be made practically water-tight; it need not be heavy; and if the walls of a roof conservatory are carried to the full height it may be well protected from the ravages of the wind. With such a roof it would be perfectly possible by a simple mechanical contrivance such as is constantly used in greenhouses to throw the whole structure open to the air, and thus, while obtaining protection from the weather when this is needed, to secure all the advantages of open air when the weather is propitious. . . . We notice that at a recent meeting of the American Pediatric Society Dr. Northup reported that by his advice a sun-room had been built on the roof of a private house in New York, a playroom in which fresh air and sunlight can be enjoyed without dust and free from the dangers of the streets. . . . But our suggestion is not merely to build a playroom on the roof, but to make this glass-covered room itself form the roof of the building, much as a weaving shed is made to form the roof of a mill in the textile factories in the North of England."

A Further Effort to Save Christ's Hospital. MR. ASHBEE, chairman of the Committee for the Survey of London, is still in the lists for Christ's Hospital. This, he says, is what we stand to lose by the House of Commons' reversal of the committee's decision to give powers of purchase to the London County Council: "Two, probably three, fine pieces of Sir Christopher Wren's work—the mediæval cloister of the Grey Friars' monastery and the remaining portion of the buildings associated with the memory, perhaps erected by the munificence, of 'Dick Whittington,' that portion of the old mediæval London which has never been built upon; and last, one of the most sacred and historic burial-grounds in London." Mr. Ashbee continues: "It needs very little prophetic power to foretell that in a few years' time, when all the mischief is done and the various commercial interests satisfied, the public will awake to the fact of what it has lost and how it has been fooled, and we shall then hear what we have so often heard before, 'Why were we not warned in time?' It is the hope of this letter, on behalf of the Committee for the Survey of London, to plead for a reconsideration of the whole matter in the public interest before it is too late, and until the Christ's Hospital Bill has passed its third reading it is not too late."

"L'Art Nouveau" Furniture Again. No doubt many will have read with interest the comment on the specimens of "L'Art Nouveau" furniture which have been placed in South Kensington. These are Mr. Vernon Watney's impressions after inspecting them: "Apart from the feeling that a great collection had been degraded, one's impression was patriotic in the sense that it seems hardly fair to our British makers of modern furniture that they should not be allowed equally good opportunities of displaying their wares at South Kensington. One also wonders why the authorities at South Kensington should have huddled together, as if in a lumber-room, our examples of old tapestries, embroideries and furniture (things which have given pleasure to successive generations during the last two or three centuries), while they display, as if in a shop window, those articles for which we are accustomed to look in our more ephemeral exhibitions. It may or it may not be a good thing that there should be in this country an exhibition (permanent or otherwise) of modern furniture; but the artistic side of the Victoria and Albert Museum is full of, and dedicated to, things which have stood the test of the only true touchstone, the test of time, and I venture to join in the appeal to you to let the strength of your columns guard it even from the appearance of being a medium for the advertisements of modern furniture makers."

Bow Church: Wren at Fault. IT having been frequently stated that Bow Church steeple was thrown 1ft. 9in. out of the perpendicular by the construction of the Central London Railway, Sir Benjamin Baker states. on the basis of the experience gained in, driving more than twenty miles of 'tubes,' that no such settlement has ever occurred or ever can occur with the cast-iron tube and shield construction carried out with the usual precautions. "Bow Church steeple is 1ft. 9in. out of the perpendicular, not on account of the Central London Railway but because Wren ventured to build a tower over 200ft. high on no better foundation than an old Roman paved road the stones of which, judging from a similar road which I came across in constructing the Metropolitan Railway, in all probability rested on consolidated mud with occasional layers of brushwood."

The Garden City Association. THE Shoreditch Borough Council has decided to send a deputation to the conference of the Garden City Association to be held at Bournville on September 21st next. The conference promises to be an important affair. Several members of Parliament and representatives from the London County Council and the borough councils are expected to be present and to take part in the proceedings. Mr. Ralph Neville, K.G., will read a paper on "Co-operation in Garden City," and other authorities will deal with education, the liquor traffic, manufactures and housing. It is probable that a public meeting will be organised in Birmingham on the evening of the 20th to discuss the whole housing problem, and arrangements are being made for parties to stay in Birmingham overnight. The total cost for each person will not amount to more than 17s. 6d. for the two days. A limited number of tickets are available for non-members, and any of our readers wishing to be present should communicate at once with Mr. Thomas Adams, secretary, 77, Chancery Lane, W.C. The Garden City Association has been making considerable progress of late, and subscriptions of as much as £60 per annum are being made to its propaganda funds. Among those who have recently given their names as vice presidents are Mr. T. W. Logan, M.P.; Mr. C. E. Schwann, M.P.; Mr. Corrie Grant, M.P.; Mr. Frederick Platt-Higgins, M.P.; Mr. Albert Spicer, J.P.; Mr. J. Williams Benn, J.P, L.C.C.; Mr. A. L. Leon, L.C.C.; Mr. Robert Williams, L.C.C.; Mr. Frank Smith, L.C.C., and Mr. Walter Crane. A Sites Committee was recently appointed, and a practical step may be anticipated in the near future. The association has acquired excellent offices at 77, Chancery Lane, and the secretary cordially invites correspondence from builders and architects interested in the housing question. On August 17th the association will take part in the Housing Exhibition at the Crystal Palace in connection with the Co-operative Festival. Plans and diagrams of the Garden City scheme will be shown, and a number of photographs of Bournville, kindly lent by Mr. Cadbury, will also be exhibited.

Presentation to Mr. John Hebb.—Mr. John Hebb, F.R.I.B.A., who has been in the service of the London County Council and their predecessor the Metropolitan Board of Works for upwards of a quarter of a century, has been presented, in view of his approaching retirement, with a handsome ormolu clock mounted in Algerian onyx, and a pair of chimney vases, by the members of the architect's department of the council. The presentation was made by Mr. W. E. Riley, the architect to the council, on behalf of the subscribers.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Claims for Extras.

NEWPORT, I.W., writes: "The tender of a builder based on a bill of quantities is accepted by a firm of architects on behalf of their clients, but no contract is signed. The builder acknowledges the receipt of the acceptance and starts the work in due course. A surveyor agreed to by all parties is appointed to measure up the variations and extras and deductions. The accounts contain several extras, and the architects refuse to pay for them, not having ordered the builder to do them, as they should have been done under another separate contract. The architects instruct the builder to charge this latter contractor, but he refuses to pay. In their final certificate the architects leave out the items in dispute. The builder now threatens to make up an entirely new account of his own, ignoring altogether the one made by the surveyor. In what position do the client and architect stand with regard to the builder? What action can the builder take?"

A solicitor should be consulted. He will probably advise that a writ be issued based upon the report of the surveyor, who, if somewhat loosely appointed, appears to have acted the part of an arbitrator. His award is almost certain to be upheld, and the builder would in any case be upon much firmer ground by basing his claim upon it than by making out a new account. G. A. T. M.

Gallery for Chapel.

CAMBORNE.—E. T. H. writes: "It is proposed to erect a gallery in a chapel to hold about 350 persons. Kindly give section and plan of same, with scantlings of timber and joists, and state whether wood or iron would be preferable for girders."

One of the dangers of giving information upon general construction to "all and sundry" is well exemplified in this question. The correspondent wishes to erect a gallery in a chapel to hold from 300 to 400 people, and asks for drawings with scantlings and formulæ; and he gives only a rough sketch plan, not to scale, and with no dimensions. Anyone who can expect a design to be given under such circumstances cannot be competent to carry out the work without supervision, and it is evidently a case in which an architect should be employed. HENRY ADAMS.

Buildings around St. Ives, Hunts, suitable to Measure for R.I.B.A. Examination.

LANCASHIRE.—P. S. W. writes: "Kindly name some buildings in the neighbourhood of St. Ives, Hunts, suitable to measure for the R.I.B.A. Final Examination. Is the porch of the church at Over, Cambridgeshire, suitable?"

The porch of Over Church would serve admirably. The church at St. Ives is a good example of Perpendicular work, and so are those at St. Neot's, Bluntisham, Conington, Ellington and Godmanchester; while those at Hartford, Hemingford Grey and Ramsey are Norman; those at Alconbury, Great Catworth, Keysdon, Warboys and Wooton are Early English; and those at Bythorne, Elton, Eynesbury, Fenny Stanton, Great Stewkley, Hemingford Abbots, Kimbolton, Spaldwick and Yaxley are Decorated. Huntingdon has Early English work at All Saints' and Perpendicular work at St. Mary's.

G. A. T. M.

Using Cross Staff with Compass and Vernier Attached.

CORNWALL.—B. J. S. writes: "I have a very good cross staff with compass and vernier attached. I know both Mr. Middleton and Mr. Usill condemn its use for setting out right angles to chain for offsets; but cannot it be used for taking angles and compass bearing with sufficient accuracy?"

It all depends on what is "sufficient accuracy" for the work on hand. The possession of a compass would render the instrument about as useful as the prismatic compass without its portability; but if it be capable of observing angles other than right angles it might be employed as an approximate theodolite. Sometimes satisfactory work can be done by one having a revolving head and a telescope attached to it; but I have not condemned the instrument generally without ample experience both of good and bad forms. It would be impossible to give hints for the use of any unusual pattern without at least an accurate drawing of it. Probably, to judge from the description given, it would serve very roughly for all the purposes of a theodolite except that it could not be levelled.

G. A. T. M.

Geysers.

MANCHESTER.—CASAL LIA writes: "Kindly give some information about putting a geyser in a house to supply a bath with hot water. What form would be the best, one heated by gas or oil, and what would be the cost?"

Messrs. Ewart & Son, Ltd., of 346, 348, 350, Euston Road, London, state: "If gas is obtainable, this is the most covenient form of heating, and is to be preferred to oil for the simple reason that it gives less trouble. The oil heating we have perfected and the 'Success' oil geyser is eminently satisfactory, but of course the lamp requires to be filled and cleaned, which necessarily is of more trouble than merely lighting the gas when a hot bath is required. For bath heating we recommend the No. 2 size 'Lightning' geyser. If the price is prohibitive an equivalent size in a cheaper form of geyser is the '0' size 'Champion' geyser, which gives good results; or if a low price article is necessary the No. 30B 'Surprise' geyser will probably do all that is wanted."

Bulging Walls.

BANGOR.—W. G. W. writes: "In 1894 the local surveyor served notice upon the tenant of the premises A. (sketch not reproduced) that the front wall had bulged out causing a crack in the cross wall, which was in his opinion unsafe, and requiring immediate attention, but nothing was done. Certain alterations are contemplated to B.'s premises adjoining, the front wall of which is in a similar condition. It is necessary to build a new front wall, and it is certain that A.'s walls will fall in consequence, however well the same may be maintained. The landlord refuses to compromise and will hold B. responsible for damages. Can the local surveyor be compelled to enforce the old notice, and can B. be held responsible for damages?"

The action of the surveyor must depend upon whether he considers the front wall to be now in a dangerous condition. B. might write to the surveyor calling his attention to the present state of A.'s wall, and mention the fact that seven years ago a notice was served respecting its then condition but that nothing has yet been done to remedy the defective structure. Should the surveyor reply that the wall is not now considered to be dangerous, and that no further action is contemplated on the part of the local authorities, then B.'s best course before commencing building operations would be to consult an experienced solicitor, who could make himself thoroughly acquainted with all the circumstances surrounding this particular case. T. E. C.

MR. JACKSON'S NEW SCHOOL CHAPEL AT GIGGLESWICK.

THE new school chapel now in course of erection at Giggleswick from the designs of Mr. T. G. Jackson, R.A., will probably cost not less than £30,000 or £40,000.

It is described as being an experiment in architecture, suggested by Ferguson's remark that the only example of a Gothic dome is that of Ely Cathedral; and the chapel, which is in the late Gothic or Jacobean style, takes the form of a Latin cross surmounted by a copper-covered dome. As approached by a steep path leading from the school the dome is seen crowning the gable walls of the chancel and transepts. From this position the nave is completely hidden, thus giving the building the appearance of a baptistery, illustrating to some extent the effect that would be produced were it possible to place those of Florence or Pisa on a similar elevation. But probably the most remarkable view is that obtained from the high road on entering Giggleswick from Settle at twilight, when the dome is seen over the village roofs, boldly silhouetted against the evening sky, thus presenting a startling resemblance to the approach to some Continental city. On the same plateau as the chapel, but beyond, is the school cricket-ground, with pavilion and gatehouse, both of which are now in course of erection from Mr. Jackson's designs. Seen from the pavilion, the copper-covered dome, which has so far maintained its natural colour, although it was hoped it would soon assume a verdigris hue, is still the same striking feature at close quarters as in the more distant views. The solemn dignity of the dome is undoubtedly assisted by the great variety of design in the chapel itself, together with the use of variously coloured building stones. Those of the walls (said to denote the school colours) are of red sandstone, into which are introduced checkered bands of dark-coloured limestone, and give at some distance the appearance of red brick, which is not altogether agreeable. The dressings and tracery of the windows are of a yellow stone. The chapel interior, which is rapidly nearing completion, has been designed regardless of time and cost. The gold and coloured mosaics of the dome are by Mr. George Murray, and have been executed by Powell & Co. The rich stained glass of the windows is by Burlison & Grylls. The sgraffitto work on the barrel ceiling of the nave and transepts is by Nichols & Stewart, and the carved cedar seating and the black and white marble paving of the aisles by Farmer & Brindly. In all there is a promise of a well-thought-out and pleasing colour scheme. Mr. Richard Evans is the clerk of works.

ASPHALTS.

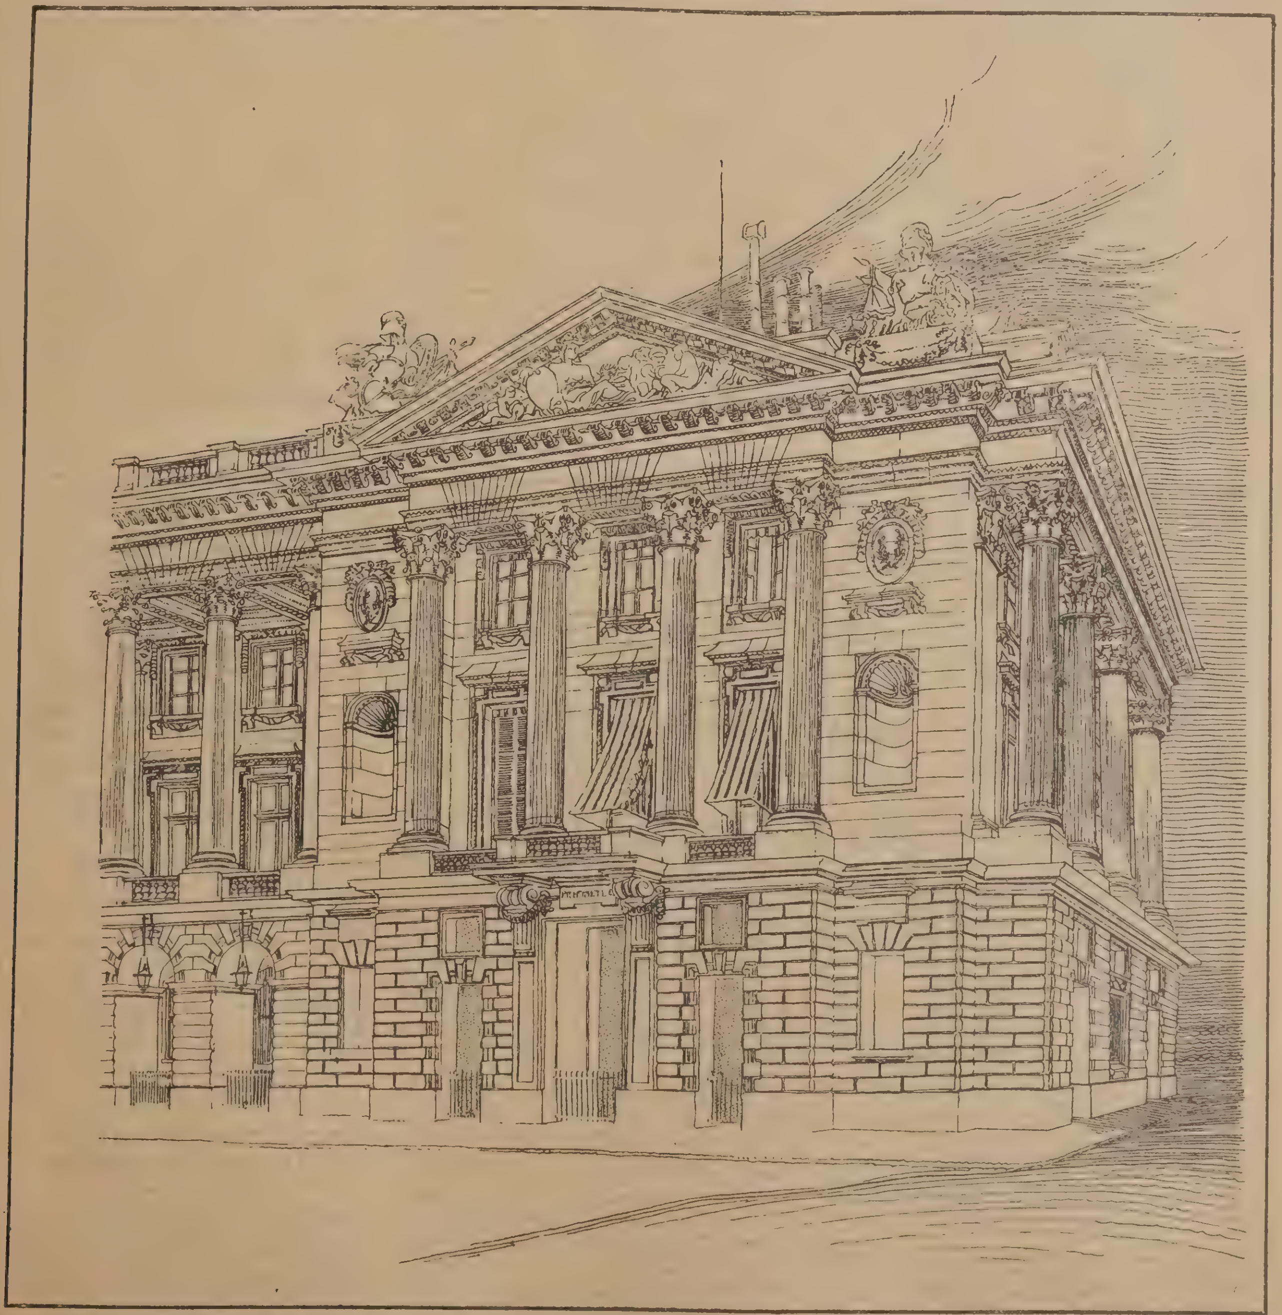
ABOUT 1840 the city of Paris and some other large towns in France made a trial of melted asphalt-rock from the French mines of Seyssel as a material for covering street pavements. The experiment attracted attention, and very soon afterwards the officers of the municipality of Hanover gave directions to the professors of the city technical school to examine the material from the mines of Limmer, which had been abandoned and almost forgotten, to see whether it could be used for street pavements in the manner in which the Seyssel asphalt had been tried in Paris. This leisurely investigation was interrupted by the political tumults of 1848, in which barricades of paving-stones were used as fortifications by the discontented mob of nearly all the large cities of the Continent. Napoleon III., a practical man, like his uncle, bethought himself that if the streets of Paris were paved with asphalt in the manner which had just been tried on a small scale there would be no paving-stones to make barricades of, and by his influence, although not with that avowed object, many miles of asphalt-paving were laid throughout Paris. London, Berlin, Marseilles, and other cities followed the example of Paris, and a great demand sprang up for asphalt-rock. Although London and Paris have now substituted wood-blocks for asphalt in the roadways of their principal streets, the demand for the material continues unabated and fresh deposits are eagerly sought for. At present although the Limmer-Vorwohle mines are extensively worked those of Pyrimont-Seyssel, on the banks of the Rhone, in the French Department of the Ain, hold the first place in regard to the quality of their product. The rock is a carbonate of lime containing from 6 to 8 per cent. of bitumen so intimately combined that it cannot be removed even by long heating. The stone is very uniform, and has a certain toughness which peculiarly adapts it for pavements. The Val de Travers, a few miles distant from Neuchâtel, in Switzerland, furnishes a very similar material. Every architect knows the octagonal and circular blocks in which the Seyssel and Val de Travers asphalts are sent all over the world. For some purposes both these asphalts are mixed with mineral pitch from a mine near Ragusa, in Sicily, owned by the same company as the Pyrimont-Seyssel mines. Lately other asphalt mines have been opened in Southern France—at Marvejols, near Grenoble; at Lovagny, and at Mons, in the Department of the Gard.

HOUSE ON THE PLACE DE LA CONCORDE, PARIS.

THE building illustrated on this page by Mr. H. F. Cooke forms part of one of the two edifices on the west side of the Place de la Concorde, Paris, separated from one another by the Rue Royale, at which point a fine view of the Madeleine is obtained. It is now occupied by the Minister of the Marine. Both buildings were erected from designs by Gabriel during the years 1762 and 1770.

AN ESSAY ON GOTHIC VAULTING.*

ALTHOUGH this book is written expressly to support Mr. T. L. Watson's views upon the vaulting of the crypt or lower church of Glasgow Cathedral, it forms an admirable introduction to the study of Gothic vaulting. The author's claim is that the vaulting of the lower church of Glasgow Cathedral is of various dates, and not of one period and one design. This has been disputed by several recognised authorities on Scottish architecture. We hardly think, however, that after the appearance of this book the fact that the vaulting is of various dates will be disputed. Including the upper and lower vaulting of the choir, five distinct periods have been traced, each being marked by features characteristic of its own period and by different types of mouldings. The middle vault is wholly of a later period than the adjoining aisles. Mr. Watson has endeavoured to trace the original plans in the different stages of the vaulting, and he gives an illustration showing them. His method of arriving at these results has chiefly been to consider the direction of the springers, which are in most cases the first ones, and the altered direction of the ribs from them and also the form of the mouldings. It might be considered somewhat risky to base any reliance upon the mouldings, yet it must be remembered that the course of mediæval architecture was a regular progression, and the mouldings are found to follow each other not only in this case but throughout all Gothic buildings in the same orderly manner. Scottish ecclesiastical buildings until the closing years of the thirteenth century were uniform in style with those of England, but during the fourteenth and fifteenth centuries friendly intercourse ceased and the architecture of Scotland branched off into its own distinctive channel. Thus Glasgow Cathedral being of the earlier date, the author of the book under notice has been much aided by the evidence of dates of certain sections of mouldings in English work, so that this assumption of the dates of various parts of the structure from the sections of the mouldings does not rest upon such insecure foundation as might at first be supposed. Glasgow Cathedral Church seems to have been planned anew three times, each in increased size and elaboration, under Bishops Jocelin, Walter and Bondington respectively. Jocelin's church appears to have been pulled down by Walter, only a few fragments of this twelfth-century building remaining, and these not *in situ.* Walter's project was on such an extensive scale that he was not able to find money enough to complete it in his time; Bondington, however, was more moderate in his demands, and did not attempt to rebuild all Walter's church, but concentrated his attention on the eastern half of the building, which he was able to almost complete within the twenty-five years of his episcopate. The author has, as we said above, not confined his work to proving the variation in date of the vaulting of the lower church, but has extended it to deal with vaulting in general. He says: "As a double vaulted church of the thirteenth century, with clerestory and aisles, the choir of Glasgow Cathedral is unique in this country—in many respects it has no parallel anywhere. Its design is such as to involve constructive difficulties in resolving which the builders were without direct precedent, and the story of the choir vaulting shows by what means these obstacles have been overcome. Its examination discovers to us, in the continuous modification of detail in succeeding



HOUSE ON THE WEST SIDE OF THE PLACE DE LA CONCORDE, PARIS, NOW OCCUPIED BY THE MINISTER OF THE MARINE.

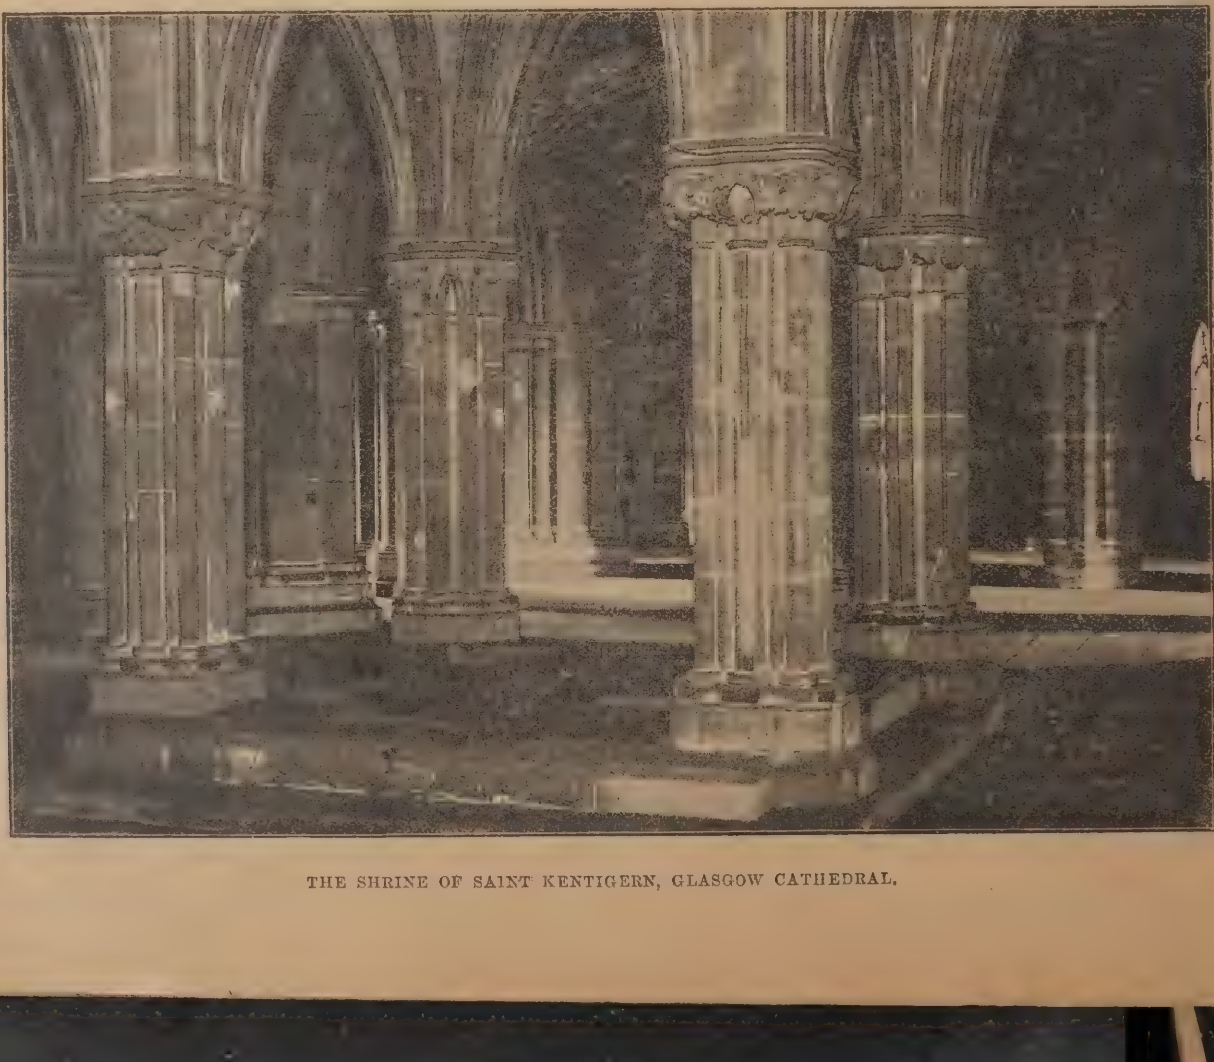
* "The Double Choir of Glasgow Cathedral: A Study of Rib Vaulting." By T. L. Watson, F.R.I.B.A. Price 25s. nett. Glasgow: James Hedderwick & Sons, "Citizen" Press.

stages of the work, something of the process followed by the mediæval builder, while the complete change of design in the middle vault, following upon an interval of only twenty years, illustrates once more the rapid development of the style, and shows on the part of the designer, whether the change was due to his own initiative or to that of others, a sustained effort to improve and perfect his art." This enquiry has led to some revision of the chronology of other parts of the building; part of the lower walls of the nave and transepts, as well as one section of the under-building of the choir, being attributed to the thirteenth instead of to the latter part of the twelfth century. We give an illustration of one original springer to show how the direction of the ribs has been altered; in this particular case it will be noted that the springer of 1240 is of two courses of stone, and at the level of the upper bed, where the work of 1260 commences, the rib is deflected in a very pronounced manner towards the right. In the original portion of the rib there is a clear indication of the direction which it was designed to take on the early plan. Where the old springers have been removed bodily and replaced by new ones, these have been wrought in the majority of cases with mouldings of the later date, while the original springers retain their early mouldings. It is in this way that Mr. Watson has been enabled to plot the three stages of plan illustrated in his book. No doubt, the reason of this change not being recognised before was that the windows of the lower church are filled with modern-stained glass, which makes the interior very dark. The shrine of Saint Kentigern, which we illustrate, was not originally intended to be in the place it now is. The development of the art of vaulting which had gone on after the first projected plan allowed this part, however, when the vaulting was finally carried out, to be given special dignity and emphasis by an elaboration which the builders were not advanced enough in knowledge to do before. Mr. Watson offers an interesting and very probable explanation of the fact that one compartment of the lower church was completed before the rest of the choir building was begun. The mediæval builder worked without heavy scaffolding; the walls were their own main scaffolding. The scaffolding was, in fact, not strong enough to support the heavier materials, which were raised directly from the ground on to the walls. As these were almost always built from the inside, it was necessary that the heavier stones should be wheeled into the building on the level of the ground; and the appliances at the disposal of the builders required that they should be hoisted vertically. The process implied a roadway into the interior of the building, and this is why Mr. Watson thinks the construction of part of the lower church was delayed. This suggestion is illustrated on page 550. He says in reference to this: "A glance at the plan of the lower building will show that no opening of sufficient width could have been formed between the pillars of the north and south aisles. Although only the major pillars of the lower aisles are beneath the pillars of the choir, the smaller intermediate pillars, and the arches which they carry, are necessary to the stability of the structure, and the whole range must have been built at one time. The width between the bases of the pillars at each side of the middle compartment is only 3ft. 6in, and this is manifestly insufficient for the larger loads or even the ordinary traffic of the building. The openings between the eastern pillars, however, offer a clear width of 6ft. 6in. between the bases, and form the only possible access for the hand-carts or other vehicles on which the heavier material had to be conveyed into the middle of the building. The chief part of the dressed stone for the clerestory walls must therefore have been brought in through the two large archways under the eastern gable and by way of the eastern aisle. It follows also that a roadway must have been formed from the exterior of the building into the eastern aisle, and for this purpose one or more wide openings must have been left in the outer walls. This could only have been done by leaving unbuilt the middle piers of the two-light windows of the eastern aisle or of the eastern chapels . . . . the mouldings show that they *were* so delayed. It seems probable that the roadway was carried right through the eastern aisle of the lower church, branching off at right angles into the platform of construction of the middle compartment. By this route the heavier loads could be wheeled in from either side of the building and brought right under any part of the clerestory walls, the stones could be grappled by the lewis and hoisted vertically from the trolley by means of a windlass, and finally settled in their places with the assistance of a short crane or jib. If we assume the mason's yard to have been on either side of the choir, or on both sides, the fall of the ground would lend itself to a slight inclination of the roadway, which would permit of a heavy load being moved with great facility. The window openings of the eastern chapels would give additional means of communication, or they may have been left unfinished mainly for the admission of as much light as possible. It is obvious that if the original plan included the axial ribs which spring from the piers of four of the two-light windows, the vaulting could not have been completed so long as these piers were unbuilt. In any case it was not desirable that the eastern vault should be constructed before that of the middle compartment, as all the light that could be got was required during the completion of the middle vault. Apart, therefore, from the evidence of the mouldings and the necessity for a way into the middle of the building, it would have been a safe assumption that the eastern vault, and not the middle compartment, must have been the last part of the lower vault to be carried out. The evidence of the late mouldings, however, removes the subject from the region of conjecture into that of ascertained fact." It is fairly certain that the aisle vaulting was completed as the building went up, both at the lower and upper levels, as this would be of service in affording facility of circulation to the workmen.

The book is admirably produced, the illustrations are well printed, and the printing of the plans in several colours according to their date serves to render these clearer than would be possible in any other way. The book should be read by all students of Gothic architecture.

A New Day School for Ossett.—Alterations and additions are being made to Bethel Congregational Chapel, Flushdyke, in order that the premises may be used as a day school. Two new classrooms are being built, 22ft. by 18ft. and 18ft. by 15ft. respectively. Plans have been prepared by Mr. George Patterson, of Ossett, and the work is in the hands of the following: Mersrs. J. Ellis & Sons, Ossett, masons; Messrs. Mark Lockwood & Sons, Ossett, joiners; Mr. John Pollard, Ossett, plumber; Mr. A. Wilkinson, Ossett, plasterer; and Mr. George Hargreaves, Dewsbury, slater.



THE SHRINE OF SAINT KENTIGERN, GLASGOW CATHEDRAL.

Law Cases.

SPRINGER IN DOUBLE CHOIR, GLASGOW CATHEDRAL.

Leeds Workhouse Plans: Uncommon Action.—In the King's Bench Division last week Mr. Brooke Little applied for a rule *nisi* for a *certiorari* directed to the justices of the West Riding of Yorkshire, sitting at the Town Hall, Leeds, to bring up a conviction of the guardians of the Hunslet Union to be quashed. Counsel stated that the Local Government Board had sent an order to build a workhouse, and the guardians set about erecting it and continued to do so, but were summoned by the Leeds Town Council for unlawfully failing to deliver to them copies of the plans and sections of the building in accordance with their by-law. That summons was served on the clerk to the guardians on a Saturday, and was returnable on the following Tuesday. Between those dates it was impossible, according to the statutory rules which governed the meetings of the guardians, to have a meeting so that they could be represented before the magistrates, and the clerk instructed a solicitor to apply for an adjournment on these grounds. The justices, however, refused the application, and convicted the guardians in their absence. The justices had no jurisdiction under the by-law, because it did not apply to buildings erected by order of the Local Government Board. Under the Public Health Act, 1875, section 157, an urban sanitary authority had power to make by-laws with respect to buildings and to the deposit of plans, but the last words of the section provided that no by-law made under the section should affect any building erected by virtue of any order of the Local Government Board. The rule was granted.

Water for Swimming Baths.—In the Chancery Division of the High Court of Justice last week the case of *Barnard Castle Urban District Council* v. *Wilson and others* was heard. This was a case of some importance to local authorities supplying water and governed by the Waterworks Clauses Acts, 1847 and 1863, and the Public Health Act, 1875 The plaintiffs were the local authority, and the defendants were the governors of the North-Eastern County School at Barnard Castle. The governors had erected a swimming bath, which held about 35,000 gallons of water, and the plaintiffs contended that the supply of water to it was not a supply for "domestic purposes" but a supply for a "trade, manufacture or business," and that the water ought, therefore, to be paid for at a special rate. Mr. Justice Buckley pointed out that the Acts above-mentioned did not allow an extra charge to be made for private baths, and did not, in fact, refer to baths at all, except public baths and washhouses. He had, therefore, he said, to contrast the words "for domestic purposes" with the words "trade, manufacture or business." The swimming bath was not a business, but a mere incident to the whole business of keeping a school, and he made a declaration that the supply for the swimming bath was a supply for domestic purposes, and ordered the plaintiffs to pay the costs of the action.

Building Mortgages.—The case of *Crouch* v. *Roberts* came before the King's Bench Division of the High Court of Justice last week. This was an action brought under an agreement with reference to the development of the Selly Oak Estate, Birmingham. The plaintiff, a builder, agreed to erect 133 small houses on the estate, of which the defendant was the freeholder. the money for building being provided by means of progressive mortgages. A dispute eventually arose between the parties, and the plaintiff brought an action to recover about £6,000 alleged to be due under the agreement. Defendant denied liability, and counter-claimed for various things, including a sum of £250 alleged to be due as commission for procuring the advance to the plaintiff of a large sum of money to enable him to build on the Bournbrook Estate, Birmingham. The case was tried at the Birmingham Assizes before Mr. Justice Wills and a special jury, and on the findings of the jury the claim was referred to an arbitrator, who found that the plaintiff was entitled to £6,231. Mr. Vachell now applied for judgment for the plaintiff on the report of the arbitrator. He said that it had been agreed that the sum of £250 mentioned in the counter-claim should be struck out and dealt with in another action which was pending. Justice Wills gave judgment for the plaintiff on the claim for £6,231 and costs, and also on the counter-claim, except that part which related to the sum of £250.

Concerning Byron's Birthplace.—In the Chancery Division of the High Court of Justice the case of *Bailey and others* v. *Lewis* was recently heard. The plaintiffs in this action, who were the trustees of the Portland estates, moved for an order to commit the defendant to prison for non-compliance with an order constraining him from erecting on the site of a passage in Holles Street, W., any building or erection other than wings, and from erecting on the site of 16 and 17, Holles Street any building without the plaintiffs' consent, or from altering the premises, or from making any opening in the party wall. The premises occupied by the defendant included 24, Holles Street, the birthplace of Byron. In support of the motion Mr. Vernon Smith, K.C., stated that the defendant was turning private houses into shops in breach of restrictive covenants, the injunction was obtained, and the defendant had done nothing to comply with the mandatory order to restore the premises to their original condition. The motion was ordered to stand over until next sittings.

A Well-known Architect Fined.—In Edinburgh Sheriff Court last week three persons were prosecuted for having begun building operations without first submitting plans and obtaining the necessary sanction. In respect to the charge against Dr. Rowand Anderson, whose agent said he had been building houses at Colinton for over twenty years without submitting plans to any authority, objection was taken to the relevancy of the indictment. This was repelled, and a fine of 7s. 6d. was imposed. Similar penalties were imposed with respect to charges of a similar nature preferred against Samuel Purves, chemist, and James Robb, builder, of Leith.

A Sewage Pumping Station is not a "Sewer."—In the Chancery Division of the High Court of Justice on Thursday last the case of *King's College, Cambridge* v. *The Uxbridge Rural District Council* was heard. This was an application for an interim injunction to restrain the defendant council from proceeding with the pumping station now being erected by them upon a certain strip of land in the parish of Ruislip. The defendant council had resolved to carry out a scheme for this parish by which the sewage was to be conveyed to one common outfall for treatment. Owing to the levels it was found necessary to lift the sewage and pump it along a rising main from Eastcote village to Ruislip village, and for this a pumping station somewhere near the spot in question was necessary. The defendant council, without any notice, were proceeding to erect a pumping station upon this strip of land; and as the plaintiffs also claimed the land and considered that the proposed erection would seriously damage the adjoining land, which was now coming into the market for building purposes, the present action was commenced to stop the defendant council from going on with their works. Mr. Justice Byrne said the question for decision was whether the defendant council had any right, without giving any notice to the plaintiffs, to go on to this land for the purpose of constructing the pumping station; in his Lordship's opinion the defendant council had no such right. The question turned on whether the work the defendant council were now doing was within section 16 of the Public Health Act, which provided that any local authority might carry any sewer through, across or under any turnpike road or any street or place laid out as or intended for a street, and, after giving reasonable notice to the owner or occupier, into, through or under any lands whatsoever within their district. No notice had been given, and a local authority had no right to carry a sewer under private property, as this was, without notice; but then a further point was raised—was this pumping station a "sewer" at all, or was it not rather, within the provisions of section 27 of the Act, an apparatus for the "distributing or otherwise disposing of sewage," for which land could and would have to be purchased; in his Lordship's opinion section 27 applied to the present case, as this pumping station clearly was a means of disposing of the sewage on to another site prepared for it, and it was not a "sewer" within section 16. It would require a great stretch of the imagination to hold that a large building, like this pumping station, was part of a sewer. For these reasons his Lordship thought that what had been done had not been legally done, and that the plaintiffs had made out their case for an interim injunction to restrain the defendants from entering upon or taking this land otherwise than strictly in accordance with their statutory powers, not being powers under section 16.

Copyright in Timber Calculation Tables.—The case of *Greenwood* v. *Barker* was heard in the Chancery Division of the High Court of Justice last Thursday. The plaintiff, J. H. Greenwood, claimed to be the author and duly registered proprietor of a pamphlet or card entitled "Calculator of Prices of Small-sized Timber," and also of a book entitled "Greenwood's Timber Calculator; also How to Check a Timber Merchant's Invoice, the Inch by Inch Method, &c." The defendant, J. R. Barker, recently compiled and published a book entitled "The Timber Merchants', Builders' and Contractors' Calculator," which contains, *inter alia*, (1) tables for pricing timber of various specified dimensions, (2) tables for pricing mouldings, laths, &c., with examples illustrating the same, and (3) directions as to various methods of checking timber merchants' invoices, together with examples illustrating the same. The plaintiff alleged that those tables, directions and examples were either exact copies of or based upon and constituted colourable imitations of matters contained in the plaintiff's card or pamphlet and his book, and that thereby the defendant had infringed the plaintiff's copyright. He accordingly claimed an injunction and delivery up. The defendant alleged that the book complained of was written and compiled by him independently and without any improper use of plaintiff's card or book, and that tables, directions and examples of the same character in all respects as those mentioned by the plaintiff had for many years been well known to and in common use by persons engaged in the building and allied trades, and that the plaintiff had no copyright in any such table, direction or example except in so far as it was the result of independent work by the plaintiff. After hearing the evidence, Mr. Justice Farwell said that unless he was prepared to accuse the defendant of wilful perjury he must believe his account of the compiling of his book, and consequently the plaintiff's action would be dismissed with costs.

AN AMERICAN ARCHITECTURAL SCHOOL.

THE Department of Architecture of the Massachusetts Institute of Technology, Boston, U.S.A., has recently published a very well prepared pamphlet upon its course in architecture illustrated with some excellent collotype reproductions (several in colour) from architectural drawings by students. The Institute of Technology was the first school in the United States to introduce a regular course in architecture. It was established in the year 1866, though it did not graduate its first regular student until 1873. From the beginning the scheme of instruction was based on the method pursued at the École des Beaux-Arts at Paris; and the wisdom of this course has been amply proven during the entire life of the school—a success all the more remarkable when it is remembered that there was no American precedent to aid in the organisation of this important work.

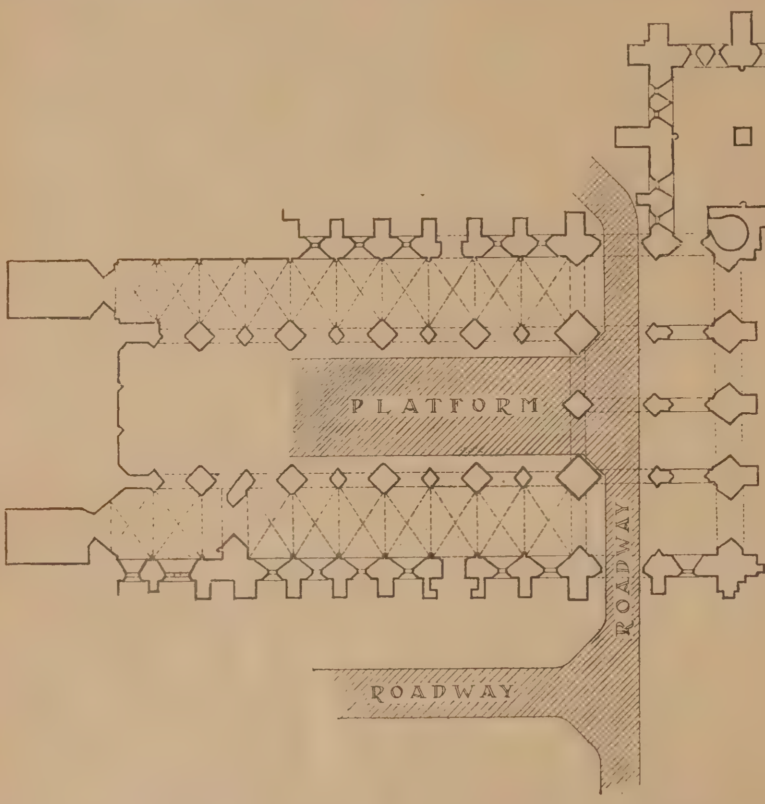


DIAGRAM OF ROADWAY EMPLOYED AT GLASGOW CATHEDRAL.

In the general plan of instruction few changes have been made or demanded. There has been simply a strengthening along the original lines, due to the natural growth of the school. The necessity, at last so universally accepted, of a thorough all-round training for the modern architect, and the steadily rising standard of excellence led in 1891 to the discontinuance of a two years' "Partial Course," previously open as an alternative. Some of the older courses have been modified, and others added to meet new conditions as they occur in architectural practice, but from the beginning there has been no change in the aim of the school. It still demands a thorough training by the Beaux-Arts method, because experience has proved that through this method the student best learns to grasp the principles governing composition and design and to present clearly and intelligently his finished work. These principles can only be developed by continued study of various problems, the result of which will be to give the pupil an ability to achieve grace and elegance in the expression of architectural ideas through an unerring and satisfactory adjustment of the structural parts. When, through exhaustive research and study, the pupil has attained this position, he can be depended upon to think for himself; and in the multiplicity of ideas he will be able to distinguish between the essentials and non-essentials. He will really learn to see and discover for himself that which is beautiful and most worthy of study in the masterpieces of past ages, and the words "archæology" and "art" will gain for him a deeper and more concrete meaning.

This continued exercise serves also to develop an instinct for the beautiful and a power which enables the student to give form to his own ideas. Understanding now the synthesis of architectural things and appreciating the spirit of architecture, he acquires a certain flexibility of imagination, enabling him to solve with straightforwardness the varied and complex problems which constantly arise in professional practice.

One other important method of instruction should be mentioned; that is the co-operation of a number of special teachers and lecturers who, from the highest ranks of their professions, spare time from practice to give the department regular instruction. This direct contact with men acquainted with everyday problems has a most stimulating influence, and also serves the good purpose of keeping the students in touch with the architect's office at the same time that they are following their regular school work.

As architecture stands first in the order of the fine arts, and in its highest development is in the closest alliance with the sister arts of sculpture and painting, the architect's education must not only consist in a broad training in construction and composition, but must also give him the knowledge necessary for ready co-operation with the sculptor and painter when he applies their arts to his buildings. This end is kept in view throughout the course.

The instruction offered in the Department of Architecture is designed to prepare its graduates for the work which they will be called upon to perform in after-life, both at the commencement of their careers as subordinates in architectural offices and in the positions of greater responsibility or independence which they may later succeed in attaining. To these ends manual dexterity and mental accuracy, together with a broad knowledge of technical details, of constructive methods and of modern practice, are of the utmost importance. Throughout the course, therefore, the acquisition of skill of hand and eye, the cultivation of good taste in line, form, colour and design, and the mastery of the principles underlying sound construction, are kept constantly in view.

These in themselves would, however, be insufficient. In no profession are breadth of culture and high mental training of greater value than in that of the architect. Recognising this fact, it is the aim of the department to insure to its graduates a liberal education as well as directly professional training. This is provided for both through supplementary studies of a more general character and by the thoroughness and method with which professional subjects are treated. As the student advances, however, the time allotted to non-professional and disciplinary studies diminishes, while that assigned to professional and fine art studies increases, until in the fourth year his whole energies are devoted to the higher branches which relate to architectural design, construction and the history of art.

The requirements for admission to the first year represent the completion of a good high school course, with considerable attention to mathematics.

Architectural History.

Architectural history is taught by lectures, amply illustrated with the stereopticon, books and photographs. A good knowledge of the great architectural styles is demanded of the pupil, and to this end the striking examples of each style are discussed and studied in the class-room; and the student is made to see that an intimate knowledge of the principles governing design in the Classic, Mediæval and Renaissance work is a necessity, if a proper use is to be made of precedent. This knowledge is stated to be found not only of the greatest use in professional practice, but will also open the way for enjoyable future study and research. Each week the students are required to present for criticism abstracts of the lectures and sketches of the historical monuments discussed. They are also required to test, by comparison with the works themselves, the descriptions and conclusions of the leading architectural authorities, and to prepare careful themes and drawings showing the results of their research. This personal investigation serves besides to give the stutents a good working acquaintance with the exceedingly valuable collection of books and photographs belonging to the department, and stimulates their appreciation of the best architectural works.

The importance of a broader æsthetic and historical training is also recognised and amply provided for. The history of architecture is closely dependent upon the general history and conditions of European civilisation in the ages when the leading architectural styles were developed and perfected. Without a somewhat extended survey of political, ecclesiastical and social history, as well as of architectural history in itself, it is impossible that the essential spirit of Classical, Gothic or Renaissance art should be fully grasped. The ages of highest architectural achievement, moreover, have been also the ages of the greatest distinction in sculpture and painting—arts which of necessity stand in a close practical relation to that of building.

With these considerations in view a course of study has been planned which aims at giving a general survey of the history and characteristics of European civilisation in the Classical, Gothic and Renaissance ages, and at familiarising the student with their sculpture and painting.

The instruction in ornament is closely allied with the history courses, as it not only gives a proper conception of the historical development of ornament and acquaintance with the characteristics of different styles, but it also considers the motives influencing architectural composition and design. Lectures are given, and problems are solved and rendered in black and white and in colour. Each finished design is carefully criticised before the class.

Drawing, Water-Colour, Pen and Ink.

During four years the student has continued practice in freehand drawing, beginning with the cast and ending with the living model. Every means has been taken to make this course efficient and attractive; for ability to draw with proper training produces freedom and skill in design. The valuable collections of the Museum of Fine Arts, enriched by many architectural casts belonging to the Institute, are always open to the students of the department of architecture. Advanced students are regularly assigned work in the museum, which is so close at hand that no inconvenience results from the arrangement. Proficiency in drawing from the cast leads to the day life-class, which is maintained throughout the school year. The benefit derived from continued practice in drawing from the living model cannot be overestimated, since it communicates an accuracy of eye, a perfection of touch, and a facility with the pencil without which one cannot become a master of design. The course in modelling given during the fourth year, after three years' preparation in line drawing, is of great assistance in the proper understanding of architectural details. It includes both the manipulation of clay and casting in plaster. To insure facility in different methods of rendering extended courses are given in water-colour and pen-and-ink drawing. The work is done as much as possible from architectural subjects, to enable the students to associate at once the principles of draughtsmanship with architectural form.

Architectural Design.

The architectural design taught has for its foundation a careful persevering study of Classic work. This is reckoned to be the logical starting-point, because in the Orders culminated all ancient architecture, and in the Orders was the birth of the great styles that developed in later years. It is a study that requires learning, historical knowledge, and great accuracy. The department think this involves all the fundamental principles of design; and there is no concealing of errors, as in the more picturesque styles. This is undoubtedly the weakness of the school, for there can be no real criticism by abstract principles, and can only properly be done with regard to the wrong use of material and upon general moral ethics; the rest is but idle interference with a man's individuality and independence of thought and can but lead to a self-conscious style. The department authorities think that after the student has left school he must undoubtedly meet the world in his own way; but if he has had a solid training in balance, proportion, light, shade, scale and colour, in a style requiring the nicest study of all these elements of good design, he may be trusted to work in any style with which he may later have to do.

The course in design begins in the second year with the history and application of the orders and the study of Classic and Renaissance works. Lectures are given on the proportion and correct use of the Greek, Roman and Renaissance orders, arcades, balustrades, windows and other architectural details. A thorough course in shades and shadows is given concurrently with that of the orders; and the student learns that by applying to his drawings the laws of the projections of shadows he indicates in a degree the third dimension, and at the very beginning he is made to see the importance of light and shade as a factor in the composition of design. To familiarise the student with these forms and the value of the third dimension, and to give him the best possible idea of scale, full-size models of various orders have been prepared, from which measured sketches and accurate drawings are made. Regular exercises in memory drawing on the blackboard not only stimulate the memory and imagination but are of the greatest assistance in teaching the different proportions and value of classic members and mouldings and in the early acquaintance by the students of a knowledge of form. Continued practice is had in the careful and accurate study of Classic detail, rendered in the most truthful and effective manner.

This severe training prepares the way for the broader work of the third and fourth years. Every month two problems are assigned to each class, one a sketch problem, which must be designed and effectively rendered in time varying from one day to one week; the second, a more difficult problem, for which an entire month is allowed. In order to accustom the students to concentrate their minds upon the development of a single idea, instead of wasting their energies in the successive adoption and abandonment of different solutions of the given problem, two days are allowed after the posting of the larger programme of the month, within which time each student must fix upon some general scheme for his design and show his idea by sketch plan and elevation on a small scale. These preliminary sketches are attached to the completed designs, which must correspond with them in all essentials. Judgment is then passed upon the drawings by a jury from the Boston Society of Architects. The designs are afterwards criticised in the presence of the students of the department, the most deserving being indicated by cards of honourable mention and the others marked according to their merits by the instructors.

Continuous studies in planning give the student opportunity to enlarge his resources in this most important part of the architect's work, particular attention being paid to special classes of buildings, such as schools, theatres, churches, hospitals, &c. Opportunities are offered, moreover, for one or two years of advanced study, to be entirely spent in professional work.

Construction and Office Practice.

Scientific construction is continually becoming a more necessary part of the architect's profession. His knowledge must be broad and thorough, and the practice of to-day shows that an architect should not only be a skilled artist but should also be so scientifically trained as to control intelligently all constructive questions.

The mathematical courses in algebra, plane trigonometry, analytic geometry and calculus, and the course in physics, prepare the way for the consideration of professional work in applied mechanics, graphical statics and strength of materials. These are followed in turn by a short course in constructive design, which applies the knowledge obtained in earlier courses to problems often encountered in modern architectural practice. The lectures on history of construction, on the other hand, present to the students the highly-developed methods used by Roman and mediæval builders.

In the second year the principles involved in different methods of perspective and the simpler problems of stereotomy are taught. In the latter course the methods of descriptive geometry, learned in the first year, are applied to the drawing of practical problems in stone-cutting.

The course in materials describes the various elements of modern construction, such as cement, lime, mortar, brick, wood, stone, metals, &c., and their use by the mason, carpenter, roofer and plumber. This practical instruction is supplemented by visits to buildings in process of construction.

The study of working drawings and specifications naturally succeeds the elementary work in materials. Practical instruction is given in making quarter-scale plans and elevations from sketches of wood, brick and stone constructions, and in making the framing plans and working drawings of various kinds necessary in actual practice. Care is taken not to attempt details which may be better learned in an architect's office, but enough is accomplished to enable the student to take immediate advantage of office opportunities upon graduation.

The student is advised to spend a part of the summer vacation, if possible, in an architect's office. What he learns of office practice in this way during the vacations of his course is a great aid to him in the clearer understanding of his school work.

The knowledge acquired from the courses on building stones and on heating and ventilation are of the greatest importance to the practising architect. In the first the characteristics of the various stones used for building are explained, and the stones themselves are tested and tried by the latest experimental methods. In the second course the laws governing the flow of gases are studied. Problems are given to the student like those which arise in actual practice; and the efficiency of warming and ventilating apparatus and devices for controlling and regulating the temperature of buildings are made the subjects of laboratory tests.

The most important elements of the general training which the student receives are the courses in general chemistry and physics, French and German, English literature and composition, political economy, history and business law. These courses vary from a half-year to two years in length. The earlier years also contain several studies of a semi-professional character, which lead in later years to more strictly technical work.

Architectural Engineering.

In recent years opportunity for specialisation has been offered by the introduction of options in architectural engineering and landscape architecture for students not desiring to follow the general course in architecture. The option in architectural engineering meets the demand for men specially trained in the computation of all the details of modern steel construction which occur in the practice of architecture. It diverges from the other options at the middle of the third year, the general architectural training which the student has had during his first years being an important aid to him in his future career. His field of employment will be broader for this knowledge; for as an architectural draughtsman his familiarity with the uses to which a building is to be put, and his ability to take part in the regular routine of the architect's office, will make his services additionally valuable. Lectures and problems on the principles of applied mechanics and lectures in the theory of structures, including loads and reactions, shears and moments, proportioning of beams, columns and tension pieces, the computation of plate and box girders, wooden and steel roof trusses, steel framing, wind bracing, fireproofing, foundations, arches, &c., give the necessary preparation for practical problems in structural design, which forms the important feature of this course. In the fourth year a part of the time is given to laboratory tests on the strength of building materials. Graduate students who have completed the regular course in architecture will also find in the engineering option an attractive field for work.

Landscape Architecture.

The option in landscape architecture offers opportunity for study in a new direction, and the course of study is the result of the fullest co-operation between the Institute instructors and practising landscape architects of the highest rank in the profession. The value of this assistance will be better understood when it is known that no precedent exists on which to base such a course and that the prescribed studies represent the result of personal experience during years of active practice. The landscape architect has heretofore had no opportunity to secure such training for his profession as have the architect and the civil engineer in theirs. It has been necessary to secure the requisite preparation in large part by apprenticeship, as formerly in the older professions. Of late years there has been such a steadily increasing demand in the United States for trained landscape architects, and so much more attention is now being paid to all questions concerning public parks and private grounds, that this profession is believed to offer unusual opportunities. The option begins with the second year of the regular course. In that year it includes horticulture, elementary architectural design, shades and shadows, perspective, freehand drawing, surveying, topographical drawing and dynamical geology, with the usual general courses in physics, language and history. In the third year the same general lines of work are followed, with work in horticulture at the Arnold Arboretum, architectural and landscape design, architectural history and freehand drawing, stadia and plane table surveying, curves and earthwork, highway engineering and structural geology. In the fourth year landscape architecture and design and horticulture are the main features, with courses in sanitary engineering and drainage, building stones and public health sanitation; history of ornament, life-class, modelling, pen and ink, water colour, specifications and working drawings, and business relations. The special instruction in landscape design is conducted by Mr. Guy Lowell, a graduate in the class of 1894, who has since taken the diploma of the Ecole des Beaux-Arts with distinction, and has made a special duty of landscape architecture in Europe.

Graduate Work.

The Institute offers opportunities for one or two graduate years of advanced study, to be spent entirely in professional work. The value of such a course cannot be overestimated, for it allows uninterrupted and continuous study at the time when the students are exactly ripe for it. They are now fitted to undertake problems of an importance equal to those given in the higher class of the Ecole des Beaux-Arts. The subjects chosen for this advanced design are representative of American needs of the day. They are studied as carefully from the practical as from the artistic point of view. With the building proper the surroundings receive equal consideration; and careful study is given in the right understanding of æsthetic requirements, and the designing of the approaches, statues, fountains, terraces and gardens in their proper equilibrium of parts. There could be no better proof of the success of this course than the striking results obtained in the competition held by the Society of Beaux-Arts Architects of New York during the three years when the pupils of the fifth year entered the lists of competitors.

In this advanced work also decorative design takes the prominent position belonging to it when associated with architecture in its highest development, and is carefully studied in the varied relations with its sister arts of painting and sculpture. The extra time allows also an exhaustive study of some archæological problem, consisting of the restoration of Greek and Roman remains or an important study in mediæval Gothic. The fifth year also allows the Institute graduate to round off his practical training with a course in architectural engineering, which will prepare him to solve any constructive problems that come up in the architect's practice.

Summer Work.

Besides the regular work the course of the department also offers in certain subjects summer instruction covering the same ground and given in the same manner as that of the regular classes. The courses are given by members of the department during June and July, and the subjects usually included are design and shades and shadows. Courses in mechanical drawing and descriptive geometry are also available. While these courses enable students who have incurred deficiencies during the school year to make them up before the next term, their principal object is to assist applicants for advanced standing, particularly students coming from other colleges, to complete the preliminary work of the second year with a view to undertaking third-year work to better advantage or even to give them the opportunity to complete the professional work in two years.

In addition to this summer instruction a summer school is held each year for the purpose of bringing the students in contact with the practical side of building, and that they may learn to appreciate the true value of scale and detail. For this purpose localities are visited where buildings are to be found which are important as representative of style or character. These buildings are thoroughly studied, measured and photographed, careful sketches of detail are drawn, and, later, complete drawings are worked out to scale.

St. Margaret's Church, Cley, Norfolk, is said to be greatly in need of repair. The oldest part of the church is the tower, built in the thirteenth century. In the early part of the fourteenth century the work of rebuilding the nave and aisles on a more pretentious scale was commenced. Then came the pestilence of 1349, now known as the Black Death, and the work was suddenly brought to a standstill, and remained, as is supposed, unfinished for 100 years. Towards the end of the fifteenth century an attempt was made to complete the building, but the presumed original design was never entirely carried out. During the eighteenth and early part of the nineteenth centuries decay made rapid progress, and about fifty years ago some "restorations" were effected that were worse than decay. There is, however, much good old work left, and the walls are generally in a sound condition, but the roofs of the north and south aisles call for immediate repair. About £1,000 would effect that, but some £6,000 are needed to put the church in proper condition.

THE EXCAVATIONS AT ST. AUGUSTINE'S ABBEY FIELD.

MR. CHARLES F. ROUTLEDGE, of St. Martin's, Canterbury, appeals for funds in connection with the excavations on St. Augustine's Abbey Field.

This ground contains the ruins of St. Pancras' Chapel, probably built by St. Augustine, and also the eastern portion of the Abbey Church of St. Peter and St. Paul, in which St Augustine and many of his successors were buried, together with the chapter-house, dormitory and infirmary, and the site of the chapel of the Blessed Virgin Mary built by Ethelbert's son and successor, Eadbald. Excavations have been in progress for several weeks past at a cost of nearly £400, a great part of which has been expended in the laborious and costly process of removing the huge mass of earth deposited twenty years ago on the site of the presbytery to the depth of several feet.

The ruins of the early Saxon Chapel of St. Pancras have been completely uncovered, and the chapter-house (80ft. long and 40ft. wide) partially traced; but the chief efforts during the present summer have been devoted to the exploration of the Abbey Church itself. Owing to the devastation caused at the dissolution of the monastery by Henry VIII., and the still more serious vandalism of modern times, when graves were disturbed and building stones carted away for sale or for repairing walls and pigsties, a very small portion of the church above ground is now existing.

The excavators have, however, been fortunate enough to make some important discoveries in the crypt and its adjacent parts, so that the general plan of the Abbey Church is gradually revealing itself.

The large eastern apse is now visible, with its central and flanking apsidal chapels. The central chapel, somewhat altered in shape by subsequent buildings, contains some interesting frescoes on the walls, and in the middle are the remains of an altar highly decorated. Behind the altar is a walled recess, probably used as the place of deposit for valuable relics. The north apsidal chapel, immediately below the shrine of St. Mildred, also contains an almost perfect altar resting on painted tiles, in front of which were found the remains of an abbot which had been enclosed in a wooden coffin, fragmentary pieces of wood and iron nails being still evident.

The south apsidal chapel, beneath the shrine of St. Adrian, is now in process of excavation. The ambulatory at the eastern end of the crypt has been uncovered, together with four pillars of the apse over which stood the high altar.

To the east of the main church is a large oblong chapel erected perhaps in the fifteenth century, encased in a larger chapel, to which it is united by massive buttresses, and containing below the floor level portions of a wall that may possibly have belonged to Saxon times.

Amongst other relics found during the excavations were an enormous quantity of worked ashlar, carved marble fragments and bits of porphyry and serpentine mosaic, with brightly-painted stones, belonging probably to some rich shrines.

The excavations still to be undertaken, comprising the sites of the north and south transepts, the central tower, chapter-house, &c., will entail considerable expense. Besides the £400 already spent, at least £600 more will be required.

Batley Theatre Royal has been entirely renovated and re-decorated by Mr. Tom Hanley, of Branch Avenue, Batley.

At Westwood Edge Church, Golcar, Huddersfield, a new chancel is being built from designs by Mr. Willie Varley, of Slaithwaite. The alterations also include the removal of the old entrance from the centre of the east front, and the erection of a new porch at the south-west corner. The work has been let to the following contractors: Masons, Messrs. Hirst, Firth & Co., Golcar; joiners, Messrs. John Varley & Son, Slaithwaite; plasterers and concreters, Messrs. James Walker & Sons, Slaithwaite; slaters, Messrs. Thomas Allison, Ltd., Milnsbridge; heating apparatus, Mr. R. Rundle, Bradford.

TO NON-INSURED READERS.

From time to time we have queries addressed to us by readers on points affecting our Accident Insurance Schemes. The greater number of the queries relate to the conditions of payment, and to enlighten those who may still be in doubt we think it desirable to state

(1.) That it is not necessary to subscribe direct to the office in order to secure the benefits.

(2.) That even if ordered through a newsagent the subscription need not be prepaid for a year. It is sufficient to order it and pay as may be arranged with the newsagent.

(3.) It is sufficient to have an intimation from the newsagent that he supplies copies regularly.

(4.) That policies can be issued either direct to the subscriber or through the newsagent, whichever may be preferred.

(5.) In applying it is not necessary to write a long letter—a postcard will do, giving the full name and address of the newsagent from whom the copy is obtained.

There are **Three Schemes** of Insurance connected with our Papers, guaranteed by the Ocean Accident and Guarantee Corporation, Ltd.

Scheme No. 1 is a free Accident Insurance
FREE. of **£500.**

(Every regular reader of the Builders' Journal is entitled to this without any payment.)

Scheme No. 2 is an Accident Insurance of **£500,** giving the following additional advantages:

Premium, 1/-

£250 for Permanent Total Disablement.

£2 10s. 0d. per week for Temporary Total Disablement.

Scheme No. 3 is an Accident Insurance of **£1,000,** with these additional advantages:

Ordinary Risks, Premium, £3/-/-

Hazardous Risks, Premium, £3/10/-

£500 for Permanent Total Disablement.

£6 per week for Temporary Total Disablement.

£1 10s. per week for Temporary Partial Disablement.

£30 Annuity.

£3 per week during confinement from such illnesses as Diabetes, Scarlet Fever, Carbuncle, &c., &c.

If these schemes interest you, write for full particulars to

Property and Land Sales.

FOLKESTONE, on the West Cliff Estate.—Notice of Sale of valuable Freehold Land (free from tithe and land tax), in a charming situation, near the stations, on the south side of and between the main railway line and the sea.—With possession.—Messrs.

DEBENHAM, TEWSON, FARMER, and BRIDGWATER have received instructions to SELL, at the QUEEN'S HOTEL, Folkestone, on MONDAY, AUGUST 26th, at TWO for THREE, in lots, 50 CHOICE FREEHOLD RESIDENTIAL BUILDING SITES in a lovely position, about 100 feet above the level of the sea, with frontages varying from 40 ft. to 100 ft. to Bathurst Road, Baldric Road, and Turketel Road, at the western side of the Leas and near the new Hotel Metropole, affording an exceptional opportunity for acquiring good FREEHOLD SITES, suitable for the immediate erection of villas and modern marine Residences of a superior character, with gardens and stabling if desired. The roads are all 50 ft. wide and made up and metalled. The sewers and the company's water mains are in. There are great facilities in this beautiful neighbourhood for yachting, sea-fishing, bathing, hunting, and golf.—Particulars and plans of Messrs. TOOMER and CHILD, Solicitors, No. 35, Walbrook, London E.C.; of ANDREW BROMLEY, Esq., Architect, Radnor Chambers, Folkestone; and of the Auctioneers, 80, Cheapside, E.C.

To Builders, Tradesmen, Small Capitalists, Plot Buyers, Careful Investors, and others. Important Land Sale of 79 valuable Freehold Building Plots, choicely contained of the Church Fields Estate, with splendid frontages to East End Road and Church Lane, East Finchley, a few minutes' walk from East Finchley Station, G.N.R. (frequent trains from King's Cross, Moorgate Street, and Broad Street), offering splendid sites within six miles of London for the erection of medium sized Villa Residences, or the creation of Ground Rents. Free Conveyances. Payment by instalments. Roads made. Sewers laid.

MESSRS. RANDALL, COX & BAKER, will SELL by AUCTION the above at the BALD FACED STAG HOTEL, East Finchley, on WEDNESDAY, AUGUST 21st, 1901, at HALF-PAST SIX p.m. precisely.

Particulars, plan, and conditions of Sale may be obtained of Messrs. POWNALL & CO., Solicitors, 9, Staple Inn, W.C., and of Messrs. RANDALL, COX & BAKER, Auctioneers and Land Agents, East Finchley, N., and Woodside Park, North Finchley, and Mr. S. H. BAKER, 62, Coleman Street, E.C.

CORNWALLIS ESTATE, LOWER EDMONTON, a few choice plots suitable for Shops, either freehold, or in ground rent; plan and particulars.—D. CHAPMAN, 79, St. Bees Street, Moss Side, Manchester.

MISCELLANEOUS.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two.

BUILDER'S BUSINESS.—One of the oldest in the Midlands (½ century) for sale. Goodwill only £100. Stock, plant and premises, if desired, at valuation. Chance of a lifetime for a beginner. – A. B., Box 1746, BUILDERS' JOURNAL Offices, Effingham House, Arundel Street, Strand, W.C.

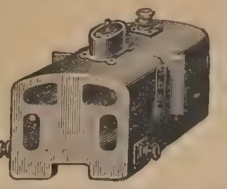
TO ARCHITECTS AND SURVEYORS.—An Old-Established Country Practice for Sale in the South of England; good reasons for giving up same.—Address, ARCHITECT and SURVEYOR, Box 1736, BUILDERS' JOURNAL Offices, Effingham House, Arundel Street, Strand, W.C.

FOR SALE BY PRIVATE TREATY as a going concern, an old-established BUILDER'S AND CONTRACTOR'S BUSINESS at Swansea, with two large Yards, two Dwelling Houses, Offices, Buildings, and Stables, and complete with Gas Engine, Saw Bench, Moulding Machine, Mortar Mill, &c., now in full working order. Gas and Water. Stock (optional) at valuation. —For particulars and to treat, apply to Mr. A. B. DAVIES, Auctioneer and Valuer, 58, Wind Street, Swansea.

R.I.B.A., Society of Architects, Surveyors' Institute (Building Section), and Civil Service Technical Examinations. Preparation by correspondence or in residence.—MIDDLETON & CARDEN, 19, Craven Street, Strand, W.C.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE & BOND, Associates R.I.B.A., 115, Gower Street, W.C. (close to the British Museum).

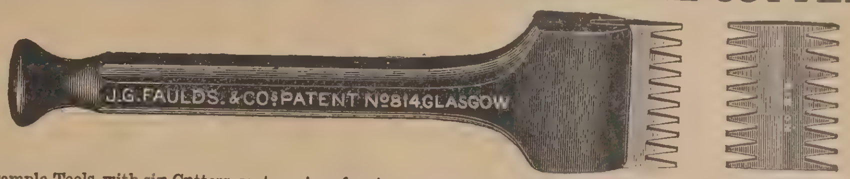
FLEMING'S "TEON" BELT.
THE BEST & STRONGEST BELT FOR DRIVING IN HEAT, STEAM, DAMP, WATER, OR OUT OF DOORS.
A Contractor writes:—"I shall be glad to recommend it as superior to any other Belting I have in use."
FLEMING, BIRKBY & GOODALL, Ltd., Wegrove Mills, HALIFAX, Yorks.



BOILERS for Heating Apparatus.
WROUGHT IRON, WELDED, or RIVETED.
HARTLEY & SUGDEN, LD., HALIFAX.

DOOR ROLLERS and Fittings.
BOUSFIELD'S PATENT.
For Warehouses, Mills, Factories, Coachhouses and Stations.
2,000 OF THESE ROLLERS IN USE BY NORTH-EASTERN RAILWAY COMPANY.
Send for Lists of compound Rollers and further particulars.
BOUSFIELD'S BAR IRONWORKS, YORK.

The IMPROVED MULTIPLEX STONE-CUTTER



Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 3s. to the Sole Inventors, Patentees, and Manufacturers—
J. G. FAULDS & Co., 48, North Frederick Street, GLASGOW, N.B.

APPOINTMENTS WANTED.

ASSISTANT disengaged, six years' experience in office and on works, well up office routine, quantities, levelling, &c.; qualifying P.A.S.I.; first-class certificate building construction.—"THEODOLITE," Box 1750, BUILDERS' JOURNAL Office, Effingham House, Arundel Street, Strand, W.C.

ADVERTISER seeks POSITION as CLERK in Architect or Surveyor's office; Shorthand (100); neat Tracer; Moderate Salary.—Box 1712, BUILDERS' JOURNAL Office, Effingham House, Arundel Street, Strand, W.C.

ARCHITECT'S ASSISTANT requires engagement. Measure up buildings, plans from rough sketches; good Draughtsman, Tracer, Colourist. Knowledge of specifications, certificate for building construction; six years' experience.—Address, C. O. Francis, High Street, Hadleigh, Essex.

ARCHITECTS' JUNIOR ASSISTANT disengaged; neat Draughtsman, Tracer, Colourist, &c. Usual office routine. Moderate salary. — Box 1744, BUILDERS' JOURNAL Offices, Effingham House, Arundel Street, Strand.

CARPENTER AND JOINER wants work at bench and fixing or on private estate.—Apply ALLISTER, Throckenholt, Wisbech.

GENERAL FOREMAN, thoroughly practical, energetic and reliable, used to taking entire management and carrying out jobs expeditiously; town or country.—W., 16, Oaklea Terrace, St. James' Road, Kingston-on-Thames.

TO BUILDERS.—PLASTERING DONE Satisfactorily at MODERATE PRICES. Town or Country. Good References.—Apply, G. LEWIS, 12, Matilda Street, Barnsbury, London, N.

WORKING FOREMAN CARPENTER AND JOINER seeks SITUATION on gentleman's estate. Late employer the Earl of Darnley.—F. J. ANSELL, Cobham, Gravesend.

YOUNG MAN, age 27, abstainer, wants permanent job as Carpenter's Mate; 6 years in Builder's yard. Accept small wages for good job, town or country. —C. H., Box 1745, BUILDERS' JOURNAL Offices, Effingham House, Arundel Street, Strand.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two.

ARCHITECT AND SURVEYOR. An old established West-end Firm has VACANCY for an ARTICLED PUPIL; Moderate Premium.—HUKINS and MAYELL, 76a, Westbourne Grove, Bayswater, W.

BUILDER'S HEAD CLERK and BOOK-KEEPER WANTED at once. Country experience indispensable. Total abstainer preferred.—Apply, with copy of recent testimonials, which must be first-class, stating age and salary required for permanency, J. W. COLLINS, Builder, Downham Market, Norfolk.

CLERK WANTED for Estate Building Works, under Clerk of Works, for office duties only. Hours, 8 till 5.30. Wages 25s. per week. Must be a good writer and quick at figures; steady, with good references.

Apply by letter, stating age, to G. STUART ROAKE, Clerk of Works, Englefield, Reading.

FIGURE DRAUGHTSMAN and Designer for Stained Glass (first class) WANTED. Permanent engagement.—Messrs. A. L. MOORE & Co., 89, Southampton Row, W.C.

REPRESENTATIVE WANTED, having a good connexion with Builders and Contractors in London and the Southern Counties, to introduce a sandstone of good quality, largely used in churches and castles of Sussex and Surrey.—Give all particulars and terms to THE STEWARD, Cowdray Estate Office, Midhurst, Sussex.

LONDON PLATE-GLASS INSURANCE CO., LTD.
Head Office: 49, Queen Victoria Street, E.C.
Ten per cent. of the Premiums returned every six years in cases where no claim has arisen.
APPLICATIONS FOR AGENCIES INVITED.
LIBERAL TERMS FOR BUSINESS INTRODUCED.

Telegrams— "DIVIDITORE, LONDON."
THE LONDON DRAWING AND TRACING OFFICE,
Telephone— No. 1011 HOLBORN.
98, Gray's Inn Road, Holborn, W.C. *(Adjoining Holborn Town Hall.)*
(ESTABLISHED 1883.) For the Prompt and Efficient Execution of all work usually required by the Profession, such as—
WORKING OR COMPETITION DRAWINGS from rough sketch or description. | PERSPECTIVES In Pen and Ink, Colour, or Monochrome. | TRACINGS On Cloth or Tracing Paper. | PHOTO-COPIES (or Sun Prints). Brown Lines on White. Black Lines on White. Blue Lines on White. White Lines on Blue. | MODELS In Cardboard, Wood, or Plaster. Illustrations sent of Models executed. | LITHO PRINTING Plans, Perspectives, Quantities, &c., &c.
OFFICE HOURS:— 9.0 to 6.0, SATURDAY 9.0 to 1.0. *Cheques and Postal Orders Crossed:*— THE LONDON CITY AND MIDLAND BANK, LIMITED. *Manager*— JOHN R. THORP, *Architect and Surveyor*

TENDERS.

Information from accredited sources should be sent to "The Editor." Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

ABERGAVENNY.—For taking down the present farmhouse and the erection of a new house, with outbuildings, stabling, and other conveniences at Bowlers' Barn Farm, near Abergavenny; also for the erection of an additional boiler-house and chimney shaft, 112ft. high at the Asylum, and other works. Mr. B. J. Francis, architect, Abergavenny:—

Bowers & Co., Hereford	£5,623	9	6
W. T. Sier, Newport	4,407	16	11
D. Thomas & Son, Cardiff	4,400	0	0
P. Gaylard, Bridgend	4,358	12	0
J. G. Thomas & Sons, Abergavenny*	4,207	0	0

* Accepted.

ADDLESTONE.—For the erection of a new school to accommodate 300 boys, for the Addlestone School Extension Committee. Mr. Horace C. Fread, architect, Molesey:—

J. W. Young	£2,870	0
W. G. Tarrant	2,339	0
Highby & Rabson	2,311	7
R. Atkinson	2,167	10
W. H. Taylor	2,134	10
E. Chamberlain	2,134	0
C. Horsell	2,050	0
W. H. Gaze & Sons	2,048	0
W. Greenfield, Weybridge*	2,033	15
Willis & Dickinson	1,939	6

* Accepted.

BLACKBURN.—For extensions to electricity works, Jubilee Street, for the Corporation. Messrs. Lacy, Clirehugh and Sillar, consulting engineers. Mr. A. S. Giles, engineer, Jubilee Street, Blackburn:—

J. Knowles	£16,550	0
S. & J. Whitehead	16,300	0
Wilson & Son	16,186	0
Marshall & Dent	16,155	10
Lewis & Son	16,060	0
Keeley & Son	16,017	0
D. Smith	15,831	6
R. Shorrock	15,800	0
Fecitt & Sons	15,775	0
Highton & Son	15,700	0
J. Cronshaw	15,600	0
Higson & Sons	15,350	0
Whittaker & Sons	15,084	0
J. Boland	14,910	0
W. J. Woof, Cronshaw*	14,884	0

* Accepted.

BODMIN.—For extensions and additions to the Cornwall County Lunatic Asylum. Mr. Silvanus Trevail, F.R.I.B.A., architect, of Truro, and Palace Chambers, Westminster, S.W. Quantities supplied:—

Wakeham Bros., Plymouth	£121,087
J. Shillitoe & Sons, Bury St. Edmunds	111,176
W. King & Son, Westminster	102,700
C. Brealy, Exeter	101,856
T. Rowbotham, Birmingham	101,500
A. E. Skinner, Plymouth	99.156
H. Willcock & Co., Wolverhampton	94,300
J. & M. Patrick, Wandsworth	94,009
A. Krauss & Sons, Bristol	92,335
A. H. Coles, Stonehouse	92,105
R. Wilkins & Sons, Bristol	90,850
W. E. Blake, Plymouth	90,193
S. Trehane, Liskeard	88,795
Pethick Bros., Plymouth*	87,973

* Accepted.

BOWDON.—For alterations and additions to the Lancashire and Yorkshire Bank. Mr. Jesse Horsfall, F.R.I.B.A., architect, 4, Chapel Walks, Manchester, and Todmorden:—

John Bland, Manchester.*

* Accepted.

BRIDLINGTON.—For laying about 1,155yds. lineal 9in. stoneware pipe sewers, 1,555yds. lineal 12in. stoneware pipe sewers, 982yds. lineal 15in. stoneware pipe sewers, 652yds. lineal egg-shaped sewers (varying in size from 4ft. 6in. by 3ft. to 3ft. 3in. by 2ft. 2in.), and 459yds. lineal 24in. cast-iron pipe outfall sewer, together with the necessary manholes, &c. Mr. E. R. Matthews, C.E., borough engineer:—

H. Tyson, Halifax	£14,126	13	1
B. Cooke & Co., Westminster	11,312	0	0
B. Graham & Sons, Huddersfield	11,295	15	0
J. Bentley, Bradford	9,818	17	3
J. Akeroyd & Son, Birstall	8,993	0	0
T. Sangwin, Hull	8,444	0	0
T. C. Starkey, Hull	8,111	15	0
B. Robinson, Hull	7,802	9	4
C. W. C. Pearson, Hull*	7,771	18	4

* Accepted subject to the Local Government Board giving their sanction to an additional loan of £2,000.

CHAILEY (SUSSEX).—For the erection of an isolation hospital, caretaker's house, and other works, for the Chailey Rural District Council. Mr. Henry Card, A.M.I.C.E., architect, 10 North Street, Lewes:—

Young, East Grinstead	£4,993
Finch, Hayward's Heath	4,899
Cook & Son, Crawley	4,813
Box & Turner, Ardingley	4,620
Turnbull & Co., Horley	4,600
Norman & Burt, Burgess Hill	4,493
Wells, Plumpton	4,474
Peerless, Dennis & Co., Eastbourne*	4,244

* Accepted.

CHELTENHAM.—For the erection of a Home for Sick Children. Messrs. H. A. Prothero & G. H. Phillott, architects, 13 Promenade, Cheltenham:—

Saunders & Son	£4 833
A. C. & S. Billings	4,752
Collins & Godfrey	4,435

COVENTRY.—For additions, &c. to Park Fields, Allesley, for Mr. J. Mayfield. Mr. F. Foster, architect, Hertford Street, Coventry. Quantities by architect:—

J. Worwood	£1,767	0	0
C. Haywood	1,750	0	0
C. Hope	1,642	0	0
Harper & Son	1,617	0	0
C. Gray Hill	1,600	0	0
C. Garlick	1,465	0	0
A. Beacham	1,405	12	9
V. A. Pearson, Earlsdon, Coventry*	1,326	0	0

* Accepted.

CWMBRAN (MON.)—For the erection of a girls' school, for the Llantarnam School Board. Messrs. B. Lawrence & Son, architects:—

Mainwaring, Cwmbran	£4,455
Leadbeter, Newport	3,893
Poulton & Whiting, Cwmbran	3,785
J. Davies, Newport	3,684
J. Jenkins & Son, Newport*	3,525

* Accepted.

DEVONPORT.—For the erection of No. 68, Free Street. Mr. H. G. Luff, A.R.I.B.A., architect, Devonport. Quantities supplied:—

Wakenham Bros.	£2,167	0
Thos. May	2,125	0
Pearn Bros.	2,119	0
Littleton	2,107	0
Smith & Son*	2,039	15
Jenkin & Son	2,035	0

* Accepted.

DEWSBURY.—For the erection of four houses in Thornhill Road, West Town, for the Dewsbury Pioneers Industrial Society, Ltd. Messrs. Holtom & Fox, architects, Corporation Street, Dewsbury. Accepted tenders:—

Mason, G. Broadbent, Ravensthorpe	£678	4	11
Joiner, T. B. Bailey, Dewsbury	229	0	0
Plasterer, A. & F. Hodgson, Dewsbury	76	10	0
Plumber, J. Stead, Batley Carr	50	0	0
Slater, W. H. Thompson, Batley	44	10	0
Painter, S. Oldroyd, Batley Carr	14	5	0

Total, £1,092 9s. 11d.

ELLERSTONES GREETLAND.—For the erection of a house for Mr. George Wood. Messrs. Walsh & Nicholas, architects, Halifax. Accepted tenders:—

E. Naylor & Sons, masons.
W. Calverly, joiner.
J. Riley, plumber.
J. Firth, slater.
J. Firth, plasterer.

HERTFORD.—For laying about 2,000 ft. of 15-in., 12-in. and 9-in. stoneware pipe sewers, with manholes, &c., and other work, for the Corporation. Mr. J. H. Jevons, A.M.I.C.E., borough engineer:—

Wallace & Inns, Hornsey (corrected total)	£1,756
Meston & Hale, Harlesden	1,251
G. F. Tomlinson, Derby	1,136
A. C. Soan, Streatham (corrected total)	1,110
J. Jackson, Forest Gate	1,102
G. Porter, Tottenham	1,090
A. T. Catley, London*	1,086

* Accepted.

LEEDS.—For the erection of a branch free library, police stations and fire stations at the corner of Dewsbury and Hunslet Hall Roads, for the Corporation. Messrs. Bedford & Kitson, architects, Leeds. Accepted tenders:—

Mason & bricklayer, F. O. Farrall	£4,831	15	0
Carpenter & joiner, B. Wood	1,891	18	6
Plumber & glazier, J. E. Bedford	1,143	17	6
Plasterer, W. Elsworth	562	8	10
Slater, W. Atkinson	169	18	0
Painters, Roylance & Horsham	77	8	4

LONDON, S.E.—For additions to the Convent of Notre Dâme, St. George's Road, Southwark. Mr. J. C. Radford, architect. Quantities by Mr. H. F. Williams:—

Holloway Bros.	£10,577	H. Roffey	£9,472
Martin, Wells, & Co.	10,139	Gregory & Co.	9,365
Perry & Co.	10,089	Patman & Fotheringham	9,237
Colls & Sons	9,843	Marsland & Sons	9,212
Godson & Sons	9,800	T. Blackmore	8,598
Adamson & Sons	9,581	F. G. Minter*	8,595
Carmichael	9,494		

* Accepted subject to deduction of some provisional amounts.

MAIDSTONE.—For the erection of a shop and seed warehouse for Messrs. Harrison & Sons. Mr. Hubert Bensted, F.R.I.B.A. architect. Quantities by Mr. H. T. Barnes:—

Elmore & Sons	£1,960
Corben & Co.	1,947
Cox Bros	1,836
Wallis & Sons*	1,793

* Accepted.

MANCHESTER.—For alterations and additions to the Lancashire and Yorks Bank, Levenshulme. Mr. Jesse Horsfall, F.R.I.B.A., architect, 4 Chapel Walks, Manchester, and Todmorden:—

J. Helen, Levenshulme.*

* Accepted.

ROCHDALE.—For extensions to the Free Library and New Art Gallery. Mr. Jesse Horsfall, F.R.I.B.A., architect, 4 Chapel Walks, Manchester, and Todmorden:—

Ashworth & Woolfenden, Rochdale.*

* Accepted.

ROSS (HEREFORDSHIRE).—For alterations and additions to "The Upper Baches," Upton Bishop, for Mr. Alexander F. Cox. Mr. Arthur P. Small, architect, Ross:—

W. Bowers, Hereford	£1,209	0
W. E. Lewis, Ross*	1,076	10

* Accepted.

RYDE (I.W.).—For the erection of a cottage at High Park for Miss E. Jones. Mr. John T. Barton, architect, Ryde:—

J. Newnham	£435	0
A. T. Brading	415	0
Wheeler Brothers, Ryde*	413	10

* Accepted.

TODMORDEN.—For the erection of four houses on the Stansfield Hall Estate. Mr. Jesse Horsfall, F.R.I.B.A., architect, 4 Chapel Walks, Manchester, and Todmorden. Accepted tenders:—

Masons, Drylands & Preston, Littleboro.
Carpenter & joiner, T. Greenwood, Todmorden.
Slater, J. F. Ford, Manchester.
Plumber, &c., R. H. Ingham, Todmorden.
Plasterer, T. Black, Todmorden.

WARSOP.—For the erection of cottages for Mr. H. Marlows. Messrs. Vallance & Westwick, architects, Mansfield:—

A. Eastwood	£629	C. G. Percival	£565
Vallance & Blythe	610	J. Collingham*	560

WOKING.—For the erection of a detached house in Albany Road, Horsell, for Mr. Stanley Tibbenham. Mr. William G. Jones, M.S.A., architect, Woking:—

Drowley & Co., Woking		£1,281
J. Harris & Son	,,	1,180
G. Allard*	,,	1,150
W. Roake	,,	1,149

* Accepted.

WOODFORD (ESSEX).—For repairs, re-painting and cleansing works in connection with the Churchfield Schools. Mr. Edward Tidman, C.E., architect to the Board, Connaught Mansions, Westminster:—

H. Wells	£155	0
Osborne	126	0
Poole	125	3
F. Ranger*	124	10

* Accepted.

Also for similar work at Woodford Green Schools:—

H. Wells	£140	0
Osborne	129	0
Poole	124	1
F. J. Hill	73	0
F. Ranger	62	0

COMING EVENTS.

Saturday, August 10, to Saturday, August 17.

INSTITUTION OF JUNIOR ENGINEERS.—Summer Excursion to Plymouth and Devonport.

Wednesday, August 14.

INSTITUTE OF SANITARY ENGINEERS.—Examination and Literary Committee, 3.0 p.m.; General Purposes and Finance Committee, 4.0 p.m.; Council Meeting, 7.0 p.m.

Thursday, August 22.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Excursion to Parson Byres Quarries, leaving Newcastle Central Railway Station at 10.5 a.m.

Saturday, August 24.

ARCHITECTURAL ASSOCIATION.—Fifth Summer Visit, to the Presbyterian College, Cambridge.

NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to South Shields.

Saturday, August 31.

NORTHERN ARCHITECTURAL ASSOCIATION.—Students' Sketching Club Excursion.

Tuesday, September 3, to Friday, September 6.

IRON AND STEEL INSTITUTE.—Autumn Meeting at Glasgow.

Saturday, September 7.

ARCHITECTURAL ASSOCIATION.—Sixth Summer Visit, to Wakehurst Manor, Ardingly, Sussex.

Tuesday and Wednesday, September 24 & 25.

CHEAP DWELLINGS CONGRESS in the Council Hall, Glasgow.

Trade and Craft.

Electric Pulley Blocks.

Mr. Thomas Veasey, of 5, Copthall Buildings, London, E.C., is the sole representative for the United Kingdom and Colonies of Averly's electric pulley blocks. For engineering, steel and iron works, machinery erecting, building and contractors' work, these offer many advantages. They have been adopted by the French Ministry of Marine at the principal Government dockyards, by the French National Cannon Foundry, the steel works of Firminy, Messrs. Marrel Frères, the leading metallurgical factories of the Loire, and other firms. The block consist of an improved lifting mechanism driven by electricity. One man can lift and manœuvre weights of from 1 to 20 tons with the greatest ease; and as the blocks are of very little weight compared with ordinary travelling bridge cranes and lifting apparatus, they can be moved with greater facility, at greater speed and require less power. Their reduced bulk and weight effect a considerable saving of space and freight, rendering them also especially applicable for Colonial requirements. Prices range from £60.

Water Softeners.

The Lawrence Patent Water Softener and Sterilizer Co., Ltd., of Norland Works, Uxbridge Road, Notting Hill, W., have a patent hot process for softening water for every purpose, including boiler feed, drinking, brewing, laundries, &c., without the use of chemicals. In this process steam is generally used as a heating medium, and by means of the heat interchanger the consumption is reduced to a minimum, as the hot soft water on leaving the boiling vessel is cooled by the incoming cold hard water, and leaves the apparatus within 15 degs. of its original temperature. The hard water is thus heated in the interchanger by the usually wasted heat of the softened water, and ultimately enters the boiling vessel at about 180 degs. Fahr. The heat required therefore is only that sufficient to raise the water through about 35 degs. Fahr., allowing for small losses by radiation, &c. The cost of working the apparatus is very small, and has been found to be rather less than 13s. 4d. per 1,000 gals., taking coal at 20s. per ton. Where the treated water is to be used for boiler feed this cost is considerably reduced, and is in fact not appreciable. The softener will remove all the temporary hardness from the water as well as any organic matter whether suspended or in solution, and renders the most impure waters perfectly fit for boiler use or for drinking purposes. The apparatus is very largely employed by boiler users, hospitals, infirmaries, &c., especially in the chalk districts of England, where the water is extremely bad for boiler purposes.

New Theatre Regulations.—In the new theatre regulations of the London County Council the rule remains that two exits shall be provided for every tier or floor, with an additional exit in respect of every 250 persons (or part of 250 persons) above 500 for whom accommodation is provided; but for the first time "the standing space from which a view of the performances can be obtained, as well as the seated area, will be considered." The holding capacity of most theatres is 50 per cent. higher—and of some 100 per cent. higher—than the seating accommodation; thus the new regulations will result in future theatres having many more exits that existing theatres.

Keystones.

A New Mission Room at Mayor's Walk, Peterborough, has been built from designs by Mr. Ruddle. Mr. F. Nichols was the builder.

Towards the Cost of Extending Oldham Infirmary, by the erection of an additional wing to accommodate twelve beds, the sum of £13,134 has been received up to the present. £18,000 is needed.

New Race Stands on the Newton Course (Plymouth) have been erected by Mr. J. Edwards, contractor, of Newton. Each has a frontage of about 100ft., and they will accommodate nearly 3,000 persons.

The death of Mr. John Wild, J.P., which took place on August 8th at Alderley Edge, Manchester, has removed a prominent figure from Oldham business circles. Mr. Wild, who was in his sixty-sixth year, was the senior partner in the firm of Wild, Collins & Wild, architects, and executed a good deal of work of note in the borough; the firm are now completing the building of St. Peter's new church.

An Historic Estate.—Toddington, Gloucestershire, comprising about 7,000 acres, and a mansion that cost £150,000, has been sold to Mr. Hugh Andrews, the high sheriff of Northumberland. The property is rich in historical associations. The ruins of the ancient Abbey of Hailes are upon it, and it was here that Richard, Earl of Cornwall, founded a Cistercian monastery in 1246.

The New Church House at Furnham, Yeovil, was opened recently. The ground-floor room is now capable of providing seating accommodation for 400 persons. On the first floor there are three lofty and well-ventilated classrooms, approached by steps from the outside. The cost of the alterations has been about £500. Mr. A. W. Yeomans, the vicar's warden, was the architect, and Messrs. Harris & Woolcott were the builders.

Fourteenth-Century Doorways found at Broughton Castle.—In the great hall of Broughton Castle, near Banbury, the plaster having been removed from the walls, five or six early fourteenth-century doorways, which have been blocked up since 1554, have been discovered, and also some very fine windows of the same period, one of them still showing a portion of the tracery. Mr. Purdon Clarke, of the Victoria and Albert Museum, has been to the Castle to give his opinion with regard to the discoveries.

New Market at Douglas.—A new market for fish, butter and vegetables has been built on the site of the old St. Matthew's Church and the former open-air market on the North Quay, Douglas, I.M. It is constructed entirely of iron and measures 115ft. 6in. by 43ft. 6in. at one side and 91ft. by 37ft. 6in. at the other side, with a height of 12ft. to the underside of the ornamental steel girders. The roof has iron principals and wood purlins, covered with ¼in. boards felted and slated with best Welsh slates. The fish and vegetable markets are separated by a brick wall running the full height of the building. Lavatories are provided, and a boiler-house enables hot water to be obtained at any time for washing the stalls and fittings. The cost of the building has been £3,000, but another £300 has been spent on the stalls. In the fish market the stalls are of white marble on white brick piers, and they are 7ft. long by 4ft. wide. Arrangements have also been made for carrying away the water after washing the fish on the stalls. The stalls in the vegetable and fruit market are built of wood. They are between 7ft. and 9ft. long and 4ft. wide, and are provided with movable shelves on which the fruit can be displayed to the best advantage. The ironwork is of an ornamental character, the pediments to the main roofs having the borough coat of arms in the centre of each, picked out in gold relief. The plans were prepared by Mr. A. E. Prescott, borough surveyor; and the contractor for the entire work was Mr. F. Callow. The ironwork was supplied by Messrs. McFarlane & Co., of Glasgow. The plumbing and gasfitting was executed by Messrs. George Sherwood & Co.

A Statue of Leopold I. has been erected at Ostend.

Chester's New Public Baths are to be opened this month.

New Station Buildings at Lugton, Glasgow, have been erected by Mr. William Duncan, of Pollokshaws.

The Museum of Practical Geology in Jermyn Street has been closed as usual from Friday evening last until September 10th.

The Children's Ward at Chester Infirmary has been renovated in memory of Miss Frances Barrow, the late superintendent.

Mr. Oliver Sheppard, sculptor, has been elected a constituent member of the Royal Hibernian Academy.

The Contract for the New Victoria Infirmary at Newcastle has been signed, and work will be commenced at once. Mr. Pringle is the contractor.

The Embankment Seats are proposed to be raised 1½ft. on stone slabs approached by a couple of steps in order to command a better view of the Thames.

The Church of St. Margaret, Burnage, near Manchester, which was only erected in 1875, is already being enlarged. A north aisle is being added at a cost of £1,000, and extensions are contemplated at the west end and other portions of the buildings.

Proposed War Memorial in Somerset House.—A committee is being formed representative of all branches of the Inland Revenue with the object of placing a memorial tablet in Somerset House to the memory of Sergeant Arthur Hoskins, of the Devon Company Imperial Yeomanry, who was killed at Vlakfontein. Somerset House is a royal building, but it is not thought the First Commissioner of Works will impose any obstacle in the way.

A Victoria Memorial for Newport, I.W.—It has been decided that a monument shall be erected in the market square at Newport as the island's memorial to the late Queen Victoria. The subscriptions approach £1,000. The designs for the memorial are to be submitted for the approval of Princess Henry of Battenberg, as Royal Governor of the island; and the suggested designs include an enlarged replica of the bronze bust of her late Majesty in the Royal Academy, which Mr. Thomas Brock, R.A., is prepared to execute.

Decorative Art Exhibition in Turin.—The first international exhibition of modern decorative art will be held in Turin next spring under the patronage of the King of Italy, and with the co-operation of societies and individual artists throughout the world. Mr. Walter Crane has accepted the office of English commissary, and promises to the general committee a collection of the best works of contemporary British artists, together with a retrospective exhibit of the origins of the new style. As regards Scotland, Mr. Francis Newbery promises the contribution of the "quaint, hardy and characteristic school of Glasgow decorative artists." Other nations represented will be France, Belgium, Austria, Hungary, Russia, Denmark, Norway, Sweden, the United States and Japan. Further information may be obtained from the general committee of the exhibition in Turin.

The Victoria and Albert Museum.—In the House of Commons on Thursday last Mr. Akers-Douglas stated that the foundations of the Victoria and Albert Museum had been completed, and the contract was for £83,410. A second contract had been made for building to the ground-floor level, and this work is now being proceeded with. As soon as this is finished tenders will at once be invited for the superstructure, the plans being now practically ready. No alterations that he was aware of had been made which would reduce the size of the museum, and no delays of importance had occurred, the work being completed within the allotted time. The contract for the foundations was not entered into until some time after the laying of the memorial stone, that ceremony having taken place in advance to suit her late Majesty's arrangements.

A Memorial Window to the late Mr. D'Oyly Carte is to be placed in the Chapel Royal, Savoy.

A new Stained-Glass Window at Clun Church, Salop, has been erected from designs by Mr. T. F. Curtis, Soho Square, London, W.

The New Hospital at Newport (Mon.), on the Cardiff Road, was recently opened by Lord Tredegar. It has been designed by Mr. W. Tanner, county surveyor. Messrs. D. Richards, Ltd., of Newport, were the contractors.

The Bells of Exeter Cathedral.—The Chapter of Exeter Cathedral has decided to rehang the peal of eleven bells. It is stated that from £1,000 to £1,200 will be required for the work, but up to the present time only about half the amount has been subscribed.

New Shoe Factory at Stafford.—The Stafford Town Council has decided to lease 10¾ acres of land on the Coton Field estate, fronting Sandon Road, to a firm of shoe manufacturers at a chief rent of £17 an acre per year, the Council to construct a street in continuation of Oxford Street.

Pepys and St. Paul's.—The immortal Pepys wrote in his diary for September 16th, 1663: "I stopped, too, at St. Paul's, and there did go into St. Fayth's Church, and also in the body of the west part of the church, and did see a hideous sight of the walls of the church ready to fall, that I was in fear as long as I was in it."

The Art of Bridge-Building.—It is said that Canova, the sculptor, being asked while on a visit to England what had struck him most forcibly here, replied: "That the trumpery Chinese bridge, then in St. James's Park, should be the production of the Government, while that of Waterloo was the work of a private company."

Improvements to Armagh Cathedral.—The long contemplated improvements to Armagh Cathedral have now been commenced. A chancel window is to be erected in memory of members of the Beresford family, necessitating the raising of the chancel roof. The new roof will be of oak. Two new brasses will also be erected. The work is being carried out to the design and under the supervision of Sir Thomas Drew.

New Mission Hall at North Shields.—The foundation-stone of this building, in Northumberland Street, was laid last week. It will comprise a large mission hall, children's school, vestry, classrooms, &c. The main hall will seat about 350 persons, while the school will accommodate over 200 children. Mr. Thomas Robson, of Tynemouth, is the builder, and Messrs. Thomas A. Page & Son, South Shields, are the architects.

Frescoes in the Pantheon, Rome.—Ferdinand Humbert's fine frescoes are much admired by visitors to the Pantheon, but as they are not signed people are in doubt as to the painter's name. The other day a party of Cook's tourists were examining the frescoes, which the guide attributed to Puvis de Chavannes, and the magic of the name gave the works additional glory. The next globe-trotters who visit the Pantheon, however, will be able to find out for themselves the name of the artist, for since this incident Humbert has added his signature to the frescoes.

Labourers' Dwellings for Liverpool: Local Architects to submit Plans.—At the last meeting of Liverpool City Council the Housing Committee recommended the acceptance of a tender for the erection of 113 labourers' dwellings in Newsham Street, Kew Street and Arley Street, in accordance with plans, specifications and quantities prepared by the Corporation surveyor, for the sum of £20,689. Mr. Thomas Roberts moved an amendment that independent local architects be asked to submit plans, to ascertain if they could suggest a more efficient economical plan for the proposed houses. The amount of the present tender worked out at £70 19s. per room, or between 8d. and 9d. per cub. ft. Other builders could erect a similar class of houses for £25 10s. per room, which meant that the present scheme could be carried out for £8,030 instead of £20,689 which the committee proposed to pay. The amendment was carried.

New Companies.

Vulcanite, Ltd.

Registered July 19th to acquire and carry on the businesses of the Patent Vulcanite Roofing and Asphalte Co., Ltd., and the Logan Vale Fibre Syndicate, in Belfast and elsewhere in Ireland, and at Storn Road, Old Ford, near London. Capital £100,000 in 50,000 five per cent. preference shares and 50,000 ordinary shares of £1 each. Registered office: Logan Vale, Belfast.

Albert (Tenements) Co., Ltd.

Registered July 29th to acquire land and buildings in Dublin and its neighbourhood for the purpose of providing houses for the poor. Capital £10,000 in £1 shares. Registered office: 22, Nassau Street, Dublin.

Station Street Corner, Ltd.

Registered July 29th to acquire the assignment of a lease for the acquisition of certain land in Station Street and John Bright Street, Birmingham, and to carry on the business of builders, contractors, &c. Capital £4,000 in £100 shares. Registered office: 33, Newhall Street, Birmingham.

Ridgill Brick Co., Ltd.

Registered July 30th to adopt an agreement with W. Ridgill, and to carry on the business of brick, tile, drain pipe, &c., merchants. Capital £3,000 in £1 shares. Registered office: 18, Sandygate, Wath-on-Dearne, near Rotherham.

F. B. Thackray & Co., Ltd.

Registered July 31st to acquire the business of a builder and contractor carried on by F. B. Thackray at Huntingdon, and to carry on the same. Capital £10,000 in £10 shares. Registered office: 5, Ermine Street, Huntingdon.

Milton and Barton Court, Ltd.

Registered August 1st to acquire certain land and buildings at Barton-on-Sea, and to carry on the business of land and property owners, builders, &c. Capital £3,000 in £1 shares.
